## APPENDIX D

### ADDITIONAL DETAILS OF THE HI-VOL FILTER ANALYSIS PROGRAM

#### D.1 DESCRIPTION OF THE SAMPLER LOCATIONS

The fifteen hi-vol monitoring sites selected for the particulate sampling program are listed in Table D-1. The locations of the monitoring sites are shown in Figure D-1. The site selection was made jointly by the H. E. Cramer Company and the EPA Project Officer after consultation with the Pennsylvania DER and the Allegheny County BAPC. The criteria used in site selection included, in addition to logistical factors, the need for obtaining particulate samples representative of industrial, urban, suburban and rural areas. The only sites considered were those currently operated by DER and BAPC as part of their regular monitoring programs for which a minimum of several years' records of particulate measurements are available. Logistical factors included:

- Availability of electrical power required to operate two hi-vols simultaneously (one hi-vol was required for the regular DER or BAPC filter sample and a second hi-vol was used for the special sampling program)
- The requirement that each site be accessible to operating personnel and observers on a 24-hour basis
- Availability of meteorological observations (the COPAMS and TM monitoring sites in Table D-1 have meteorological measurement capabilities)
- The requirement that the sites be grouped geographically so that all monitors could be serviced and periodic activity observations could be made at each site during each 24-hour sampling period

TABLE D-1  
LIST OF HI-VOL MONITORING SITES

Site Number	Name	Agency	Classification
1	Baden (COPAMS)*	DER	Industrial
2	Beaver Falls (COPAMS)*	DER	Suburban
3	Koppel	DER	Industrial
4	Brighton Township	DER	Suburban
5	Midland	DER	Industrial
6	Elco	DER	Rural
7	Downtown	BACP	Urban
8	Central Lab	BACP	Urban
9	Hazelwood**	BACP	Industrial
10	North Braddock (TM)***	BACP	Industrial
11	Duquesne II	BACP	Industrial
12	Liberty Boro (TM)***	BACP	Industrial
13	Clairton	BACP	Industrial
14	Greater Pittsburgh Airport	BACP	Rural
15	South Fayette	BACP	Rural

\*COPAMS - Commonwealth of Pennsylvania Air Monitoring System (DER telemetered data site)

\*\*Hazelwood T, a TM site, is located approximately 0.5 kilometers south of the selected Hazelwood hi-vol site.

\*\*\*TM - Allegheny County Bureau of Air Pollution telemetered site

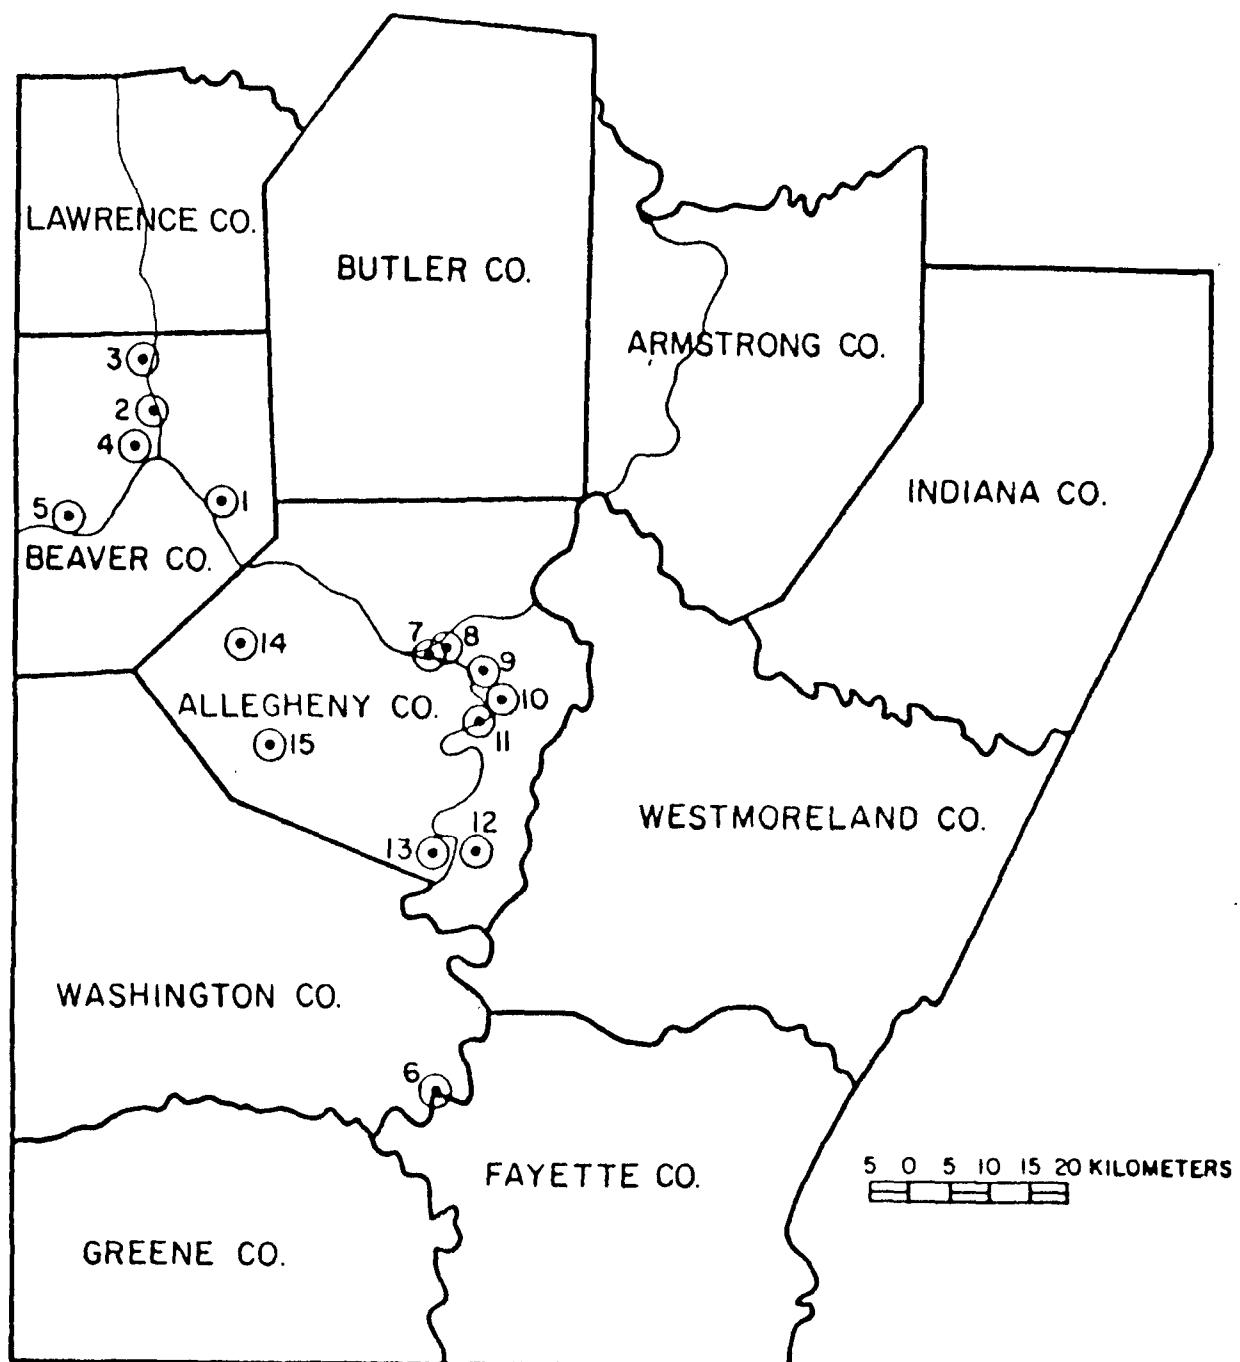

FIGURE D-1. Locations of hi-vol monitoring sites. The numbers refer to site names and other details given in Table D-1.

The site classifications given in Table D-1 are admittedly qualitative and are intended principally to serve as a basis for grouping the monitor locations according to the proximity of major industrial sources, population density and traffic density.

Figures D-2 through D-5 present 2-kilometer by 2-kilometer topographic maps showing the major roads, railroads and buildings in the areas surrounding the individual monitoring sites. The location of the monitor is shown by the  symbol at the center of each map. Terrain elevations in Figures D-2 through D-5 are in feet above mean sea level, and the contour interval is 100 feet (30.5 meters). A brief description of each monitor site is given below.

Site No. 1 - Baden (DER, COPAMS)

The Baden monitor is located on the north side of the Ohio River, immediately adjacent to the Ohio River Boulevard, on a slight rise approximately 6 meters above the level of the Boulevard. Vehicle traffic comprising passenger cars and trucks is typically moderate-to-heavy. Directly across the Ohio River Boulevard from the monitor site there are multiple railroad tracks leading to a switching yard complex and railroad car humping stations. Rail traffic is typically heavy and at low speed with much idle operation of the diesel switching engines. The Jones and Laughlin (J&L) Aliquippa Works is located on the south side of the Ohio River directly west of the Baden monitor site. Heavy particulate emissions are associated with the operation of the coke ovens and the new BOF shop which are the facilities closest to the monitor.

Site No. 2 - Beaver Falls (DER, COPAMS)

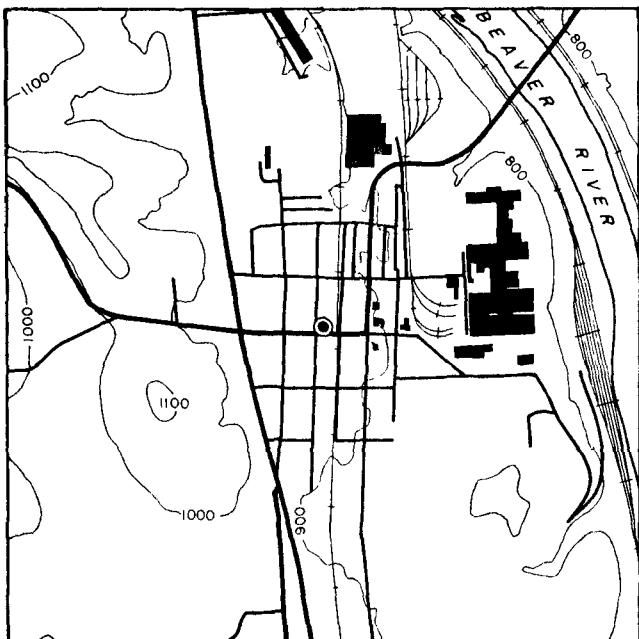

The Beaver Falls monitor is located near ground level immediately adjacent to a hard-packed earth parking lot and loading area for an industrial warehouse. Observations during the study showed that diesel

SITE NO.13 CLAIRTON

SITE NO 14 GREATER PITTSBURGH AIRPORT

SITE NO.15 SOUTH FAYETTE

FIGURE D-5. Topographic maps of the areas surrounding the Clairton, Greater Pittsburgh Airport and South Fayette monitoring sites.

tractor-trailer traffic was continuous during the five-day work week and daylight hours. Only one loading dock was observed to be in use, and only one truck was in the yard at any one time. Trucks usually did not idle during loading operations. There is a railroad track on the far side of the loading yard.. During each observation period, at least one diesel train passed by at slow speed, suggesting fairly continuous rail traffic. Except for the truck-loading and rail operations, the area surrounding the monitor appears to be typical of a suburban community.

Site No. 3 - Koppel (DER)

The Koppel monitor is on the roof of the municipal fire station, approximately 10 meters above street level. The Babcock and Wilcox (B & W) Koppel Plant is located approximately 0.5 kilometers east of the monitor. On Pennsylvania Route 351, used by diesel trucks hauling scrap to and from the B & W Plant, the bumping of the trucks as they cross the tracks produces visible dust clouds. During the observation periods, the use of torches to cut the scrap was frequently noticed at the B & W Plant. According to the technician servicing the DER hi-vol at the Koppel site, this is a common occurrence. A small charcoal grill was noted on the roof of the fire station about 7 meters north of the hi-vol sampler. There was no evidence that the grill was used during any of the sampling days.

Site No. 4 - Brighton Township (DER)

The Brighton Township monitor site is in a grass field adjacent to the overflow parking lot for the Beaver County Hospital. The parking lot was vacant at the times the observers visited the site. The only particulate emissions noted were infrequent visible plumes from a small hospital incinerator stack located 200 meters north and 30 meters above the sampler.

Site No. 5 - Midland (DER)

The Midland hi-vol monitor is at an elevation of approximately 10 meters above street level on the roof of the Midland Post Office, which is directly across Midland's main downtown street (Pennsylvania Route 68) from the Crucible Steel Plant complex. While stack and fugitive emissions from Crucible Steel were dominant, the monitor was also impacted by emissions from heavy vehicle traffic on all days of the week except Sunday. The most noticeable emissions from Crucible Steel typically were from the vicinity of the strip mill and scarfer with south winds. All of the monitoring equipment as well as the roof of the building on which the monitor was located were coated with a rust-colored dust that appeared to adhere to the surfaces.

Site No. 6 - Elco (DER)

The Elco monitor is located on a hillside lawn of a private residence on Washington County Route 88 overlooking the Monongahela River, which is about 100 meters below the elevation of the monitor. Light vehicle traffic was observed on Route 88 on all sample days.

Site No. 7 - Downtown (BAPC)

The Downtown monitor is on the roof of the multistory County Office Building located in downtown Pittsburgh at an elevation of approximately 30 meters above ground level. Heavy car and truck traffic moving at slow speeds or idling was observed on all days except Sunday when the traffic was light. The industrial source complex most likely to affect this sampler is the Jones and Laughlin integrated steel plant located about 3 kilometers to the east.

Site No. 8 - Central Lab (BAPC)

The Central Lab monitor is located on a roof approximately 15 meters above ground level in the Oakland section of Pittsburgh. The traffic patterns are similar to those at the downtown monitor site. The Jones and Laughlin plant is only 1 kilometer from this monitor, and odors from the plant were frequently noted during the visits to the monitor.

Site No. 9 - Hazelwood (BAPC)

The Hazelwood monitor is located on the roof of an apartment building, approximately 15 meters above street level, on the main thoroughfare of the Hazelwood district. The hi-vol is about 500 meters south of the ACBAPC Hazelwood TM station and 200 meters east of the newest Jones and Laughlin coke batteries. Coking process emissions were typically present during observations, as were emissions from the trucks and cars on the heavily-traveled street below the monitor. Traffic patterns were typically heavy and slow moving on all days except Sunday.

Site No. 10 - North Braddock (BAPC)

The North Braddock monitor is situated on the roof of the North Braddock municipal building complex, approximately 5 meters above the level of the parking lot. It is some distance away from the heaviest downtown Braddock vehicle traffic, but is only 1 kilometer northwest of the United States Steel Edgar Thompson Plant.

Site No. 11 - Duquesne II (BAPC)

The Duquesne II monitor is located on the roof of a shopping center building, 5 meters above the level of the parking lot. Vehicle traffic in the lot consists principally of passenger cars. Allegheny County Route 837, the main riverside thoroughfare, is 100 meters to the east. The United States Steel Duquesne Plant is located directly across Route 837. Vehicle traffic in the shopping center and along the county route was heavy on all days except Sunday. Visible stack or fugitive emissions from the Duquesne Plant were generally not prominent.

Site No. 12 - Liberty Boro (BAPC)

The Liberty Boro monitor is located on a school roof approximately 10 meters above the ground. The school is 2.5 kilometers north-northeast of the United States Steel Clairton Works at a terrain elevation approximately 150 meters above the terrain elevation of the coke works. The school was in session only on the last sampling day and vehicle traffic was very light. Odors were typically present at the site and emissions from the Clairton Works were generally visible below the hills to the south-southeast.

Site No. 13 - Clairton (BAPC)

The Clairton monitor is mounted on the roof of the Clairton water treatment plant, approximately 10 meters above ground level, and only 300 meters southwest of the nearest coke battery of the United States Steel Clairton Works. Typical activity near the monitor included diesel truck traffic hauling slag to a nearby dump and heavy vehicle traffic on County Route 837, 100 meters to the northeast.

Site No. 14 - Greater Pittsburgh Airport

The Greater Pittsburgh Airport monitor is located on the airport terminal roof, approximately 20 meters above the ramp and loading areas. In addition to the aircraft operations, there was heavy vehicle traffic along the roadway leading to the airport and in the airport parking lots.

Site No. 15 - South Fayette (BAPC)

The South Fayette monitor is located on the roof of the South Fayette Township High School, approximately 10 meters above ground level. Vehicle traffic was very light except on the last sampling day which coincided with the opening of school.

Tables D-2 through D-7 give the hourly observations of wind speed, wind direction, ambient air temperature, Pasquill stability category (following the Turner (1964) definitions of the Pasquill stability categories) and "weather" at the Greater Pittsburgh Airport on the six sampling days (10, 16, 22 and 28 August 1976; 3 and 9 September 1976). The term "weather" is used to refer to observations of fog, haze, smoke and precipitation; the absence of an entry in the "weather" column for a given hour indicates that none of these conditions was reported. Table D-8 gives the 24-hour average wind speeds and precipitation data for the sampling days, and Table D-9 lists the mixing depths and vertical potential temperature gradients obtained from the twice-daily upper-air soundings made at the Greater Pittsburgh Airport before, during and after each sampling day. The mixing depths in Table D-9 were estimated using the procedures outlined in Section 3.3 of Cramer, *et al.* (1975); the potential temperature gradients are the average values for the surface mixing layer. Meteorological conditions on the individual sampling days are discussed below.

10 August 1976

A slow-moving surface high pressure system passed over the Pittsburgh area during the period 9 - 11 August 1976. Early morning ground fog cleared at the Greater Pittsburgh Airport by about 1200 EST on 10 August 1976, but broken middle clouds remained until about 1700 EST. Light-to-moderate northwest winds persisted throughout most of the day, with the wind becoming calm after about 2100 EST. Rawinsonde data for the Greater Pittsburgh Airport show relatively deep mixing depths at 0700 and 1900 EST, with a slightly stable potential temperature gradient at 0700 EST and an adiabatic potential temperature gradient at 1900 EST. However, the 0700 EST sounding on 11 August 1976 shows that, with clear skies, a strong surface-based inversion formed during the night of 10 - 11 August 1976.

16 August 1976

A weak frontal system passed over the Pittsburgh area on the morning of 15 August 1976, with 12.2 millimeters (0.48 inches) of precipitation recorded at the Greater Pittsburgh Airport for the 24-hour period ending at midnight on 15 August. A surface high pressure system followed the front and remained over Pittsburgh on 16 August. Fog or haze was observed during the period 0500 to 0800 EST on 16 August, and broken middle clouds were observed during the period 1100 to 1600 EST. Winds were light-to-moderate and from the west-northwest through north. Upper-air soundings at the Greater Pittsburgh Airport indicate that:

- A shallow mixing layer with a moderate surface-based inversion developed during the night of 15 - 16 August
- A relatively deep mixing layer with an adiabatic lapse rate developed during the daylight hours on 16 August
- A strong surface-based inversion with a corresponding shallow mixing depth formed during the night of 16 - 17 August

22 August 1976

A surface high pressure system was approximately centered over the Pittsburgh area on 22 August 1976. With the exception of scattered to broken high cirrus clouds after 0800 EST, skies were clear in the Pittsburgh area on 22 August. At the Greater Pittsburgh Airport, haze and smoke were observed during the period 0100 to 0900 EST and haze was reported after 1700 EST. During the period 1200 to 2100 EST, light-to-moderate northwest and north winds were observed. The wind was calm or light and variable during the remaining hours of 22 August. Upper-air data for the Greater Pittsburgh Airport show that strong surface-based inversions devel-

oped during the nights of 21 - 22 August and 22 - 23 August. The 1900 EST sounding on 23 August shows a relatively deep mixing layer with a slightly stable lapse rate.

28 August 1976

A trace of precipitation was reported at the Greater Pittsburgh Airport on 27 August 1976 as a short-wave trough at 500 millibars passed over the Pittsburgh area. Similarly, a trace of precipitation was measured on 28 August as an advancing frontal system induced light rain showers at about 2100 EST. Broken to overcast low clouds covered the Pittsburgh area after 0500 EST on 28 August, and haze or ground fog was reported throughout the day. Upper-air soundings made at the Greater Pittsburgh Airport on 28 August indicate that the mixing depth varied from about 350 meters in the early morning hours to about 700 meters in the afternoon. The vertical potential temperature gradient within the surface mixing layer was approximately equal to the moist-adiabatic value during the period. Light-to-moderate south or southwest winds persisted from 0100 EST until about midnight when the wind shifted to the northwest, probably indicating a frontal passage.

3 September 1976

A surface high pressure system, centered over the Great Lakes on the morning of 2 September 1976, moved across the Pittsburgh area on 3 September. Calm winds and dense fog (visibility at or near zero) were observed at the Greater Pittsburgh Airport during the period 0100 to 0900 EST on 3 September. After the fog cleared, light-to-moderate surface wind speeds were measured, with the wind direction ranging from east through south-southwest. Rawinsonde measurements at the Greater Pittsburgh Airport show a shallow mixing layer with a slightly stable lapse rate at 1900 EST.

A surface-based inversion of moderate strength developed during the night of 3 - 4 September 1976.

9 September 1976

A weak cold front passed over the Greater Pittsburgh Airport at about midnight on 9 September 1976. The storm resulted in 7.1 millimeters (0.28 inches) of precipitation at the airport for the 24-hour period ending at midnight on 9 September. This precipitation occurred in the form of light rain showers during the period 1900 to 2400 EST. Skies were clear on 9 September until clouds in advance of the front moved into the Pittsburgh area at about 1600 EST. Haze was reported from 0600 EST until 2300 EST, when fog replaced haze as the major restriction to visibility. Winds were calm until moderate southwest winds developed at about 0900 EST. After the frontal passage at about 2400 EST, the wind direction shifted from southwest to northwest and the wind speed increased to over 10 meters per second. According to the 0700 EST upper-air sounding at the Greater Pittsburgh Airport, a strong-surface based inversion formed during the night of 8 - 9 September. However, a relatively deep surface mixing layer with an adiabatic lapse rate developed by 1900 EST on 9 September and continued throughout the night of 9 - 10 September.

D.3            OBSERVER'S LOGS FOR THE SAMPLING DAYS

The Observer's Logs for the six special sampling days are given in Tables D-10 through D-15. The logs include filter numbers, filter weights, air flows through the hi-vol samplers during the sampling period and 24-hour average particulate concentrations. The sampling sites were visited several times during each 24-hour sampling period, and the logs also contain notes by the observers of industrial or other activities in the vicinity of the sampling sites that could have affected the observed particulate concentrations. Some of the remarks, such as those referring to noticeable odors from a particular source, are subjective.

TABLE D-10  
OBSERVER'S LOG FOR TUESDAY 10 AUGUST 1976

Site	Filter Numbers		Weight (mg)	Flow (acfm)	Concentra- tion ( $\mu\text{g}/\text{m}^3$ )	Observer's Remarks
	Installed	Spare				
Baden	1110918	1110919	150	51.2	72	J&L ore pile handling fugitives.
Beaver Falls	1110914	1110915	80	46.4	42	Normal.
Koppel	1110940	1110944	134	51.1	64	B&W fugitives from scrap cutting. Spray painting 100m to southwest.
Brighton Twp	1110916	1110917	144	47.6	74	Normal.
Midland	1110920	1110921	174	47.2	90	Faulty wiring produced inter- rupted 24 hour run. Plume aligned along river.
Elco	-	-	-	-	-	Not yet installed.
Downtown	1110910	1110911	246	51.0	118	Normal.
Central Lab	1110908	1110909	173	51.0	83	J&L open hearth emissions visible. Local construction dust. Traffic odor.
Hazelwood	1110912	1110913	227	54.0	103	J&L coke plant plumes fanning near stacks. Wind from northwest.

TABLE D-10 (Continued)

Site	Filter Numbers		Weight (mg)	Flow (acfm)	Concentra- tion ( $\mu\text{g}/\text{m}^3$ )	Observer's Remarks
	Installed	Spare				
North Braddock	1110924	1110925	172	49.0	86	USS-ET plume fanning near stack. Noticeable odor.
Duquesne II	1110926	1110927	240	45.0	131	USS-Duquesne low level dusts from BOP shop.
Liberty Boro	1110930	1110931	234	42.0	136	School pavement drilling dust source. USS-Irwin low level dust cloud.
Claирton	1110934	1110935	133	59.0	55	USS-Claирton plumes dispersing near stacks. Dust and quench steam at ground level. Notice- able odor.
Airport	1110906	1110907	142	49.0	71	Normal.
South Fayette	1110904	1110905	26	52.0	12	Normal. Questionable sample.

TABLE D-11  
OBSERVER'S LOG FOR MONDAY 16 AUGUST 1976

Site	Filter Numbers		Weight (mg)	Flow (acfm)	Concen- tration ( $\mu\text{g}/\text{m}^3$ )	Observer's Remarks
	Installed	Spare				
Baden	1093219	1093220	164	46.6	86	Fog, wet terrain, diminishing during day.
Beaver Falls	1093221	1093222	152	43.2	86	Fog, wet terrain, diminishing during day.
Koppel	1093223	1093224	189	51.6	90	Fog, wet terrain, diminishing during day. Motorcycles in alley below sampler.
Brighton Twp	1093225	1093226	119	45.0	65	Fog, wet terrain, diminishing during day.
Midland	1093227	1093228	149	43.9	83	Re-roofing adjacent building at same level as sampler. Crucible low level dusts, smokes.
Elco	1093213	1093214	147	55.0	66	Light traffic.
Downtown	1093215	1093216	284	50.0	139	Normal.
Central Lab	1093241	1093242	224	50.0	110	J&L quenching plumes taking a long time to disperse.
Hazelwood	1093201	1093202	180	54.0	130	J&L coking smokes, red furnace smoke evident. Odor very noticeable. 15-hour run only.

TABLE D-11 (Continued)

#### D.4 FILTER ANALYSIS RESULTS

This section presents the results of the optical microscopy, scanning electron microscopy (SEM) and energy-dispersive X-ray (EDAX) analyses of the hi-vol filter samples from the fifteen monitor locations described in Section D.1. Although filter samples were collected on six days, three of the sampling days were determined to be unsuitable for detailed analyses because of the frequent occurrence of calm or light and variable winds during the 24-hour sampling period. The three sample days selected for hi-vol filter analysis are 16 August, 28 August and 9 September 1976. (SEM results are also given for the Liberty Boro monitor on 22 August 1976.)

Tables D-16 through D-88 give the results of the particle count analyses performed by optical microscopy. Each table lists, for the primary filter alone, the cover filter alone or the primary and cover filters in combination, the filter number(s), the monitor location, the sample day, the particulate loading on the filter(s) as determined by the Coors Spectro-Chemical Laboratory and the 24-hour average particulate concentration. Each table also gives the concurrent filter particulate loading and 24-hour average particulate concentration for the colocated monitor operator by the Pennsylvania Department of Environmental Resources (DER) or the Allegheny County Bureau of Air Pollution Control (BAPC). In the optical microscopy analysis, the particulates were classified according to six generic categories: (1) flyash, (2) iron oxide, (3) magnetic iron oxide, (4) quartz, (5) biologicals and (6)  $\text{CaCo}_3$ . The particle counts in the tables refer to a filter segment with an area of 0.00968 square centimeters. As explained in Section 3.6, the particle counts in each generic category and size range were used with the particle densities assigned to each generic category to calculate the particulate mass on this filter segment. Under the assumption of uniform particulate loading on the filter, the total particulate mass on the entire filter was obtained by multiplying the mass of the filter

segment by the ratio of the total filter area to the area of the filter segment. Both the calculated mass and the total measured mass determined by the filter weight are entered at the top right of each table.

Tables D-89 through D-167 give the results of the SEM filter analyses. The format for Tables D-89 through D-167 is the same as for Tables D-16 through D-88 except that, in the SEM analysis, the particles were classified according to the following three generic categories: (1) spheres, (2) irregularly-shaped particles, and (3) agglomerates. The particle counts in Tables D-89 through D-167 refer to a filter segment with an area of 0.02053 square centimeters. As a consistency check, two separate SEM filter analyses were performed on the filter from the Central Laboratory monitor for 9 September 1976, the North Braddock monitor for 9 September 1976 and the Liberty Boro monitor for 28 August 1976. The results of both analyses are included in the tables (for example, see Tables D-148 and D-149).

The results of both the optical microscopy and SEM analyses were used to estimate the distributions of mass by particle diameter. For each filter and for each particle size category, the combined mass of particles in the six (optical microscopy) or three (SEM) generic particle categories was calculated using the procedures outlined in Section 3.6. These results were then combined to form the cumulative mass distributions by particle diameter shown in Figures D-6 through D-11. (The contributions of biological particles are removed from the optical microscopy results in Figures D-6 through D-8.) Each figure contains fifteen cumulative mass distributions, corresponding to the fifteen particulate monitoring sites. The mass distributions in each figure are identified by the monitor site number given in Table D-1.

On the basis of the hourly wind speeds and wind directions for the sampling days as well as the monitor locations, the filters were assigned to one of three categories: (1) industrial, (2) urban, or

(3) rural. The industrial filters were Baden, Midland, Hazelwood and Clairton on 16 August 1976 and Baden, Midland, North Braddock and Liberty Boro on both 28 August and 9 September 1976. The Downtown and Central Laboratory filters were placed in the urban classification on all three sampling days. Similarly, the Brighton Township, Elco, Greater Pittsburgh Airport and South Fayette filters were placed in the rural classification on all three sampling days.

Figure D-12 shows the cumulative mass distribution by particle diameter for all of the filters analyzed by optical microscopy which have a calculated filter loading greater than or equal to 100 milligrams. The industrial, urban and rural cumulative mass distributions derived from these filters are plotted respectively in Figures D-13, D-14 and D-15. Similarly, Figure D-15 shows the cumulative mass distribution by particle diameter for all of the filters analyzed by SEM techniques which have a calculated filter loading greater than or equal to 100 milligrams. The corresponding industrial, urban and rural cumulative mass distributions are plotted respectively in Figures D-17, D-18 and D-19.

Energy-dispersive X-ray (EDAX) analyses were performed on a number of filters. The surface of each SEM filter stub analyzed by EDAX scan was made of the entire surface. The height of each integral energy peak recorded during the EDAX scan was divided by the height of the integral energy peak of gold to obtain a ratio which was essentially free of the effects of any discrepancies between filters in counting rates, beam intensities, etc. With the exception of copper, mercury, arsenic and lead, the threshold energy ratio for elements present in larger than trace quantities was arbitrarily set at 0.10, and the elements were ranked according to descending magnitude of the energy ratio. The threshold ratio for the trace elements of copper, mercury, arsenic and lead was set equal to 0.03. The results of the EDAX analyses for 16 August, 18 August and 9 September 1976 are given respectively in Tables D-168, D-169 and D-170. Elements with an energy peak much larger than the normal peaks are underlined in the tables.

For a selected subset of the filters, an SEM-EDAX analysis was performed for twelve to twenty particles on each filter. Tables D-171 through D-216 summarize the results of these analyses. For each particle, the elements which comprise the particle are listed in descending order of the ratio of the integral energy peak of the element to the integral energy peak of gold. Elements with energy peaks much larger than the usual peaks, are underlined in the tables. Tables D-171 through D-216 also give, for each particle, the particle diameter in microns (micrometers), the particle description (spherical, irregularly-shaped or agglomerate) and a tentative identification of the particle type or origin. We point out that all of the particles considered in Tables D-171 through D-216 had diameters larger than 5 micrometers. SEM photographs of some of the selected filters are shown in Figures D-20 through D-30.

A number of large particles with diameters greater than 40 micrometers observed on the filters were analyzed using the SEM-EDAX techniques described above. The results of these analyses of selected large particles are presented in Tables D-217 through D-224, and photomicrographs containing these particles are shown in Figures D-31 through D-86. Five very large particles with diameters greater than 100 micrometers were also analyzed. The elemental analysis of these particles is presented in Table D-225, the descriptions and possible identifications are given in Table D-226, and photomicrographs are shown in Figures D-87 through D-91.

Slag produced by the steel industry is found throughout southwest Pennsylvania in slag dumps and has been extensively used in road and building construction. Therefore, slag particles are likely to be a primary constituent of non-traditional fugitive emissions. We therefore performed an analysis of samples of the different types of slag found in the area to determine the correlation between the elemental compositions of these slag samples and the compositions of some of the particles found on the hi-vol filters.

Tables D-227 through D-229 give the results of the elemental analyses of the slag samples. The particles from the samples were divided into two groups, one containing large particles (diameters of the order of 100 micrometers) and one containing small particles (diameters of the order of 10 micrometers). Table D-227A gives the results of the analysis of large particles contained in slag samples from an electric arc furnace and Table D-227B gives the results of the analysis of some of the small particles found on the surface of these large slag particles. Photomicrographs of these samples are shown in Figures D-92 through D-101. Similarly, Table D-227C gives the results of the analysis of the small particulates contained in slag samples from an electric arc furnace and Table D-227D gives the results of the analysis of some of the smaller particles found on the surface of these small slag particles. Photomicrographs of these samples are shown in Figures D-102 through D-112. The analyses of large particles from a blast furnace and the small particles found on their surfaces are summarized in Tables D-228A and D-229B. The photomicrographs of these particles are shown in Figures D-113 and D-114. The elemental analyses of large slag particles from a basic oxygen furnace and the smaller particles found on their surfaces are summarized in Tables D-229A and D-229B. Figures D-115 and D-116 show the corresponding photomicrographs.

Walter C. McCrone Associates, Inc. used optical microscopy to analyze six selected filters as a check on the validity of the SEM and Coors optical microscopy analyses. Tables D-230 through D-236 summarize the results of the McCrone analyses. These tables give the percent by number of particles within various size ranges for three general particle categories: (1) combustion products, (2) minerals, and (3) biological materials.

TABLE D- 172  
PARTICLE ANALYSIS OF SELECTED FILTERS

Monitor Site: Beaver Falls Filter Number: 1093221		Date of Sample: 16 August 1977 Photomicrograph Stub Number: 47	
Particle Number on Photomicrograph	Elements in Order of Spectral Height	Dimension & Description	Probable Identification
1	Si, S, Ca (low level)	55 microns agglomerate	organic-industrial particle
2	Si, S, Ca (low level)	15 microns irregular	organic
3	Si, Ca, S, Al (low level)	25 microns irregular	organic-industrial particle
4	S, Si, Ca, (low level)	20 microns irregular	insect part
5	Si, Al, S, Ca (low level)	15 microns irregular	organic
6	<u>Fe</u> , S, Si, Ca, Cl, K, Al	15 microns agglomerate	iron-oxide
7	Si, S, Ca (low level)	60 microns irregular	organic-coal
8	Si, S, Ca Fe	15 microns agglomerate	industrial particle
9	S, Si, Ca (low level)	12 microns irregular	sulfate
10	S, Si, Ca, (low level)	12 microns irregular	organic
11	Si, Al, S, Ca	15 microns irregular	soil dust
12	<u>Si</u> , S, Ca, Cl, Fe	20 microns irregular	soil dust

TABLE D-173  
PARTICLE ANALYSIS OF SELECTED FILTERS

Monitor Site: Koppel *		Date of Sample: 16 August 1977	
Filter Number: 1093223		Photomicrograph Stub Number: 48	
Particle Number on Photomicrograph	Elements in Order of Spectral Height	Dimension & Description	Probable Identification
1	Si, Al (low level)	45 microns irregular	organic
2	S, Ca, Si, Fe	15 microns irregular	industrial particle
3	S, Ca	25 microns agglomerate	organic-industrial particle
4	S, Ca, Si, Al, Fe	40 microns agglomerate	industrial particle
5	Si, Al, S, Ca	30 microns agglomerate	industrial particle
6	S, Ca, Si (low level)	15 microns irregular	industrial particle
7	Si, Ca, S	20 microns irregular	organic-coal
8	S, Si, Ca, K	15 microns irregular	industrial particle
9	Si, S, Ca, Cl, Fe	20 microns agglomerate	industrial particle
10	Si, S, Ca	30 microns irregular	organic-coal
11	S, Ca, Si, Fe	15 microns irregular	industrial particle
12	Si, Ca, S, K, Cl, Al, Fe	8 microns irregular	mineral

\*Note: Observer noted that 20 meters to the north there was an hibachi grill at the same level as the monitor which could be a source of coal particulates.

TABLE D-174  
PARTICLE ANALYSIS OF SELECTED FILTERS

Monitor Site: Brighton Twp Filter Number: 1093225		Date of Sample: 16 August 1977 Photomicrograph Stub Number: 49	
Particle Number on Photomicrograph	Elements in Order of Spectral Height	Dimension & Description	Probable Identification
1	<u>Si</u> , Ca, Al, K	20 microns spherical	flyash
2	Si, Ca, Al, Fe, S, Ti, Cl	15 microns irregular	mineral
3	Si, S, Al, Cl, Ca, K	15 microns irregular	soil dust
4	Si, Ca, Al, S, K	15 microns irregular	industrial particle
5	<u>K</u> , Si, Al, Fe, Ca, S, Ti	8 microns spherical	industrial particle
6	Si, K, Al, S, Cl	20 microns irregular	industrial particle
7	Si, Ca, K, Al, S	10 microns irregular	soil dust
8	Si, Al, Cl, Ca, S	15 microns irregular	industrial particle
9	Si, Ca, S, Al, Fe	12 microns irregular	soil dust
10	<u>Fe</u> , Si, Ca, Ti, Al, K, Mn, S, Zn	15 microns irregular	industrial particle (iron-oxide)
11	Si, Fe, Ca, K, S, Al	6 microns irregular	mineral
12	<u>Si</u> , Ca, Al, Fe, S, K	8 microns spherical	flyash

FIGURE D-19. Cumulative mass distribution of rural filter sites for the SEM data.

FIGURES D-20 THROUGH D-116 - PHOTOMICROGRAPHS

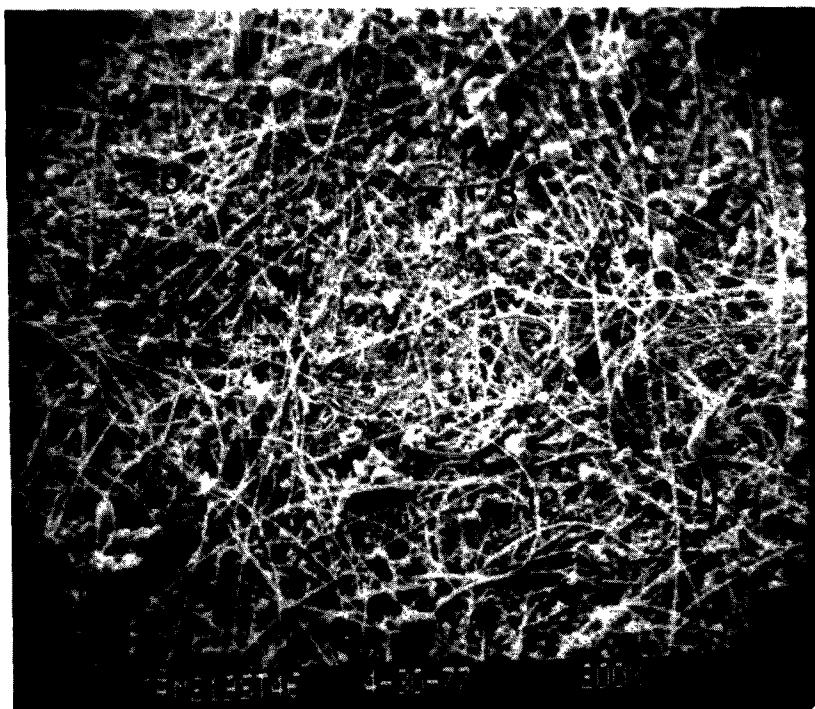

FIGURE D-20: Stub Number 46 which shows a magnified portion of the filter taken from the Baden Monitor on 8/16/76. (Refer to Table D-171)

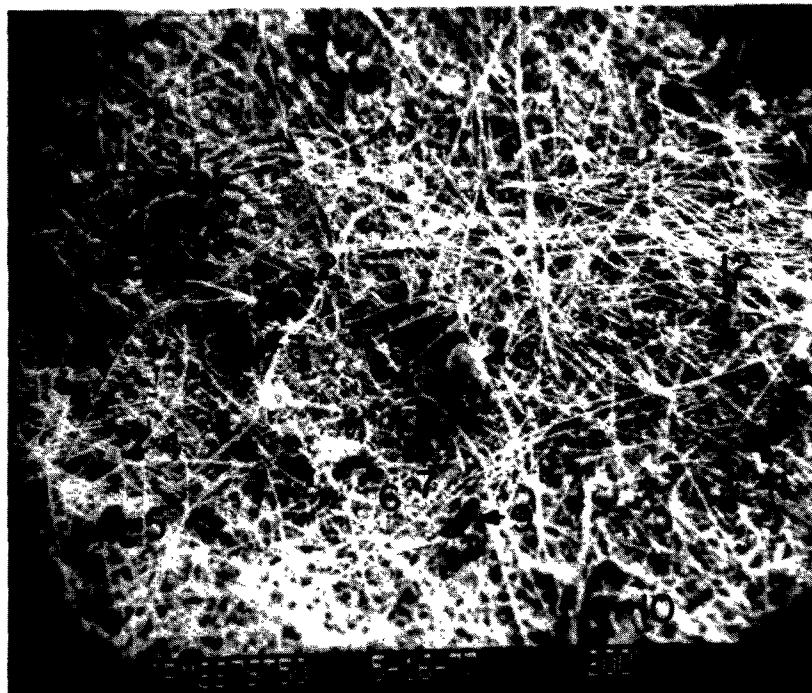

FIGURE D-21: Stub Number 46 which shows a magnified portion of the filter taken from the Midland Monitor on 8/16/76. (Refer to Table D-175)

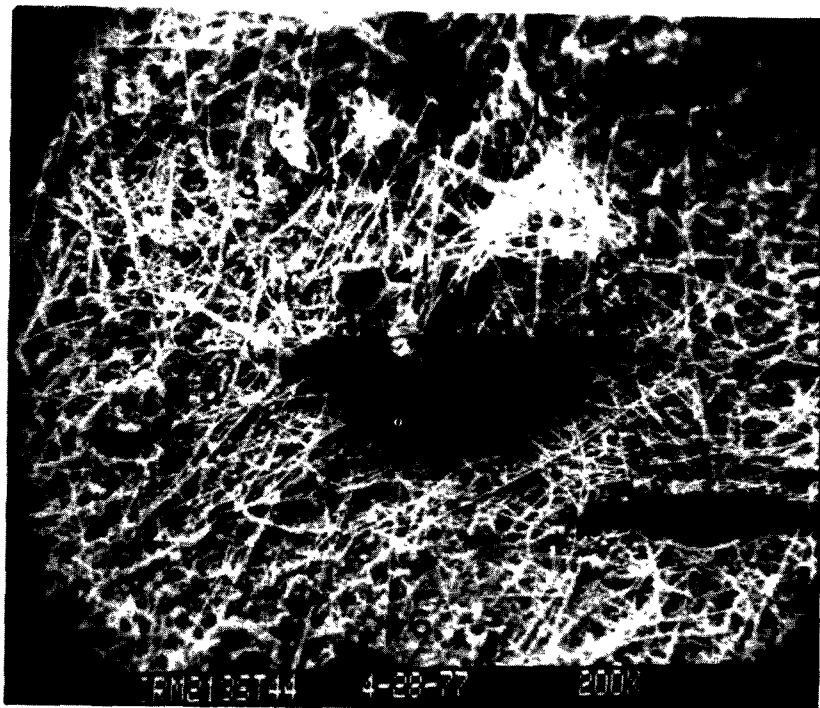

FIGURE D-22: Stub Number 44 which shows a magnified portion of the filter taken from the Elco monitor on 8/16/76. (Refer to Table D-177)

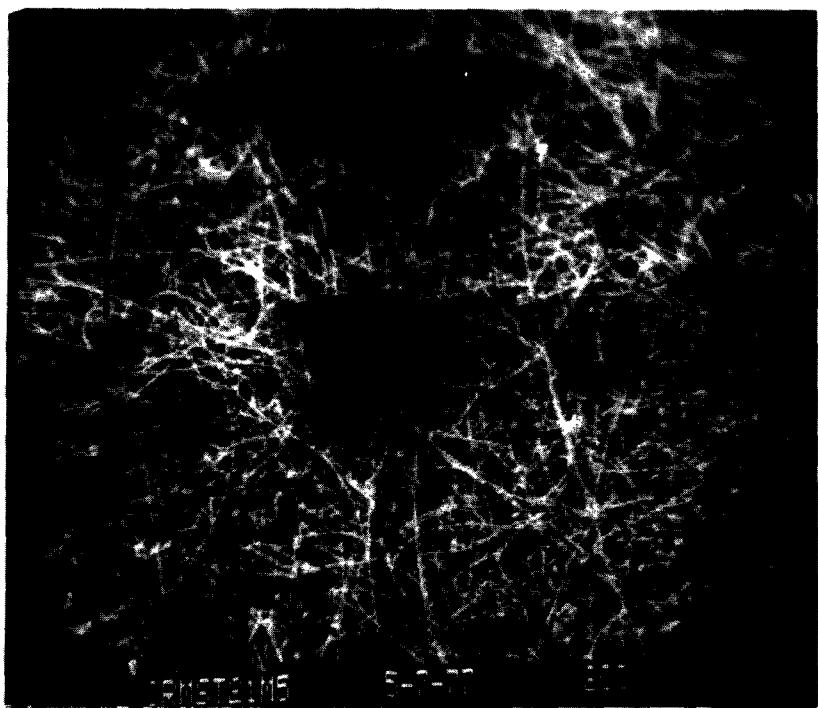

FIGURE D-23a: Stub Number 21 which shows a magnified portion of the filter taken from the Central Lab Monitor on 8/16/76. (Refer to Table D-179)

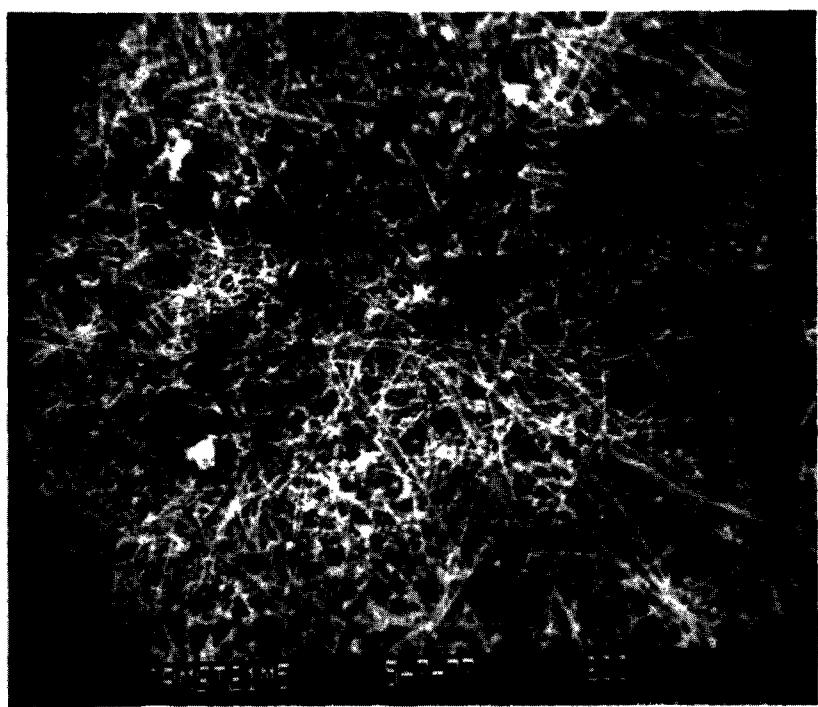

FIGURE D-23b: Stub Number 21 which shows a magnified portion of the filter taken from the Central Lab Monitor on 8/16/76. (Refer to Table D-179)

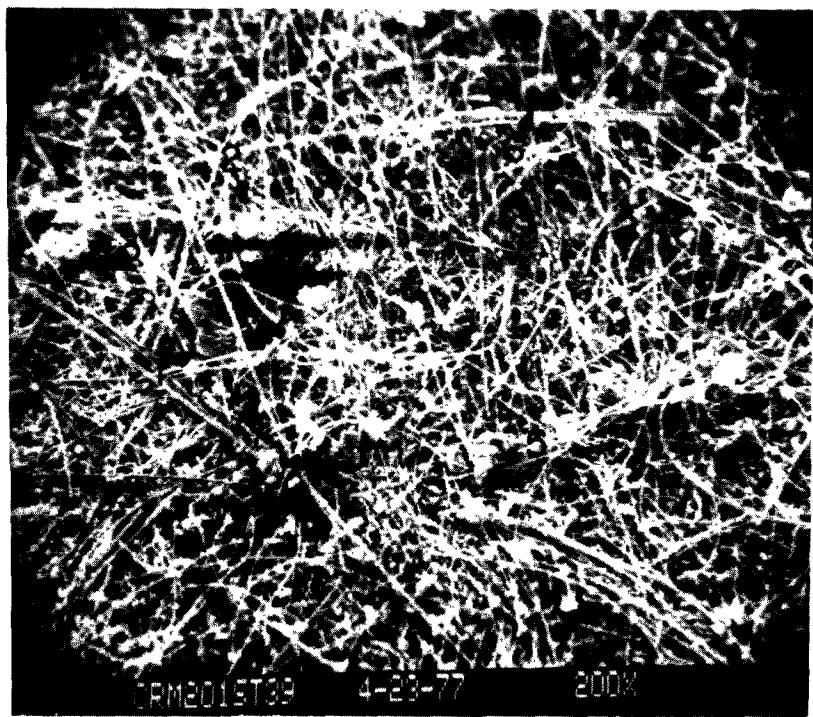

FIGURE D-24a: Stub Number 39 which shows a magnified portion of the filter taken from the Hazlewood Monitor on 8/16/76. (Refer to Table D-180)

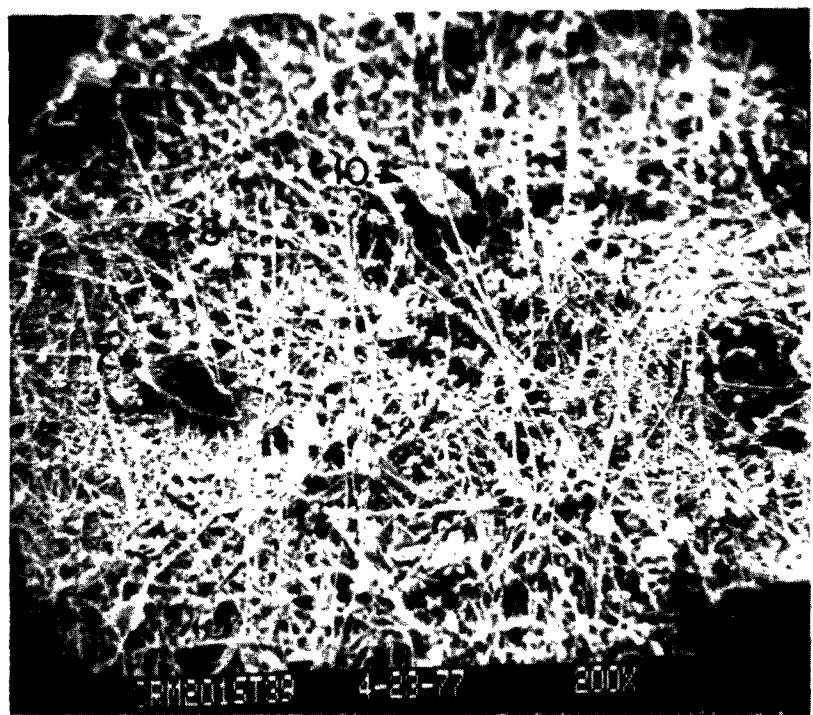

FIGURE D-24b: Stub Number 39 which shows a magnified portion of the filter taken from the Hazlewood monitor on 8/16/76. (Refer to Table D-180)

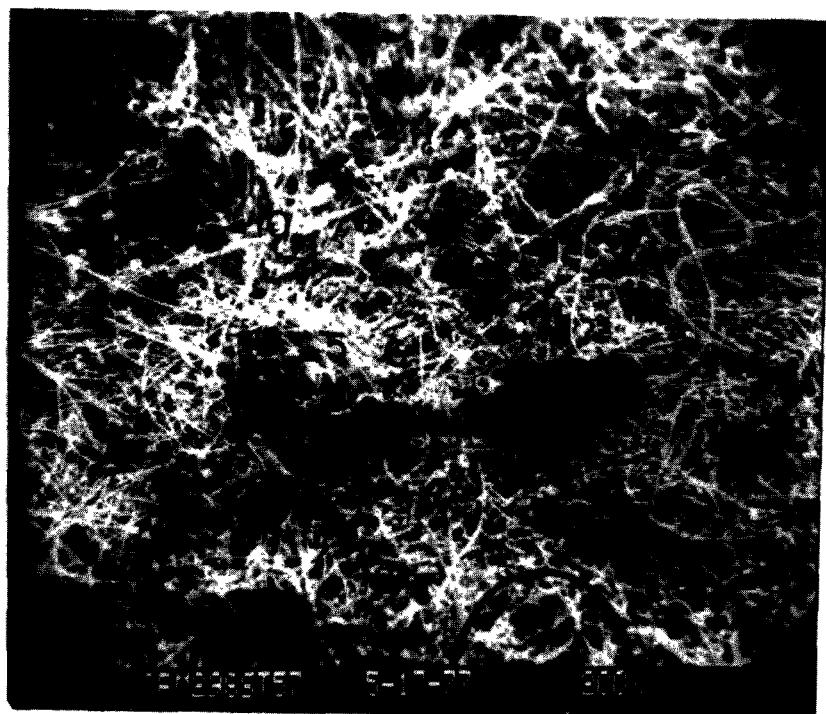

FIGURE D-25: Stub Number 57 which shows a magnified portion of the filter taken from the No. Braddock Monitor on 8/28/76. (Refer to Table D-194)

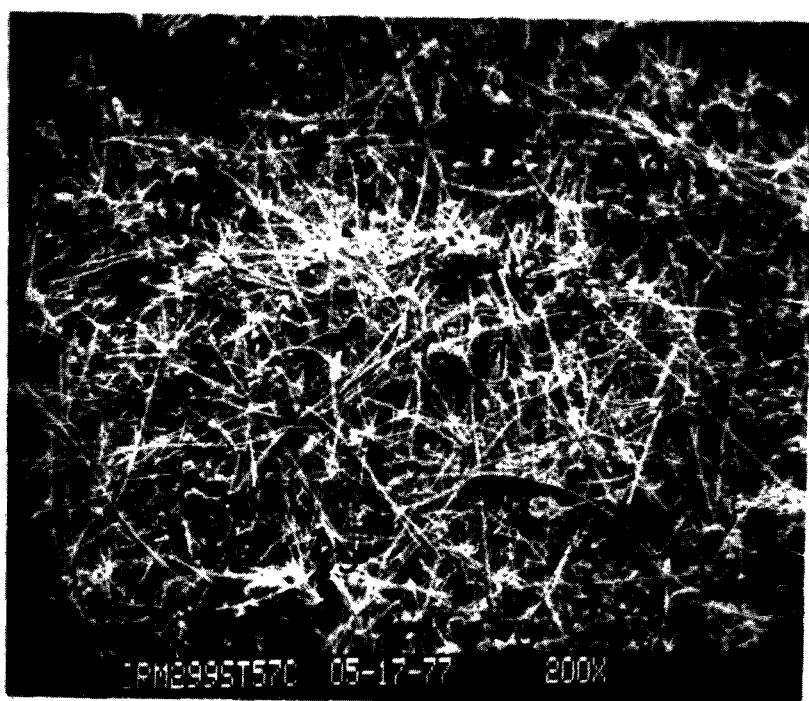

FIGURE D-26: Stub Number 57C which shows a magnified portion of the cover filter taken from the No. Braddock Monitor on 8/28/76. (Refer to Table D-195)

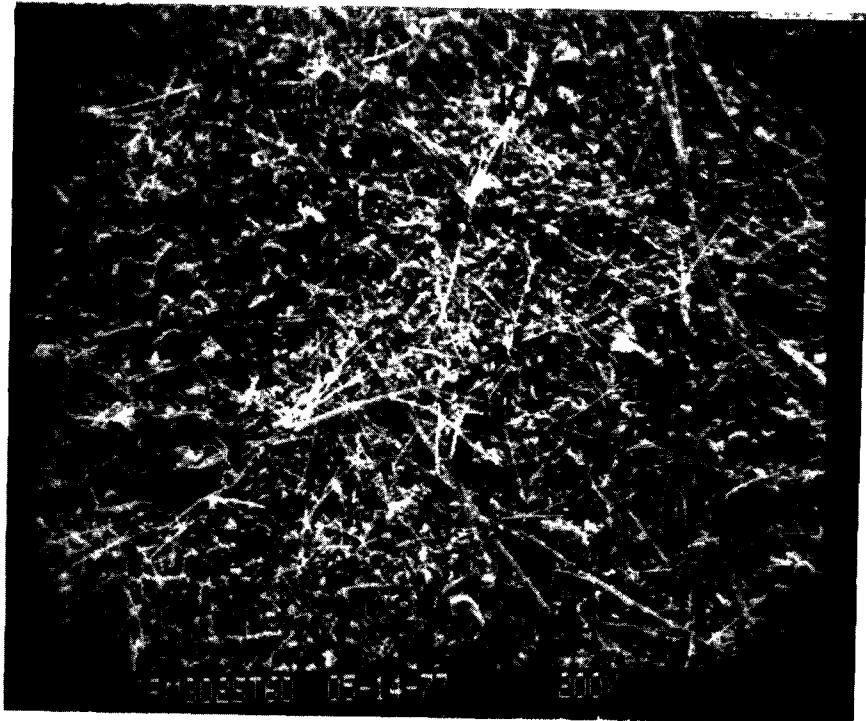

FIGURE D-27: Stub Number 60 which shows a magnified portion of the filter taken from the Liberty Boro Monitor on 8/28/76. (Refer to Table D-198)

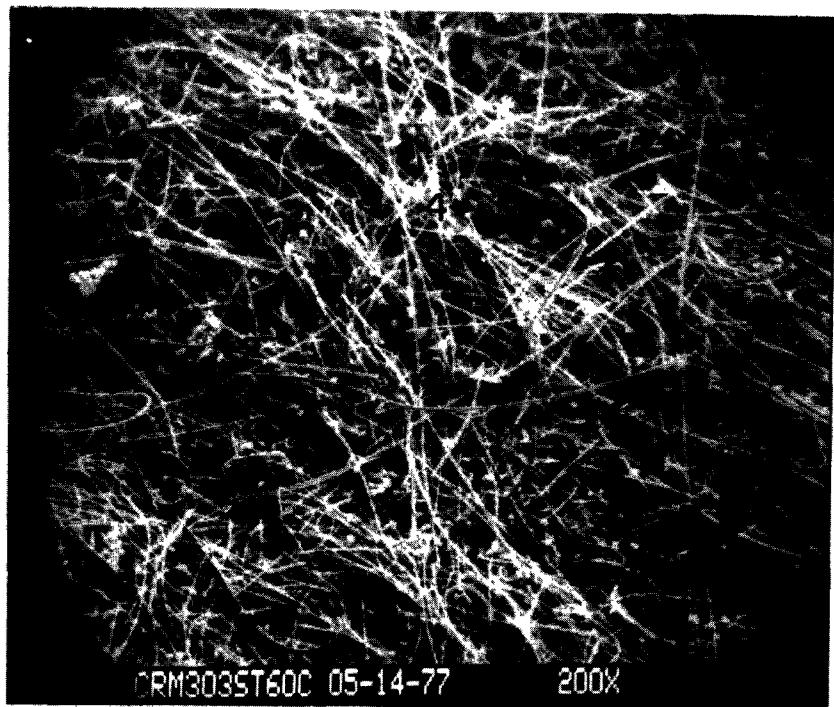

FIGURE D-28a: Stub Number 60C which shows a magnified portion of the cover filter taken from the Liberty Boro Monitor on 8/28/76. (Refer to Table D-199)

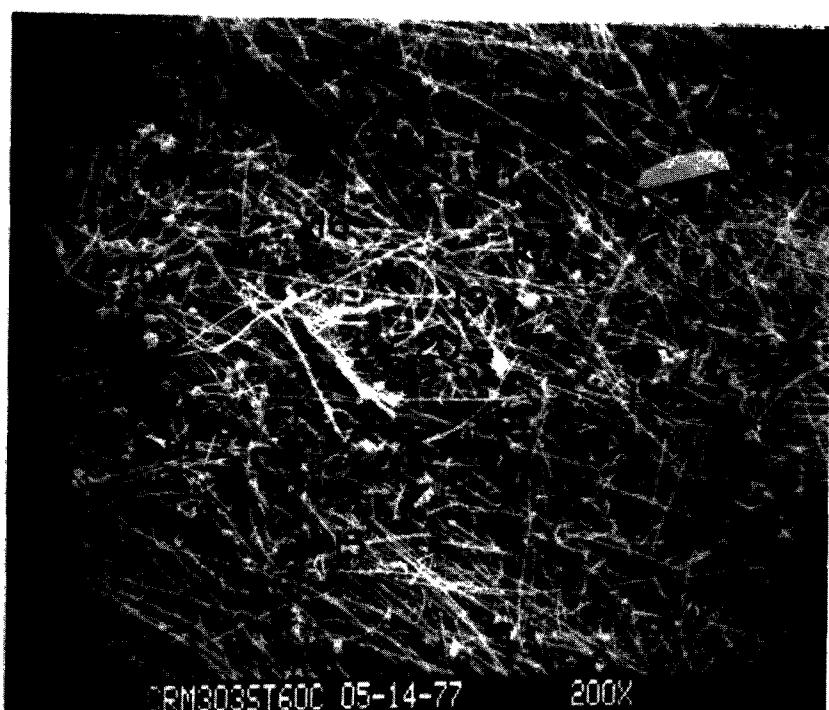

FIGURE D-28b: Stub Number 60C which shows a magnified portion of the cover filter taken from the Liberty Boro Monitor on 8/28/76. (Refer to Table D-199)

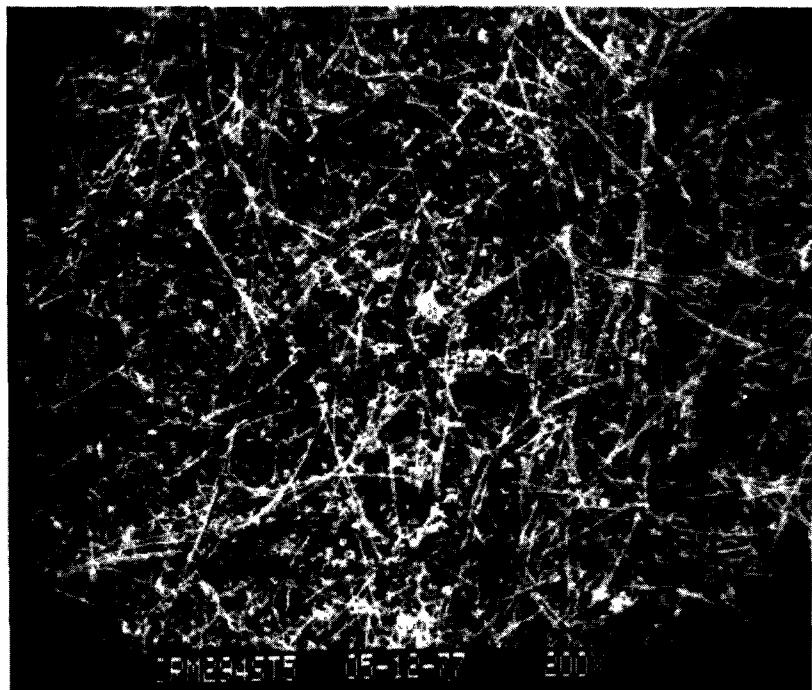

FIGURE D-29a: Stub Number 53 which shows a magnified portion of the filter taken from the Airport Monitor on 9/9/76. (Refer to Table D-214)

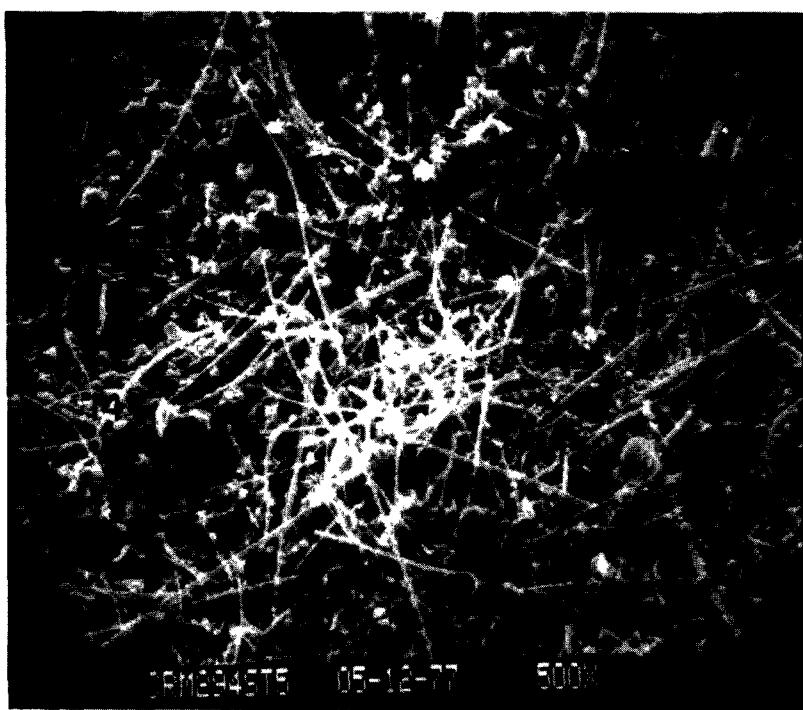

FIGURE D-29b: Stub Number 53 which shows a magnified portion of the filter taken from the Airport Monitor on 9/9/76. (Refer to Table D-214)

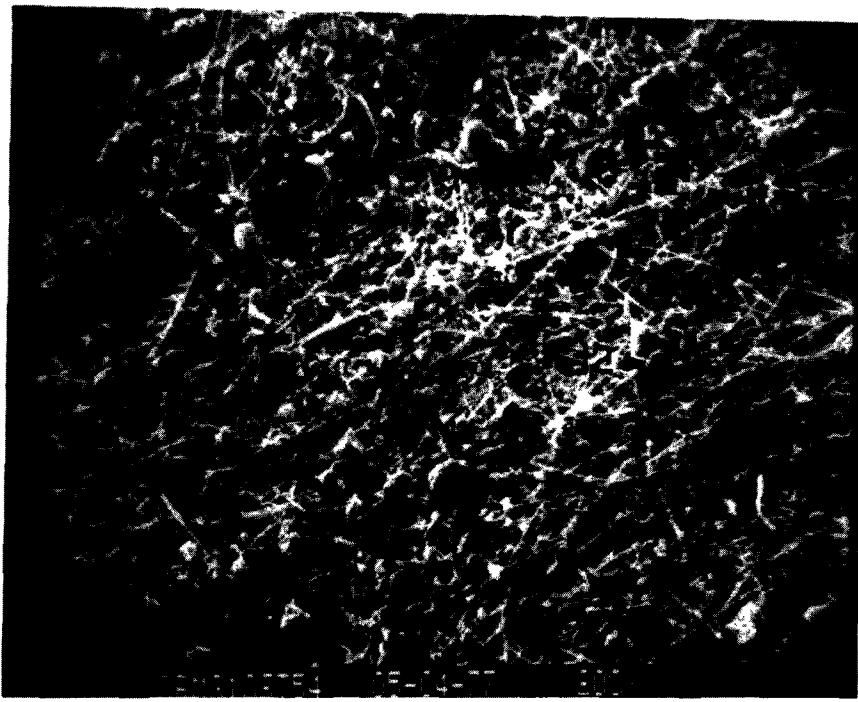

FIGURE D-30: Stub Number 54 which shows a magnified portion of the filter taken from the So. Fayette Monitor on 9/9/76. (Refer to Table D-21b)
