INTRODUCTION

The HANDBOOK OF RCRA GROUND-WATER MONITORING CONSTITUENTS contains physical and chemical properties of constituents listed in 40 CFR Part 264, Appendix IX.

Appendix IX is the list of ground-water monitoring constituents for permitted hazardous waste treatment, storage, and disposal facilities that are implementing the ground-water monitoring requirements of 40 CFR Part 264 Subpart F.

Appendix IX was intended to be a "living" list — to be updated and revised as analytical methods are developed and standardized, and as research on the fate and transport of specific contaminants in the subsurface advances. The constituents contained in this handbook are those currently listed in Appendix IX, however the Handbook also contains constituents that are being considered for addition to or deletion from Appendix IX. Those constituents that are being considered for addition to Appendix IX are indicated in the Handbook by a single asterisk (*) following the chemical name. Those constituents that are being considered for deletion from Appendix IX are indicated by a double asterisk (**).

For each constituent listed in Appendix IX, the Handbook provides the following information, as available:

1. Appendix IX Name: The name of the constituent as it appears on the list of ground-water monitoring constituents listed in 40 CFR Part 264, Appendix IX. The Handbook is organized by Appendix IX name.
2. CAS Name: The name of the constituent as it appears in the Chemical Abstracts Service (CAS) Registry.
3. CAS Number: The CAS registry number.
4. Empirical Formula: The chemical formula that provides the number of each type of atom in the molecule. For metals, the Handbook provides the chemical symbol.

5. Maximum Contaminant Level: The maximum permissible level of the constituent in water which is delivered to any user of a public water system. Proposed maximum contaminant levels (MCLs) are provided where final MCLs are not yet available. If there does not exist a maximum contaminant level for the constituent, the notation "NA" is presented in the text. New and revised MCLs are continually being proposed and promulgated under the Safe Drinking Water Act and are published in the Federal Register. The most recent MCLs available as of August 1992 have been included in the text.

6. Molecular Weight: The molecular or formula weight of the constituent in grams/mole.

7. Boiling Point: The temperature in degrees celsius at which the vapor pressure of the constituent in aqueous form is equal to atmospheric pressure, except where an alternate reference pressure for the constituent's boiling point is otherwise noted.

8. Melting Point: The temperature in degrees celsius at which the constituent in solid phase is in equilibrium with the liquid phase at atmospheric pressure, except where an alternate reference pressure for the constituent's melting point is otherwise noted.

9. Specific Gravity: The ratio of the density of the constituent relative to the density of water. Specific gravity values are reported in the form: SG at T_c/T_w where:

SG = Specific Gravity

T_c = Temperature of the constituent at the time of measurement

T_w = Water temperature

If only one reference temperature is given, it represents T_c , with an assumption that $T_w = 4^\circ\text{C}$. If no reference temperature was available for the constituent's specific gravity, the notation [UT] is presented after the value.

10. Solubility:

The concentration of the constituent (in milligrams per liter) that is required to form a saturated solution in water at the referenced temperature. If no reference temperature was available for the constituent's solubility, the notation [UT] is presented after the value.

11. Vapor Pressure:

The pressure (in mm Hg) of the vapor phase of the constituent that is in equilibrium with its liquid or solid phase at the referenced temperature. If no reference temperature was available for the constituent's vapor pressure, the notation [UT] is presented after the value.

12. Henry's Law Constant:

The ratio of the equilibrium concentration (in atmosphere) of the constituent in air relative to its concentration (in moles/cubic meter) in water at the referenced temperature. If no reference temperature was available for the constituent's Henry's Law Constant, the notation [UT] is presented after the value.

13. Log K_{ow} :

The log of the ratio of the equilibrium concentration of the constituent in octanol relative to its concentration in water.

14. Possible SW-846 Methods:

The analytical methods presented in the USEPA publication "Test Methods for Evaluating Solid Waste" (SW-846), as amended by Updates I and II, that may be used to determine the concentration of the

constituent in ground water. For each method, an Estimated Quantitation Limit (EQL) is given if an EQL is available. When different EQLs exist for 5 and 25 mL sample sizes, the EQL for the 5 mL sample size is provided in the Handbook. When the Handbook presents two EQLs for one analytical method, the two EQLs represent the EQLs obtained using two different detector types.

15. Chemical Structure:

The chemical formula drawn to show the relative arrangements of the atoms. For metals, the Handbook provides the chemical symbol.

Evaluation Form

USEPA is interested in how worthwhile users have found the Handbook, and what changes can be made to the Handbook to make it a more valuable resource. To assist in this effort, we would appreciate your response to the following questions.

Overall, I feel the Handbook is:

- Very Useful (I'm glad I have it.)
- Somewhat Useful (It's not something I really need to have, but I'll use it every now and then.)
- Not Useful (I won't ever use the Handbook.)

I. Please indicate what information contained in the Handbook you find most useful?

II. What information contained in the Handbook is of little use? Why?

III. In which of the following ways can you see yourself using the Handbook?

- Determining the fate and transport of contaminants in ground water.
- Choosing an analytical method for ground-water analysis
- Evaluating corrective actions, selecting treatment methods, or reviewing Corrective Measures Studies
- Evaluating the potential for LNAPLs or DNAPLs in ground water
- Modelling
- Other _____

IV. What additional items, if any, would you like to see included in the Handbook?

- Synonyms
- Dynamic and kinematic viscosities
- Degradation products
- Possible applicable treatment methods
- Solubilities for a range of reference temperatures
- SW-846 Extraction Methods
- Other _____
