PREFACE

In response to State and local agency requests for air toxics information, EPA has designed and is implementing the National Air Toxics Information Clearinghouse. This information dissemination center has been developed in cooperation with the State and Territorial Air Pollution Program Administrators (STAPPA) and the Association of Local Air Pollution Control Officials (ALAPCO).

The purpose of this document, published by the National Air Toxics Information Clearinghouse, is to inform State and local agencies and other Clearinghouse users of current research and regulatory development projects underway at the U. S. Environmental Protection Agency (EPA), the National Institute for Occupational Safety and Health (NIOSH), and State and local agencies, and to help them identify sources of specific air toxics information. Every effort has been made to ensure accuracy as of April 1988, the date that compilation of information was completed. However, future changes in agency priorities and funding levels may change the scope and estimated project completion dates.

This document is the 1988 update of the annual National Air Toxics Information Clearinghouse ongoing research document, last published in June 1987. The Clearinghouse plans to continue updating this document on an annual basis. Other documents published by the Clearinghouse include:

ABSTRACT

The National Air Toxics Information Clearinghouse has been established by the EPA's Office of Air Quality Planning and Standards for the purpose of facilitating information transfer among Federal, State, and local air quality management agencies. This document has been published as part of that effort. Its purpose is to inform State and local agencies and other Clearinghouse users of U. S. Environmental Protection Agency (EPA), National Institute for Occupational Safety and Health (NIOSH), and State and local agency research and EPA regulatory development projects concerning toxic air pollutants.

The document is divided into two parts and an appendix. The first part lists 365 air toxics projects currently in progress at EPA, NIOSH, and State and local agencies. A brief description of each project and a contact name, office, and telephone number are given. The second part of the document contains the index that allows readers to locate projects of interest. Projects are indexed by agency, project type, chemical name, Chemical Abstract Service (CAS) number, and source category Standard Industrial Classification (SIC) Code. The appendix lists regulatory development projects on toxic chemicals underway at the EPA's Office of Drinking Water (ODW). While most of these projects are not directly related to air problems, health information on toxic chemicals from ODW projects may be of interest to Clearinghouse users.

This work complements information contained in the Clearinghouse documents entitled "National Air Toxics Information Clearinghouse: Bibliography of Selected Reports and Federal Register Notices Related to Air Toxics, Volume 1: Citations," July 1987 (EPA-450/5-87-005), Volume 2: Citations - 1988, July 1988 (EPA-450/5-88-005) and Index - 1988, July 1988 (EPA-450/5-88-006).

This document was submitted in partial fulfillment of EPA Contract No. 68-02-4330, Work Assignment No. 44, by Radian Corporation under the sponsorship of the U. S. Environmental Protection Agency. Compilation was completed in May 1988, and the report was completed in July 1988.

INTRODUCTION

This list of ongoing research and regulatory development activities has been compiled by the National Air Toxics Information Clearinghouse as one of several tools designed to facilitate information exchange on air toxics. A total of 365 ongoing projects concerning toxic air pollutants are listed. These projects have been funded by the EPA, NIOSH, or State and local agencies. The sponsoring agency, a contact name and telephone number, and a description of the work are provided for each project. To facilitate use of this document, the projects are indexed by sponsoring agency, project type, chemical name and CAS registry number, source category SIC Code, and SIC Code title.

This document is designed to help Clearinghouse users identify sources of information for specific air toxics questions or problems. It is an updated version of the June 1987 Clearinghouse "Ongoing Research and Regulatory Development Projects" document (EPA-450/5-87-004, PB88-113196/REB). The list of projects contained in this document focuses on studies which have not yet resulted in publicly available reports. The list indicates estimated completion dates as well as a contact person who can provide study details. In future updates of this document, new projects will be added, and the dates and names previously provided will be updated as required. Projects which have been completed since the last edition have been removed. Some of these projects resulted in published reports which are listed in the July 1988 Clearinghouse publication "Bibliography of Selected Reports and Federal Register Notices Related to Air Toxics, Volume 2: Citations - 1988."

DOCUMENT SCOPE

Eighteen types of projects which are considered to be of greatest interest to agencies concerned with the regulation of toxic air pollutants are included in this compilation. Both basic scientific research projects

and studies conducted to assess the need for regulations and/or to support regulatory development activities have been included. Federal regulations may or may not be developed for sources and/or pollutants covered by these projects. The 18 categories of projects are briefly defined below.

1. Accident Prevention/Emergency Response - These projects range in scope from establishing accident prevention and emergency response measures to evaluating releases or spills and preparing appropriate responses to the accident. This includes procedures under development to meet the SARA Title III community-right-to-know program requirements.

2. Ambient Monitoring - Projects involving the development of monitoring methodologies for toxic air pollutants and actual monitoring studies.

3. CHIPs - Chemical Hazard Information Profile - In these studies, EPA's Office of Toxic Substances (OTS) compiles preliminary information about sources, environmental distribution, exposure and health effects of specific chemicals.

4. Control Technology - Projects addressing control of air toxics from specific sources or mitigation of effects from toxic air pollutants in a geographic area (i.e., effects of urban soup).

5. Dispersion Modeling - Projects in which dispersion modeling of an air pollution source or sources emitting toxic air pollutants is performed. Often these projects will require source evaluation and characterization prior to any modeling.

6. Emission Factor Documents - These projects examine the sources and emissions of specific pollutants.

7. Epidemiology Studies - Epidemiology studies examining human health effects possibly resulting from exposure to toxic air pollutants.

8. Exposure Assessments - Projects involving the estimation of the population exposure to ambient concentrations of specific chemicals.

9. Health Assessments - Projects that result in the compilation of information on health effects of specific chemicals.

10. Indoor Air - Projects relating to indoor air pollutants, including monitoring and health and exposure assessments of indoor air pollutants.

11. NESHAP - OAQPS projects to support the development of national emission standards for hazardous air pollutants (NESHAP) under Section 112 of the Clean Air Act. These projects may include collecting or generating the following types of information: an analysis of the affected industry or air pollution source including emissions data and applicable control technology; an analysis of regulatory alternatives in terms of potential environmental, economic, and energy impacts; and health information including exposure and risk assessments.

12. NSPS - OAQPS projects to support the development of new source performance standards (NSPS) for sources of certain hazardous air pollutants under Section 111 of the Clean Air Act. These projects may involve gathering or generating the following types of information: an analysis of the affected industry or air pollution source including emissions data and applicable control technology and an analysis of regulatory alternatives in terms of potential environmental, economic, and energy impacts.

13. Pre-Regulatory Assessments - Projects that include reviewing the health effects, sources, emissions to the ambient air, and potential for public exposure to specific pollutants in order to decide whether these pollutants should be regulated under the Clean Air Act or other appropriate mechanisms.

14. Regulatory Development Guidance - EPA-funded projects that provide guidance to State and local agencies on development of air toxics control programs.

15. Risk Assessments - Projects that estimate potential human risks resulting from exposure to hazardous air pollutants.

16. Source Assessments - Projects involving the identification and quantification of emissions from specific source categories and evaluating applicable control technologies.

17. Source Sampling - Projects involved in the development of source sampling methodologies or that include sampling specific sources of hazardous air pollutants.

18. Toxicity Testing - Laboratory studies assessing adverse health effects associated with exposure to one or more chemicals.

The following EPA offices were contacted for lists of projects within these 18 categories:

- Office of Air and Radiation,
- Office of Pesticides and Toxic Substances,
- Office of Solid Waste and Emergency Response,
- Office of Research and Development, and
- Regional Offices for all 10 EPA Regions.

The National Institute for Occupational Safety and Health (NIOSH) under the Department of Health and Human Services was also contacted. In selecting projects from these lists, emphasis was placed on projects dealing with toxic air pollutants which belong to the categories listed above. State and local agencies submit their project lists directly to the Clearinghouse.

The Office of Drinking Water projects have been listed in the Appendix. While not specifically air related, health information on toxic pollutants resulting from ODW projects may be helpful to Clearinghouse users.

USING THIS DOCUMENT

This document has been divided into two parts and an appendix. Part 1 contains individual entries for 365 ongoing research and regulatory development projects. The EPA and NIOSH projects appear first, followed by State and local agency projects. Project entries are numbered sequentially throughout Part 1, beginning with the prefix CL-BIB or with the two-letter postal code abbreviation for the State for State/local agency projects.

Breaks in numerical sequence indicate the removal of previous entries after completion of the specific project. Each entry generally contains the following elements:

- Project Title,
- Status of Project,
- Contact Office, Name, and Telephone Number,
- Chemical Abstract Services (CAS) Registry Number,
- Chemical Name,
- Air Pollution Source,
- Project Type, and
- Project Description (seven lines maximum).

The Status of Project field contains the start date and anticipated completion date, if known. Any proposed publication information, if appropriate, is also included. Since most NIOSH projects are long-term projects, journal articles on various phases of a project may be published before the overall project completion date shown in the entry. In the case of emission standards projects (NESHAP and NSPS), the entry indicates whether the standard is currently in the proposal or promulgation stage.

The next element in each project entry lists the office doing the work and the name and telephone number of the Project Officer or other knowledgeable contact. Abbreviations used for the offices and the telephone number for each office are included in Table 1.

The CAS number, chemical name, and source fields may not be applicable to all entries. For example, projects that deal with groups of chemicals such as "organic compounds" or "heavy metals" rather than specific pollutants cannot be assigned CAS numbers. Several special Clearinghouse acronyms prefaced with "CL- " have been assigned to groups of common pollutant types where no CAS number was applicable. The list of Clearinghouse chemical acronyms is shown in Table 2. In some projects dealing with specific source categories, lists of chemicals emitted are not yet available, so "various" has been used under Chemical Name. Other chemical-specific projects may not deal with specific air pollution sources.

In these cases, the Air Pollution Source field of the entry has been omitted. Wherever possible, an effort has been made to list the specific chemical name(s), CAS registry number(s), and/or source type(s) for each project. Figure 1 gives an example of a typical entry.

If a project clearly falls into 1 of the 18 categories listed above, only that one project type is listed in the entry. However, there is often overlap between the kinds of information included in these categories, therefore, more than one is selected based on the project title and description.

The final element provides a brief description of the project. It has been limited to seven lines; therefore, it is somewhat general in nature.

Part 2 of the document consists of the index. This is organized both alphabetically and numberically. Each project is indexed by project type, CAS number, chemical name, SIC Code and the corresponding SIC Code title, and the agency conducting the work. These indices allow users to locate projects pertaining to a specific chemical, source, or type of information. For example, if information is desired on a specific chemical, it can be obtained by looking up the chemical name in the index or by looking up the CAS Number for that chemical. Under the chemical name are a list of titles and project numbers (e.g., CL-BIB-0193 or CA001 010). Using this project number, one can look up the projects of interest in Part 1 of this document. Similarly this process can be done for various source types for which there are SIC Codes. For example, if information on projects related to steel or the chemical industry was desired, a listing could be found alphabetically in the index under each of these categories. If an entry contains more than one project type, it is listed in the index under each applicable project type. Only those chemical names, CAS numbers, and sources with SIC Codes used in the 18 project descriptions are found in the index. A table of contents to the index is found at the beginning of Part 2. This lists all terms found in the index and the index page number where the term and associated projects are listed.

Regulatory development projects underway at the EPA Office of Drinking Water (ODW) are summarized in the Appendix. While these projects are not specifically air related, Clearinghouse users may find toxic chemical

information generated by ODW useful. For example, background documents for setting Maximum Contaminant Levels under the Safe Drinking Water Act contain health information on toxic chemicals and many chemicals being studied by ODW are also potential air pollutants. The Appendix contains a brief description of ODW regulatory development activities and lists of chemicals currently under study.

Information in this report is also available through the National Air Toxics Information Clearinghouse computerized data base known as NATICH. By accessing the data base on-line, the user may identify ongoing project citations by a combination of factors such as pollutant name or CAS number, SIC Code, project type, and/or sponsoring agency (EPA, NIOSH, or State/local agency). For more information on accessing NATICH, contact the Clearinghouse staff at (919) 541-0850 or (FTS) 629-0850.

CONTACT: NIOSH/DSHEFS/IWSB, Elizabeth Ward (513) 841-4203
CAS NO: 75-21-8, 624-83-9, 106-99-0
CHEMICAL: ETHYLENE OXIDE, METHYL ISOCYANATE, 1,3-BUTADIENE
SOURCE: Chemical Industry
PROJECT TYPE: Epidemiology Study
DESCRIPTION: This is a retrospective mortality study of 34,000 Union Carbide employees at three chemical plants in the Kanawha River Valley (KV) region of West Virginia. These plants have produced a large array of chemicals, many of which are used in the Union Carbide Texas City plants that have been associated with an excess risk of brain cancer among its employees. Initial analyses will attempt to test the apparent excess proportions of multiple myeloma and cancer of the brain and kidney at the KV plants. These excesses were revealed by a company-sponsored proportionate mortality study based on 819 deaths known to Union Carbide. One of the chemical exposures experienced by the KV workforce is ethylene oxide (ETO). Analyses of workers exposed to ETO and of other exposures of concern will be carried out via subcohort or case control designs.

TITLE: Mortality and Industrial Hygiene Study of Formaldehyde
STATUS: Started 10/80; complete 3/89
CONTACT: NIOSH/DSHEFS/IWSB, Leslie Stayner (513) 841-4203
CAS NO: 50-00-0
CHEMICAL: FORMALDEHYDE
PROJECT TYPE: Epidemiology Study
DESCRIPTION: This is a mortality study of garment workers who produce shirts from fabrics treated with formaldehyde resins. These fabrics continually release free formaldehyde resulting in occupational exposure to this chemical. This study is being conducted in two phases. The initial phase consists of proportional mortality ratio (PMR) analyses of 257 deaths from an insurance fund. The second phase consists of a retrospective and prospective cohort mortality study (SMR) of approximately 19,000 workers. In addition, industrial hygiene surveys of the plants included in the study and other industries with formaldehyde exposures are being conducted. Free formaldehyde from fabric treated in earlier years and of the particulates found in the work place of the garment workers will be analyzed.

TITLE: Ethylene Oxide Mortality Study - NCI
STATUS: Started 10/82; complete 9/90
CONTACT: NIOSH/DSHEFS/IWSB, Nelson Steenland (513) 841-4203
CAS NO: 75-21-8
CHEMICAL: ETHYLENE OXIDE
PROJECT TYPE: Epidemiology Study
DESCRIPTION: This is a cohort mortality study of workers who have been exposed to ethylene oxide in the course of sterilizing medical supplies or spices. The mortality experience of the cohort will be compared to that of the general population, stratified by age, race, sex, and calendar time. Further analysis by dose categories will be conducted to detect any dose-response. Exposure categorization will be based on existing industrial hygiene sampling data, new sampling data collected by NIOSH, and historial reconstruction based on process descriptions. The principal hypothesis to be tested is that exposure to ethylene oxide increases the risk of leukemia.

TITLE: Investigation of Workers Exposed to MBOCA
STATUS: Started 10/82; complete 9/88
CONTACT: NIOSH/DSHEFS/IWSB, Elizabeth Ward (513) 841-4203
CAS NO: 101-14-4
CHEMICAL: MBOCA, (CURENE)
PROJECT TYPE: Epidemiology Study
DESCRIPTION: The project consists of a cohort mortality and cancer incidence study. Personnel records of 540 workers exposed to MBOCA from 1968-1979 at an MBOCA production facility were filmed in 1981. Mortality follow-up has been ongoing since that time. Currently, a cancer incidence study which involves a telephone interview to determine whether cancer has been diagnosed and a medical screening examination (urine cytology and urinalysis) to detect new cases is planned. The telephone interview will also elicit a detailed work history, which will be used to evaluate degree of exposure and information about smoking habits. Since the latency for the population, about 10 years, is short for induction of bladder tumors by occupational carcinogens, there is a plan to follow up by recontacting the population at regular intervals after the initial interview and screening examination.

TITLE: Mortality of Dioxin Workers
STATUS: Started 10/79; complete 12/88
CONTACT: NIOSH/DSHEFS/IWSB, Marilyn Fingerhut (513) 841-4203
CAS NO: 95-95-4, 87-86-5, CL-DIOXIN
CHEMICAL: DIOXINS, 2,4,5-TRICHLOROPHENOL, PENTACHLOROPHENOL
PROJECT TYPE: Epidemiology Study
DESCRIPTION: This epidemiological study will assess the association between exposure to dioxin and the risk of developing cancer, especially soft tissue sarcoma. Records were collected for all U.S. workers who were identified as having worked in the production of dioxin-contaminated chemicals such as the herbicide 2,4,5-Trichlorophenoxy-acetic acid (2,4,5-T), its feedstock 2,4,5-Trichloro-phenol, and the wood preservative, pentachlorophenol. About 6,000 workers have been identified in 13 facilities throughout the U.S. Descriptions of the chemical processes and job conditions as well as industrial hygiene measurements and analyses of dioxin in products will be used to construct an exposure index for the population.

Through this project, cohorts from previous NIOSH studies will be followed through the most current date possible, additional death information will be added to the file, the analysis will be rerun, and new reports will be prepared. Therefore, the reanalysis will include a greater number of deaths (increasing the statistical power) and the latency period will be extended five to ten years (depending on the individual study).

TITLE: Retrospective Cohort Investigation of Non-Asbestos Welders
STATUS: Started 10/84; complete 9/89
CONTACT: NIOSH/DSHEFS/IWSB, Nelson Steenland (513) 841-4203
CAS NO: CL-WELD
CHEMICAL: WELDING FUMES
SOURCE: Steel Industry, Welding
PROJECT TYPE: Epidemiology Study
DESCRIPTION: NIOSH has identified a cohort of welders of mild steel who are not exposed to asbestos, nickel, or chromium. The principal exposure of these workers has been to iron oxide, a promoter of lung cancer in animals. A retrospective cohort mortality study of these mild steel welders will be conducted. Industrial hygiene measurements of the extent of exposure to welding fumes have been taken by management since the late 1960's. The use of a nonexposed cohort as a comparison group will enable the mortality experience of the welders to be compared to another group which is likely to share similar smoking habits. If a lung cancer excess is observed, a case-control study with smoking interviews will be conducted.

TITLE: An Assessment of the Effectiveness of OSHA's Lead Standard
STATUS: Started 10/86; complete 9/89

STATUS: Ongoing

CAS NO: CL-ALDEHYD, CL-HCARB
CHEMICAL: ALDEHYDES, HYDROCARBONS
SOURCE: Woodburning homes
PROJECT TYPE: Source Assessment, Indoor Air Pollution
DESCRIPTION: The U.S. EPA's Integrated Air Cancer Project (IACP) conducted a field study in Boise, Idaho during November 1986-February 1987. As part of this study, samples were collected in ten pairs of homes, one with and one without a woodburning appliance. Paired homes were located near each other and concurrent sampling was conducted inside each home and outside the home not burning wood. In most cases, concentrations of total non-methane hydrocarbons and aldehydes were higher inside the homes than outside. Comparisons of individual hydrocarbon and aldehyde concentrations relative to woodburning vs. non-woodburning, daytime vs. nighttime, and indoor vs. outdoor will be discussed.

TITLE: Sources of Fine Particle Organic Matter in Boise
STATUS: Ongoing
CONTACT: ORD/ASRL-RTP, Charles Lewis (919) 541-3154
CAS NO: CL-ORGANIC
CHEMICAL: ORGANIC COMPOUNDS
SOURCE: Automobiles, wood smoke
PROJECT TYPE: Emission Factor, Ambient Moniotoring, Source Assessment
DESCRIPTION: In airsheds whose atmospheric mass loadings are dominated by woodsmoke and mobile source emissions, extractable organic matter (EOM) generally constitutes 50% or more of the fine particle ambient mass concentration. It is also the portion of the ambient aerosol associated with mutagenicity. For both reasons it is of interest to determine the percentage of EOM which is contributed by each source, as well as any other less obvious ones. In past IACP studies, a multiple linear regression approach, using Pb and K tracers for motor vehicle and wood smoke sources, respectively, has been very successful in the source apportionment of EOM (and also mutagenicity). However, since 1985, a significant change has occurred in Pb emissions of motor vehicles. New data will be used to evaluate the current viability of Pb as a tracer.

STATUS: Ongoing
CONTACT: ORD/ASRL-RTP, Roy Zweidinger (919) 541-2324
CAS NO: CL-ORGANIC, CL-SVOC
CHEMICAL: ORGANIC COMPOUNDS, SEMIVOLATILE COMPOUNDS
SOURCE: Woodstoves, mobile sources
PROJECT TYPE: Ambient Monitoring, Source Sampling
DESCRIPTION: The distribution of organic material between vapor and condensed states is of interest since the physical state has significant effects on transport, reactivity and environmental effects of pollutants. Information will be gathered on the distribution of vapor phase and condensed organic material for an airshed primarily impacted by woodstove and mobile source emissions. Both ambient air and source sample results will be presented. Observations on the relationship of vapor phase semivolatile and condensed organic material in the source and ambient samples will be made. The significance of the semivolatile materials in assessing source impacts and air quality will also be examined.

TITLE: Particulate Matter-Organic Compounds Interactions on Municipal Incinerator Flyash
STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, John Margeson (919) 541-2848
CAS NO: CL-POM
CHEMICAL: PARTICULATE ORGANIC MATTER
SOURCE: Municipal Incinerators
PROJECT TYPE: Source Sampling
DESCRIPTION: Flyash, a fine particulate effluent from municipal incinerators, consists of 70-95% inorganic material. The large surface area of the fine flyash from incineration allows adsorption and concentration of potentially mutagenic or carcinogenic polynuclear organic material (POM) on the particulate surface. The development of a laboratory-based gas chromatographic approach for evaluating the effects of compound/particle matter interaction using temperature and flow conditions which model particle and organic material collection in the Semi-VOST method will be studied. The gas phase retention of selected organic compounds on the municipal waste incineration flyash will be examined.

DESCRIPTION: A multitask research effort has been implemented to develop a validated sampling and analytical technique to measure multiple metals in the emissions from stationary sources. The methodology is designed to measure 16 toxic metals. The sampling method was formulated based upon extensive literature and laboratory studies. The results of these studies indicate th that the desired design of the sampling train is a modified EPA Method 5 train.

TITLE: Laboratory Evaluation of a Test Method for Measuring Emissions of Selected Toxic Metals from the Incineration of Hazardous Materials
STATUS: Complete; report due FY 88
CONTACT: ORD/EMSL-RTP, Thomas Ward (919) 541-3788
CAS NO: CL-METAL
CHEMICAL: METALLIC COMPOUNDS
SOURCE: Municipal Waste Incinerators
PROJECT TYPE: Source Sampling
DESCRIPTION: This work was designed to formulate and evaluate a method for sampling and analyzing emissions from the incineration of hazardous materials for twelve toxic metals. A method was formulated consisting of a modified EPA Method 5 sampling train with nitric acid/hydrogen peroxide, water, and acidified potassium permanganate used as the absorbing solutions. Initially, the method was evaluated by spiking the absorbing solutions with the metals of interest, and digesting these samples either with conventional heating or open vessel microwave digestion methods. The samples were analyzed by inductively coupled plasma emission spectroscopy (ICPES). Both digestion methods were found to yield recoveries of 100 plus/minus 20 percent of the spiked metals.

TITLE: The Influence of Woodburning on the Mutagenicity of Air Outdoor and Indoors
STATUS: Ongoing
CONTACT: ORD/OHR/HERL, Joellen Lewtas (919) 541-3849
CAS NO: CL-WOOD, CL-IAP
CHEMICAL: WOOD SMOKE, INDOOR AIR POLLUTANTS
SOURCE: Woodstoves
PROJECT TYPE: Exposure Assessment, Source Sampling, Indoor Air Pollution
DESCRIPTION: Micro-mutagenesis bioassay methods have been developed and applied to the Integrated Air Cancer Project studies in order to determine the major sources of mutagens in the airshed and to evaluate human exposures. Simultaneous sampling and bioassay studies were conducted on indoor and outdoor air samples in matched pairs of homes with and without woodstoves. Analysis of samples collected in a major field study in Boise, ID confirm the results of a pilot indoor study in a Raleigh, NC neighborhood. The homes both with and without woodstoves had higher concentrations of particulate mutagens when the outdoor concentrations were elevated.

STATUS: Ongoing
CONTACT: EPA Region IX, Richard Crume (415) 974-8153
CAS NO: CL-HAZWAST
CHEMICAL: HAZARDOUS WASTE
PROJECT TYPE: Ambient Monitoring, Source Sampling
DESCRIPTION: During the past several years, air monitoring activities have dramatically increased at hazardous waste sites designated for cleanup by the U.S. EPA's Superfund program. This increase in activity results in the need for new and improved air sampling devices, sample preparation techniques, and analytical procedures for the new measurement of low concentrations of air toxics. This project provides guidance to Superfund project officers and contractors in designing quality assurance project plans and in making actual on-site measurements of toxic air contaminants.

PROJECT TYPE: Exposure Assessment, Source Assessment, Ambient Monitoring, Indoor Air Pollution
DESCRIPTION: The Particle Total Exposure Assessment Methodology (Particle-TEAM) Program is currently being developed by the U.S. Environmental Protection Agency (USEPA) to estimate the level of human exposure of particles and relate exposure to sources of aerosol matter. This program follows a sequence of TEAM programs designed to estimate everyday exposures to other potential hazards such as volatile organic compounds (VOCs). The Particle-TEAM program is focused on specific size fractions of aerosol particles analyzed for at least metals, nicotine, and as resources permit, semivolatile organics. A field study will be conducted to help determine the indoor aerosol particle size distribution and concentration spectrum.

DESCRIPTION: A review of methods which have been used or proposed in the past for measuring condensable emissions for various non-regulatory purposes was conducted. Based on this review, recommendations for approaches both for measuring condensables apart from pre-existing particulate matter and inclusive of known sized particulate fractions were made to the EPA and a recommendation for the development of a specific method and protocol using an air dilution technique was made. The hardware for the selected approach is expected to be comparable to that of Method 5 in size and weight and to be capable of providing emissions data from standard isokinetic traverses of a stack.

TITLE: Classification of Mass Spectra of Toxic Compounds with an Inductive Expert System
STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, Dr. Donald Scott (919) 541-7948
CAS NO: CL-ORGANIC
CHEMICAL: ORGANIC COMPOUNDS
PROJECT TYPE: Ambient Monitoring, Source Sampling
DESCRIPTION: The performance of an inexpensive, inductive rule-building expert system, 1ST-CLASS, using the ID3 algorithm was compared to that of SIMCA class modeling in classifying the binary mass spectra of 78 toxic and related compounds. The compressed mass spectra consisted of 17 masses chosen using information theory. The expert rules verified the six main classes and two subclasses found with SIMCA class modeling. In general, fewer masses were involved with the rules than with the SIMCA models, and the rules are normally optimized with regard to minimum number of steps in the rule, not minimum number of variables.

STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, Robert Burton (919) 541-3077
CAS NO: CL-ORGANIC, CL-PM
CHEMICAL: ORGANIC COMPOUNDS, PARTICULATE MATTER
PROJECT TYPE: Ambient Monitoring, Source Sampling
DESCRIPTION: The new high flow rate (40 CFM) Virtual Impactor has been subjected to a series of laboratory tests to evaluate precisely its cutpoint and particle loss characteristics. In addition, a new electronic volumetric flow controller coupled with a high efficiency induction motor have been designed to facilitate field sampling. Field tests by both the University of Minnesota and the U.S. EPA are planned to compare fractionated fine (0-2.5 um) and coarse (2.5-10um) mass loadings sampled by the Virtual Impactor to those masses collected by the existing low flow (16.7 liter/min) dichotomous sampler. Organic extraction and bioassay of test samples will be performed to determine the feasibility of employing the new sampler for collecting organic particulate during the next series of field studies conducted by the Integrated Air Cancer Program (IACP).

TITLE: Transformation of Boise Sources: The Production and Distribution of Mutagenic Compounds in Wood Smoke and Auto Exhaust
STATUS: Ongoing
CONTACT: ORD/ASRL-RTP, Larry Cupitt (919) 541-2878
CAS NO: CL-ORGANIC, CL-PM
CHEMICAL: ORGANIC COMPOUNDS, PARTICULATE MATTER
PROJECT TYPE: Source Sampling, Ambient Monitoring
DESCRIPTION: Emissions from the principal combustion sources in Boise (e.g., automobiles and wood smoke) have been shown to produce a wide variety of mutagenic compounds. These mutagenic species are associated with both the particulate-bound and the vapor phases. In the source emissions, most of the mutagenicity is associated with the particle-bound organics. Irradiation of the dilute exhaust materials in photo-chemical simulation chamber, however, increases the mutagenicity of the gas-phase pollutants substantially, suggesting that the overwhelming majority of the mutagenic burden may exist in the vapor phase.

STATUS: Ongoing
CONTACT; OHR/HERL-RTP, Randall Watts (919) 541-2491
CAS NO: CL-ORGANIC, CL-WOOD
CHEMICAL: ORGANIC COMPOUNDS, WOOD SMOKE
PROJECT TYPE: Ambient Monitoring
DESCRIPTION: Particulate filters were collected from collocated PM-10 samplers with and without internal impactors, thereby producing parallel 0-2.5 and 0-10 micron samples. The filters were comparatively analyzed for percent extractable organics, mutagenicity concentration, and mutagenic potency of extracted organics. These ambient air samples were collected on Pall-flex(TM) filters during the 1985 IACP wood smoke study conducted in a residential area of Raleigh, NC. Eleven sample sets representing 11 sampling periods were selected for each type of sampler. These sampling periods had fine particle (0-2.5 micron) concentrations ranging from 11-129 micrograms per cubic meter. This preliminary particle size comparison study indicated that extractable organics and organic mutagens were primarily associated with the 0-2.5 micron particles.

TITLE: Analysis of Semivolatile Compounds in Passive Air Samples by On-Line Supercritical Fluid Extraction/Gas Chromatography
STATUS: Ongoing; complete FY 89
CONTACT: ORD/EMSL-RTP, Nancy Wilson (919) 541-4723
CAS NO: CL-SVOC
CHEMICAL: SEMIVOLATILE ORGANIC COMPOUNDS
PROJECT TYPE: Ambient Monitoring
DESCRIPTION: On-line supercritical fluid extraction/gas chromatography (SFE/GC) provides an important alternative to Soxhlet extraction for the recovery of semivolatile organic compounds from adsorbents. The on-line extraction method concentrates the entire sample on the head of the GC column for analysis, avoiding the large dilution inherent in Soxhlet extraction. An on-line SFE/GC system has been constructed and tested for use with Tenax(TM)-filled passive air samplers. Optimization of extraction conditions, including the use of extraction fluids modified with organic solvents, has been investigated.

TITLE: Identification of the Composition of Source-Related Groups of Volatile Organics in Ambient and Indoor Air
STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, William McClenny (919) 541-3158

CHEMICAL: VOLATILE ORGANIC COMPOUNDS
PROJECT TYPE: Indoor Air Pollution, Ambient Monitoring
DESCRIPTION: Using new methodology for frequent sampling and analysis of volatile organics, essentially real-time monitoring for a large number of compounds is now possible. Repetitive hourly data of this type has been interpreted to reveal seven source factors, that is, groups of compounds that vary together, in the ambient air in an industrialized area near Richmond, Virginia. Identification of source factors in indoor air using similar time resolved data has also been demonstrated.

SOURCE: Hazardous Waste
PROJECT TYPE: Source Sampling
DESCRIPTION: Four test methods for determining the volatile emission potential of hazardous waste have been evaluated for predicting whether pretreatment of a waste is needed to remove volatile organic compounds prior to disposal. The test methods were: equilibrium headspace analysis, elevated temperature purge and trap, batch steam distillation and gravimetric purge and trap. Each test method was evaluated by preparing synthetic wastes that approximated the chemical and physical properties of six different waste categories. Recovery profiles, which are a measure of the recovery/removal efficiency of a test method, were used to compare one method to another.

TITLE: Quality Assurance for Measurement of Variables When Using Proposed Method 5G for Wood Heater Certification Testing
STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, Thomas Ward (919) 541-3788
CAS NO: CL-PM
CHEMICAL: PARTICULATE MATTER
SOURCE: Wood Heaters
PROJECT TYPE: Source Sampling
DESCRIPTION: The U.S. EPA has proposed New Source Performance Standards (NSPS) for particulate emissions from wood-burning heaters which require that new wood heaters be tested to demonstrate compliance with the regulation's emission limits. The proposed regulation permits testers to choose one of several emission sampling approaches. For reasons of cost and relative ease of performance, the sampling method predicted to be used most often is EPA Method 5G. This project evaluates the most critical source of potential error in the sampling and analytical measurements which are used to determine emissions and of the Quality Assurance measures necessary to determine quality of the data produced.

CHEMICAL: WOOD SMOKE
SOURCE: Woodstoves
PROJECT TYPE: Ambient Monitoring, Source Assessment
DESCRIPTION: Over two heating seasons, the U.S. EPA, the New York Energy Research and State Development Authority (NYSERDA), and the Coalition of Northeast Governors (CONEG) conducted a study of the efficiency of four woodstove technologies: stoves equipped with integral catalytic combustors, low-emission non-catalytic stoves, retrofit catalyst woodstove, and conventional woodstoves. Three principal performance parameters were examined in the study: emissions characteristics, wood-use characteristics, and creosote formation in flues. Audits were performed to assess the implementation of planned quality control activities and the performance of measurement systems.

TITLE: Evaluation of Sampling Methods for Measuring Ethylene Oxide Emissions from Sterilization Chambers and Control Units and Determining Control Unit Efficiency
STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, John Margeson (919) 541-2848
CAS NO: 75-21-8
CHEMICAL; ETHYLENE OXIDE
SOURCE: Sterilization Chambers
PROJECT TYPE: Source Sampling, Control Technology
DESCRIPTION: The U.S. EPA is currently considering the development of regulations to control ethylene oxide (EtO) emissions from commercial sterilization facilities. Thereuring EtO emissions must be established. The method fore, a reliable sampling and analysis method for measuring EtO emissions must be established. The method must be capable of measuring total EtO emissions and must be applicable to determining the efficiency of EtO control devices. Measurement of EtO emissions from commercial sterilization facilities is not a straightforward process. The EtO is emitted from the chamber or control unit intermittently, and the emissions vary in intensity and EtO content. A semi-continuous direct sampling procedure applicable to commercial sterilization facilities was evaluated in the field.

STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, Jimmy Pau (919) 541-3680
CAS NO: CL-VOC
CHEMICAL: VOLATILE ORGANIC COMPOUNDS
PROJECT TYPE: Source Sampling
DESCRIPTION: The gas-liquid counter-current dynamic impinger is being investigated as an alternative to EPA Method 25 in stationary source sampling for volatile organic compounds (VOCs). The impinger method offers the following advantages over the sampling approach used in Method 25: (1) a continuous sampling process, constantly being replenished with source gas and fresh purging liquid, (2) ability to provide concentration data during the sampling process, and (3) potential for automation of the sampling process. The dynamic impinger sampling system separates mixtures of gases into purgeable and nonpurgeable fractions.

TITLE: A Study of Products from the Photooxidation of Toluene Using MS/MS Analysis
STATUS: Ongoing
CONTACT: ORD/ASRL-RTP, Larry Cupitt (919) 541-2878
CAS NO: 108-88-3
CHEMICAL: TOLUENE
PROJECT TYPE: Source Sampling
DESCRIPTION: A 5.1 ppm toluene/0.9 ppm NOx mixture was irradiated in a 22.7 m3 Teflon smog chamber operated in a dymanic mode. The effluent from this mixture was passed (at 150 L/min) to a triple quadrupole MS/MS operated in an atmospheric pressure ionization mode. Many of the ring-fragmentation products were identified using this technique and estimates of their concentration were made using structurally similar standards. Several major organic products were also quantitated using GC and HPLC. Under the conditions employed approximately half of the reacted carbon could be accounted for by the observed oxygenated products. Mechanisms for several of the product paths will be examined.

TITLE: Background and Status of the Computerized Accidental Release Planning System
STATUS: Ongoing
CONTACT: AEERL/ATRD/IPB, Jane Bare (919) 541-1528
CAS NO: CL-VARIOUS
CHEMICAL: VARIOUS
PROJECT TYPE: Accident Prevention/Emergency Response
DESCRIPTION: The Superfund Amendments and Reauthorization Act (SARA) contains Title III Sections 301-303 which seek to improve local chemical emergency response capabilities by allowing citizens and local emergency planning committees (LEPCs) to obtain information about extremely hazardous chemicals in their communities. EPA published a list of 406 acutely hazardous substances complete with Threshold Planning Quantities (TPQs). The facilities handling these chemicals in quantities greater than the TPQs are required to submit information to the LEPCs. This computerized system allows the communities the ability to handle the volume of incoming data. Pre-programmed searches are written to make the system user-friendly. This system also allows LEPCs to use a quick and approximate dispersion model which will enable them to determine vulnerability areas.

These procedures have continued to be evaluated and improved. Monitoring procedures, reasons why changes have been made in the procedures, estimates of data quality and monitoring costs, and areas where additional improvements might be feasible in the future are considered.

TITLE: Statistical Properties of Hourly Concentrations of Volatile Organic Compounds at Baton Rouge, Louisiana
STATUS: Ongoing
CONTACT: OAQPS, William Hunt, Jr. (919) 541-5558
CAS NO: CL-HCARB
CHEMICAL: HYDROCARBONS
PROJECT TYPE: Ambient Monitoring
DESCRIPTION: Ambient concentrations of sixteen species of hydrocarbons and halogenated hydrocarbons are measured hourly. Concentrations are extremely variable, ranging from zero to several hundred times the median concentration. The upper tail can be approximated by a log-normal distribution. Significant variations in concentrations with time of day, season and wind direction are observed, but these effects account for little of the variability in the concentrations. The results have implications for the design of toxic monitoring programs with less frequent sampling.

STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, Richard Berkley (919) 541-2439

CHEMICAL: BENZENE, TRICHLOROETHYLENE, TOLUENE, TETRACHLOROETHYLENE, CHLOROBENZENE, ETHYLBENZENE, XYLENES
PROJECT TYPE: Ambient Monitoring
DESCRIPTION: Initial attempts to use a Photovac 10S50 portable photoionization gas chromatograph as a screen device for organic vapors in ambient air were only partially successful because of several problems peculiar to analysis at low levels. The Photovac 10S50 was operated as a mobile screening unit during a two-week study in Richmond and Hopewell, VA. It was also operated as a stationary automatic sampling device during a three-day study in Staten Island, NY. Results obtained in these studies were in reasonable agreement with other methods and demonstrated the effectiveness of this instrument as a rapid screening device and its ability to produce quick, reliable results.

STATUS: Ongoing
CONTACT: ORD/EMSL-RTP, William Nelson (919) 541-2301
CAS NO: CL-VOC
CHEMICAL: VOLATILE ORGANIC COMPOUNDS
PROJECT TYPE: Exposure Assessment, Indoor Air, Ambient Monitoring
DESCRIPTION: The Balitmore area was chosen to apply the TEAM approach in a metropolitan area not having major petrochemical industry facilities, as did previously-studied CA and NJ areas. TITLE: Biomarkers for Assessing Body Burden from Exposure to Toxic Environmental Pollutants
STATUS: Ongoing
CONTACT: EMSL-RTP/MDAD/MDB, James Mulik (919) 541-4459
CAS NO: CL-VOC
CHEMICAL: VOLATILE ORGANIC COMPOUNDS
PROJECT TYPE: Indoor Air
DESCRIPTION: The actual body burden of airborne toxic chemicals resulting from all routes of human exposure cannot be determined by traditional techniques which only measure the concentrations in air. Human exposure has been related to biological endpoints in several studies using biochemical markers. If such exposures can be related to blood levels and ultimately to body burden, then the feasibility of using noninvasive techniques for assessing health risk becomes attractive. Preliminary chamber studies in the laboratory have shown that subjects exposed to selected volatile organics at near-normal ambient levels give measurable expired-air decay rates for elimination. These preliminary results can be used to correlate with the primary biomarkers which are directly related to biological endpoints and are more closely related to health risk.

PROJECT TYPE: Indoor Air
DESCRIPTION: Three techniques will be studied. Two are direct techniques using GCs and precolumns containing different materials (one strong H-bonding substrate, one anhydrous material) at different operating conditions. The third is an indirect technique that passes the blood sample through a Spandex/Tenax AC column. The VOCs are desorbed using a solvent rinse and thermal desorption techniques, then separated and quantified off a capillary column.

CL-BIB-0513

TITLE: Chemical Ionization Mass Spectrometry for Trace-Level Determination of Ambient Polar Volatile Organic Compounds
STATUS: Ongoing
CONTACT: EMSL-RTP/MDAD/MDB, James Mulik (919) 541-4459
CAS NO: CL-VOC
CHEMICAL: VOLATILE ORGANIC COMPOUNDS
PROJECT TYPE: Indoor Air
DESCRIPTION: No sampling/analytical technique currently exists in the Agency for unambiguous determination of ambient levels of a broad range of polar VOCs. This is primarily due to the difficulty in sampling and analyzing these compounds. This project will examine the feasibility of using a Finnegan MAT ITD with the CI source option, recently available commercially for measuring health-related polar VOCs. This equipment is expected to be both sensitive (picograms) and specific (GC-MS), a tool around which methodology can be developed.

CL-BIB-0514

TITLE: Chamber Exposure Studies (Blood-Breath)
STATUS: Ongoing
CONTACT: EMSL-RTP/MDAD/MDB, James Mulik (919) 541-4459
PROJECT TYPE: Indoor Air, Exposure Assessment
DESCRIPTION: There is increasing interest in assessing human exposure, body burden, and health risk resulting from environmental exposure to toxic air pollutants in order to evaluate possible acute and/or chronic health effects. By analyzing exhaled air, the rate of elimination of volatile organic compounds (VOCs) in the breath should give valuable information about the uptake, metabolism, and elimination of such compounds. In this project, four subjects will be exposed to "naturally occurring" elevated levels of various pollutants to permit the measurement of breath concentrations of selected VOCs as a function of time with a greater degree of reliability. At the same time, blood samples will be collected to obtain information on the blood/breath ratios of the compounds of interest.

EPA OFFICE OF DRINKING WATER PROJECTS

The EPA Office of Drinking Water (ODW) has studies underway on several potentially toxic chemicals as part of its regulatory development activities. Information on these projects has been included in the National Air Toxics Information Clearinghouse ongoing research and regulatory development projects document because many toxic drinking water contaminants being studied by ODW are also potential air pollutants. Clearinghouse users may find health information generated by ODW projects useful. For further information on the projects described below, contact: Joseph Cotruvo or Craig Vogt, Criteria and Standards Division, Office of Drinking Water (WH-550D), U. S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C., 20460, (202) 382-7575, (FTS) 382-7575.

Under the Safe Drinking Water Act (SDWA), the U. S. Environmental Protection Agency is required to publish regulations which apply to public drinking water systems and control specific contaminants which in the Administrator's judgment "may have any adverse effect on the health of persons." Information concerning these regulations is listed below.

Drinking Water Regulations under 1986 Amendments to SDWA

Significant directives to EPA's standard-setting program for drinking water contaminants included in the 1986 Amendments to the SDWA are provided below:

- EPA is to set Maximum Contaminant Level Goals and National Primary Drinking Water Regulations for 83 specific contaminants and for any other contaminant in drinking water which may have any adverse effect upon the health of persons and which is known or anticipated to occur in public water systems.

- Recommended Maximum Contaminant Levels (RMCLs) are now termed Maximum Contaminant Level Goals (MCLGs). No changes were made in the basis of an MCLG; i.e.:

  > MCLGs are non-enforceable health goals which are to be set at the level at which no known or anticipated adverse effects on the health of persons occur and which allows an adequate margin of safety.

- Maximum Contaminant Levels (MCLs) are to be set as close to MCLGs as is feasible. The definition of "feasible" is as follows:

  > Feasible means with the use of the best technology, treatment techniques and other means, which the Administrator finds, after examination for efficacy under field conditions and not solely under laboratory conditions, are generally available (taking costs into consideration).

Granular Activated Carbon (GAC) is stated in the SDWA as feasible for the control of synthetic organic chemicals (SOCs), and any technology or other means found to be best available for control of SOCs must be at least as effective in controlling SOCs as GAC.

- MCLGs and MCLs are to be proposed at the same time and also promulgated simultaneously.

- MCLGs and MCLs/Monitoring requirements are to be set for 83 contaminants listed in the SDWA. The best available technology (BAT) must also be specified for each.

  The 83 contaminants are shown in Table A-1. Seven substitutes are allowed if regulation of any seven other contaminants would be more protective of public health. The list of substitutes must be proposed by June 19, 1987.

- The timetable to produce the MCLGs and MCLs/Monitoring requirements is as follows:

  - 9 by June 19, 1987
  - 40 by June 19, 1988
  - 34 by June 19, 1989

- MCLGs and MCLs/Monitoring requirements are also to be set for other contaminants in drinking water that may pose a health risk.

  - The 1986 Amendments require the EPA to publish a list of drinking water contaminants that may require regulation under the SDWA.
  - The list must be published by January 1, 1988, and every 3 years following.
  - MCLGs and MCLs/Monitoring requirements are to be set for at least 25 contaminants on the list by January 1, 1991.
  - MCLGs and MCLs/Monitoring requirements are to be set for at least 25 contaminants every 3 years following January 1, 1991 (i.e., 1994, 1997, ...).

- Criteria must be established from which States can determine which surface water systems must install filtration. The criteria are to be set by December 19, 1987.

- A treatment technique regulation is to be set that will require all public water systems to use disinfection.

  - Variances are available. EPA will specify variance criteria.
  - The disinfection treatment rule must be promulgated by June 19, 1989.

- Requirements are to be set for water systems to monitor for unregulated contaminants.
  - Minimum monitoring frequency would be five years.
  - States can add/delete contaminants from list.
  - Monitoring regulations are to be promulgated by December 19, 1987.
- MCLGs and MCLs/Monitoring requirements are to be reviewed by EPA every three years.
- Other requirements/provisions of the 1986 Amendments:
  - Public notification regulations are to be changed to provide for different types and frequencies of notice depending upon the potential health risk. Final regulations are due September 19, 1987.
  - BAT for issuance of variances is to be set when MCLs are set. BAT may vary depending upon the size of systems and other factors, including costs.
  - Exemptions can be extended for systems with 500 connections or less. No limit is placed on the number of extensions but certain criteria will have to be met.
- A summary of deadlines pertinent to standard-setting is presented in Table A-2.
- The status of the National Primary Drinking Water Regulations is presented in Table A-3.

16. ABSTRACT

The document is divided into two parts and an appendix. The first part lists 365 air toxics projects currently in progress at EPA, NIOSH, and State and local agencies. A brief description of each project and a contact name, office, and telephone number are given. The second part of the document contains the index that allows readers to locate projects of interest. Projects are indexed by agency, project type, chemical name, Chemical Abstract Service (CAS) number, and source category Standard Industrial Classification (SIC) Code. The appendix lists regulatory development projects on toxic chemicals underway at the EPA's Office of Drinking Water (ODW). While most of these projects are not directly related to air problems, health information on toxic chemicals from ODW projects may be of interest to Clearinghouse users.
