INTRODUCTION

This is the second Cumulative Supplement to EPA's *Toxic Substances Control Act Chemical Substances Inventory: Initial Inventory*, which was published in May 1979. This Cumulative Supplement II supersedes both the Supplement I published in October 1979 and the first Cumulative Supplement of July 1980. The Initial Inventory and the Cumulative Supplement II now constitute the Revised Inventory representing a total of over 58,000 chemical substances including 1,800 generic names generated for chemicals whose identities have been claimed as confidential.

Section 8(b) of the Toxic Substances Control Act (TSCA), Public Law 94-469, requires the Administrator of the U.S. Environmental Protection Agency to identify, compile, keep current, and publish a list of chemical substances manufactured, imported, or processed for commercial purposes in the United States. In accordance with this requirement, the Office of Pesticides and Toxic Substances (OPTS) promulgated the Inventory Reporting Regulations (40 CFR Part 710) in December 1977, which set into motion a two-phase reporting period. The first phase, January 1 - June 1, 1978, affected manufacturers and importers of chemical substances in bulk form. This resulted in the publication of the Initial Inventory in May 1979. Publication of the Initial Inventory marked the beginning of a 210-day second reporting period, June 1 - December 31, 1979, during which processors and users of chemical substances and importers of chemical substances used in mixtures or articles were asked to report.

The Inventory defines what chemical substances "exist" in U.S. commerce, for purposes of implementing the Toxic Substances Control Act. Chemical substances which are not included on the Inventory are considered "new" and are therefore subject to premanufacture notification requirements under Section 5 of TSCA. As a major building block in an information base, the Inventory provides valuable support for assessing human health and environmental risks posed by chemical substances. It is not a list of toxic chemicals; toxicity is not a criterion used in determining the eligibility of chemical substances for inclusion on the Inventory.

The Inventory does not purport to identify all chemical substances currently in U.S. commerce, because some such substances are specifically excluded by statute or regulation (40 CFR Part 710). Additionally, no printed version of the Inventory can be completely up-to-date because it is continually subject to change. New substances for which premanufacture review under Section 5 has been completed and that are being manufactured or imported will continue to be added to the Inventory. A few substances that have been included on the Inventory may be deleted if the Agency, after a careful review of the Inventory, decides that they should not have been reported. Furthermore, information regarding chemical identity claimed as confidential cannot be included in the published version of the Inventory. Recognizing these limitations, the Agency maintains a Master Inventory File, which includes all eligible substances that have been reported; the file is continually updated as new information becomes available. After the publication of this Cumulative Supplement, the Agency may publish updates to the printed Inventory as it deems appropriate.

The Cumulative Supplement II lists over 13,000 chemical substances, including over 1,400 generic names for substances with confidential identities and 168 "new" substances for which premanufacture notification review has been completed *and* that have actually been introduced in the U.S. market. Substances for which premanufacture notification review has been completed but for which manufacture or importation has not commenced in the United States are not included on the Inventory; such substances are not considered to exist in U.S. commerce. For such a substance to be placed on the Inventory, a notice of commencement to manufacture or import must be submitted to the Agency before actual manufacture or importation commences.

With the publication of the Cumulative Supplement II, the printed Inventory is nearly 97 percent complete. Significantly, the total number of generic names published has increased from 686 to 1,800 thus covering approximately 90 percent of the substances with confidential identities. Substances that have not yet been listed on the printed Inventory include those that are (a) trademarked reaction products whose exact identities have not been established; (b) confidential substances for which a mutually acceptable generic name has not been developed; (c) substances whose confidential identity claims have been withdrawn and for which a Chemical Abstracts Service (CAS) Registry Number has yet to be assigned; and (d) substances for which enforcement investigation has not been completed. These substances, except category d, are nevertheless included in the Agency's Master Inventory File and, for all practical purposes, are considered to be on the Inventory.

Recognizing the limitations of the printed Inventory — i.e., it can never be as up-to-date as the Agency's Master Inventory File and it cannot include specific identities for confidential substances — the Agency provides a service to assist those who, for various reasons, wish to query the Inventory. In order to minimize confusion, all such inquiries must be submitted in writing. A person who intends to manufacture or import a chemical substance that does not appear on the published Inventory may ask EPA to determine whether the substance in question is included in the Agency's Master Inventory File. The Agency will provide a conclusive answer only if the person who submits the inquiry is able to demonstrate a "bona fide intent" to manufacture or import the substance for a commercial purpose. The exact procedures for establishing and submitting a bona fide intent are discussed in detail in the Premanufacture Notification Requirements and Review Procedures (44 FR 2242). When a bona fide intent has been established with a formal submission, the Agency will perform a comprehensive search of the entire Master Inventory File — i.e., both confidential and non-confidential portions — to determine conclusively whether the substance in question is already included.

If a person does not wish to comply with the bona fide intent submission requirements and still wishes the Agency to determine whether a particular chemical is included on the Inventory, the Agency will, upon receipt of such a request, perform a search of the nonconfidential portion of the Master Inventory File. In this case, because the confidential portion

of the File is not searched, the results may not be conclusive. Similarly, a submitter who cannot locate a reported substance on the printed Inventory may ask the Agency to determine the status of that submission. Such a request must be accompanied by a legible copy of the Inventory Reporting Form as it was originally submitted. This is necessary to ascertain that TSCA Confidential Business Information is not inadvertently disclosed to a party not authorized to receive it.

EPA will continue to accept corrections related to substances previously reported for the Inventory. These corrections must be related to previous submissions, must fall within one of the categories stipulated in the July 29, 1980 *Federal Register* notice (45 FR 50544), and must be accompanied by appropriate documentation. When a chemical substance is found to be incorrectly reported by a single reporter, the Agency may initiate action to delete the incorrect chemical identity from the Inventory. In this case, the Agency will first propose in the *Federal Register* the potential deletion and public comment will be solicited. A person may petition EPA not to delete a substance if it can be demonstrated that the petitioner has manufactured the substance for a commercial purpose since its inclusion on Inventory. In any event, a decision will be announced in the *Federal Register* regarding the final disposition of the incorrectly reported chemical. One such substance, 2-Naphthalenamine (CAS Registry No. 91-59-8), has been removed from the TSCA Inventory (See 46 FR 11356 and 46 FR 30563). This substance is considered by EPA not to be on the TSCA Inventory, the presence of its name and synonyms in previously published versions of the Inventory notwithstanding.

The Agency also provides user assistance to persons who may have questions regarding the printed Inventory and the interpretation of the Inventory Reporting Regulations. The Agency welcomes any comments, suggestions and reports of errors regarding the Inventory.

All Inventory inquiries must be submitted in writing and accompanied by appropriate documentation. Incomplete inquiries or submissions will not be processed until all materials have been received. Special care should be taken with the submissions that contain TSCA Confidential Business Information. Bona fide intent submissions as well as requests for nonconfidential searches should be sent to:

Like the Initial Inventory, the Cumulative Supplement II lists, in ascending CAS Registry Number order, the preferred names of chemical substances covered by this publication. An asterisk (*) is used to highlight Registry Numbers for most substances that appear in the UVCB Index (Chemical Substances of *U*nknown or *V*ariable Composition, *C*omplex Reaction Products, and *B*iological Materials). Those Registry Numbers that are followed by asterisks do not appear in any of the CAS publications or services that cite Registry Numbers. A dagger (†) denotes chemical substances that are defined more precisely in Appendix A, Chemical Substance Definitions. Appendix B, Confidential Chemical Substance Identities, lists generic (less specific) names of chemical substances that are included in the Master Inventory File but whose identities have been determined by the Agency to merit confidential treatment. These names were developed according to procedures specified in the EPA publication *Guidelines for Creating Proposed Generic Names for Confidential Chemical Substance Identities for the TSCA Inventory*. Each generic name actually describes a category of chemical substances. However, of the substances covered by a particular generic name, only those actually reported for the Inventory are considered to be included.

The Agency has also prepared three indices to the Cumulative Supplement II for use in conjunction with, but not as a substitute for, the Supplement. The Substance Name Index, the Molecular Formula Index, and the UVCB Index provide alternate means of finding substances that are listed on the Inventory. Preceding the Chemical Substance Identities is the Registry Number Update which lists CAS Registry Numbers of the Initial Inventory that have been replaced by other CAS Registry Numbers of the published Inventory, or are no longer in the published Inventory.

In the Substance Name Index of the Initial Inventory (i.e., Volumes II and III) and of the Cumulative Supplement II, certain synonyms listed might be trade names. Some of the trade names contain other substances reported for the TSCA Inventory, in addition to the one represented by the assigned CAS Registry Number. In other cases, the assigned CAS Registry Number might have been incorrectly associated with the trade name product. To prevent misuse of trade name materials, CAS Registry Numbers of trade name entries in the Substance Name Index should be verified with the supplier of the trade name substance.

For a chemical substance whose identity has been claimed as confidential, it has been the policy of the Agency not to assign a corresponding CAS Registry Number. In a few cases, CAS Registry Numbers were found to already exist in the literature, but are, nevertheless, not included on the Inventory.

The Inventory continues to grow as new chemical substances are put into U.S. commerce. The Agency is fully committed to disclosing the nonconfidential Inventory information, so that the public will continue to be kept abreast of new developments in the chemical market. For this reason, the Agency will continue periodic publications to update the Inventory.
