ABSTRACT

A data base of GC/MS data obtained during the analysis of 1,159 household products for six common chlorocarbon solvents has been reanalyzed for the presence and concentration of 25 additional chemicals. Using computerized GC/MS software, 1,043 of the original GC/MS data files were recovered and analyzed for the presence of the additional chemicals. An efficient microcomputer-based data base system was developed and used to assemble, reduce, and view the analytical data.

Of the 25 additional chemicals, those found most frequently in the household products include acetone (315 products), 2-butanone (200 products), methylcyclohexane (150 products), toluene (488 products), ethylbenzene (157 products), *m*-xylene (101 products), and *o,p*-xylene (93 products). A total of 63.6% of the products analyzed in this study contained one or more of the 25 additional analytes at concentrations greater than or equal to 0.1% by weight. Five analytes, 1,1,2,2-tetrachloroethane, chlorobenzene, styrene, nonane, and *d*-limonene, were not found in any of the products at concentrations greater than or equal to 0.1% by weight.

The major accomplishment of this work is the production of a large data base of semiquantitative information for 31 common chemicals in over 1,000 household products. This information will be useful for assessing the potential for exposure to the 31 chemicals in the home environment. The quantitative information presented in the report are also available on diskette in a spreadsheet format.

SECTION 1

INTRODUCTION

The Office of Pesticides and Toxic Substances and the Office of Air and Radiation of the U.S. Environmental Protection Agency (USEPA) have been attempting to define pollutants and their levels and sources in indoor air, particularly in residential settings. The Office of Solid Waste and Emergency Response, under the authority of the Superfund Amendments and Reauthorization Act (SARA), is concerned with minimizing disposal of household products containing toxic substances.

As a contribution to these efforts, this study reviews an analytical data base of 1,159 household products compiled by Midwest Research Institute (MRI) in a previous study (USEPA, 1987). While the objective of the original work was to quantify six chlorinated target analytes by purge and trap gas chromatography/mass spectrometry, full mass spectra were collected and archived for all analyses. Therefore, the data collection is suitable for the estimation of other analytes assuming that appropriate response factors can be generated.

The purpose of this work is to supplement the original study by providing data on the occurrence and estimated concentrations of 25 additional chemicals in the household products contained in the data base.

This report details the computerized analysis of existing gas chromatography/mass spectrometry (GC/MS) data to determine the occurrence and concentration of 25 common chemical components (see Table 1) in 1,159 household products. The target analytes selected for this work include chemicals studied in the Total Exposure Assessment Methodology (TEAM) studies (Wallace, 1987) and other analytes recommended by the Office of Toxic Substances (OTS) and other USEPA programs. The GC/MS data were initially obtained from the determination of six chlorocarbon solvents (dichloromethane, tetrachloroethylene, carbon tetrachloride, trichloroethylene, 1,1,1-trichloroethane, and 1,1,2-trichlorotrifluoroethane) in the household products.

The analytical procedure used for these analyses is diagrammed in Figure 1. The strategy adopted to best estimate the concentrations of the target analytes in the products without actual reanalysis of the products by GC/MS consisted of computerized reduction of the existing GC/MS data. Authentic standards were analyzed to obtain accurate library mass spectra and retention behavior of the target analytes under conditions designed to replicate the original analyses. Using the library mass spectra, computerized Target Compound Analysis (TCA) was used in conjunction with manual interpretation to search for each of the 25 analytes in each existing GC/MS data file. As the

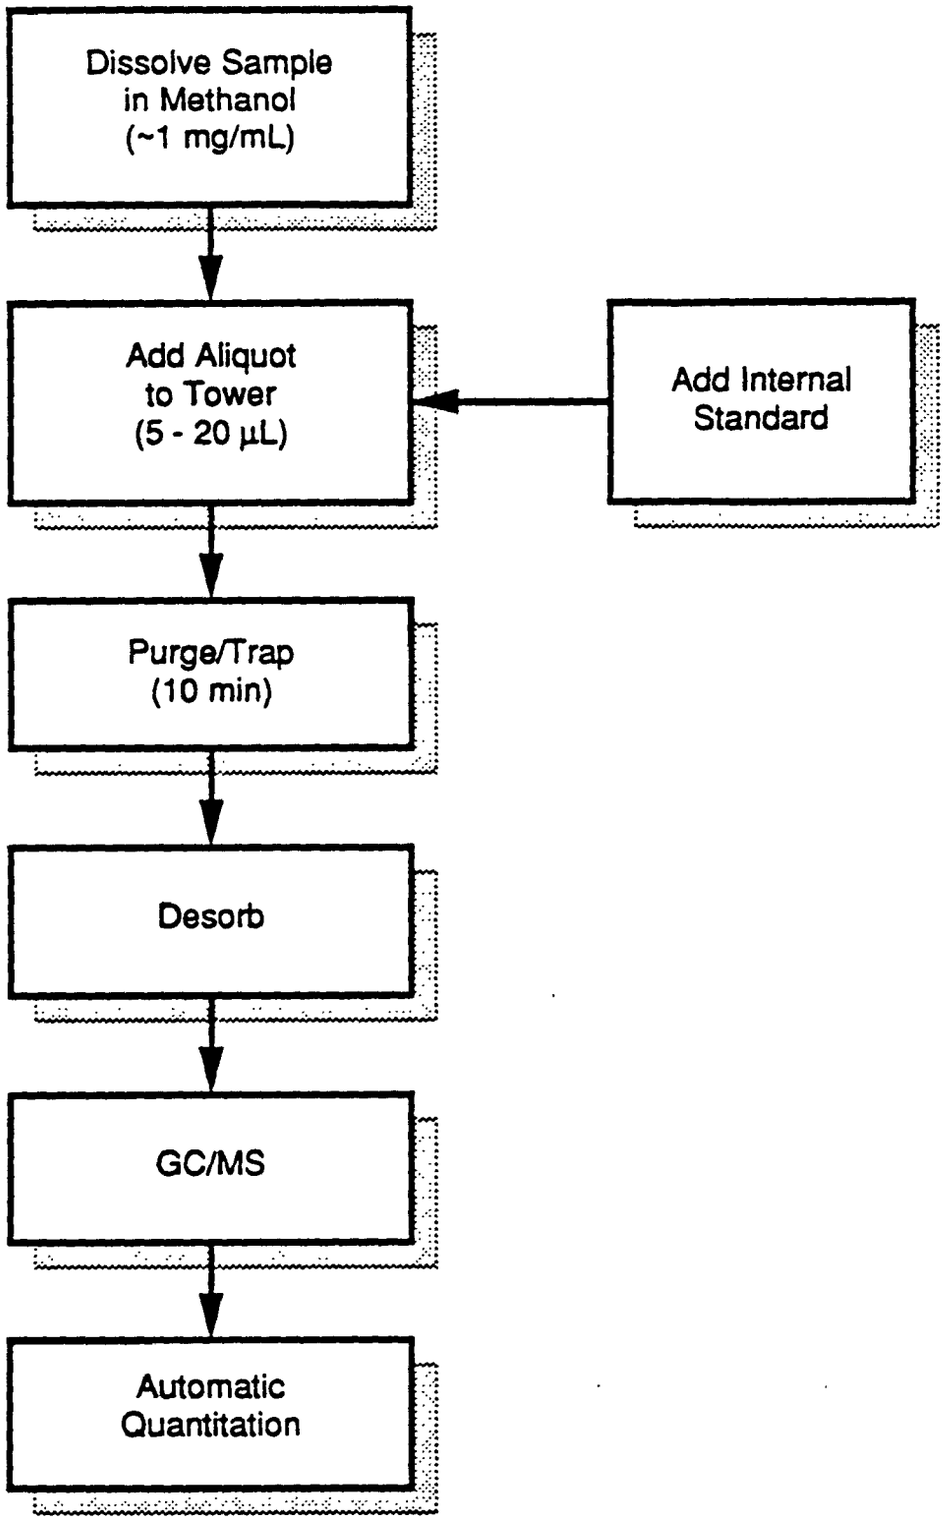

Figure 1. Analysis procedure for household product shelf survey.

original work was not concerned with the additional 25 analytes, no calibration information (i.e., response factors) was available. Therefore, a calibration curve for each analyte was performed by analysis of a set of standards with the GC/MS equipment used for over 70% of the original work. The estimated analyte concentrations were determined by comparison of the electronically integrated analyte ion abundances of the quantitation ions with the internal standard integrated ion abundances using response factors determined from the calibration standards. Analytical conditions that best approximated the original GC/MS performance for the internal standards were used for acquisition of relative response information.

Of the 1,159 products analyzed originally, 1,043 were successfully analyzed for this work. Of that number, 63.6% contained one or more of the target analytes at concentrations of at least 0.1% by weight. Five analytes, 1,1,2,2-tetrachloroethane, chlorobenzene, styrene, nonane, and d-limonene, were not found in any of the products.

SECTION 2

CONCLUSIONS AND RECOMMENDATIONS

A data base of GC/MS data obtained during the analysis of 1,159 household products for six common chlorocarbon solvents has been reanalyzed for the presence and concentration of 25 additional chemicals (see Table 1). Using computerized GC/MS software, 1,043 of the original GC/MS data files were recovered and analyzed for the presence of the additional chemicals. An efficient microcomputer-based data base system was developed and used to assemble, reduce, and view the analytical data.

Of the 25 additional chemicals, those found most frequently in the household products include acetone (315 products), 2-butanone (200 products), methylcyclohexane (150 products), toluene (488 products), ethylbenzene (157 products), *m*-xylene (101 products), and *o,p*-xylene (93 products). A total of 63.6% of the products analyzed in this study contained one or more of the 25 additional analytes at concentrations of at least 0.1% by weight. Five analytes, 1,1,2,2-tetrachloroethane, chlorobenzene, styrene, nonane, and *d*-limonene, were not found in any of the products at or greater than 0.1% by weight.

The major accomplishment of this work is the production of a large data base of semiquantitative information for 31 common chemicals in over 1,000 household products. This information will be useful for assessing the potential for exposure to the 31 chemicals in the home environment. The quantitative information presented in the report is also available on diskette in a spreadsheet format.

We recommend that the data produced in this study be made generally available to exposure assessment researchers in order to permit studies such as the determination of household sources of specific chemicals; assessment of the potential of specific products to generate harmful vapors; and characterization of the major components of the household products. Furthermore, as it was possible to revisit the original GC/MS data to obtain useful information on an additional 25 analytes, studies should continue to characterize the household products for other chemicals. Potential studies to address new sets of target chemicals or, alternatively, to identify those GC/MS peaks not identified as one of the 31 analytes already studied should be conducted.

SECTION 3

MATERIALS AND METHODS

PRODUCT INVENTORY/DATA RETRIEVAL

The products selected for this study have been described previously (USEPA, 1987) and are listed in Appendix A. The products originally spanned 67 product categories (see Table 2) representing a wide number of common household products. Each product has been given a sample code which describes the sample, the city of purchase, product category, product form, and sequential city/product number. The breakdown of the sample code is shown in Table 3. Specific details of the sampling design have previously been reported (USEPA, 1987). Appendix A contains several products having code numbers beginning with 900, which were appended to the list at a later date. Those products were assigned to product categories during the present study.

During the course of the present study, several products were identified that either had code numbers misassigned or were assigned to inappropriate categories in the original report (USEPA, 1987). Those products were assigned to proper categories and given appropriate code numbers during this work. Those products having code number changes are shown in Table 4 and are cross-referenced with the original code numbers found in the previous report (USEPA, 1987).

The household product samples were originally analyzed by GC/MS at three laboratories: MRI (Kansas City, MO), Envirodyne Engineers (St. Louis, MO), and Versar (Springfield, VA). During the present study, it was necessary to obtain the archived raw GC/MS data files and process them for the analysis of the new set of target analytes. Of the 1,159 products originally analyzed, 922 were analyzed at MRI, 92 at Envirodyne, and 145 at Versar. GC/MS data files were available and obtained for 1,043 of the original 1,159 products. These data files are summarized by product category in Table 5. Only two of the product categories originally studied (drain cleaners and circuit board cleaners) were not available to the present study due to the unavailability of the corresponding GC/MS data files. An additional two of the original categories, No. 9 (nonaerosol wax), and No. 82 (video disk cleaner) have no products indicated due to the reassignment of categories described above and are not included in the remainder of this report.

APPARATUS AND MATERIALS

Purge and Trap GC/MS System

The purge and trap system employed for this work complies with the specifications outlined in EPA Method 624, "Purgeables." A schematic of this system is shown in Figure 2. Although no actual household product samples were analyzed by GC/MS for the present work, the purge and trap GC/MS system was used for the analysis of standards for the target analytes in Table 1.

Operating parameters for the Finnigan/MAT CH-4B GC/MS system are given in Table 6, and were designed to replicate the chromatographic behavior observed for the original analyses.

GC/MS Data Processing

A Finnigan/INCOS data system was used for data acquisition and handling for both the analysis of the standards for the new target analytes as well as for the processing of the original GC/MS data files. Analysts used the Target Compound Analysis (TCA) software for the identification and quantitation of the target analytes. The TCA procedure identifies target analytes based upon relative retention times and comparison of the observed mass spectrum with an authentic spectrum obtained by the analysis of a standard solution.

Because the original GC/MS data were obtained over a long period of time from three different laboratories, significant retention differences were observed throughout the course of this work. To resolve the differences, manual interpretation and modification of the automatic software procedures were necessary to provide for semiautomated processing of the mass of GC/MS data.

Reagents and Standards

Solvents--

Methanol--High purity methanol (Burdick and Jackson, Muskegon, Michigan) was used for all sample and standard preparations.

Reagent water--Milli-Q® water was further cleaned by filtration through a bed of activated charcoal and purged with nitrogen at 50°C prior to use.

Reference Standards--Reference standards of the target analytes were obtained from Aldrich and are listed in Table 7 with their CAS Registry Numbers and purity.

Calibration Standard Solutions--Calibration standard solutions were prepared by accurate dilutions of the reference standards with high purity methanol. The weight concentrations were then calculated using specific gravity data.

Bromofluorobenzene (BFB) Standard--A 50-ng/µL solution of BFB was prepared in high purity methanol.

o-Xylene	95-47-6	97	X104-0
m-Xylene	108-38-3	99	18,556-6
p-Xylene	106-42-3	99+	24,045-1

[a]Sample received from manufacturer. Purity unknown.

Internal Standard (IS) Solution--The internal standard solution containing 20 μg/mL bromochlorobenzene and 160 μg/mL of bromochloropropane was prepared in high purity methanol.

SECTION 4

EXPERIMENTAL PROCEDURES

SYSTEM CALIBRATION FOR TARGET ANALYTES

The GC/MS system was calibrated according to procedures outlined in EPA Method 624. Two calibration curves (low and high), containing six and five points, respectively, were generated. Two quantitation ions were chosen for each analyte based upon its mass spectrum. For the low calibration curve, the ion used for quantitation was the base peak or molecular ion to provide sensitivity to the 0.1% w/w level. For the high calibration curve, an ion of lesser abundance (typically < 10% relative abundance) was chosen so that saturation of the ion signal was not a factor at the highest concentration level.

The original GC/MS analyses were not concerned with the additional 25 analytes in this work. Therefore, no concentration calibration information for the five different GC/MS systems used was available for the 25 analytes prior to this program. It is assumed that the relative responses of the target analytes obtained at MRI during the calibration for the present work are representative of the responses obtained during the original analyses at MRI, Versar, and Envirodyne. This assumption is made with the knowledge that there could be significant differences in the relative responses of the analytes for the GC/MS systems used during the original analyses, as discussed in Section 5.

DATA PROCESSING

Processing of the existing GC/MS data files for analysis of the target analytes consisted of a two-phase procedure. The first part entailed the use of TCA software on the GC/MS data system to produce quantitation lists for each sample analysis. The completed quantitation lists were electronically transferred to a personal computer-based data base for subsequent processing and compilation. The following sections describe the data processing steps in more detail.

Target Compound Analysis (TCA)

Each GC/MS data file was processed by Finnigan/MAT's TCA software provided with the GC/MS computer system. The suite of TCA programs uses a quantitation library containing information about the target analytes to locate and quantitate each analyte in a GC/MS analysis. The quantitation library contains a reduced mass spectrum, relative retention time, and compound name for each analyte, as well as the internal standard compound

reference number by which to quantitate. The TCA routines produce a quantitation report for each GC/MS run, which contains an entry for each analyte. For each analyte, the table includes retention information, quantitation mass, peak area, peak height, and quantitation library reference number.

Qualitative assignment of positive identification of the target analytes was verified by the use of MRI-written computer procedures which printed mass chromatograms for each analyte. The data analyst used the mass chromatograms to cross-check the assignments made by TCA. Once positive assignment of target analytes was made, a mass spectrum for each positive response was printed for final verification purposes.

Electronic Data Transfer

Completed quantitation reports were transferred to a Macintosh II personal computer as ASCII text files via a dedicated local area network in the MRI mass spectrometry facility. Transferred quantitation reports were archived on floppy disk.

Data Processing on the Macintosh

The ASCII quantitation reports were imported into a 4th Dimension data base (Acius, Inc. Cupertino, CA) designed and constructed at MRI for the express purpose of handling quantitative GC/MS data. Within the data base, the quantitation reports were reviewed, listed, modified, searched, and sorted using the 4th Dimension software. The data base system was used to ultimately compute the % w/w concentrations of each analyte for each product and merge that information with the data base generated from the original study. The original data base contains concentration information for the six chlorocarbon analytes and is listed in full in the original report.

Final Data Base Design

The completed household products data base consists of 1,168 records, representing 1,159 products. Nine products are two-component products which were analyzed and reported separately. These two-component products are represented in the data base by two records having the same code number. Each record contains 41 fields. The first 11 fields correspond to the inventory information in Appendix A. The remaining fields contain the % w/w concentration results for the original six analytes, as well as the additional 25 analytes studied in this work. *o*- and *p*-Xylene are included as one field, since these two analytes coeluted in the chromatographic system used. The data base is available in two formats. These are Lotus 1-2-3 for IBM compatibles and Microsoft Excel for the Macintosh.

SECTION 5

RESULTS AND DISCUSSION

The results of this study are presented in two parts. The first part describes the calibration of the analytical GC/MS system for the target analytes. The second part presents the results of processing the archived GC/MS data for the additional analytes.

CALIBRATION CURVE/REFINEMENT OF TARGET LIST

The results of the GC/MS system calibration are shown in Tables 8 and 9 for the low and high calibration curves, respectively. For the low-level curve, bromochloromethane was used as the internal standard. Bromochloropropane was used as the internal standard for the high-level curve. Note that for the high-level curve, different quantitation masses were used for analytes that saturated their primary quantitation mass when analyzed at high levels. In those cases, secondary quantitation masses of lower relative abundance were chosen to minimize the possibility of saturation. A chromatogram obtained from the analysis of one of the calibration standards is shown in Figure 3.

In general, the precision of the relative response factors for the target analytes was less than 35%, the EPA Method 624 calibration criterion. One compound, nonane, did not meet the 35% criterion. However, nonane was not observed in any of the products. As the calibration was used for an estimate of analyte concentrations obtained from several different instruments and laboratories, this limit was deemed acceptable.

It was found during the analysis of the calibration standards that four of the target analytes originally selected by EPA for analyses during this program, 2-butoxyethanol, 2-ethoxyethanol, 2-methoxyethanol, and methyl ethyl ketoxime were not detected by the purge and trap technique. Three of those, the alkoxyethanols, were observed in good abundance by direct injection GC/MS. Because they could not be purged from water, the alkoxyethanols would not have been observed in the original analyses and were therefore dropped from further consideration. The fourth analyte, methyl ethyl ketoxime, was not observed by purge and trap or by direct injection and was assumed to decompose during GC/MS analysis and dropped from further consideration.

ANALYTICAL RESULTS

The analytical results for the determination of the concentrations of the 25 target analytes in the household products are presented in the appendices. The weight percent concentration of each analyte was determined. Concentrations greater than approximately 0.1% are shown in the appendices; concentrations less than 0.1% are not reported.

Table 8. Response Factors for Low-Level Calibration Curve

Analyte	Mass[a]	No. analyses	Mean RRF[b]	% RSD[c]
Acetone	58	6	0.129	33.1

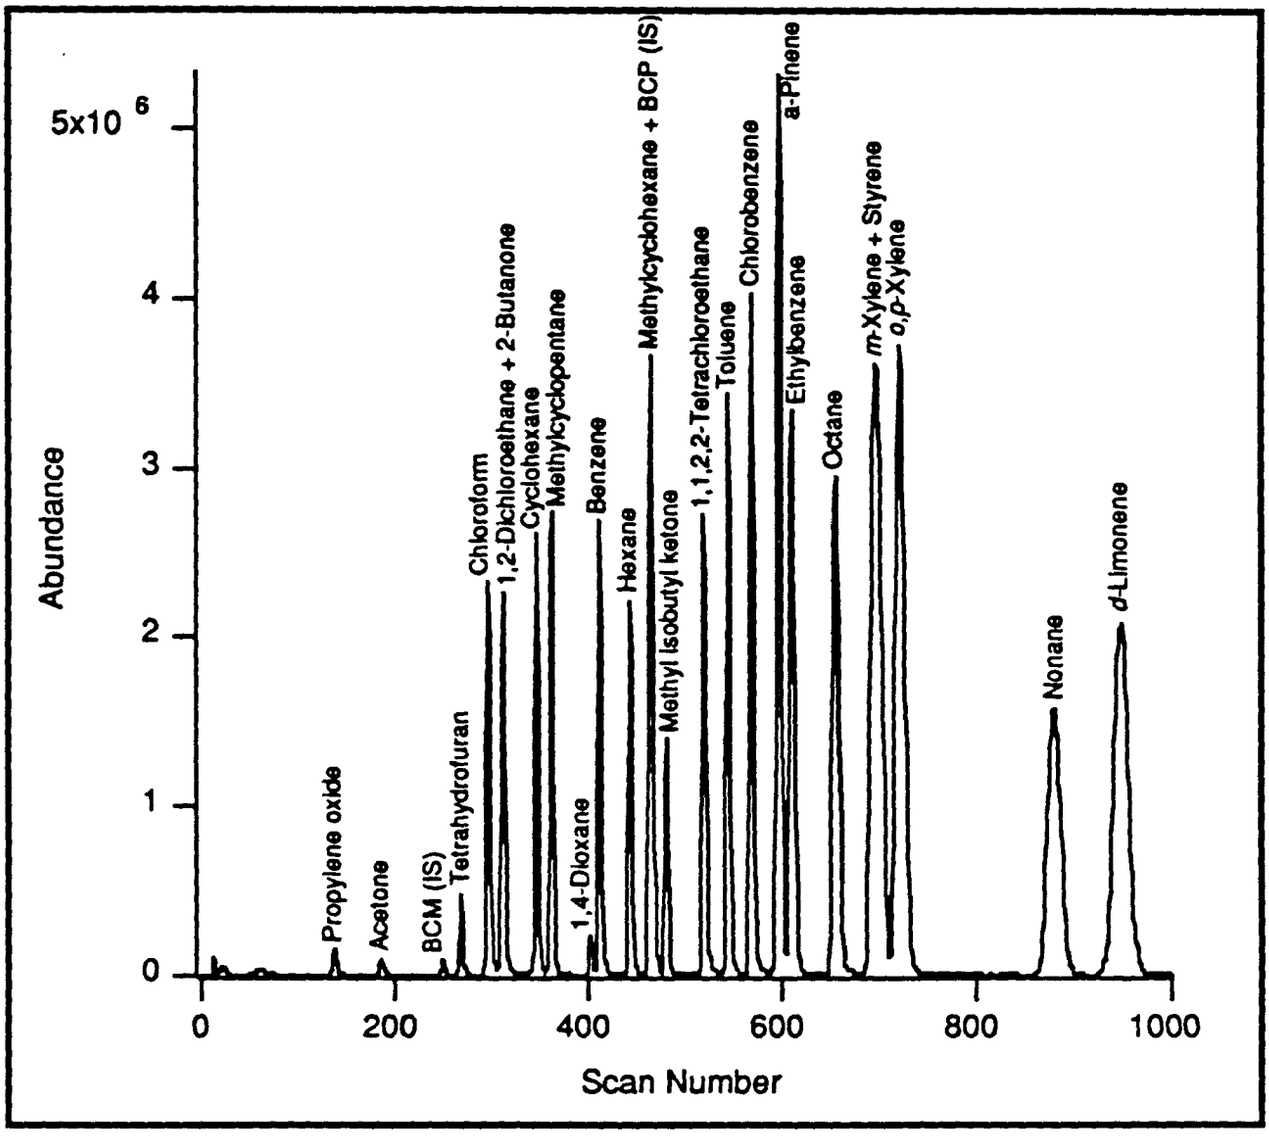

Figure 3. Example total-ion-current chromatogram for analyses of household products calibration standard.

In the original study, some of the products were composited prior to analysis for the six chlorocarbons. If any of the six chlorocarbons was found in a composite, the individual products in the composite were analyzed. If none of the original six chlorocarbons was found in the composite, however, only the GC/MS data for the composites were available for analysis for the 25 new target analytes. Table 10 lists these composites. For composite analyses that resulted in positive results for any of the 25 target analytes, it is not possible to determine which product or products in the composite contain that analyte. In addition, a concentration of 0.1% reported for a composite of five products may actually reflect a concentration of 0.5% in a single component of the composite. Therefore, for those products analyzed as composites, positive hits for any analyte are indicated as "CH" or "composite hit" rather than as a concentration value. For completeness, however, a table showing the analytical results for each composite is given in Appendix D.

The original analyses were only concerned with the determination of the list of six chlorocarbons. It was found that the majority of the GC/MS data was acquired under conditions in which some of the later eluting analytes could not have been observed. For household product analyses where this was found to be the case, that analyte is shown as "NA" or "not analyzed." Those target analytes falling into the NA group with the most frequency are ethylbenzene (P18), octane (P19), styrene (P20), *m*-xylene (P21), *o,p*-xylene (P22), nonane (P23), and d-limonene (P24).

Comprehensive Household Product Survey

In Appendix B, the entire list of household products (included in Appendix A) is given with the sample code, the product name, and the estimated concentration (weight percent) of each analyte in each product. Where products have no entries, the GC/MS data files were not available.

Product Lists by Target Analyte

In Appendix C are tables for each analyte listing those products which were determined to contain that analyte at levels greater than approximately 0.1%. Also in Appendix C is a table (C20) of those 377 household products in which none of the target analytes were observed above 0.1%. Five target analytes (1,1,2,2-tetrachloroethane, chlorobenzene, styrene, nonane, and d-limonene) were not found in any of the household products.

Category Summary

A matrix of the occurrence of the target analytes as a function of product category is shown in Tables 11a, 11b, 11c, and 11d. In that table, the number of household products in each product category analyzed in this study is given, followed by a fraction for each analyte. The fraction numerator is the number of products in the category that show a positive result for that analyte. The fraction denominator represents the number of products that could have produced results for that analyte. Therefore, the denominator does not include those products that show "NA" or "CH" for a particular analyte in Appendix B, because it is not possible to determine if a positive result was observed for that analyte.

Table 10. Composites Analyzed

Composite no.	Products in composite
1	108101, 108102, 108103, 108104, 108105
2	108106, 108107, 108108, 108109, 108110
3	108301, 108302, 108303, 108304, 108305
4	110305, 110307, 110310
5	110411, 110412, 110413, 110304

[a]Values represent the number of products having positive identification of analyte over the total number of products in the category in which the analyte could have been observed. The denominator does not include instances of products analyzed as composites that show a positive result for the analyte.

QA/QC

Precision

Precision was assessed by four replicate purge and trap GC/MS analyses of a standard mixture containing the target analytes. The results of these determinations are given in Table 12. Twenty-one of the 25 target analytes met the 25% range percent criterion.

During the original work, 60 of the household products were analyzed in duplicate to assess precision for actual samples. For this work, the results for those products analyzed in duplicate were compiled. From that list of 60 products, 20 of them had both original and duplicate GC/MS data available and had at least one of the target analytes present. The results of the duplicate analyses are shown in Table 13.

Performance Samples

After the generation of the standard curves, performance audit samples containing the 25 analytes were analyzed to demonstrate the accuracy of the method. The data quality objective for assessing the accuracy of these samples is 75 to 125% of the true value. The results obtained are shown in Table 14 and ranged from 76 to 123% for the low level spike and 46 to 150% for the high level spike solution.

Accuracy/Limitations of Analytical Data

Estimate of Data Accuracy--

The GC/MS data used in this work were originally acquired for the analysis of the six chlorocarbons listed in Table 15. The data were acquired over several months on five GC/MS instruments listed in Table 15. In the original study, performance audit samples were analyzed prior to sample analysis on each instrument to provide a measure of accuracy of the analytical method.

The concentrations of the 25 additional analytes were computed using RRF values determined from calibration curves analyzed on MRI's CH4 instrument over 2 years after the GC/MS data were acquired. The formula for computation of the analyte concentration from the RRF and GC/MS data is

$$C_x = (A_x \times C_{is})/(A_{is} \times RRF)$$

where A_x = GC/MS peak area for the analyte

A_{is} = GC/MS peak area for the internal standard

C_{is} = concentration of the internal standard

C_x = computed concentration of the analyte

RRF = relative response factor for the analyte.

As no calibration standards or performance audit samples for the additional analytes were analyzed at the time of the original GC/MS analyses, there is no measure of the accuracy of the reported concentration values in the data base. Additional uncertainty is introduced because 28.5% of the samples were analyzed on instruments other than the MRI CH4 and all GC/MS data were acquired more than 2 years before the calibration curves for the 25 new analytes were obtained.

To obtain some insight into the variability of RRFs between instruments and over time, the RRFs of the 12 low level calibration curves of the original six chlorocarbons were compared. Table 15 lists the average RRF and the RRF range for each calibration curve and each of the six chlorocarbons.

Since the computed concentration of the analyte (C_x) is inversely proportional to the RRF, the variability between two calibration curves is reflected in the ratios of their RRFs. These ratios are correction factors for the variability between instruments and calibration curves. Table 15 shows ranges of correction factors for the six chlorocarbons. If these correction factors were known, the computed concentrations could be multiplied by the correction factors to estimate the range of the true concentrations. Of all the RRFs reported, the greatest variability is between the Versar curve obtained on 10/24/85 (RRF = 0.99) and the Envirodyne curve obtained on 10/15/85 (RRF = 5.09) for methylene chloride. If a methylene chloride concentration were computed from GC/MS data obtained using the Versar instrument and an RRF obtained using the Envirodyne instrument, the computed concentration would be approximately one-fifth the real concentration. Multiplying the computed concentration by 0.19 (the ratio of 0.99 to 5.09) would correct for the variability in RRFs between the two instruments. If GC/MS data from the Envirodyne instrument and an RRF from the Versar instrument were used, the computed concentration would be five times the real concentration. Variations of RRFs between instruments for the six chlorocarbons are more typically on the order of two or less; that is, most estimates would vary from about 50% too low to about 100% too high or one-half to twice the real concentration. Variability between RRFs obtained from the same instrument is less than variability between instruments for the data reported in Table 15.

The distribution of the samples among the five instruments is shown in Table 15. Over 70% of the samples were analyzed on the MRI CH4, which is the same instrument used to generate the RRFs for the additional 25 analytes. The instrument used to analyze each sample is identified in the diskette version of the data base.

The comparison of RRFs for the six chlorocarbons provides some insight into the variability between instruments and over time for the analysis of the 25 new analytes. First, although the method generally distinguishes the presence of an analyte at relatively high concentrations from an analyte present at trace levels, concentrations near to the cutoff point of 0.1% may be omitted incorrectly from the data base. There may be a few cases where concentrations not reported in the data base because they were below 0.1% by weight may actually be higher, perhaps as high as 0.5 or 1%. Second, since over 70% of the samples were analyzed on the instrument used to obtain the calibration data for the 25 new analytes, the reported concentrations are

Table 15. Relative Response Factor Variability and Range Obtained for Analyses of Original Six Analytes

Lab/Inst.	% Samples[a]	Date[b]	Relative response factor (RRF)					
			Methylene chloride	Trichlorotri-fluoroethane	Trichloro-ethane	Carbon tetrachloride	Trichloro-ethylene	Tetrachloro-ethylene

		Correction factor range[f]	0.19-5.14	0.47-2.11	0.29-3.45	0.33-3.07	0.38-2.67	0.39-2.58

[a]Percentage of household product samples analyzed on that instrument.
[b]Date on which calibration curve was acquired.
[c]Average or mean relative response factor for the analyte across all instruments.
[d]Relative standard deviation for the mean response factors.
[e]Minimum and maximum range for RRF values.
[f]A factor which corrects the computed concentration for variability between instruments and over time. The computed concentration values multiplied by the correction factors equals the range within which the true values are expected to fall. The upper and lower limits of the range were obtained from the ratios of the limits of the RRF ranges.

probably more accurate than the RRF data for the six chlorocarbons suggest. Third, the relative differences between concentrations reported for each set of data from a single instrument are approximately correct. Thus, even if there is a 5-fold error in a subset of data, samples can be ranked from highest to lowest concentration.

The data reported for the 25 target analytes can be used to identify those chemicals found most often in the consumer products analyzed, to identify product classes that contain particular chemicals, and to identify products and classes of products with the highest concentrations of chemicals. The data will be useful to regulatory programs in targeting chemicals for further study and to research programs in designing experiments. In addition, the concentration data can be used for preliminary exposure assessment analysis, provided the assessors keep in mind the uncertainties inherent in the data.

Limitations of Analytical Results--

A number of the 25 additional analytes, notably the alkanes (*n*-nonane, *n*-hexane, and *n*-octane), are the linear isomers for those carbon numbers. It is likely that the technical grades of alkanes used to produce the household products are mixtures of many alkane isomers. This study utilized GC/MS techniques for identification of the target analytes. Therefore, false positive assignments for the linear alkanes are possible when isomeric hydrocarbons having similar mass specta are present in significant quantities. For example, a peak identified as *n*-hexane may not be *n*-hexane, but an isomer such as 2-methylpentane. Therefore, assignment of a peak as one of the linear alkanes may be incorrect. The fact that the peak is some alkane is correct, however, because alkanes, as a chemical class, have very distinctive and characteristic mass spectra.

Systems Audit

A qualitative review of the total system was conducted by the laboratory contractor's Quality Control Coordinator, K. Boggess. During the systems audit, she found the GC/MS analyst and data analyst to be knowledgeable with regard to the procedures and protocol necessary to conduct their assignments. No major deviation in the procedures or protocol was observed that would affect quality of the data.

Data Audit

An in-depth data audit of the data from 10 samples through the data reduction and handling procedures was conducted. No systematic errors were found in the data or calculations that would affect the quality of the data.

APPENDIX B

LABORATORY RESULTS FOR ADDITIONAL ANALYTES IN HOUSEHOLD PRODUCT SURVEY

KEY FOR APPENDIX B

Analyte no.	Analyte name
P1	Propylene oxide
P2	Acetone
P3	Tetrahydrofuran
P4	Chloroform
P5	2-Butanone
P6	1,2-Dichloroethane
P7	1,4-Dioxane
P8	Cyclohexane
P9	Methylcyclopentane
P10	Benzene
P11	Hexane
P12	Methylcyclohexane
P13	Methyl isobutyl ketone
P14	1,1,2,2-Tetrachloroethane
P15	Toluene
P16	Chlorobenzene
P17	α-Pinene
P18	Ethylbenzene
P19	Octane
P20	Styrene
P21	*m*-Xylene
P22	*o,p*-Xylene
P23	Nonane
P24	*d*-Limonene

• = analyte not present above 0.1% w/w.
NA = analyte could not have been observed under conditions of analysis.
CH = Analyte found for product in a composite analysis.

CODE NO.	PRODUCT NAME	ANALYTE CONCENTRATION (%w/w)

APPENDIX C

PRODUCT SAMPLES SORTED BY CHEMICAL CONSTITUENT

Table		Page
C1	Products Containing Propylene Oxide (P1)	C-3
C2	Products Containing Acetone (P2)	C-5
C3	Products Containing Tetrahydrofuran (P3)	C-11
C4	Products Containing Chloroform (P4)	C-12
C5	Products Containing 2-Butanone (P5)	C-13
C6	Products Containing 1,2-Dichloroethane (P6)	C-17
C7	Products Containing 1,4-Dioxane (P7)	C-18
C8	Products Containing Cyclohexane (P8)	C-19
C9	Products Containing Methylcyclopentane (P9)	C-21
C10	Products Containing Benzene (P10)	C-23
C11	Products Containing Hexane (P11)	C-24
C12	Products Containing Methylcyclohexane (P12)	C-26
C13	Products Containing Methyl Isobutyl Ketone (P13)	C-29
C14	Products Containing Toluene (P15)	C-31
C15	Products Containing α-Pinene (P17)	C-40
C16	Products Containing Ethylbenzene (P18)	C-41
C17	Products Containing Octane (P19)	C-44
C18	Products Containing *m*-Xylene (P21)	C-46
C19	Products Containing *o,p*-Xylene (P22)	C-48
C20	Products Not Containing Target Analytes	C-50

KEY FOR APPENDIX C

Analyte no.	Analyte name
P1	Propylene oxide
P2	Acetone
P3	Tetrahydrofuran
P4	Chloroform
P5	2-Butanone
P6	1,2-Dichloroethane
P7	1,4-Dioxane
P8	Cyclohexane
P9	Methylcyclopentane
P10	Benzene
P11	Hexane
P12	Methylcyclohexane
P13	Methyl isobutyl ketone
P14	1,1,2,2-Tetrachloroethane
P15	Toluene
P16	Chlorobenzene
P17	α-Pinene
P18	Ethylbenzene
P19	Octane
P20	Styrene
P21	*m*-Xylene
P22	*o,p*-Xylene
P23	Nonane
P24	*d*-Limonene

• = analyte not present above 0.1% w/w.
NA = analyte could not have been observed under conditions of analysis.
CH = Analyte found for product in composite analysis.

APPENDIX D

ANALYTICAL RESULTS FOR COMPOSITE ANALYSES

KEY FOR APPENDIX D

Analyte no.	Analyte name
P1	Propylene oxide
P2	Acetone
P3	Tetrahydrofuran
P4	Chloroform
P5	2-Butanone
P6	1,2-Dichloroethane
P7	1,4-Dioxane
P8	Cyclohexane
P9	Methylcyclopentane
P10	Benzene
P11	Hexane
P12	Methylcyclohexane
P13	Methyl isobutyl ketone
P14	1,1,2,2-Tetrachloroethane
P15	Toluene
P16	Chlorobenzene
P17	α-Pinene
P18	Ethylbenzene
P19	Octane
P20	Styrene
P21	*m*-Xylene
P22	*o,p*-Xylene
P23	Nonane
P24	*d*-Limonene

• = analyte not present above 0.1% w/w.
NA = analyte could not have been observed under conditions of analysis.

Note: Concentration shown is the maximum possible concentration for the analyte in the product if the entire amount of analyte found in the composite was due to that product. If more than one product contained the analyte, actual concentrations will be lower.
