This report has been reviewed by the Region IV, Surveillance and Analysis Division, U.S. Environmental Protection Agency, and approved for publication. Approval does not signify that the contents necessarily reflect the views and policies of the U.S. Environmental Protection Agency, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

PREFACE

Nashville, Tennessee and Louisville, Kentucky have required an extension of the 1982 deadline for attaining the ozone standard. Therefore, these areas must prepare a 1982 ozone SIP revision using city-specific EKMA modeling. These requirements are detailed in 44 FR 65667. This study was undertaken to produce ambient air data of known and acceptable quality required to develop NMOC/NO_X ratios to be used in the city-specific EKMA modeling. The successful completion of the tasks associated with this study required the close coordination of the joint efforts of EPA, the state and local agencies, and Dames & Moore.

During the period from July 1, 1981 through September 15, 1981, Dames & Moore operated eight ambient air monitoring stations in the greater Nashville, Tennessee and greater Louisville, Kentucky areas. A total of seven ambient air monitors at five sites were operated in the greater Nashville, Tennessee area. Dames & Moore also conducted quality assurance performance audits of these monitors plus an additional two monitors and one wind measurement system operated by the State of Tennessee. In the greater Louisville, Kentucky area, Dames & Moore operated three sites containing a total of six ambient air monitors and two wind measurement systems. The performance audits included all of these sensors plus one air quality monitor operated by the Air Pollution Control District of Jefferson County (Louisville, Kentucky) and one operated by the Indiana State Board of Health.

This report contains only the monitoring data collected at the sites operated by Dames & Moore. However, performance audit results, including accuracy and precision statistics, are presented for all sites regardless of their operating organization.

ABSTRACT

During the period July 1, 1981 through September 15, 1981, ambient air data collection was conducted in the greater Nashville, Tennessee and Louisville, Kentucky metropolitan areas. The data collected included NMOC, CH_4, NO, NO_x, O_3, wind direction, and wind speed, and are to be used in city-specific EKMA modeling of the ozone nonattainment areas that encompass these cities. The data were collected under an approved quality control plan with a quality assurance program that provided a quantitative assessment of the precision and accuracy of the validated data.

ACKNOWLEDGEMENTS

The cooperation of the state and local agencies, Metropolitan Health Department of Nashville and Davidson County, Tennessee Division of Air Pollution Control, Air Pollution Control District of Jefferson County Kentucky, Kentucky Division of Air Pollution Control, and Indiana State Board of Health is gratefully acknowledged. These agencies provided equipment, operating space, technical support, and encouragement to the project team.

We especially want to recognize the efforts of the instrument specialists, without whose dedication, technical expertise, and long hours this monitoring program could not have succeeded. Mr. Jim Gray of EPA IV Surveillance and Analysis Division provided technical support in the operation of NMOC analyzers. Mr. Gary L. Wentz, Dames & Moore, provided performance audits of all analyzers in both networks. The Nashville network was operated for Dames & Moore by Mr. Dennis W. Totzke, assisted by Mr. James G. Haywood. The Louisville network was operated by Mr. James C. Merritt, ably assisted by Ms. Suzanne S. Merritt.

SECTION 1

EXECUTIVE SUMMARY

During the period July 1, 1981 through September 15, 1981, Dames & Moore operated eight air quality monitoring sites in the Nashville, Tennessee and Louisville, Kentucky areas. The purpose of this monitoring was to collect NMOC, NO, NO_x, O_3, and wind data to support city-specific EKMA modeling of these two urban areas. An additional three sites were operated by the state and local agencies.

The sites operated by Dames & Moore reported valid data for a total of 93.8 percent of the 49,896 possible parameter-hours in the study. Excluding reasonable time for calibrations, audits, and scheduled maintenance, the data recovery rate was 95.8 percent. Valid data recovery rates for NMOC, NO/NO_x, O_3, and wind were 92.2, 94.2, 88.7, and 97.5, respectively.

Accuracy and precision statistics were computed for all analyzers in the study, including those operated by the state and local agencies. In Nashville, the Level 3 accuracy probability limits were 8.0, -2.9; 11.8, -10.2; and 8.5, -12.2; and the precision probability limits were 13.1, -6.8; 9.3, -14.8; and 13.0, -12.5; for NMOC, NO_x, and O_3, respectively. In Louisville, the Level 3 accuracy probability limits were 3.3, -8.6; 8.1, -8.4; and 17.4, -29.3; and the precision probability limits were 15.8, -9.4; 8.4, -10.7; and 12.8, -19.1; for NMOC, NO_x, and O_3, respectively.

SECTION 2

PROJECT APPROACH

MONITORING LOCATIONS, PARAMETERS, AND RESPONSIBILITIES

A total of 11 monitoring sites encompassing 33 air quality and meteorological parameters were included in this study. The majority of the monitors were operated by Dames & Moore with the remainder operated by the owning state or local agency. Quality assurance performance audits were conducted by an independent Dames & Moore auditor on all sites and parameters. In addition, EPA Region IV, Tennessee, Kentucky, and Indiana conducted performance audits at selected sites. Table 2-1 contains a summary of the monitoring site designations, parameters, and operating/audit responsibilities.

The locations of the monitoring sites in and around Nashville are shown in Figure 2-1. Similarly, the Louisville site locations are shown in Figure 2-2.

QUALITY CONTROL

The monitoring conducted by Dames & Moore was implemented under a quality control program documented in Dames & Moore's Manual of Technical Practices - Air Quality (MTPAQ). A Project Memorandum, Revision 1, dated July 8, 1981, contained quality control procedures specific to this study. Together these two documents became the project Quality Control (QC) Plan.

The QC Plan was developed in accordance with 40 CFR 58, Appendix A, Sections 2.1 and 2.2. It was designed to be consistent with the practices and procedures of the affected state and local air pollution control agencies' QC programs.

QUALITY ASSURANCE

The project quality assurance procedures were also detailed in the QC Plan. The essential features of the quality assurance program were the procedures to audit the performance of the air quality analyzers.

At the beginning of the project, the calibration and audit technicians participated in an initial verification session using their equipment and

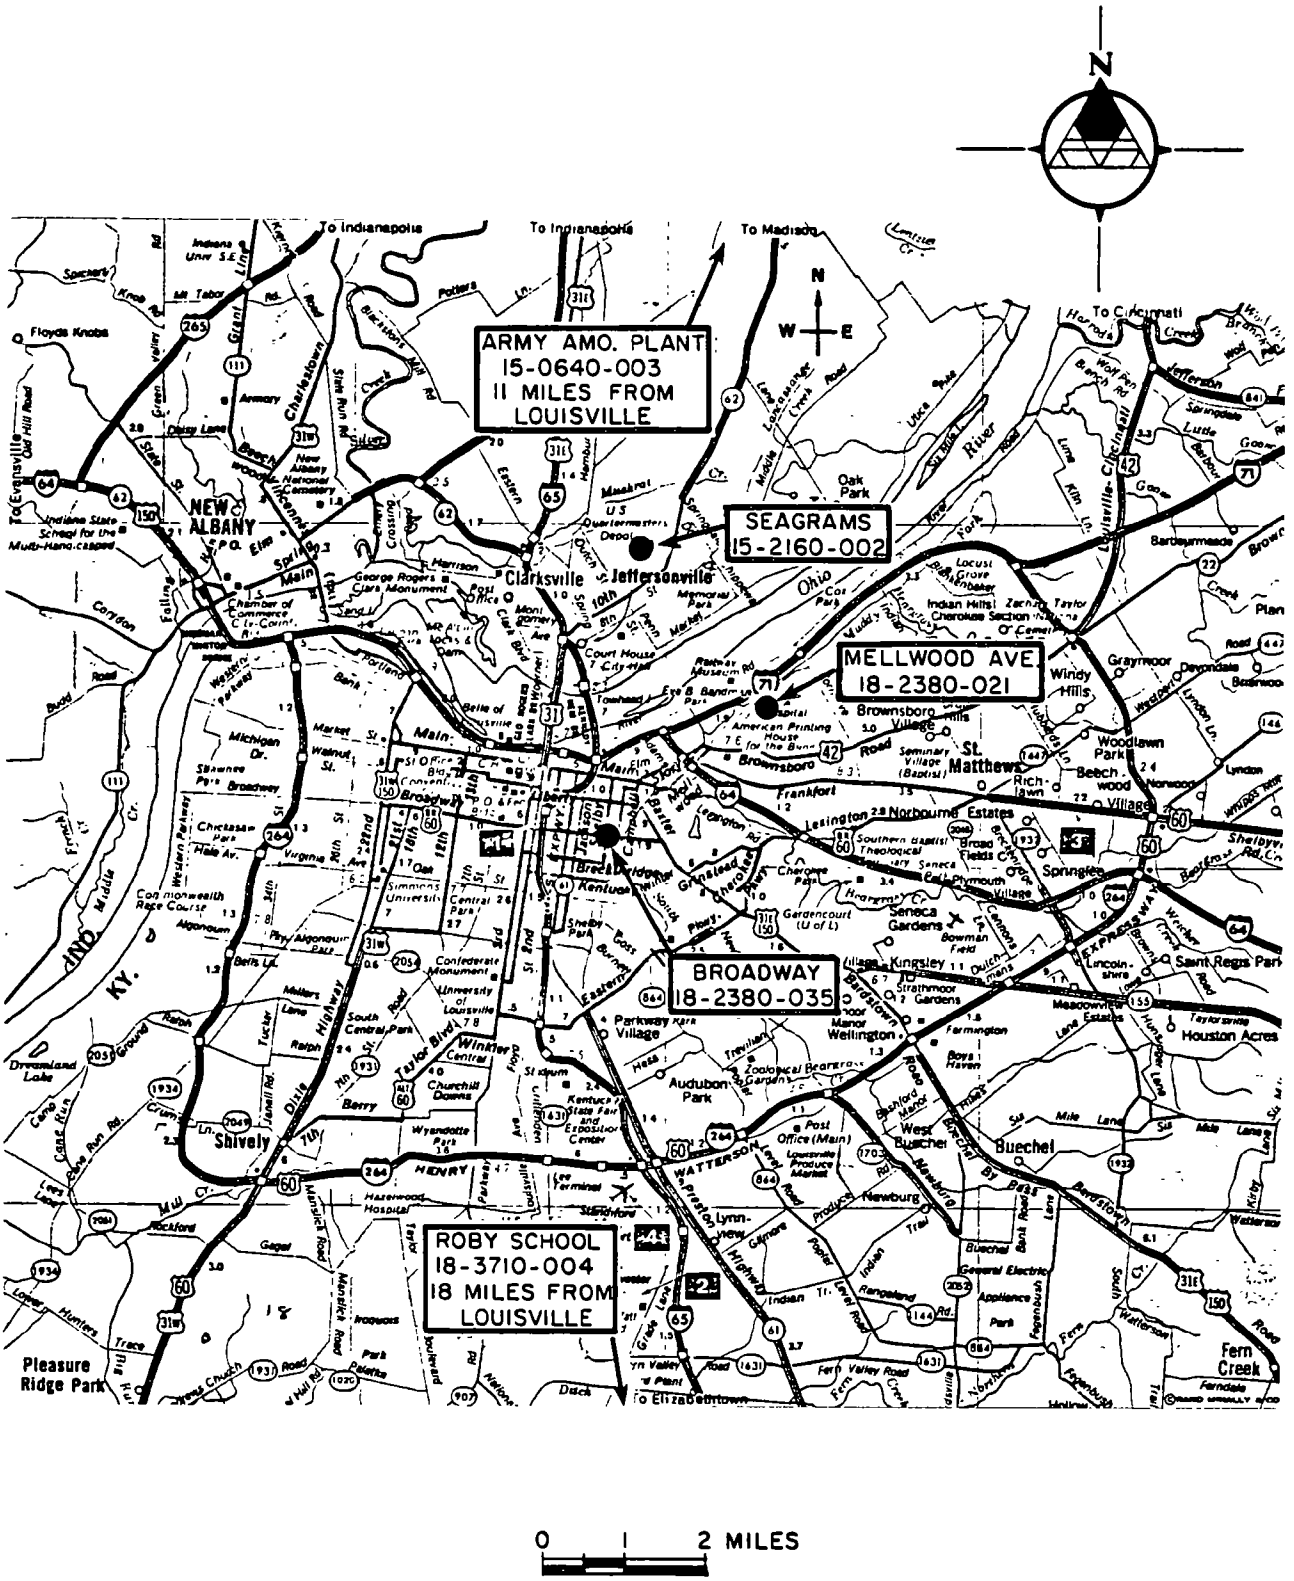

FIGURE 2-2 LOUISVILLE MONITORING SITE LOCATIONS

standards at the EPA Audit Systems Verification Center at Research Triangle Park, North Carolina. The initial set of calibration and audit gas standards were certified traceable to National Bureau of Standards Reference Materials by the vendor and verified by Audit Systems Verification Center personnel. All subsequent gas standards were certified by the vendor and verified by Dames & Moore. In the case of O_3, Dames & Moore's reference photometer was verified by Audit Systems Verification Center personnel. Dames & Moore transfer standard photometers were then verified against the reference photometer.

During operation of the network, each analyzer received a daily manual zero and span check introduced through the sampling manifold. Twice per week, each analyzer was also subjected to a precision check. Three times during the study, each analyzer was audited by an independent audit technician using audit equipment and standards different from those used for primary calibration, precision checks, or span checks. Some of the analyzers were also audited by EPA, Tennessee, and Kentucky personnel.

INTER-AGENCY COORDINATION

An essential ingredient to the overall success of this program was the coordination between the participating organizations. This was achieved through two coordination meetings and weekly data reporting to all affected agencies.

The QC Plan developed by Dames & Moore was distributed to all affected agencies. Then, during the week of June 15-19, 1981, a Systems Audit was conducted in each city with EPA and the local pertinent agencies participating. Those agencies are listed in the Acknowledgements section of this report. Each site was jointly inspected and the procedures in the QC Plan reviewed. Some changes were requested and made to both the sites and the QC Plan. The result was that each agency agreed to the adequacy of the procedures under which the monitoring was to be conducted.

During the course of the monitoring, Dames & Moore submitted weekly reports to the Project Officer containing the following information on instrument performance:

- Operational status;
- Calibrations performed;
- Maintenance required;
- Zero, span, and precision check results;
- Performance audits performed;
- Down time and reasons for missing data; and
- Hard copy of all data generated in SAROAD format.

These weekly reports, as well as monthly progress reports and monthly performance audit reports, were all distributed to the pertinent agencies to afford them the opportunity to participate in a continuing review and critique of the monitoring program.

After the completion of the data collection, a second coordination meeting was held in both cities with the participating agencies. The purpose of the meeting was to review and validate the data collected and reported during the study. All of the recorded data were minutely examined, with some questionable data deleted; the result is the valid data base presented in this report.

MONITORING OPERATIONS

The details of the monitoring operations procedures are contained in the QC Plan. This subsection contains an overview of those procedures and some of the more significant operational difficulties encountered.

All of the monitors were operated continuously from July 1, 1981 through September 15, 1981. Each monitor was serviced daily, including weekends and holidays. The daily checks included manual zero and span checks with the results recorded on a quality control chart. Anytime the daily monitor span (at 80 percent of full scale) exceeded $\pm$15 percent of the span value, the analyzer was recalibrated. Usually the monitors were recalibrated whenever $\pm$10 percent of the span was exceeded.

The monitors were calibrated prior to being placed in operation, before termination of operation, after each major maintenance, and anytime the monitor was determined to be out of control as described above. Each calibration was completed in two stages. The first stage involved the full range of calibration standards being introduced to the monitor before any adjustments were made. Then, any needed maintenance or adjustments were made. The second stage involved the full range of calibration standards after the final adjustments were made. In addition to the calibrations required as described above, NO/NO_x and O_3 monitors were recalibrated at least monthly and $NMOC/CH_4$ monitors were recalibrated twice per month.

Each monitor's output was recorded on analog strip chart recorders. The data were reduced to hourly averages and recorded on SAROAD format forms by the operating technicians. To compute a valid 1-hour average, at least 30 continuous minutes of valid data had to be recorded within the clock hour. Two hours of each parameter on each date were subsequently reviewed by a data quality control specialist to validate the digitization. The quality control specialist also reviewed all calibration forms, control charts, site logs, and other documentation for accuracy and completeness.

Only two operating problems resulted in any monitor achieving less than 90 percent total data recovery. The NMOC analyzer at Tennessee State University (Nashville) required extensive repairs before it would operate properly. The repair efforts of several technicians over several weeks were not successful at bringing this analyzer on line until 10 days after the project startup date. Following these initial difficulties, the analyzer performed satisfactorily.

The other operating problem arose from the O_3 monitor at the Trinity Lane (Nashville) site. This site was originally equipped with a Bendix 8002 chemiluminescent analyzer. That analyzer failed to hold a calibration and was replaced with a Dasibi 1003 photometric analyzer early in the monitoring period. Some difficulties continued to be experienced with the replacement analyzer. The problem was identified as electrical problems in the service connection or grounding within the building. These electrical problems were never eliminated but were controlled by connecting the analyzers in this site to separate outlets.

SECTION 3

CALIBRATION

PROTOCOL

Calibration of NMOC analyzers was accomplished by the use of certified cylinders of CH_4 and C_3H_8 in separate cylinders. Each calibration consisted of introducing first zero air to the analyzer and adjusting each channel for correct response. Then CH_4 was introduced and the CH_4 and total organic carbon channels were adjusted to the correct span response. Finally, C_3H_8 was introduced and the NMOC channel adjusted to the correct span response. Each calibration included multipoint response checks at approximately 0.9, 2.0, and 8.5 ppm CH_4 and 0.9, 4.0, and 8.5 ppmC C_3H_8.

Calibration of NO/NO_x analyzers was accomplished by quantitative dilution of a certified gas cylinder of approximately 75 ppm NO in air using a Monitor Labs ML 8500 calibrator. The NO and NO_x channels were thereby set. The response of the NO_2 channel and converter efficiency was then checked by gas phase titration of NO with O_3. Each calibration included multipoint response checks at zero and approximately 0.05, 0.20, and 0.45 ppm NO.

Calibration of O_3 analyzers was accomplished by generating O_3 concentrations with a Dasibi 1007 ultraviolet O_3 source. The output of the source was measured by a Dasibi 1003 O_3 transfer standard modified to perform as an ultraviolet photometer. A common external zero air source was used for both the O_3 generator and the transfer standard. The transfer standard was calibrated against a reference ultraviolet photometer. Each calibration included multipoint response checks at zero and approximately 0.05, 0.15, and 0.45 ppm O_3.

RESULTS ACHIEVED

Tables 3-1 and 3-2 show the calibration results achieved in Nashville and Louisville, respectively. Each table shows when the analyzers were calibrated and their deviation from expected response at 80 percent of full scale.

SECTION 4

PERFORMANCE AUDITS

PROTOCOL

The audit concentration generation protocol used by Dames & Moore was identical to that used for calibration except that different equipment and standards were used. For NMOC analyzers, different zero and span gas standards were used. For NO/NO_x analyzers, a different NO span gas bottle was used, and a Columbia Scientific Industries CSI 1700 was used as the dilution device. For O_3, the CSI 1700 was used to generate O_3, and a Dasibi 1003 transfer standard was used to monitor the O_3 output from the CSI 1700.

RESULTS ACHIEVED

Tables 4-1 and 4-2 show the audit results achieved in Nashville and Louisville, respectively. Each table shows when the analyzers were audited and their deviation from expected response at 80 percent of full scale. Some audits were conducted by EPA and the states of Tennessee, Kentucky, and Indiana. The results of these audits have been included in the tables for completeness.

[1]Computed at 80 percent full scale.

SECTION 5

PRECISION AND ACCURACY

PROTOCOL

The procedures for calculating precision and accuracy statistics are given in 40 CFR 58, Appendix A, Section 4.1.

Each air quality monitor operated by Dames & Moore was subjected to a precision check at 20 percent of full scale twice per week. The analyzers operated by other organizations participating in this study were precision checked less frequently but within the biweekly requirement of 40 CFR 58. The precision check data were then used to calculate the overall precision statistics for each analyzer and for all analyzers in this study.

Each analyzer in the study was also audited for accuracy by Dames & Moore three times. Selected analyzers were also audited by other agencies as described in Section 4.0. The audit results from all audits were then used to compute overall accuracy statistics for each analyzer and for all analyzers in this study.

RESULTS ACHIEVED

Tables 5-1 and 5-2 summarize the precision and accuracy results for Nashville and Louisville, respectively. These results include all analyzers and audits and not just those operated or performed by Dames & Moore. There are double entries in Tables 5-1 and 5-2 because not all organizations performed their audits at the same concentration levels.

SPAN VARIABILITY CONTROL CHARTS

Control charts were maintained on a daily basis documenting the variability of each analyzer to span inputs at 80 percent of full scale. These results are not required or included in the 40 CFR 58 precision statistics, but they do provide an effective visual demonstration of the stability and, therefore, precision of the analyzers. Figures 5-1 and 5-2 present graphically the span variability reports for Nashville and Louisville, respectively.

SECTION 6

DATA PRESENTATION

DATA RECOVERY

One goal of this project was to achieve at least 80 percent valid data recovery, excluding reasonable time for routine service, maintenance, precision checks, audits, and calibrations. That goal was met overall and was met individually for all analyzers except Trinity Lane (Nashville) O_3.

The Trinity Lane O_3 analyzer difficulties were related to the power source at that site (see Section 2.0). As a result, 203 hours (11.0 percent) of the data reported from this site were deleted from the data base because the strip chart trace was, in the judgment of the data validation team, anomalous for a properly functioning analyzer, even though it had passed the span and precision checks during this period.

The data recovery statistics in Table 6-1, therefore, present the raw data recovery, the data recovery allowing for reasonable exclusions, and the data recovery if the Trinity Lane anomalous trace data had not been removed.

The data listings in Appendices A and B present all of the valid data resulting from Dames & Moore's operation of the analyzers in Nashville and Louisville, respectively.

SPECIAL CONSIDERATIONS

The NMOC analyzers did occasionally overrange. That is, the ambient concentrations exceeded the full scale response of the analyzer. This happened three times on the NMOC channel but several times on the CH_4 channel. Since the CH_4 channel could not be set to a range higher than 10 ppm full scale, this situation had to be tolerated and given the following special treatment in the data reduction process.

Consider a strip chart trace with an ambient concentration increasing up to and exceeding the calibrated full scale range of the analyzer (e.g., 10.00 ppmC) during a portion of an hour. The data reduction treatment was to proportion the hour into increments that would segregate that portion of the trace that exceeded the full scale range, as in the following example:

				Network Average	95.3	97.8

*Excluding reasonable time for routine service, maintenance, precision checks, audits, and calibrations.

†85.3 including anomalous trace.

Time Period	Concentration
1200 - 1215	= 9.90 ppmC
1215 - 1230	= 9.15 ppmC
1230 - 1245	> 10.00 ppmC
1245 - 1300	= 8.85 ppmC

The average value for the hour would then be computed from these increments using the full scale response of the analyzer for the value of the overrange period. In this example, the concentration logged on the SAROAD form would be 9.48 ppmC.

Table 6-2 presents a listing of those hours that an overrange condition occurred and the percent of the hour affected.

TABLE 6-2. DATA OVERRANGE LISTING

Site	Parameter	Date (Hour Beginning)	Percent of Hour Off Scale

16. ABSTRACT

During the period July 1, 1981 through September 15, 1981, ambient air data collection was conducted in the greater Nashville, Tennessee and Louisville, Kentucky metropolitan areas. The data collected included NMOC, CH_4, NO, NO_x, O_3, wind direction, and wind speed, and are to be used in city-specific EKMA modeling of the ozone nonattainment areas that encompass these cities. The data were collected under an approved quality control plan with a quality assurance program that provided a quantitative assessment of the precision and accuracy of the validated data.
