Region V Fish Tissue Report

Summary

Fish tissue data are reported from all Region V States except for Ohio where no tissue data are presently available. The time period of this report extends from the spring of 1983 through the fall of 1985. Data were obtained from a STORET printout for Illinois, Indiana, Michigan, and Minnesota. Wisconsin's data came from the State's own computer system. The parameters listed in this report are chemicals with Food and Drug Administration action levels and include PCB's, DDT, dieldrin, mercury, and occasionally chlordane.

In order to better understand the overall status of fish tissue problems for each State, the chart below gives an overview of the total number of fish samples analysed during the study period, the number of violations which occurred, and the percent of violations. A more detailed description of fish tissue violations per State is described in the body of the report.

	Illinois	Indiana	Michigan	Minnesota	Wisconsin
Total number of fish analysed	972	276	314	931	3185
Total number of FDA violations	153	17	52	66	731
Percent of FDA violations	16%	6%	17%	7%	23%

Region V Fish Tissue Report

Introduction

In fulfillment of the requirements of the Guidance for State Water Monitoring and Wasteland Allocation Programs (EPA 44014-85-031), most Region V States are collecting and analyzing fish tissue from designated core network stations as well as other selected stations where toxic problems are suspected. Upon completion of the laboratory analyses, the data are entered into the STORET system where it becomes available for public use. This generally takes 12 to 18 months to complete.

The objective of this report is to identify lakes (where possible) and river reaches throughout Region V where toxic chemicals in fish tissue exceed the recommended FDA action levels as shown on the following page. It should be pointed out that this is the only document in the Region where fish tissue data that are generated as part of the State Water Monitoring and Wasteload Allocation Program is brought together under one cover. It therefore can serve as a comprehensive reference to fish toxicity problems and needs for State, Region, and Headquarters use.

All data, with the exception of Wisconsin and Ohio, were extracted from a STORET printout. Wisconsin's data was obtained from its own computer system. Ohio has not had a strong fish tissue analyses program, and therefore no report is included since it has not participated in the National program. The time period of this report is from the spring of 1983 through the fall of 1985.

Although much fish tissue data are provided by the STORET system, there still remains a significant amount that is being generated by state agencies, and is contained internally without being available through STORET or other computer systems. This is an inherent concern that needs to be resolved so that all state generated tissue data can be made available for general use.

The parameters for this report include only chemicals with Food and Drug Administration action levels. These are PCB's, DDT, dieldrin, mercury, and occasionally chlordane, and were the only chemicals that exceeded FDA levels. The FDA levels are written to include only fillets. However, where appropriate, whole fish samples are also included for informational purposes only.

Chemicals with Food and Drug Administration Action Levels

FDA Action Level

<u>Chemical</u>	<u>(mg/kg)</u>
Chlordane	0.3
DDT	0.5
Dieldrin	0.3
Endrin	0.3
Heptachlor	0.3
PCBs	2.0
Mercury	1.0
Toxaphene	5.0

The Food and Drug Administration has set the above toxicity limits for the maximum protection of human health from the potential carcinogenic effects of exposure through ingestion of contaminated fish flesh. In order to better inform the general public about toxicity problems in fish, the USEPA Great Lakes National Program Office has compiled a paper entitled "Summary of Great Lakes Fish Advisories of the Great Lakes States (DeVault, David S. and G.P. Lahvis)." This paper serves as a general health advisory and cautions against the consumption of certain fish species taken from the Great Lakes and their appended tributaries. The complete text is shown as Appendix 1.

If additional information is needed, please contact Max Anderson at FTS 886-6228 or (312) 886-6228.

I L L I N O I S

Illinois

The fish tissue data presented for the State of Illinois represents samples collected between October 1983 and November 1985, and was obtained from a STORET printout.

A total of 972 fish samples were analysed, of which 153 or 16 percent exceeded Food and Drug Administration action levels. PCB's, DDT, and dieldrin were the chemicals in violation.

The Du Page and Des Plaines Rivers showed the highest percent of FDA exceedences in the State (67% and 62%) with PCB's and DDT being the chemicals of concern.

The greatest amount of fish tissue data available was from Lake Springfield where 162 samples were analysed. The chemicals of concern were DDT and dieldrin, where numerous (51) values were above FDA action levels. This area should be considered for further investigation. Fish species were not listed.

A significant number of samples were also collected from Lake Michigan in the areas of Foster Avenue, Waukegan Harbor, and the Great Lakes Naval Station. Both PCB and DDT values were high and ranged from 12.10 mg/kg to 2.20 mg/kg for PCB's and 4.00 mg/kg to 0.55 mg/kg for DDT. The FDA action levels are 2.00 mg/kg (PCB's) and 0.5 mg/kg (DDT). Chinook salmon, lake trout and carp were analysed. Data were not available as to the kind of sample (fillet, whole fish, etc.).

Crab Orchard Lake is another area of concern where PCB values ranged from 11.00 mg/kg to 2.10 mg/kg. Carp, large mouth bass and channel catfish were the fish species analysed. The Kaskaskia River showed some elevated dieldrin values in carp and channel catfish.

Table 1 and Figure 1 show counties and their associated water bodies where violations occurred. Table 2 and Figure 2 summarize the fish tissue data, while Appendix 2 lists the sampling stations, sampling date, FDA action level chemicals, and fish species.

A series of STORET maps showing river system sampling locations and FDA parameter violations are enclosed, and are listed as Figures 3, 4, 5, and 6.

I N D I A N A

Indiana

The data from Indiana represent samples collected from October 7, 1983 to October 10, 1984. A total of 276 fish samples were analysed, of which 17 or 6 percent exceeded Food and Drug Administration (FDA) action levels.

The highest chemical concentrations were PCB's which occurred in fish taken from the Indianapolis Water Canal and St. Joseph River at Darden Bridge, with 13.25 and 12.07 mg/kg respectively. A White River catfish at Williams, Indiana showed 7.25 mg/kg PCB's (see Appendix 3).

Fish sampling was conducted in the Grand Calumet River/Indiana Harbor Canal area on October 4, 1984, but no data are available in STORET. Also, there are no data for calendar year 1985.

Figure 7 shows counties in Indiana where FDA violations occurred. The number within the shaded area represents the number of violations (also see Table 3).

A series of STORET maps showing river system sampling locations and FDA parameter violations are enclosed, and are listed as Figures 8, 9, and 10.

M I C H I G A N

Michigan

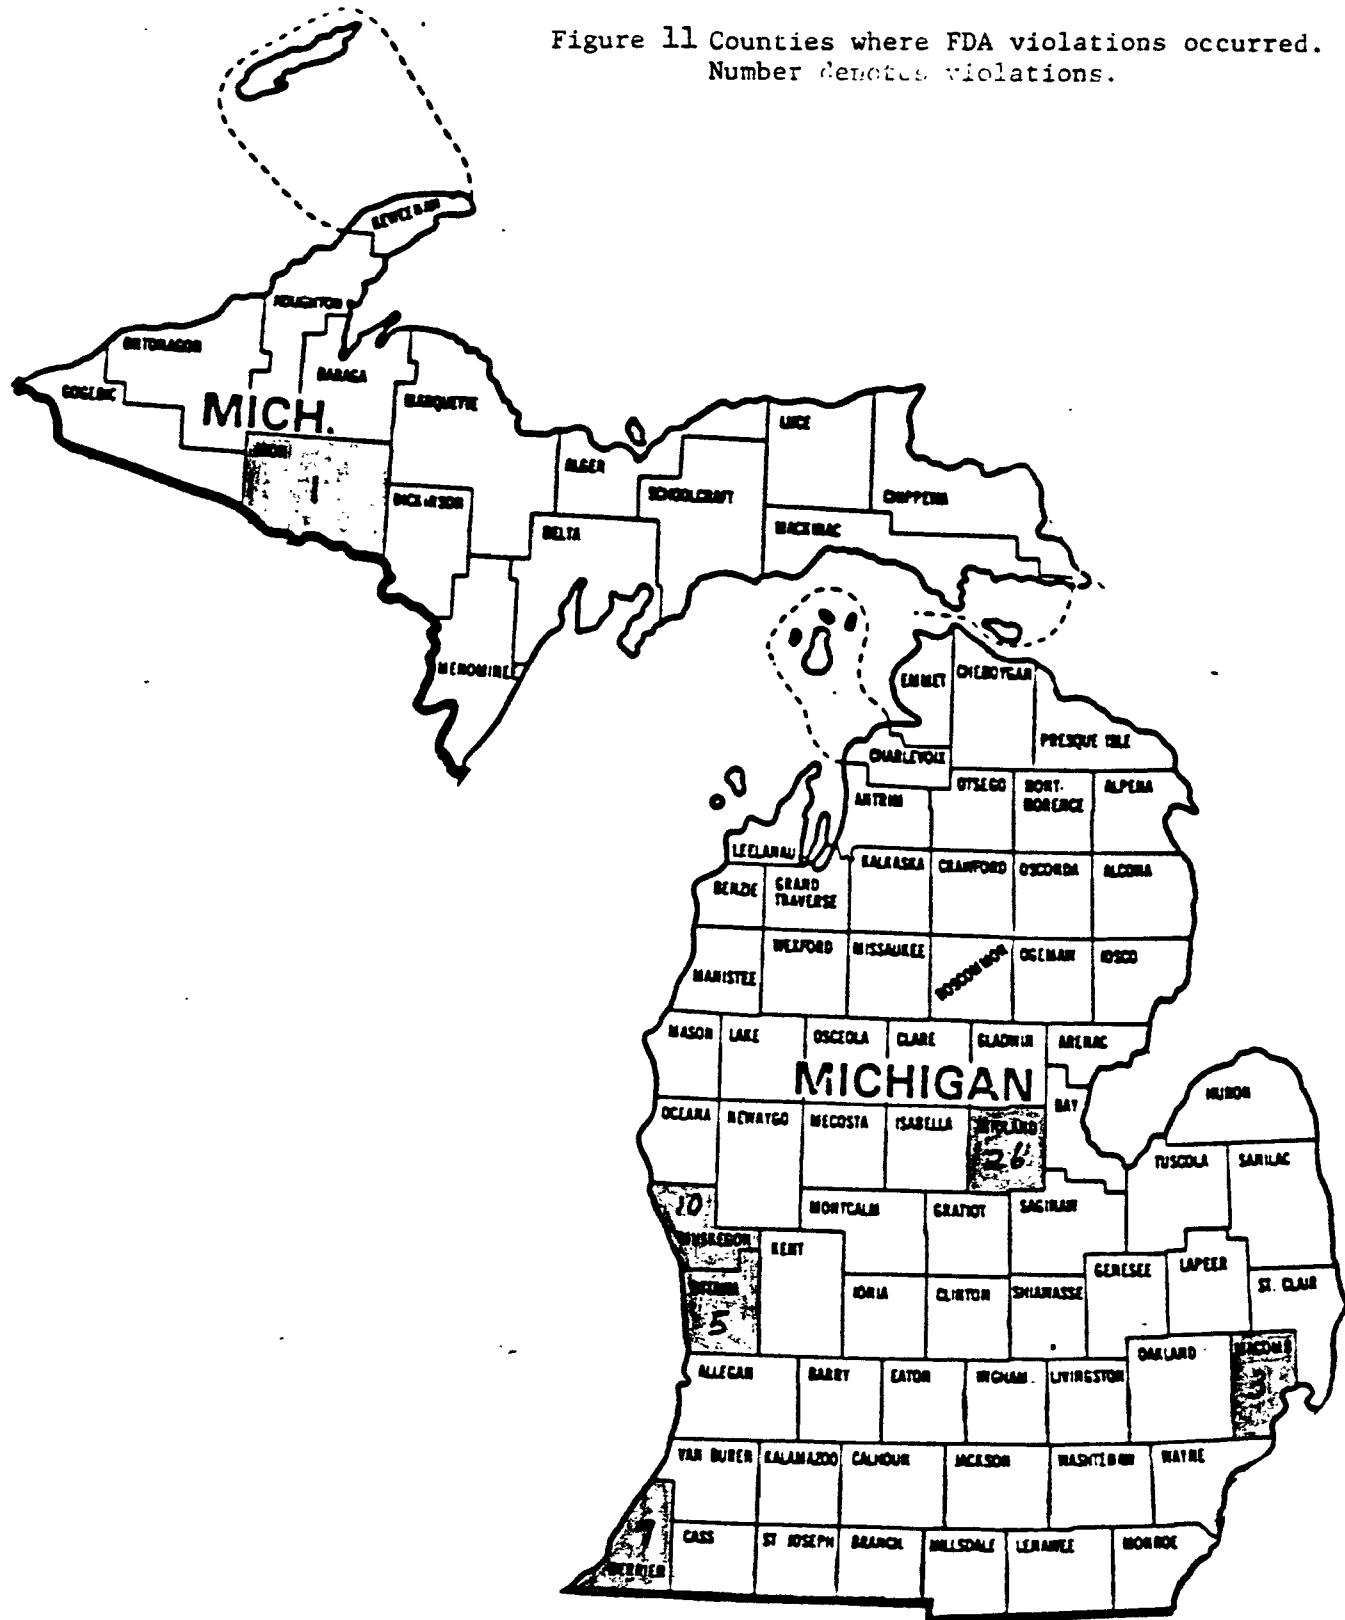

Sampling for fish tissue data for this report occurred between October 31, 1983 and May 28, 1985 and was obtained from a STORET printout. A total of 314 samples were analysed of which 52 or 17 percent exceeded Food and Drug Administration (FDA) action levels.

Except for one mercury violation, DDT in the form of P,P' DDE and P,P' DDD where the only other chemicals in violation. PCB data was not reported.

The Pine River in Midland County and the Clinton River in Macomb County showed the highest percent of FDA action level exceedences with 90 and 60 percent respectively. The Tittabawassee River showed nearly 50 percent.

Table 4 and Figure 11 show counties and associated water bodies where FDA violations occurred. Table 5 and Figure 12 summarize the fish tissue data for Michigan, while Appendix 4 lists the sampling stations, sampling date, FDA action level chemicals, and fish species.

Minnesota

The fish tissue data presented for the State of Minnesota represents samples collected from June 1, 1983 to October 22, 1985. Data for this report was taken from a STORET printout. A total of 931 samples were analysed, of which 66 or 7 percent exceeded Food and Drug Administration (FDA) action levels.

Table 6 and Figure 13 show counties and associated water bodies where FDA violations occurred. Table 7 and Figure 14 summarize the fish tissue data. Appendix 5 lists the sampling stations, sampling date, FDA action level chemicals, and fish species. PCB values above the FDA levels of 2.00 mg/kg ranged from 2.00 mg/kg to 7.53 mg/kg. The highest concentrations were in fish collected from the Mississippi River. Mercury values above the FDA level of 1.00 mg/kg ranged from 1.00 mg/kg to 2.48 mg/kg. Mercury violations were in fish taken from lakes throughout the State.

A series of STORET maps showing river system sampling locations and FDA parameter violations are enclosed, and are listed as Figures 15 and 16.

W I S C O N S I N

Wisconsin

The fish tissue data presented for the State of Wisconsin represents samples collected from February 24, 1983 through November 18, 1985, and was obtained from a computer printout courtesy of Wisconsin Department of Natural Resources. A total of 3185 fish samples were analysed, of which 731 or 23% exceeded Food and Drug Administration (FDA) action levels. A significant number of samples (1015) were taken from Lake Michigan, Green Bay, and Sturgeon Bay. The remaining 2170 samples were collected from various other lakes and streams throughout the State.

Table 8 and Figure 17 show counties and associated water bodies where FDA violations occurred. Table 9 gives a breakdown of data from Wisconsin's major water bodies, which is also illustrated in Figure 18. Appendix 6 lists the sampling stations, sampling date, FDA action level chemicals, and fish species.

It is significant to note that some very high PCB values above the recommended 2.00 mg/kg level were found. The highest value recorded was 160.00 mg/kg in a carp fillet taken from Cedar Creek near Cedarburg. Additional high PCB values were recorded at various other locations throughout the State, with some exceeding the FDA values by ten to twenty times or greater (see Appendix 6).

An interesting phenomenon occurred in some of the lake trout samples. The chemical chlordane was found to be in violation in 32 fish samples, and of these, 26 or 81 percent were lake trout. This affinity to chlordane by lake trout over other fish species is unexplained, and perhaps should be explored in future work.

It appears that there could be a problem in the Kinnickinnic River at Baran Park, Chase Ave. and 27th St. in Milwaukee where 100 percent of the samples were in violation of FDA values.

PCB's ranged from 6.20 mg/kg to 52.00 mg/kg, and DDT from 0.70 to 2.23 mg/kg. Although the total number of samples were few (7), some followup work needs to be considered for this area.

Mercury violations occurred in 34 lakes throughout Wisconsin. The values ranged from 1.00 to 2.50 mg/kg. The FDA standard is 1.00 mg/kg.

Appendix 6 should be looked at carefully to identify additional locations where elevated chemical values occur.

Conclusions

The intent of this report is to pull together fish tissue data from the STORET System and other available sources for the purpose of providing, to the Region, a forum whereby fish tissue toxicity data can be brought together under one cover to be used as another water quality management tool. The future value of this document will be enhanced as more complete and comprehensive fish tissue data becomes available through various state-wide programs.

A review of the problems and concerns found to exist within the Region is discussed below.

Illinois

1. The Du Page and Des Plaines Rivers showed the greatest number of FDA violations in the State, with PCB's and DDT being the chemicals of concern.
2. A DDT and dieldrin problem exists in Lake Springfield. Further investigation needs to be conducted in this area.
3. PCB and DDT values were high in samples taken from Lake Michigan in the areas of Foster Avenue, Waukegan Harbor, and Great Lakes Naval Station.
4. Crab Orchard Lake is also an area of concern where PCB values in some fish were elevated above recommended FDA limits.

Indiana

1. The highest chemical concentrations were PCB's which occurred in fish taken from the Indianapolis Water Canal, St. Joseph River at Darden Bridge, and the White River at Williams.

Michigan

1. The Pine and Clinton Rivers showed the highest percent of FDA violations with 90 and 60 percent respectively. The Tittabawassee River showed nearly 50 percent. The chemicals were DDT in the form of P,P' DDE and P,P' DDD.

Minnesota

1. PCB values were highest in fish collected from the Mississippi River.
2. Mercury violations were found in fish taken from various lakes throughout the State.

Wisconsin

1. Some very high PCB values above the recommended 2.00 mg/kg FDA level were found. The highest value recorded was 160.00 mg/kg in a carp fillet taken from Cedar Creek near Cedarburg.
2. The chemical chlordane was found to be in violation in 32 fish samples, and of these, 26 or 81 percent were lake trout. This is unexplained and perhaps should be explored further.
3. It appears that there could be a problem in the Kinnickinnic River at Baran Park, Chase Avenue, and 27th Street in Milwaukee where 100 percent of the samples were in violation of FDA values. Although the total number of samples were few (7), some followup work needs to be considered for this area.
4. Mercury violations occurred in 34 lakes throughout Wisconsin.

Recommendations

1. It is recommended that this Fish Tissue Report continue to be produced on an annual basis as a means of assessing both short-term and long-term (monitoring) fish contaminant problems throughout the Region.
2. Ohio is the only State in Region V that is not actively participating in the National Monitoring and Wasteload Allocation Program for fish tissue monitoring. Because of this, much valuable fish toxicity data are not available. It is recommended that Ohio's laboratory capabilities program for analysing organic chemicals be accelerated so that a comprehensive fish contaminant program can soon be brought on line. This should be a high priority issue.
3. The bulk of the data for this report comes from the STORET System. However, it is a well known fact that a significant amount of fish contaminant data, which is not part of the National Ambient Monitoring Program, are being generated by Region V States and are stored in each States' own computer system. It is recommended that a strong effort be made, by working closely with each state agency, to extract these data for Region-wide as well as National use.
4. In the past, Illinois has entered into STORET the type of fish sample analysed such as fillet, whole fish, etc. For some reason this information was omitted from this year's printout. It is recommended that Illinois continue to include this information. Also, Illinois should identify the kinds of fish that are collected from Lake Springfield. These data are missing from STORET.

APPENDIX 1

Summary of Great Lakes Fish Advisories
of the
Great Lakes States

David S. DeVault
Garet P. Lahvis

Great Lakes National Program Office
United States Environmental Protection Agency
536 South Clark Street
Chicago, Illinois 60605

SPRING 1986

Introduction

The State Health Departments of New York, Michigan, Minnesota, Illinois, Indiana, Ohio, and Wisconsin have issued advisories for people who consume sport fish from the Great Lakes. The following is a summary of the current advisories. Each state also provides advice beyond that summarized in this report. Consumption advice to young women and children, for example, is generally more conservative than advice to adult males, but varies between States. The reader is referred to the Departments of Natural Resources in the individual states for further information.

Lake Michigan

General health advisories for consumption of fish in Michigan, Indiana, Illinois, and Wisconsin waters.

Group I.¹ Fish posing the lowest health risk.

- smelt
- perch
- bullhead
- coho salmon
- rainbow trout
- lake trout under 20 inches

Group II.² Women and children should not eat these fish.

- chinook salmon larger than 25 inches
- lake trout 20 to 25 inches
- smallmouth bass
- walleye under 20 inches
- northern pike

Group III.³ No one should eat these fish.

- walleye larger than 20 inches
- brown trout
- carp
- lake trout larger than 25 inches
- white sucker
- catfish
- white bass

To supplement these general advisories for Lake Michigan, the following Wisconsin tributaries have specific advisories:

<u>Tributary</u>	<u>Group I¹</u>	<u>Group II²</u>	<u>Group III³</u>
Lower Fox River	bullhead white sucker perch	northern pike walleye	carp larger than 16 inches
Upper Fox River	-----	bullhead black crappie northern pike largemouth bass	all other fish species
Sheboygan River	-----	-----	all fish species except trout and salmon (refer to general Lake Michigan advisory for trout and salmon)
Onion River	-----	-----	All fish species
Milwaukee River	perch	redhorse rock bass smallmouth bass under 13 inches	carp northern pike

1 90% or more of the samples analyzed are below USFDA action levels for PCB, DDT, dieldrin, and chlordane. These fish are, however, contaminated at low levels.

2 50% or more of the samples analyzed are below USFDA action levels for PCB, DDT, dieldrin, and chlordane.

3 90 % or more of the samples analyzed are above USFDA action levels for PCB, DDT, dieldrin, and chlordane.

The following Michigan tributaries also have specific advisories:

Do not eat listed species caught from:

- Kalamazoo River (downstream from Kalamazoo) and Portage Creek (downstream from Milham Park); carp, suckers, catfish, and largemouth bass. No more than one meal per week for all other species.
- Lake Macatawa (Ottawa County): carp
- Hershey River (downstream from Reed City) bullhead and trout.
- St. Joseph's River (downstream of Berrien Springs Dam): carp
- Manistique River (downstream from M-90/Old US-2): carp.

Lake Superior

Wisconsin

All fish species are below USFDA action levels. These fish are, however, contaminated at low levels.

Michigan

Do not eat any fish from:

Deer Lake, Carp River, and Carp Creek (Marquette County)

Do not eat listed species caught from:

Torch Lake (Houghton County): walleye and saugers

Do not eat more than one meal per week of:

lake trout (all areas)

Minnesota

Unrestricted consumption of:

lake trout (open lake) 20-25"

chinook salmon (open lake) 25-30"

northern pike (St. Louis River) 15-20"

Limit consumption to six meals per month for:

northern pike (St. Louis Bay) 15-20"

shorthead redhorse (St. Louis River) 15-20"

Limit consumption to two meals per month for:

northern pike (St. Louis Bay) 20-30"

Limit consumption to one meal per month for:

walleye (St. Louis Bay) 15-20"

white sucker (St. Louis Bay) 15-20"

Lake Huron

Michigan

Do not eat any fish caught from:

Pine River (downstream from St. Louis)

Do not eat listed species caught from:

Shiawassee River (M-59 to Owosso): carp

Tittabawassee River (downstream of Midland): carp and catfish

Do not eat more than one meal per week of:
lake trout (all areas)
salmon, trout and muskellunge (southern half of the lake)
carp, catfish, salmon, and trout (Saginaw Bay)

Lake Erie

Michigan

Do not eat listed species caught from:
Raisin River (downstream from Monroe): carp

Do not eat more than one meal per week of:
carp, catfish and muskellunge (western end of the lake)
muskellunge (Lake St. Clair, St. Clair River, Detroit River)
carp (Belle Isle)

Ohio

Eat no fish from the lower two miles (from the harbor breakwater to the 24th Street Bridge in Ashtabula) of the Ashtabula River.

Eat no fish from the lower 5 miles (from the mouth to East 31st Street Bridge in Loraine, Ohio) of the Black River.

New York

Consume no more than one meal (1/2 pound) per week of any fish species.

Lake Ontario

New York

Do not consume:
eel
channel catfish
lake trout
chinook salmon
coho salmon over 21"
rainbow trout over 25"
brown trout over 18"

Consume no more than meal per month:

- white perch
- smaller coho salmon
- rainbow and brown trout
