ABSTRACT

Tables of correction factors for radioactive decay are presented which facilitate the task of calculating the activity of a radioactive nuclide at a given time, given its activity at any other time. Tables are included for those nuclides which are commonly measured or used as standards or tracers. A universal decay correction table is also presented for application to radionuclides which are not included.

ACKNOWLEDGEMENTS

The authors gratefully acknowledge the assistance of Vicki Peterson, Terence Grady, Brian Spavin and Susan Snyder in preparation of this report.

INTRODUCTION

The first edition of the *Radioactive Decay Correction Factors* was prepared by K. H. Falter as Public Health Service Publication No. 999-RH-12. The demand for this publication exceeded the most optimistic expectations.

The preparation of the second edition was preceded by an inquiry to workers in the field as to the desirability of this type of publication and what additions or deletions should be incorporated into a second edition. All but one of the 51 replies favored a second edition with certain radionuclide additions. The second edition, therefore, contains several radionuclides which have come into wide use since publication of the first edition, e.g., ^{123}I, ^{13}N, ^{197}Hg, ^{18}F and ^{15}O. In addition, certain calculation intervals were modified to allow greater application of the tables. A universal decay correction table is also presented for calculation of activities of radionuclides not included in the first edition.

Tables of correction factors for the most commonly used radionuclides are presented. The factors are based on the equation which describes the rate of physical decay of radionuclides:

$$A_t = A_o e^{-\lambda t} \text{ or } A_t = A_o e^{-\ln 2 t/T_{1/2}}$$

Where:

A_t is the activity at desired time t,

A_o is the activity at $t = o$ time,

e is the base of natural logarithms,

$T_{\frac{1}{2}}$ is the half-life, and

λ is $\frac{\ln 2}{T_{\frac{1}{2}}}$ or the decay constant.

The factors in the tables are:

$$F(t) = \frac{A_t}{A_o} = e^{-\lambda t}$$

Where $F(t)$ is the correction factor for time interval t.

The fractional ingrowth tables give the activity of the daughter at any time t as a fraction of the activity of the parent at time $t = 0$. These factors are based on the following equation:

$$F(t) = \frac{A_d(t)}{A_p(o)} = \frac{\lambda_d}{\lambda_d - \lambda_p} (e^{-\lambda p t} - e^{-\lambda d t})$$

Where:

$F(t)$ = fractional ingrowth after time t,

$A_d(t)$ = activity of the daughter after time t,

$A_p(o)$ = activity of the parent at time $t = 0$,

$\lambda_d = \frac{\ln 2}{T_{\frac{1}{2}}}$ where $T_{\frac{1}{2}}$ is the half-life of the daughter, and

$\lambda_p = \frac{\ln 2}{T_{\frac{1}{2}}}$ where $T_{\frac{1}{2}}$ is the half-life of the parent.

To find the activity of the parent nuclide at $t = 0$, give the activity of the daughter at time t, divide the daughter's activity by the appropriate fractional ingrowth factor.

The factors in the universal decay table are:

$$G(n) = \frac{A_n}{A_o} = e^{-(\ln 2)\cdot n}$$

Where:

n is $t/T_{1/2}$, or the number of half-lives,

A_n is the activity after n half-lives, and

$G(n)$ is the correction factor for interval n.
