DISCLAIMER

This document was initiated prior to the Agency's recently instituted peer and policy review system. However, the report has been reviewed by the Office of Monitoring Systems and Quality Assurance, U.S. Environmental Protection Agency, and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation of use.

The reader is cautioned to consider this report in its entirety. Reliance upon or use of any individual segment of this report without consideration of the whole document may be misleading and could possibly lead to erroneous conclusions.

U.S. Environmental Protection Agency

FOREWORD

This report describes the results of a comprehensive multimedia environmental monitoring program conducted by the U.S. Environmental Protection Agency (EPA) at Love Canal, in Niagara Falls, New York. The study, conducted during the summer and fall of 1980, was designed to assess (from an environmental contamination perspective) the habitability of residences located some distance from the inactive hazardous wastes landfill. EPA was directed to conduct this study in response to a presidential state of emergency order that was declared at Love Canal on May 21, 1980. Due to the existence of a state of emergency at Love Canal, the design and field sampling portions of the project were completed under severe time constraints.

The monitoring program performed by EPA at Love Canal involved the collection and analysis of approximately 6,000 field samples, making the Love Canal study the most comprehensive multimedia monitoring effort ever conducted by EPA at a hazardous wastes site. The precision and accuracy of the environmental measurements obtained were documented through application of a thorough quality assurance program. As a result, this study exemplifies the design and execution of a state-of-the-art environmental monitoring program.

In recognition of the widespread anxiety associated with the emergency declaration order, this report was intentionally written for the general public. Volume I, Chapter 1, consists of an overview of the entire project and was intended to be accessible to a wide audience. The remainder of Volume I provides additional information concerning the design of the project and study findings. Technical details regarding specific aspects of the quality assurance programs used to validate the monitoring data are included as Appendixes to Volume I. Volumes II and III present the Love Canal monitoring data.

Courtney Riordan

ACKNOWLEDGMENTS

The results of the largest single multi-media monitoring program ever carried out by EPA are contained in this report. The design and implementation of the study resulted from the collaborative efforts of EPA's Office of Research and Development (ORD) laboratories; the ORD Headquarter's office, other Headquarter's program offices and EPA's Region II. The report itself interprets and synthesizes the massive amounts of data and information that were generated during the course of the field study and the subsequent laboratory analyses.

This report was written by Dr. John Deegan, Jr. The success with which coherence has been brought to the results derives from his personal effort in compiling, evaluating, reviewing, analyzing and interpreting the multitude of data and information. The clarity of the text is derived from his ability to develop and express concepts and conclusions based upon his long involvement with the field study and the subsequent laboratory analyses.

In a project of this magnitude it is impossible to acknowledge the individual contributions of the numerous participants without inadvertently omitting someone. Therefore, a general acknowledgment of the immense commitment of time and energy contributed by the hundreds of EPA and contractor personnel involved in the conduct of this study must suffice, including: the U.S. EPA Environmental Monitoring and Support Laboratory, Cincinnati, Ohio (EMSL-Cin), Robert L. Booth, Acting Director; the U.S. EPA Environmental Monitoring Systems Laboratory, Las Vegas, Nevada (EMSL-LV), Glenn E. Schweitzer, Director; the U.S. EPA Environmental Monitoring Systems Laboratory, Research Triangle Park, North Carolina (EMSL-RTP), Thomas R. Hauser, Director; the U.S. EPA Robert S. Kerr Environmental Research Laboratory, Ada, Oklahoma (ERL-Ada), Clinton W. Hall, Director; and the GCA Corporation, Leonard M. Seale, General Manager, Technology Division, and their subcontractors. The dedication of these people to the task was essential for the study's completion.

Because of the important contributions certain individuals made to this project their efforts deserve to be identified. To begin with, the overall management of this project was the responsibility of Courtney Riordan, Director of the Office of Monitoring Systems and Quality Assurance (OMSQA). Without his con-

tinued oversight, guidance, and wise counsel this project would not have been completed satisfactorily. The Project Director for the field monitoring portion of the project was Thomas R. Hauser, EMSL-RTP; Steven M. Bromberg, EMSL-RTP was the Project Officer.

The following individuals also made major contributions to the project: William L. Budde (QA Officer for water analyses, Appendixes C and F), EMSL-Cin; Steven K. Seilkop (statistical analysis and consulting), EMSL-RTP; Jack W. Keeley, D. Craig Shew, and Jerry T. Thornhill, ERL-Ada and Paul Beam, Office of Water and Waste Management (hydrogeologic program); Gerald G. Akland and Terence Fitz-Simons (statistical consulting), Thomas A. Hartlage (air sampling), Thomas C. Lawless (data processing), and John C. Puzak (QA officer for air analysis, Appendix E), EMSL-RTP; Stuart C. Black (QA Officer for soil/sediment/biota analyses), Kenneth W. Brown (soil/sediment/biota sampling), Eugene P. Meier, and Andrew D. Sauter, EMSL-LV; W. Lamar Miller, and R. Charles Morgan, Office of Solid Waste and Emergency Response; James D. Bunting and William J. Walsh, Office of Enforcement; Thomas G. McLaughlin, Robert B. Medz, and Frode Ulvedal, Office of Research and Development; Robert G. Lewis, EMSL-RTP; James R. Marshall, EPA Region II; John Warren (statistical consulting), Office of Policy and Resource Management; Robert M. Bradway, David R. Cogley, Rose Mary Ellersick, and Kenneth T. McGregor, GCA Corporation; C. Stephen Kim, New York State Department of Health (NYS DOH); and Joseph L. Slack, New York State Department of Environmental Conservation (NYS DEC).

In many ways, the success of the entire program was dependent on those individuals who assisted the On-Scene Coordinator, Dr. John Deegan, Jr., at Love Canal during the monitoring portion of the project. The able staff at the EPA Love Canal Field Office included: Christine H. White, Helen E. Burnett, Michael A. Cinquino, and Sharon J. Thompson.

Above all others, however, the involvement of the concerned residents of Love Canal throughout the course of this project must be acknowledged. Without their support, suggestions, and cooperation this study could never have even been initiated, let alone completed.

INTRODUCTION

This Volume consists of supplementary information on the Love Canal multimedia environmental monitoring program conducted by the U.S. Environmental Protection Agency (EPA) during the summer and fall of 1980. The results presented herein are to be considered in the context of the monitoring study described in Volume I. Volume I is to be consulted for details on the design, findings, and conclusions of the monitoring program.

In Appendix A a number of figures are presented to illustrate some of the monitoring results obtained, for a variety of targeted environmental contaminants, in some of the media monitored. The figures contain results that are representative of the findings obtained for the relevant medium/source/location indicated. As was described in Volume I, the maximum concentration of the chemical of interest at each site sampled is reported. This strategy was adopted to incorporate the information obtained at quality assurance/quality control (QA/QC) sites, where duplicate or triplicate field samples were collected, and to incorporate the information obtained from repetitively sampled field sites (for example, air monitoring sites). Because maximum concentrations are reported in the figures, the results may be considered conservative indicators of actual concentration levels in the areas monitored.

Appendix B consists of a variety of statistical tables that have been prepared to characterize the extent and degree of environmental contamination found in the general Love Canal area. Basically, the tables are of three types, and each is described in-turn. For ease of identification, the tables are referred to as follows: (1) difference tables; (2) count tables; and (3) frequency tables. Figures 1 through 3 provide sample illustrations of the three types of tables mentioned.

In Figure 1, an example of a difference table is presented. This table reports the percentage of times a substance of interest was detected at a "trace" or greater concentration, and the median concentration value of all determinations for the substance of interest in Declaration, Control, and Canal Areas field samples. Difference tables are included in Appendix B only when relevant and when sufficient numbers of samples were collected for a particular medium/source/location combination to warrant computation of the statistical tests incorporated in the tables.

NOTE: SEE LEGEND FOR EXPLANATION OF HEADINGS 1-6.

Figure 1. Sample Page From a Difference Table.

FIGURE 1. LEGEND

The specific items reported in difference tables are as follows:

1. Descriptive title of the medium/source/location sampled.

2. Identification of the substances monitored. All targeted substances that were not detected in any samples collected from the Declaration, Control, and Canal Areas have been deleted from the tables in order to conserve space. As a result, it is important to consider the information presented in difference tables in the context of the full list of targeted substances monitored at Love Canal.

3. The data are aggregated according to Declaration, Control, and Canal Areas and the following is reported for all validated field samples: (1) the percentage of positive determinations (qualitative identifications); (2) the standard deviation (standard error) of the percentage; and (3) the number of samples analyzed.

4. Differences in the percent of positive determinations are presented, comparing Canal vs. Control, Declaration vs. Control, and Canal vs. Declaration, as well as the probability value corresponding to each reported percent difference. Probability values were computed using a one-tailed Fisher's exact test. (See, for example, Y. M. M. Bishop, S. E. Fienberg, and P. W. Holland, Discrete Multivariate Analysis, M. I. T. Press, 1975, 364). Because of the relatively small numbers of samples collected in the Canal and Control Areas it is recommended that the statistical tests performed on these data be ignored or considered cautiously. In addition, caution is urged in the interpretation of all these statistical results because Type I errors may confound warranted inferences.

5. The data are aggregated according to Declaration, Control, and Canal Areas and the following is reported for all validated field samples: (1) the median concentration value—the symbol "B" represents below detection, and "T" represents trace (that is, the concentration interval consisting of the limit of detection to the limit of quantitation); and (2) the 90th percentile concentration value (that is, the concentration value for which 90 percent of the determinations are lower in value). Concentration values are reported in micrograms per liter (parts per billion) for water analyses, micrograms per kilogram (parts per billion) for soil analyses, and micrograms per cubic meter for air analyses.

6. Differences in the median concentrations are presented, comparing Canal vs. Control, Declaration vs. Control, and Canal vs. Declaration, as well as the probability value corresponding to each reported difference. Probability values were computed using a one-tailed Fisher's exact test. (See, for example, A. M. Mood, F. A. Graybill, and D. C. Boes, Introduction to the Theory of Statistics, McGraw-Hill, 1974, 521). Differences in median concentrations and corresponding probability values were not computed for B and T results. Because of the relatively small numbers of samples collected in the Canal and Control Areas it is recommended that the statistical tests performed on these data be ignored or considered cautiously. In addition, caution is urged in the interpretation of all these statistical results because Type I errors may confound warranted inferences.

NOTE: SEE LEGEND FOR EXPLANATION OF HEADINGS 1-12.

Figure 2. Sample Page From a Count Table.

FIGURE 2. LEGEND

The specific items reported in count tables are as follows:

1. Descriptive title of the medium/source sampled.

2. Descriptive title of the location sampled.

3. Descriptive title of the area sampled. In addition to the provision of count tables for data aggregated according to Declaration, Control, and Canal Areas, count tables are also provided on a sampling area basis for certain medium/source/location combinations.

4. Identification of the substances monitored. All targeted substances that are included in the validated data base (for each particular medium/source/location/area combination) are listed in count tables.

5. Total number of validated field samples determinations for the substance identified.

6. Number of determinations that are below the limit of detection.

7. Number of trace determinations (that is, qualitative identifications of the substance of interest—usually refers to the concentration interval consisting of the limit of detection to the limit of quantitation).

8. Number of quantified determinations (that is, determinations greater than the limit of quantitation).

9. Median concentration of all validated determinations for a substance of interest. The symbol "B" represents below detection, and "T" represents trace.

10. The minimum concentration value in the subset of quantified determinations.

11. The maximum concentration value in the subset of quantified determinations.

12. The mean (arithmetic average) concentration value for the subset of quantified determinations.

NOTE: SEE LEGEND FOR EXPLANATION OF HEADINGS 1-8.

Figure 3. Sample Page From a Frequency Table.

FIGURE 3. LEGEND

The specific items reported in frequency tables are as follows:

1. Descriptive title of the medium/source/location sampled.

2. Descriptive title of the area sampled. In addition to the provision of frequency tables for data aggregated according to Declaration, Control, and Canal Areas, frequency tables are also provided on a sampling area basis for certain medium/source/location combinations.

3. Identification of the substances monitored. All targeted substances that were not detected in any samples collected in the area referenced have been deleted from the tables in order to conserve space.

4. Total number of validated field samples determinations for the substance identified.

5. Percentage of the total number of validated field samples determinations that occur in the given concentration classes. Note that the units of the concentration classes are indicated by heading number 8. The symbol "BD" stands for below detection (that is, below the limit of detection), and "MDL" stands for minimum detection level (that is, the limit of quantitation).

6. Concentration percentiles (typically of interest) are indicated. The symbol "B" represents below detection, "T" represents trace, and a number followed by the letter "E" stands for multiplying the number before the "E" by the power of ten indicated after the letter. For example,

   "6E3" stands for $(6 \times 10^3) = 6{,}000$.

   Concentration units are indicated by heading number 8.

7. The four greatest concentrations are indicated. The concentration conventions identified for heading number 6 also apply here.

8. The concentration units used for reporting the data are indicated. For air analyses the units are per cubic meter, for water analyses the units are per liter, and for all other media the units are per kilogram. The symbol "N G" represents nanograms, the symbol "MICRO" represents micrograms, the symbol "10" represents 10 micrograms, the symbol "MILLI" represents milligrams, the symbol "F C" represents femtocuries, the symbol "P C" represents picocuries, and the symbol "N C" represents nanocuries.

In Figure 2, an example of a count table is presented. This table reports selected descriptive statistics of the monitoring data aggregated according to Declaration, Control, and Canal Areas, and (as appropriate) according to sampling area.

In Figure 3, an example of a frequency table is presented. This table provides additional information on the occurrence of particular concentration values of the monitoring data aggregated according to Declaration, Control, and Canal Areas, and (as appropriate) according to sampling area. A frequency table summarizes the monitoring data by grouping the data according to number and percentage of determinations that occur in specified ranges (that is, it describes the distribution of concentration values found in the data). In addition, percentile concentration values are reported (that is, the percentage of determinations that are lower than the indicated concentration values), as well as the four greatest concentration values.
