Printed on Recycled Paper

DISCLAIMER

This document has been reviewed in accordance with U.S. Environmental Protection Agency policy and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

PREFACE

The National Center for Environmental Assessment (NCEA) has prepared this document to assist scientists and concerned communities in identifying subsets of the general population who might experience more frequent contact with and greater exposures to environmental contaminants. Furthermore, this document provides demographic data to help users determine the number of people in these potentially highly exposed subsets of the general population.

The 1994 *Executive Order on Federal Actions to Address Environmental Justice in Minority Population and Low-Income Populations* emphasized the importance of protecting minority and low-income communities from disproportionate environmental hazards and effects. In addition to low-income and minority populations, other populations categorized by age, gender, and location, to name a few, are candidates for potentially increased exposures depending on the given scenario. This document was initiated because previous efforts focused predominantly on factors, data, and scenarios based on national averages for the general population. To provide protection to highly exposed populations, risk and exposure assessments must consider relevant and more accurate data that pertain to these populations.

The current document results from revisions and narrowing of content scope from several NCEA draft documents, including *Exposure Factors for Specific Demographic and Ethnic Subgroups* (March 1995), which presented exposure data that were found to correlate significantly with ethnicity. Significant portions of that document were incorporated into the revised *Exposure Factors Handbook* that was published in the Fall of 1997. Remaining materials became the basis for the draft document *Identifying Susceptible Populations* (March 1996), which provided information to help assessors identify and enumerate populations potentially at risk for increased exposures and at risk due to heightened biological sensitivities to environmental contaminants. The above draft documents were reviewed by staff members from the U.S. Environmental Protection Agency who offered comments that have led to the current document, *Sociodemographic Data Used for Identifying Potentially Highly Exposed Populations*. The major difference between this draft and previous drafts is that biologically

FOREWORD

The National Center for Environmental Assessment (NCEA) of the U.S. Environmental Protection Agency's Office of Research and Development (ORD) has five main functions: (1) providing risk assessment research, methods, and guidelines; (2) performing health and ecological assessments; (3) developing, maintaining, and transferring risk assessment information and training; (4) helping ORD set research priorities; and (5) developing and maintaining resource support systems for NCEA. The activities under each of these functions are supported by and respond to the needs of the various program offices. In relation to the first function, NCEA sponsors projects aimed at developing or refining techniques used in exposure assessments.

This document is being published as a companion to the *Exposure Factors Handbook*. Due to unique activity patterns, preferences, practices, and biological differences, various segments of the population may experience exposures different from those of the general population, and these exposures, in many cases, may be greater. It is necessary for risk or exposure assessors characterizing a diverse population to identify and enumerate certain groups within the general population who are at risk for greater contaminant exposures or exhibit a heightened sensitivity to particular chemicals. This document provides information, where possible, for addressing these populations.

Michael A. Callahan, Director
National Center for Environmental Assessment
Washington Office

sensitive data are not addressed and the scope has been expanded to include additional categories of highly exposed populations in addition to ethnicity.

The data and population subsets presented are not intended to be comprehensive or prescriptive. This document does not include all possible populations and does not include guidance for identifying and enumerating all populations under every circumstance. The inclusion of a specific population in this document is not intended to imply that the specific population addressed is more likely than the general population to experience potentially high exposures to a given contaminant. Likewise, the reader should not conclude that all members of a population included in the text will necessarily experience greater exposures to a given contaminant.

This document addresses potential exposure to a single contaminant, source, or stressor. To address the areas, multiple and cumulative risks is not within the scope of this document. The guidelines on EPA's risk assessment approach are shifting towards greater consideration for multiple endpoints, sources, pathway and routes of exposure, and all the environmental media, etc. EPA's Science Policy Council has developed a document entitled, "Guidance on Cumulative Risk Assessment, Part 1. Planning and Scoping." This document is available on EPA's web site at the following address: <http://www.epa.gov/ORD/spc/cumrisk2.htm>. The document can be downloaded using Adobe Acrobat software, which is available at no cost from Adobe. The Adobe Internet address is: <http://www.adobe.com>.

AUTHORS, CONTRIBUTORS, AND REVIEWERS

The National Center for Environmental Assessment (NCEA) was responsible for the preparation of this handbook. The original document was prepared by Versar, Inc., under EPA Contract No. 68-D3-0013, Work Assignment No. 2-31. Revisions, updates, and additional preparation were provided by Versar, Inc., under EPA Contract No. 68-D5-0051, Work Assignment Nos. 3-24 and 97V-9. Amy Amina Wilkins, NCEA-Washington Office, served as the EPA work assignment manager for each effort, providing overall direction and coordination of the production effort as well as technical assistance and guidance and as a contributing author.

1. INTRODUCTION

The U.S. Environmental Protection Agency (EPA) is charged with protecting human health from adverse effects resulting from exposure to contaminants in the environment. EPA estimates risk to human health by conducting risk assessments, as illustrated in Figure 1-1. An important step in risk assessment is exposure assessment (U.S. EPA, 1992a). The process of exposure assessment involves (1) identification of potential exposure pathways, (2) quantification of chemical intakes/potential doses, and (3) identification/estimation of the exposed population (U.S. EPA, 1992a). This document addresses the third component of an exposure assessment, estimation of the magnitude of the exposed population. It does not address the duration or degree to which a population is exposed to a contaminant(s) of concern. Duration and degree of exposure and other aspects of exposure assessment are presented in *Exposure Factors Handbook* (1997).

A primary goal of risk assessment is to develop a distribution of the range of exposures/risks occurring in the exposed population. In the past, some risk assessments did not characterize the subsets of the exposed population with higher than average exposures/risks. Individual populations can experience greater risk than the general population through higher than average exposure and/or higher than average biological sensitivity. An important limitation in the scope of this document is that it addresses populations who are potentially at greater risk due to high exposure, but not populations with greater risks due to biological sensitivity.

The data and population subsets presented are not intended to be comprehensive or prescriptive. This document does not include all possible populations and does not include guidance for identifying and enumerating all populations under every circumstance. The inclusion of a specific population in this document is not intended to imply that all members of a specific population addressed are more likely than the general population to experience potentially high exposures to a given contaminant.

The specific goals of this document are to (1) help assessors identify potentially highly exposed populations and (2) help assessors estimate the size of these populations. It provides information on the number of individuals or the percent of the general population associated with

dietary preferences, cultural practices, geographic location and setting (i.e., urban vs. rural), and other activities that target populations and individuals as possibly highly exposed candidates. The literature summaries provided are not all-inclusive, but are meant to provide the reader with a general overview of population data reported in recent literature. In most cases, data are from government publications, peer-reviewed literature, and trade associations. Data are presented as they appear in the original studies/reports. No attempt was made to verify or assess the quality of the data beyond what is described in the published reports. Within the constraint of presenting the original material as accurately as possible, terminologies used to describe areas such as racial populations and study results are those presented by the study authors.

The *Exposure Factors Handbook* was first published in 1989 (U.S. EPA, 1989a). The revised handbook was published in 1997. This document is intended to be used in conjunction with the revised *Exposure Factors Handbook* (U.S. EPA, 1997). The handbook provides statistical data on human characteristics and behaviors used in assessing exposure (e.g., ingestion rates of foods, activity duration and frequency, soil ingestion rates, body weight, skin surface area), addressing the second component of the exposure assessment process mentioned above. It focuses primarily on exposure factors pertaining to the general population but also presents, where possible, data specific to various age, gender, racial or ethnic, and occupational subgroups. The procedure for using these two documents in combination is as follows:

- An assessor will use this document to help determine if potentially highly exposed populations may exist in the area of interest and to estimate the size of such groups.
- Once the suspected potentially highly exposed populations are identified, the assessor can then use the *Exposure Factors Handbook* (U.S. EPA, 1997) to select intake and other exposure factor values specific to the groups identified above. These exposure factor values would be combined with site-specific information on environmental concentrations of contaminants to estimate exposure levels.

Other related documents that assessors may find helpful for identifying and evaluating highly exposed populations include, but are not limited to, the following: *Methods for Enumerating and Characterizing Populations Exposed to Chemical Substances* (U.S. EPA, 1985); *Populations of*

Potential Concern in Chemical Exposure and Risk Assessment (U.S. EPA, 1989b); and *Risk Assessment Guidance for Superfund*, Volume 1 (U.S. EPA, 1989c).

Although multitudes of anecdotal and circumstantial evidence suggest that a particular subgroup may be more susceptible than other members within the general population, very little direct evidence exists of what the actual exposures and risk levels are for specific chemicals or physical agents in the environment. Therefore, the data presented in this document for various subgroupings do not imply or necessitate that all or any members of a given group are highly exposed. The data contained in this document should be used as a tool to alert the assessor to subgroups that may potentially experience greater exposures than the general population. The data also should be used to help the assessor determine the number of individuals who potentially may be subjected to increased exposures. When possible, assessors are encouraged to collect site-specific data to help confirm if any groups are experiencing high exposures.

1.1. TERMINOLOGY USED TO DEFINE CONCEPTS RELATING TO EXPOSURE

1.1.1. Exposure

The *Guidelines for Exposure Assessment* define exposure as “the contact of an organism with a chemical or physical agent” (U.S. EPA, 1992a). The document further defines exposure as “contact of a chemical, physical, or biological agent with the outer boundary of an organism.” Exposure is quantified as the concentration of the agent in the medium in contact integrated over the time duration of that contact (U.S. EPA, 1992a).

1.1.2. High End, Upper End, Exposure Distribution

A goal of many exposure assessments is to estimate the complete range of exposures occurring in the exposed population and number of people at each exposure level. This concept can be illustrated graphically by a distribution curve showing numbers of people exposed at various levels. Note: persons in the high end of the health risk distribution are not necessarily the same individuals as those in the high end of the exposure distribution (U.S. EPA, 1992a). Individuals represented within what is known as the “upper end” or “high-end” of an exposure distribution are referred to as highly exposed individuals. A high-end exposure estimate is

defined in the *Guidelines for Exposure Assessment* as “a plausible estimate of individual exposure or dose for those persons at the upper end of an exposure or dose distribution, conceptually above the 90th percentile, but not higher than the individual in the population who has the highest exposure” (U.S. EPA, 1992a).

1.1.3. Susceptibility, Highly Exposed, Biologically Sensitive

Definitions for “susceptibility,” “highly exposed,” and “sensitivity” vary according to various professions. For example, toxicologists refer to individuals who respond to the lowest concentrations of a given toxicant as “susceptible” (Hattis et al., 1987). Genetic epidemiologists define susceptible individuals as those who become ill (Khoury et al., 1989). EPA has used the term “susceptible” to refer to both highly exposed and biologically sensitive individuals. An informal survey conducted within EPA showed that many investigators considered susceptible populations to be either sensitive or highly exposed (Grassman, 1995). However, the terms “highly exposed” and “sensitive” are quite different and are not used interchangeably in this document. For example, if a population showing heightened sensitivities towards a particular toxic agent experiences little contact with that agent, the overall risk in this instance could be very low. Conversely, a population with sensitivities similar to those of the general population can be at greater risk if it experiences greater contact with toxic agents.

Individuals are “highly exposed” on the basis of their activities, preferences, and behavior patterns that differ from those established for the general population. For example, high exposure could relate to food choices, frequency of foods consumed, cultural practices, geographic location, residential setting (urban vs. rural), occupation, education, socioeconomic status, proximity to hazardous facilities, and activity patterns. These parameters may vary according to seasonal aspects, age, and other factors.

A “sensitive” individual is one who shows an adverse effect to a toxic agent at lower doses than the general population or who shows more severe or more frequent adverse effects after exposure to similar amounts of a toxic agent as the general population. For example, the fetus is more sensitive to many chemicals than older individuals. Biological sensitivity may

result from age (Calabrese, 1986), gender (Calabrese, 1985), genetics (Omenn, 1984), deficiencies relating to diet and health, or other factors (Rios et al., 1993; Calabrese, 1986).

Figure 1-2 presents the Methodological Approach for Identification and Evaluation of Populations Potentially at Greater Risk. The figure illustrates that populations are potentially at greater risk when they are "more exposed" or "more susceptible" (Sexton et al., 1993). The scope of this document, however, does not include identifying biologically sensitive populations or determining one's susceptibility (or sensitivity) to a chemical. Rather, it examines how activities or behaviors can subject particular segments of the population to greater exposures and more frequent contact with environmental contaminants.

1.2. IDENTIFYING THE POTENTIALLY HIGHLY EXPOSED POPULATION

As discussed previously, one objective of this document is to help assessors identify potentially highly exposed populations. This section summarizes the types of information presented that address this issue. Although the topic is beyond the scope of this document, some discussion is included on how these factors relate to biological sensitivity. These discussions are included as important related issues that assessors can pursue from other sources. Assessors are reminded that if an individual (or population) is exposed to environmental compounds, it does not necessarily result in that individual (or population) being highly exposed relative to the general population.

The fact that data for a particular subgroup are presented does not mean that all members within that subgroup are highly exposed or that such exposure constitutes a high risk. Also, this document does not include all possible groupings of susceptible populations. Direct cause-and-effect relationships are not being claimed; rather, information is presented that has the potential for demonstration of correlations between exposure and the incidence and severity of symptomatic effects. Some of the important factors for identifying potentially highly exposed populations are chemicals of concern, age, gender, and lifestyle. Therefore, these areas are addressed in the following sections of this document.

1.2.1. Chemical(s) of Concern

Identification and characterization of specific chemicals of concern are necessary steps in identifying and enumerating populations with high-end exposures. For example, a chemical classified as a pesticide would prompt assessors to consider populations working in an agriculturally related occupation or people who participate in gardening as possible candidates for receiving higher exposures to pesticides (further discussed in Sections 1.2.3 and 7.4). Because of its prevalence in the environment, lead is another chemical of concern that can be associated with various conditions and groups. For example, older houses often have lead-based paints (Sutton et al., 1995; Barltrop, 1965) (Section 4.1 and Table 4-3). Soils near roadways (Romieu et al., 1995) (Section 3.6) tend to have elevated lead levels from the previous use of lead in gasoline. Not only is lead a chemical to which children are biologically more sensitive than adults, but it is also a chemical that children are more likely to be exposed to because of the prevalence of certain activities in children (ILSI, 1992) such as pica. Pica is defined as the intentional ingestion of nonfood items (Bruhn and Pangborn, 1971; Vermeer and Frate, 1979; NRC, 1993). Children exhibiting pica may experience exposures to lead from ingestion of paint chips and lead-contaminated soils. Thus, children are a population who should be recognized as having possibly higher exposures to lead and other chemicals from ingestion. Additional examples of populations potentially more exposed to specific environmental agents than the general population are presented in Table 1-1. This table is not intended to be comprehensive. Rather, it is presented to show possible examples of chemical-specific population exposures.

1.2.2. Age

The age of the population should be considered when estimating exposure. For example, nursing infants could potentially have more exposure (per unit body weight) to some lipophilic contaminants than the general population through ingestion of breastmilk containing these contaminants. Lipophilic compounds such as pesticides and dioxins have commonly been identified in human milk (NAS, 1991; NRC, 1993). The levels of these compounds in human milk vary with duration of lactation, number of children nursed, and the weight of the nursing mother (NAS, 1991).

Young children may have an increased potential for exposure to soil contaminants as a result of pica and mouthing behaviors. The relatively higher ratio of surface area to body weight of fetuses, neonates, and children, as compared to adults, may result in children being exposed to higher concentrations of chemical per unit body weight than adults (Wester and Maibach, 1982).

Age also can be used to identify biologically sensitive individuals. The effect of age sensitivity to contaminant exposure will vary with the substance (Calabrese, 1986). For example, although sensitivity to skin irritants generally decreases with age, renal function also decreases with age, thereby increasing sensitivity to chemicals that affect kidneys (Calabrese, 1986). Thus, children tend to be more resistant than adults to the harmful effects of renal toxicants (Calabrese, 1986). In addition, adults more than 50 years old generally have a decreased capacity to detoxify and/or excrete some chemical substances, and also exhibit a functional decline in the immune system (Calabrese, 1986). The fetus, in comparison to older individuals, is more sensitive to many chemicals. For example, the developing nervous system of the fetus or neonate has increased susceptibility to the neurotoxic effects of lead (ATSDR, 1992). In addition, children at various stages of development are also more sensitive to exposure to chemicals because of the immaturity of their enzyme detoxification and immune systems (Calabrese, 1986; Lorenz and Kleinman, 1988; NRC, 1993; Gladkte and Heimann, 1975).

Age demographics for the general U.S. population are presented in Section 2. Age-related activities are discussed in Sections 8 and 9.

1.2.3. Gender

Gender-related behavior and activity patterns also can increase an individual's exposure to toxic agents (Behrman et al., 1987). For example, during pregnancy some women may have increased food consumption because of increased nutritional need and thus can have increased exposure to any toxic contaminant present on or in a food sources. Additionally, pica is practiced by some women during pregnancy and most often involves the consumption of dirt or clay (Neuhauser, 1994). These substances may be contaminated with chemical/toxic compounds.

Gender-related economic factors, specifically those related to living in low-income households, can increase an individual's potential exposure to toxic agents (NRC, 1993;

Starfield, 1982; Mitchell and Dawson, 1973; Starfield and Budetti, 1985; CDHS, 1991). Data presented in Table 10-4 of this document show that for each year studied (1966-1994), a greater percentage of women than men live in poverty (U.S. Bureau of the Census, 1995).

Participation in certain occupations can also increase an individual's exposure to toxic agents. For example, men comprise between 75% and 80% of workers in the farming industry (U.S. DOL, 1994); therefore, they may be exposed more frequently than women to agricultural pesticides. Women comprise more than 90% of workers in the cleaning industry (U.S. DOL, 1994); therefore, women have the potential for more frequent exposure than men to chemicals contained in cleaning products. Occupational data by gender are presented in Section 7 of this document.

Although sex-linked differences in sensitivities to toxic chemicals have not been investigated extensively, the gender differences observed for several toxic substances have been attributed to such factors as differential gastrointestinal absorption (Adrian et al., 1986), plasma protein binding (Rane et al., 1971; Morselli et al., 1980; Morselli, 1989), biliary excretion (Lorenz and Kleinman, 1988; NRC, 1993), tissue distribution (NRC, 1993; Morselli, 1980), and enzymatic bioactivation/detoxification activities (NRC, 1993; Greengard, 1977). With regard to a sensitive population, neither sex universally can be labeled more sensitive or less sensitive to all substances. However, because of the physiological changes (e.g., a marked increase in the requirement for calcium and iron, hormonal alterations, respiratory disease susceptibility) that occur during pregnancy, pregnant women may be predisposed to the toxic effects of such chemicals as beryllium, lead, manganese, and organophosphate insecticides (Romero et al., 1989; Neuhauser, 1994).

1.2.4. Lifestyle, Behavior, and Social Structure

The fact that exposure to a pollutant may be determined, in part, by the behavior of the receptor (i.e., human) is a basic principle of exposure assessment. The risk potential is increased by a behavior that may not place a person in direct contact with a particular pollutant, but nevertheless makes them more susceptible to the pollutant's effects when exposure to that pollutant does occur. For example, smoking enhances the toxicity of other chemicals by

restricting airway conductance or making it more difficult to clear volatiles from the lungs (Klaassen et al., 1996). Excessive consumption of alcohol appears to interfere with the detoxification enzyme system of the liver (Klaassen et al., 1996).

Another example of increased risk due to behavioral practices is the use of metallic mercury for medicinal and religious practices in Caribbean and Hispanic populations. Mercury sprinkled on the floor or carpet could result in potentially increased exposure (dermal, inhalation, and ingestion) to mercury for these specific populations (Wendroff, 1990).

Other activities that may lead to individuals having potentially greater than average exposure to pollutants include breastfeeding, normal outdoor play for children, gardening and the consumption of homegrown foods, dirt biking, fishing, and hunting. The potentially highly exposed populations may include groups defined by ethnic origin, race, geographic region of residence, income level, or other demographic factors. Exposure/risk among these populations may differ from that of the general population as a result of behavioral or cultural factors (i.e., ethnic-related activities/traditions, geographic/regional behaviors, or social activities that may contribute to higher risk such as smoking or alcohol or drug use).

1.2.5. Personal Health

An individual's personal health can affect the extent to which they experience adverse effects upon exposure to environmental pollutants. Elements of personal health such as nutritional status, disease history, body weight, body fat, preexisting medical conditions, or genetic predispositions can exacerbate health consequences for individuals exposed to any environmental contaminant. For example, a person with asthma may experience respiratory problems after exposure to a respiratory irritant. This exposure could lead to a potentially life-threatening asthma attack, while a person not afflicted with asthma could experience only minor reactions (Calabrese, 1978). The authors note that issues related to personal health are of potential concern for the exposure/risk assessor; however, addressing potentially susceptible or highly exposed populations based on health concerns is beyond the scope of this document. The reader is referred to the following reference sources for information available on this subject: Calabrese, 1978; Kuczmarski, 1994; CDC, 1994; Montgomery and Carter-Pokras, 1993; Otten et

al., 1990; Rios et al., 1993; U.S. Bureau of the Census, 1995; and Weiss et al., 1992. Full citations are presented in Section 1.6. It should be noted that the references mentioned above are not intended to be all-inclusive, but are presented as examples of available sources addressing health concerns.

1.3. ENUMERATION OF VARIOUS HIGHLY EXPOSED POPULATIONS

A major difficulty encountered in the preparation of exposure assessments is the enumeration and characterization of specific populations exposed to chemical substances. The EPA Office of Toxic Substances 1985 document *Methods for Enumerating and Characterizing Populations Exposed to Chemical Substances* (U.S. EPA, 1985) presents methods and supporting information for enumerating and characterizing populations exposed to chemical substances in each of several exposure categories. Risk assessors should refer to this document for guidance in enumerating populations where site-specific data are not available. The categories of exposed populations addressed are as follows:

- Populations exposed to chemical substances in the ambient environment (all media);
- Populations exposed to chemical substances in the occupational environment;
- Populations exposed to chemical substances via the ingestion of foods;
- Populations exposed to chemical substances via the use of consumer products; and
- Populations exposed to chemical substances via the ingestion of drinking water.

All printed census information is available for purchase through the Government Printing Office (GPO). Other forms of information such as computer tapes, microfiches, maps, and technical documentation can be obtained from the U.S. Department of Commerce, Bureau of the Census.

The Census of Population is the major source for the size, distribution, and demographic characteristics of a geographically defined population. These include detailed characteristics

such as age, sex, enumeration of various ethnic groups, and characterization of socioeconomic data.

Not all the population data required to assess highly exposed populations can be obtained from census data. For example, enumeration of populations who are potentially sensitive to contaminant exposure on the basis of personal health factors (preexisting diseases, allergies, or genetic predispositions) cannot be ascertained from census data. These data can sometimes be obtained from local government sources, health agencies, or references from medical journals. (See Table 11-1 for sources of local data.) Likewise, for enumeration of populations with high-risk behavior patterns, such as subsistence fishers, assessors may turn to surveys, State government agencies, or ethnographic field techniques (interviews, oral histories, etc.).

1.3.1. Framework of Methods

The framework for enumerating and characterizing exposed populations is the same for each population of interest and is comprised of three stages (U.S. EPA, 1985):

1. The identification of the exposed population.
2. The enumeration of the exposed population.
3. The characterization of the exposed population according to age, sex, and other demographics.

Figure 1-3 is a flow diagram of the three-stage framework. The first stage involves determining the site locations of the chemical/pollutant of concern from various sources in the environment. The people living at or near these locations can be identified via mapping techniques, site visits, aerial photographs, etc. These tools also can be used to estimate the number of people exposed to various chemicals in the environment. As an example, contaminant concentration isopleths can be plotted on a population density map, and the number of people within a given area of equal chemical concentration can be determined. The final step is to examine the exposed populations to determine the highly exposed populations. The application of this process to specific exposure scenarios is discussed as follows.

1.3.2. Contact With Chemicals in the Ambient Environment (All Media)

Populations potentially exposed to a chemical substance in the ambient environment can be identified through an evaluation of the substance's sources, its behavior in the environment, location of the source, and applicable monitoring data. Populations may be further defined by their participation in specific activities (i.e., occupation, exercise, hobbies, etc.) leading to exposure, and by demographics (age and gender).

1.3.3. Chemical Contact Resulting From Disposal Activities

Exposures resulting from disposal and transportation-related spills of chemical substances are types of exposures occurring in the ambient environment (all media). Populations exposed to chemical substances in these categories are identified either by geographic location or by occupation if site-specific data are not available.

1.3.4. Chemical Contact in Occupational Setting

The enumeration of occupationally exposed populations relies on the direct utilization and combination of numerous databases. This information is largely the result of efforts by the Federal Government (e.g., National Institute for Occupational Safety and Health [NIOSH] and Occupational Safety and Health Administration [OSHA]) to monitor employment and worker practices. The age and sex of a worker can affect physiological parameters that determine exposure (e.g., breathing rate, skin surface area) in the work environment. In addition, detailed exposure assessments may require that populations be described by age and sex distributions.

1.3.5. Ingestion of Chemicals in Foods

Foods and food products have geographic distributions and processing patterns that fluctuate depending on seasonal demand, availability, and personal preference. The population exposed to contaminants found in various foods and other products can be enumerated using information on the size of the consuming population in conjunction with information on the amount of food contamination. One approach for determining the size of the consuming

population is to divide the total amount of food consumed (for a particular food category or subset that is contaminated) by the average per-person or per-household ingestion rate.

1.3.6. Contact With Contaminants in Consumer Products

The identification and enumeration of populations exposed to chemical substances via the use of consumer products necessitates a listing of all products containing the chemical in question. The data needed to compile such a list can be derived from the materials balance for the chemical of concern and through literature searches. Other data sources are governmental agencies (e.g., Consumer Product Safety Commission [CPSC], industry fact sheets, and product labels). The potentially exposed population may be estimated using sources such as consumer product use surveys, which indicate what fraction of the total population uses a particular product or the characteristics of the population that uses the product (i.e., gender or age). Also, exposed population estimates may be made by using total number of products sold divided by the average number of products used per household. The age and sex of the exposed consumers affect the physiological parameters that determine exposure; they also identify sensitive populations. Detailed exposure assessments may require that populations be described by age and sex distribution.

1.3.7. Ingestion of Chemicals in Drinking Water

Identification of populations exposed to chemical substances via the ingestion of drinking water involves examining the sources of the chemical substance. Enumeration involves the use of local information or various computerized databases that contain information on drinking water, such as the sources of the raw water supply, intake locations, treatment methods, and populations served.

1.4. HOW TO USE THIS DOCUMENT

This document was prepared to assist risk assessors and other scientists in identifying subsets of the general population who might experience more frequent contact with, and greater exposures to, environmental contaminants than the general population. The first example

presents a theoretical description of how to use this document. The two scenarios presented at the end of this section illustrate how the tables and figures in this document can be used in conjunction with the *Exposure Factors Handbook* to characterize potentially highly exposed populations. These examples are not intended to be a complete analysis, but are for illustrative purposes only. Reference tables other than ones provided in the example scenarios may be appropriate, as determined by the assessor.

1.4.1. Examples of Exposure Scenarios

The information presented in this section explains how to use this document. The second example is less detailed and only refers the reader to specific tables for analysis.

1.4.2. Identifying Potentially Highly Exposed Population on the Basis of Exposure Pathway

Table 1-2 presents examples of identifying potentially highly exposed population based on exposure pathway. The sample exposure pathways presented are included as examples only, and are not presented as being the most likely pathways by which populations may be exposed.

1.4.3. Identifying Potentially Highly Exposed Population on the Basis of Chemical/Contaminant

Table 1-3 presents examples of identifying potentially highly exposed population based on chemical or contaminant of concern. The 15 contaminants listed in the table are taken from the 1997 Agency for Toxic Substances and Disease Registry (ATSDR)/EPA's Priority List of Hazardous Substances: 1997. The information is from the ATSDR web site, available at the following Internet address: <http://atsdr1.atsdr.cdc.gov:8080/cxcx3.html>. The contaminants presented are included as examples only, and are not presented as being the most hazardous chemicals to which populations may be exposed.

1.5. DOCUMENT ORGANIZATION

This document presents a summary of various factors influencing risk for highly exposed populations. In addition, data sources are explored that can assist exposure/risk assessors in enumerating these highly exposed or susceptible populations.

- Section 2 presents characteristics of the general U.S. population, including sociodemographic, socioeconomic, and health-based factors.
- Section 3 provides population data based on the effects of location of residence.
- Section 4 provides population data based on residential factors.
- Section 5 provides population data based on time in nonresidential buildings.
- Section 6 presents population data for selected recreational activities.
- Section 7 presents occupational population data.
- Section 8 examines cultural and behavioral factors.
- Section 9 provides population data for drinking water and certain food groups.
- Section 10 evaluates population data associated with socioeconomic factors, such as living in poverty.
- Section 11 provides information on accessing information on the Internet useful for identifying potentially highly exposed populations, as well as providing a listing of State environmental protection agencies and a reference source for trade organizations.

Example 1 - Tetrachloroethylene Contamination at a Superfund Site

The Problem:

A Superfund site has caused tetrachloroethylene (also known as perchloroethene) to enter groundwater used as a drinking water source for a community of 10,000 people in Ohio. The risk assessor is interested in knowing if anyone in the affected area may be highly exposed to this chemical.

Identifying the Highly Exposed Populations:

The assessor determines that elevated exposures could occur in two ways:

- High ingestion rates of contaminated water, and
- High background exposures due to activities other than drinking water.

High Ingestion Rate of Contaminated Water:

Using the exposure pathway paradigm in Table 1-2, the assessor identifies three potentially highly exposed populations associated with water consumption: athletes, residents of hot climates, and outdoor workers in hot climates. The groups associated with hot climates will not be of concern, because Ohio has a moderate climate. Athletes may be a concern; using Chapter 6 and Figures 6-1 and 6-2, the assessor learns that approximately 50% of the adult population on a national basis are involved in some form of exercise. Table 1-2 also references the assessor to Table 3-30 in the *Exposure Factors Handbook*, which recommends assuming 6 liters per day (L/day) water consumption for active adults in temperate climates. Clearly, not all of these people exercise aerobically on a regular basis. However, this high percentage suggests that it is reasonable to assume that at least some members of a population of 10,000 will engage in such activities. Therefore, the assessor concludes that some members of the exposed population could have elevated exposures as a result of high water consumption and uses the 6 L/day value to estimate this level of exposure. The nationwide statistics in this document are not adequate for making quantitative estimates of how many people are exposed at this level. Additional sources of information, however, are referenced in Section 11.

High Background Exposures:

The possibility of high background exposures is investigated using Table 1-3. The assessor looks up tetrachloroethylene in this table and sees that a number of people may have elevated background exposures to this chemical (e.g., home repairers or remodelers, house cleaners, painters, and workers at dry cleaning establishments). The assessor then refers to Tables 6-22 through 6-24, 7-7, and Appendix 7B in this document to establish the potentially high background exposed population. Table 6-22 indicates that 48% of people were involved in home improvement/repair during the last 12 months. Table 6-23 indicates that 13 million people paint as a hobby (or X% of population), etc. Accordingly, a high percentage of this population could have elevated background exposures. Tables 5-23 (recommended inhalation rates - select rate based on specific activity level) and 16-13 through 16-18, 16-22, and 16-23 (duration and frequency data of exposure or product use for some categories) from the *Exposure Factors Handbook* can be used. For example, from Table 5-23, one can assume a mean inhalation rate of 1.0 cubic meters per hour (m^3/hr) for a house cleaner who cleans spots on walls or doors based on short-term, light activities. The total exposed time for using specific house cleaning products (all-purpose cleaners) is 64 hours/year (Table 16-16). The duration of performing a specific task (clean spots on walls or doors) is 50 minutes/event (Table 16-15), and the mean frequency for performing this task is 6 times/month. Other tables may be appropriate as determined by the assessor.

Example 2 - Unspecified Soil Contamination in a Residential Community

The Problem:

A residential community is under development in Virginia. For the past 100 years, the land to be developed has been agricultural. Heavy use of pesticides in the past has led to concerns of soil contamination. The risk assessor is interested in knowing whether any subset of the future residents may have high exposures to the soil contaminants.

Identifying the Highly Exposed Populations by Exposure Pathway:

The assessor postulates that elevated exposures to soil contaminants could occur in three ways:

- Inhalation of particulates;
- Dermal contact with soil; and
- Ingestion of soil.

Increased Dermal Contact and Inhalation of Particulates:

Using Table 1-2, the assessor identifies four potentially highly exposed populations associated with dermal contact with soil: children playing outdoors, gardeners, people engaged in sporting activities (e.g., baseball, softball, golf, football, and soccer), and outdoor workers who may have increased contact with soil (e.g., termite inspectors, highway repairmen, cable repairmen, construction workers, farmers, and nursery workers). These same populations would have elevated exposures via inhalation of suspended soil particles. To characterize the potentially highly exposed groups, the assessor can then use Table 7-7, Appendix 7B, Tables 6-16 and 6-24, and Figure 6-1 in this document. Relevant information in *Exposure Factors Handbook* can be found in Tables 6-2 through 6-8, 6-14, 6-15, 6-16 (exposed skin surface area), and 6-12 (soil adherence value). Duration and/or frequency values for some categories may be obtained from Tables 15-92, 15-93, 15-107, 15-108, and 15-176.

Ingestion of Soil:

Using Table 1-2, the assessor identifies children playing outdoors, pregnant women, migrant workers, and participants in outdoor activities (e.g., gardening, golf, baseball, football, hiking, and camping) as populations who may be highly exposed as a result of soil ingestion. Turning again to Table 1-2, the assessor can use Tables 2-1, 8-2, 8-3, 6-16, 6-19, and 6-24 in this document and Tables 4-11, 4-15, 4-16, 4-22, 15-85, and 4-23 and Section 4.5 for soil ingestion in *Exposure Factors Handbook* as tools to characterize the potentially highly exposed groups. Other tables may be appropriate as determined by the assessor.

Table 1-1. Populations Potentially at Risk of Exposure to Specific Chemical(s) of Concern

Population/Activities	Chemical(s) of Potential Concern
<u>Infant and Child Activities</u>	
Infant breastfeeding	BHC-beta, BHC-gamma (lindane), cadmium, carbon disulfide, chlordane, DDD, DDE, DDT, 1,4-dichlorobenzene, dichloromethane, dieldrin, dioxin, heptachlor, heptachlor epoxide, hexachlorobenzene, lead, mercury, tetrachloroethene, PCBs
Normal outdoor play	Highly to moderately adsorptive substances (e.g., asbestos, beryllium, copper, lead, mercury, silver, thallium, zinc)
Dirt biking	Highly to moderately adsorptive substances (e.g., asbestos, beryllium, copper, lead, mercury, silver, thallium, zinc)
<u>Adult Activities</u>	
Household activities:	
Gardening	Arsenic, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, cadmium, chrysene, coal tars, creosote, dibenzo(a,h)anthracene, dieldrin, dioxin, heptachlor, lead, selenium
Auto care	Ammonia, benzene, dichlorodifluoromethane, dichloromethane, nitrobenzene, 1,1,1-trichloroethane, trichlorofluoromethane, zinc
Home repair/remodeling	Ammonia, arsenic, bis(2-chloroethyl)ether, bis(chloromethyl)ether, coal tars, cresol, dichlorodifluoromethane, dichloromethane, diethyl phthalate, dimethyl phthalate, di-n-butyl phthalate, lead, mercury, methyl ethyl ketone, methyl isobutyl ketone, pentachlorophenol, tetrachloroethene, toluene, xylene, zinc
Sports:	
Hunting (deer and waterfowl)	Deer: pesticides Waterfowl: substances with high to moderate bioaccumulation potential
Fishing	Any substance with high to moderate bioaccumulation potential
Target shooting	Lead
Hobbies:	
Arts and crafts	Ammonia, benzene, bis(2-ethylhexyl)phthalate, chloroethene, creosote, dichloromethane, diethyl phthalate, dimethyl phthalate, di-n-butyl phthalate, lead, mercury, methyl ethyl ketone, methyl isobutyl ketone, phenol, 1,1,1-trichloroethane, 2,4,6-trichlorophenol, toluene, zinc
Film developing	Ammonia, cyanide, dichlorodifluoromethane, 1,1,1-trichloroethane, trichloroethene, trichlorofluoromethane, toluene, xylene
Furniture refinishing	Benzene, bis(2-ethylhexyl)phthalate, dichloromethane, diethyl phthalate, dimethyl phthalate, di-n-butyl phthalate, methyl ethyl ketone, methyl isobutyl ketone, toluene, xylene

(continued)

Table 1-1. Populations Potentially at Risk of Exposure to Specific Chemical(s) of Concern
(continued)

Population/Activities	Chemical(s) of Potential Concern
<u>Occupations</u>	
Agricultural workers	Pesticides
Blacksmiths	Cyanide, PAHs
Chimney sweeps	Coal tars
Commuters	Particulates, carbon monoxide, benzene, formaldehyde, criteria pollutants
Domestics/housecleaning	Ammonia, anthracene, bis(2-chloroethyl)ether, di-n-butyl phthalate, 1,4-dioxane, ethylene oxide, mercury, phenol, styrene, tetrahydrofuran, tetrachloroethene, toluene, trichloroethane, xylene, zinc
Electrical equipment repair	PCBs
Exterminators	Pesticides
Firefighters	Cyanide
Jewelers	Lead, nickel
Laboratory technicians	Acrolein, arsenic, asbestos, bis(chloromethyl)ether, benzidine, benzoic acid, chloroethene, chloromethane, 2,4-dinitrophenol, 1,4-dioxane, mercury, pyrene, silver, trichloroethene, trichloromethane
Painters/paint store employees	Benzene, dichloromethane, nickel, tetrachloroethene, toluene, trichloromethane
Road pavers and roofers	Coal tars, PAHs
Service station attendants	Benzene, lead
Welders	Chromium, nickel
<u>Adult Risk-associated Behavior</u>	
Alcohol consumption	Lead, trichloroethene, trichloromethane, pesticides, PCBs
Smoking/environmental tobacco smoke	Asbestos, benzene, beryllium, cadmium, chrysene, cyanide, lead, nickel, trichloroethene, PAHs
Substance abuse	Pesticides, PCBs
<u>Residential (housing characteristics)</u>	
Basements	Radon
Kerosene heat	Carbon monoxide, nitrous oxide
Inner city location	Lead, cockroach antigen, benzene, criteria pollutants
Private wells	Pesticides, metals, solvents, microbials

1 IDENTIFICATION OF EXPOSED POPULATIONS

- Evaluate chemical/physical properties
- Identify sources & releases
- Evaluate transport and transformation
- Gather monitoring data
in order to identify
- Media and exposure route
- Exposure scenarios (i.e., ambient, occupational, consumer, food, drinking water)
- Microenvironments and activities

2 ENUMERATION OF EXPOSED POPULATIONS

Data sources and enumeration methods are used to determine numbers of populations exposed to chemical substances in:

- The ambient environment
- The occupational environment
- Food
- Drinking water
- Consumer products

3 CHARACTERIZATION OF EXPOSED POPULATIONS

Data sources are used to obtain demographic characteristics of exposed populations, e.g., age, sex). Data sources include:

- Geographic or activity-specific data
- Generic data

Figure 1-3. The Three-Stage Framework for Identifying, Enumerating, and Characterizing Populations Exposed to Chemical Substances

Source: U.S. EPA, 1992b.

Table 1-2. Identifying Potentially Highly Exposed Populations on the Basis of Exposure Pathway

Exposure Pathway	Potentially Highly Exposed Population	Tables on Sociodemographics from this Document	Tables on Factor Values from EFH
Water Ingestion			3-30

	Occupations or Hobbies: Electricians, electric cable repairpersons, electroplators, emergency response workers, firefighters, hazardous waste haulers or site repair workers, maintenance cleaners, metal finishers, pavers and roofers, pipefitters/plumbers, timber products manufacturers, transformer/capacitor repairers, and personnel involved in waste oil processing	7-3, 7-4, 7-7, Appendix 7B, 7C	
Cadmium	Activities: Jewelry hobbyists	6-23	
	Occupations: Alloy makers, aluminum solder makers, ammunition makers, auto mechanics, battery makers, bearing makers, braziers and solderers, cable and trolley wire makers, cadmium platers, cadmium vapor lamp makers, pottery makers, copper-cadmium alloy makers, electrical condenser makers, electroplaters, engravers, farm workers, glass makers, incandescent lamp makers, jewelers, lithographers, lithopone makers, mining and refining workers, paint makers, paint sprayers, pesticide makers, pharmaceutical workers, photoelectric cell makers, pigment makers, plastic products makers, metal sculptors, solder makers, textile printers and cadmium alloy and cadmium-plate welders	7-3, 7-4, 7-7, Appendix 7B, 7C	
	Behavioral Patterns: Smokers	8-6, 8-7	15-141

Table 1-3. Identifying Potentially Highly Exposed Populations on the Basis of Hazardous Substance
(Hazardous Substances from 1997 EPA/ATSDR Priority List of Hazardous Substances) (continued)

Hazardous Substance	Potentially Highly Exposed Population*	Relevant Tables in this Document	Relevant Tables in Exposure Factors Handbook
Polycyclic aromatic hydrocarbon (PAH) compounds (Other names: Acenaphthene, acenaphthylene, anthracene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene, pyrene, Dibenzo(a,h)anthracene)	Activities: Charcoal grillers Fishers Furniture refinishing hobbyists Occupations: Aluminum workers, asphalt workers, carbon black workers, chimney sweeps, coal tar production plant workers, coal-gas workers, coke oven workers, fishermen, graphite electrode workers, machinists, auto and diesel engine mechanics, municipal trash incinerators, printers, road workers, roofers, smoke houses, steel foundry workers, tire and rubber manufacturing workers, workers exposed to creosote such as carpenters, farmers, railroad workers, tunnel construction workers, and utility workers. workers using high-temperature food fryers and broilers	6-2 6-23 7-3, 7-4, 7-7, Appendix 7B, 7C	15-34 10-83, 10-84, 10-85
Chloroform (Other names: trichloromethane, methenyl chloride, methane trichloride, methyl trichloride, formyl trichloride)	Activities: Swimmers Drinking chlorinated water Showering in enclosed stalls Occupations: Chloroform manufacturers, fluorocarbon-22 and ethylene dichloride manufacturers, internal combustion engine industries, pesticide manufacturers, pulp and paper millers, food processing industry and paint store workers, pharmaceutical manufacturing plants, sewage treatment plants personnel	6-24 7-3, 7-4, 7-7, Appendix 7B, 7C	15-18, 15-65, 15-66, 15-67 15-19, 15-20, 15-21, 15-22, 15-23 6-26
DDT, P'P' (other name: dichlorodiphenyltrichloroethane)	Banned in the U.S. in 1972, however residues can still be detected on agricultural products and other food products Occupations: Farmers, nursery personnel may be exposed to residues still found in soil	7-3, 7-4, 7-7, Appendix 7B, 7C	
Trichloroethylene (other names: TCE, trichloroethene, ethylene trichloride, 1-chloro-2,2-dichloroethylene, 1,1-dichloro-2-chloroethylene, 1,1,2-trichloroethylene, TRI)	Activities: Arts and crafts hobbyists Bathing, laundering or cooking with contaminated water Occupations: Metal degreasing operators, municipal and hazardous waste incinerator workers, manufacturers of adhesive glues, disinfectants, pharmaceuticals, dyes, perfumes, soaps, paints, and coatings, workers in chemical industries that manufacture polyvinyl chloride, pentachloroethane, and other polychlorinated aliphatic hydrocarbons, flame retardant chemicals and insecticides, mechanics, oil processors, printers, resin workers, rubber cementers, shoe makers, textile and fabric cleaners, tobacco denicotinizers, varnish workers, and some dry cleaners	6-23 9-3 7-3, 7-4, 7-7, Appendix 7B, 7C	15-18, 15-19 to 15-21, 15-24, 15-89 15-99

Table 1-3. Identifying Potentially Highly Exposed Populations on the Basis of Hazardous Substance
(Hazardous Substances from 1997 EPA/ATSDR Priority List of Hazardous Substances) (continued)

Hazardous Substance	Potentially Highly Exposed Population ^a	Relevant Tables in this Document	Relevant Tables in Exposure Factors Handbook
Chromium (hexavalent)	<p>Activities: Living on landfill derived from chromium-containing soil Children playing outdoors (esp. near roadways or contaminated landfill)</p> <p>Occupations: Welding of alloys and steel, chrome electroplating, paints and pigments manufacture, chemical manufacture, industrial cooling towers using chromate chemicals as rust inhibitors, chrome alloy production, textile manufacturing, photoengraving, copier servicing, leather tanning, and airborne emissions from incineration facilities</p>	2-1 7-3, 7-4, 7-7, Appendix 7B, 7C	15-25, 15-59, 15-60, 6-14
Hexachlorobutadiene (Other names: HCBd, perchlorobutadiene, Dolen-Pur)	<p>Occupations: Manufacturers of rubber compounds and lubricants, and manufacturers of chemicals such as tetrachloroethylene, trichloroethylene and carbon tetrachloride.</p>	7-7	
Chlordane, including aldrin, dieldrin, and heptachlor (Trade names: Velsicol-1068, Octachlor, Chlorkil, Ortho-chlor, Dowchlor, Gold Crest C-100, Topiclor 20)	<p>Activities: Living in homes previously treated for termite infestation Eating food prepared from plants grown on chlordane-treated fields and the fat of meat or milk from animals that eat grass from chlordane-treated fields</p> <p>Occupations: Chlordane pesticide manufacture for export, or chlordane cleanup workers (Chlordane has been banned from commercial use in the U.S.)</p>		16-31, 16-32
Tetrachloroethylene (Other names: tetrachloroethene)	<p>Activities: House repairers or remodelers Use of spot removers, or exposure to recently dry-cleaned fabrics Possible well water contamination Auto repair Hobbyists using paint removers and wood cleaners</p> <p>Occupations: Dry-cleaning workers, machinists, plastic extruders, and electronic assemblers, or workers manufacturing consumer products containing tetrachloroethylene, house cleaners, painters</p>	6-23 6-23 6-23	5-23, 6-2, 6-3, 6-4, 6-5

^a Potential highly exposed populations may include these groups, but are not limited to these groupings.

2. SOCIODEMOGRAPHIC CHARACTERISTICS OF THE GENERAL U.S. POPULATION

This section presents sociodemographic characteristics of the U.S. population that may be useful when assessing highly exposed populations. Characteristics included are gender, age, race, ethnicity, geographic location, economic factors, and institutionalized populations. Some data are included in more than one section because these data may be useful for more than one type of assessment. Relevant terms (e.g., race) are defined when available in the sections where they are presented. Definitions of relevant terms are presented as they appear in the cited reference to avoid misrepresentations.

Much of the data in this section are adapted or derived from the 1995 *U.S. Bureau of the Census, Statistical Abstract of the United States*. It is a standard summary of statistics on the social, political, and economic organizations of the United States. Sources of the information presented include Federal statistical bureaus and other organizations that collect and provide statistics as a principal activity, government regulatory agencies, private research, trade associations, health associations, etc. (U.S. Bureau of the Census, 1995; 1997). Statistics presented were obtained and tabulated by various means: (1) complete enumeration or census, (2) samples, (3) extraction from records kept for administrative or regulatory purposes, and (4) through interviews or mail explicitly for statistical purposes (U.S. Bureau of the Census, 1995; 1997). The following statistical abstract data presented are based on census data collected from the decennial Census of the Population, a monthly population survey, a program of population estimates and projections, and a number of other periodic characteristics. The U.S. Constitution requires that the U.S. Bureau of the Census collect data every 10 years (U.S. Bureau of the Census, 1995). These decennial censuses provide data for many socioeconomic reports on the status of the general U.S. population.

U.S. Census Bureau data are accessible on the World Wide Web via the Internet. The Bureau's home page (Internet address: www.census.gov) contains information on the kinds of data available and instructions on how to conduct data searches, extract data, and download data files. Information available includes summaries from the most recent census in database format and search tools such as *Map Stats* and *US Gazetteer*, which generate census data profiles of specific U.S. locations. Another option available is the *Tiger Mapping Service*, which allows the generation of national-scale, street-level maps from publicly available data. Questions on the U.S. Census Bureau's home page can be sent to webmaster@census.gov (U.S. Census Bureau

Home Page, Dec. 23, 1996). Section 11 contains information on how to access U.S. Government data on the Internet.

2.1. RESIDENT POPULATION BY GENDER AND AGE

The gender and age distribution of the population in question should be determined to identify populations with potentially high exposures. Table 2-1 presents the U.S. general population by gender and age for the year 1994 (U.S. Bureau of the Census, 1995). Figure 2-1 illustrates the population distribution of the U.S. general population by age and gender for the years 1987, 2000, 2010, and 2030 (Spencer, 1989). Gender- and age-related factors resulting from varying behavior and activity patterns are discussed in Sections 1.2.2 and 1.2.3 of this document.

Gender- and age-related factors can increase exposure to toxic agents. For example, children often exhibit behavior and activity patterns that are different from adults, which may potentially increase their exposure to environmental agents. Infants have a greater surface area to body weight ratio than adults (Calabrese, 1986); thus, infants potentially may be at greater risk from environmental contaminants via dermal exposure. Also, children spend time in outdoor play or structured activities. As a result, they can have higher exposure to contaminants found in the soils on playgrounds, parks and other outdoor recreational areas, and residential yards. In addition, children and infants tend to put objects into their mouths; these objects may contain chemical components or include soil particles containing chemical contaminants, which might increase their risk of exposure to contaminants by ingestion. Infants have faster respiratory rates than adults, resulting in potentially increased risk from contaminants via inhalation. Also, individuals who spend most of their time in an indoor environment (e.g., elderly residents of nursing homes) may experience higher exposures to indoor air contaminants.

2.2. RESIDENT POPULATION BY RACE

The racial composition of a population in question should be determined to ascertain if exposure to certain environmental contaminants may be different for that group based on race or ethnicity. For example, certain cultural practices (e.g., use of mercury for spiritual purposes) are more common in some ethnic groups than in others. The Bureau of the Census is directed by the U.S. Office of Management and Budget, under Statistical Policy Directive No. 15, to collect and publish statistics of the general population by race (U.S. Bureau of the Census, 1995). Common racial classifications include American Indian, Alaska Native, Asian or Pacific Islander, black,

and white. The concept of race that the U.S. Bureau of the Census uses reflects self-identification by survey respondents and is not intended to reflect any biological or anthropological definitions. Respondents who do not identify (themselves) with a specific racial group on the questionnaire are included in the "other race" category. Hispanic is defined, by directive, as an ethnicity, not a race (U.S. Bureau of the Census, 1995). A self-identification question is used in the census questionnaire to identify Hispanic origin, and Hispanic persons may be of any race (U.S. Bureau of the Census, 1995). Persons classified as Hispanic include those who reported their race as Mexican-American, Chicano, Mexican, Puerto Rican, Cuban, Central or South American (Spanish countries), or other Hispanic origin (U.S. Bureau of the Census, 1995). Table 2-2 presents total numbers and percent distribution of the general population by racial categories not of Hispanic origin (white; black; American Indian, Eskimo, Aleutian; and Asian and Pacific Islander) and persons of Hispanic origin for years 1980, 1985, 1990, and 1994.

2.3. RESIDENT POPULATION BY AGE, RACE, AND HISPANIC ORIGIN

Table 2-3 presents the resident general U.S. population by age, race, and Hispanic origin from 1980 to 1994. Race and Hispanic origin are defined in Section 2.2.

2.4. RESIDENT POPULATION BY GEOGRAPHIC REGION

The risk assessor may be concerned with the geographic location of the population of concern. Examples of geographic factors that may be relevant for determining exposure of populations include amount of time spent outdoors and length of growing season (potentially greater in areas of warmer climates), and amount of time spent indoors exposed to indoor air contaminants (potentially greater in colder climate areas). The Bureau of the Census subdivides the United States into four geographic regions of Northeast, Midwest, South, and West. These regions are further divided into divisions containing different States. The regions, divisions, and their corresponding States (using standard U.S. Postal Service abbreviations for States) are shown below. Table 2-4 presents the resident general population by these geographic regions, race, and Hispanic origin, for the year 1990.

Region	Division and Abbreviation	States
Northeast	New England (NE)	CT, ME, MA, NH, RI, VT
	Middle Atlantic (MA)	NJ, NY, PA
Midwest	East North Central (ENC)	IL, IN, MI, OH, WI
	West North Central (WNC)	IA, KS, MN, MO, NE, ND, SD
South	South Atlantic (SA)	DE, DC, FL, GA, MD, NC, SC, VA, WV
	East South Central (ESC)	AL, KY, MS, TN
	West South Central (WSC)	AR, LA, OK, TX
West	Mountain (M)	AZ, CO, ID, MT, NV, NM, UT, WY
	Pacific (P)	AK, CA, HI, OR, WA

2.5. SOCIAL AND ECONOMIC CHARACTERISTICS OF THE GENERAL U.S. POPULATION

Socioeconomic characteristics of a population may affect exposure to certain environmental contaminants. Living in poverty could potentially contribute to increased exposure. For example, populations living in older housing units, and especially those with limited funds available for regular repairs and maintenance, may have lead-based paint and inadequate ventilation systems; both may contribute to increased risk for exposure to environmental contaminants. Various socioeconomic data were available from the U.S. Bureau of the Census (1995) describing the general population. For convenience and consistency, these data are presented by racial categories as provided in the reference cited. Table 2-5 presents socioeconomic data for U.S. white and black populations, and Table 2-6 presents socioeconomic data for the American Indian population. Figure 2-2 presents the Native American populations in thousands residing in the 10 EPA regions by State for 1995. Table 2-7 presents socioeconomic data for the Asian and Pacific Islander population, and Table 2-8 presents socioeconomic data for the Hispanic population.

2.6. RESIDENT POPULATION BY HOUSEHOLD

Many risk assessments are based on exposure to individuals or groups of individuals living in a household or residence. For example, an assessor may wish to determine the percentage of households in a given area with young children who spend time outdoors playing. These children may subsequently be exposed to soil contaminants resulting from deposition of airborne particulates.

A household is described by the U.S. Bureau of the Census as composed of all persons who occupy a housing unit (a house, apartment, etc.) that constitutes separate living quarters (U.S. Bureau of the Census, 1995). A household includes related family members and all the unrelated persons (lodgers, foster children, employees, etc.) who share a housing unit. A family is defined by the Census Bureau as a group of two or more persons related by birth, marriage, or adoption and residing together in a household (U.S. Bureau of the Census, 1995). Table 2-9 presents the numbers (in thousands) of household units in regions, divisions, and States from 1980 to 1994. Table 2-10 presents the numbers (in thousands) of family and nonfamily households by race, Hispanic origin, and type.

2.7. URBAN AND RURAL U.S. POPULATION BY REGION, DIVISION, AND STATE

A risk assessor may wish to enumerate the population residing specifically in urban or rural areas of a State or in a metropolitan area. For example, a risk assessor considering the population exposed to a pesticide as a result of application for agricultural use would choose an appropriate percentage of the nearby rural population. Likewise, living in a rural area that is known to have certain contaminants in its water supply (i.e., groundwater) also can increase risk. Living in urban areas with increased vehicle traffic and the resulting increase in air pollution from auto exhaust can increase risk to certain air contaminants, such as benzene.

The U.S. Bureau of the Census defines urban populations as persons living in incorporated or unincorporated cities or towns of 2,500 or more inhabitants or in urbanized areas defined as adjacent densely settled surrounding areas with a minimum of 50,000 persons (U.S. Bureau of the Census, 1995). Populations not classified as urban are classified as rural (U.S. Bureau of the Census, 1995). Table 2-11 presents the total populations of each region, division, and State, as well as the numbers and percent distribution of urban and rural populations by region, division, and State. The composition of the regions and divisions is provided in Section 2.4.

2.8. RESIDENT POPULATION WITH WORK DISABILITIES

The U.S. Bureau of the Census (1995) considers a disability to be reduced ability to perform tasks one would normally do at a certain stage in life. Table 2-12 presents numbers of disabled persons, ages 21-64 years old, for the total population and by percent employed for 1991, 1993, and 1994.

2.9. NATIVE AND FOREIGN-BORN RESIDENT POPULATIONS

Table 2-13 presents the numbers of persons in the general population who were born in the United States and those born in foreign countries. Data are presented for years 1920 to 1990. These data are presented as an additional population characterization.

2.10. RESIDENT POPULATION ON ACTIVE DUTY IN THE MILITARY

Table 2-14 presents the numbers of individuals serving on active duty in the armed forces, by service, for the years 1950 to 1993. Services included are Army, Navy, Marine Corps, Air Force, and Coast Guard. This population is included not necessarily because they are potentially highly exposed, but as another characterization breakdown of the general population. If an exposure is related to the population of a specific military organization due to some job-related activity, the population potentially exposed can be enumerated. For example, if a contaminant in the insulation (such as asbestos) of a ship is a potential problem, Navy and Coast Guard personnel could potentially have greater exposures than the general population.

2.11. RESIDENT INSTITUTIONALIZED POPULATIONS AND THOSE LIVING IN GROUP QUARTERS

The U.S. Bureau of the Census (1995) classifies a person as living in group quarters if that person is not living in a household. Household is defined in Section 2.6. Persons living in group quarters include those who are institutionalized (e.g., under care or custody in juvenile facilities, jails, correctional centers, or hospitals, or residents in college dormitories, rooming houses, military barracks, etc.). Data pertaining to these specific populations may be useful when a potential exposure is limited to a selected microenvironment. For example, patients in a hospital potentially could be exposed through the dermal or inhalation pathways to chemicals used for sterilization procedures, such as antiseptics in hospital rooms or as sterilization agents for bed linens. Table 2-15 presents numbers for the general population living in institutions by type of group quarters (nursing homes, college dormitories), region, and State. Note: because

group quarters include military barracks, there may be some overlap with data presented in Section 2.10. Table 2-16 presents numbers of the general population living in jails by race and detention status for the years 1978 to 1994. Table 2-17 presents numbers of the general population living in Federal and State prisons for the years 1970 to 1993.

2.12. TRENDS IN SOCIODEMOGRAPHIC CHARACTERISTICS OF THE GENERAL U.S. POPULATION

Population trends are useful if an assessor is estimating an exposed population across time. For example, if the risk for increased exposure is specific to a specific population (e.g., race, gender) the estimated exposed population may be determined in some instances up to 1995 and projected for the years from 2000 to 2050, in increments of 10 years.

2.12.1. Trends in Gender and Age Characteristics of the General U.S. Population

Table 2-18 shows trends in the ratio of males to females for all age groups from 1950, with projections for 2025 (U.S. Bureau of the Census, 1995). Data indicate that there are slightly more males than females under the age of 14 years. Between ages 14 to 24 years, the numbers of males to females are nearly equal; however, after the age of 24 years, the ratio of males to females shows a fairly consistent decrease. The ratio of males to females is lowest at age 65 years and over. The average male-to-female ratio (for all ages) has dropped slightly from 98.6 in 1950 to 95.4 in 1994, and is projected to increase slightly to 96.3 by 2025.

2.12.2. Trends in Demographics of Race and Ethnic Characteristics of the General U.S. Population

Trends in demographics of race/ethnicity are presented in Table 2-19. The percent distribution is provided for the resident population by race from 1980 to 1995, with projections to 2050. Data in this table are adapted from Table 19 in *Statistical Abstract of the United States, 1995* (U.S. Bureau of the Census, 1995). These data indicate an increase in the general population for persons of Hispanic origin since 1980. The percent distribution (of the total distribution of 100 percent) for the Hispanic origin population was 6.54 percent in 1980 and increased to a projected distribution of 22.46 percent for the year 2050.

2.12.3. Trends in Regional Distribution of the General U.S. Population

Table 2-20 presents changes in location of primary residence of the general population. Data in this table are adapted from Table 30 in *Statistical Abstract of the United States, 1995* (U.S. Bureau of the Census, 1995). Census data indicate that percentage increases in population from 1960 to 1994 were highest in the West and South regions. The greatest population decreases occurred in the Midwest and Northeast regions.

2.12.4. Trends in Demographics of Social and Economic Characteristics of the General U.S. Population

Tables 2-5 through 2-8, discussed previously in Section 2.5, indicate changes in the socioeconomic characteristics of the general population. The trends from these tables are summarized as follows:

- White population in 1994, relative to 1980 (Table 2-5):
 - Total population increased by 12.5%;
 - Number of high school graduates dropped by 3%;
 - Number of college graduates increased by 5%;
 - Number employed increased by 3.5%;
 - Relative to 1980, the median income rose by \$2,000 in 1990, then dropped to \$600 below the 1980 value by 1994;
 - Number of persons below the poverty level increased by 3.2%; and
 - Consistent family types and housing tenure.
- Black population in 1994, relative to 1980 (Table 2-5):
 - Total population increased by 27%;
 - Number of high school graduates increased by 5.4%;
 - Number of college graduates increased by 11.3%;
 - Number employed increased by 3.9%;
 - Number of families headed by women increased by 7.6%;
 - Relative to 1980, the median income rose by \$949 in 1990, then dropped to \$1,053 below the 1980 value by 1994; and
 - Number of persons below the poverty level increased by 2%.
- American Indian population (Table 2-6): Data from past years were not readily available; therefore, trends could not be evaluated. Data on socioeconomic status of the American Indian population should be available from the Bureau of Indian Affairs in Washington, DC.

- Asian and Pacific Islander population in 1994, relative to 1990 (Table 2-7):
 - Total population increased by 11.5%;
 - Number of high school graduates decreased by 1.7%;
 - Number of college graduates decreased by 1.3%;
 - Number employed decreased by 2.6%;
 - Relative to 1990, the median income dropped by \$2565;
 - Number of persons below the poverty level increased by 1.2%; and
 - Consistent family types and housing tenure.

- Hispanic population data trend summary (Note: All tables by number listed for the Hispanic population as data sources are the table numbers presented in the *Statistical Abstract of the United States* [U.S. Bureau of the Census, 1995]):
 - Total population increased by 83% from 1980 to 1995 (data from Table 19);
 - Number of high school graduates increased by 9.3% from 1980 to 1994 (data from Table 238);
 - Number of college graduates increased by 1.5% from 1980 to 1994 (data from Table 238);
 - Number employed increased by 2.1% from 1980 to 1994 (data from Table 627);
 - Relative to 1980, the median income dropped by \$1,082 by 1993 (data from Table 723);
 - Percentage of persons below the poverty level increased by 8.8% from 1979 to 1993 (data from Table 744); and
 - Homeowner-occupied housing increased by 46% from 1980 to 1990 (data from Table 1226).

2.12.5. Trends in Demographics of Distribution by Households of the General U.S. Population

Table 2-9, shown in Section 2.6, presents percent change in numbers of households by State. Trends generally parallel those of regional distribution of the general population, in that the greatest increases occurred in the West and South regions, with slight increases in the North and Midwest regions. Table 2-9 also indicates that the number of persons per household nationwide has dropped slightly, from 2.75 persons in 1980 to 2.64 persons in 1994.

2.12.6. Trends in Demographics of Urban and Rural U.S. Population

Table 2-21 indicates that, since 1960, the percent of the general U.S. population residing in urban areas has increased. The population percentage residing in rural areas has decreased.

2.12.7. Trends in Demographics of Resident Population With Disabilities

Trends for persons with disabilities may be inferred from economic data containing the number of persons receiving public assistance. The assumption is that persons with disabilities often are not able to work to fully support themselves. Table 2-22 presents numbers of persons receiving public assistance in the United States from 1980 to 1993. Table 2-23 in this document is a summary of data presented in table number 611 in the 1995 *U.S. Bureau of the Census Statistical Abstract of the United States*, and it indicates that the percentage of persons receiving public assistance increased from 6.5% in 1990 to 7.7% in 1993.

2.12.8. Trends in Demographics of Native and Foreign-Born Resident Populations

Table 2-13, Section 2.9, indicates that the percentage of the general U.S. population born in foreign countries has decreased over the past 70 years from 13.2% in 1920 to 7.9% in 1990. Immigration rates from 1901 to 1993 are presented in Table 2-24 (U.S. Bureau of the Census, 1995). These data show that the rate of immigration was 10.4% between 1901 and 1910, dropped to 0.7% between 1941 and 1950, and since that time has risen to a current rate of 4.8%. The U.S. Bureau of the Census defines immigrants as aliens admitted for legal permanent residence in the United States (U.S. Bureau of the Census, 1995). The category "immigrant" includes persons who may have entered the United States as nonimmigrants or refugees but who subsequently changed status to permanent resident.

2.12.9. Trends in Demographics of Resident Population on Active Duty in the Military

Table 2-25 presents the numbers and percent distribution of the general U.S. population on active duty in the military. Data for this table were adapted from the U.S. Bureau of the Census, 1995. These data indicate that the percent of the general population serving in the military was approximately 0.9% in 1950, increased to about 1.6% between 1955 and 1970, then dropped to approximately 0.8% from 1975 to 1993.

2.12.10. Trends in Demographics of Resident Populations Living in Institutions and Group Quarters

Trends for persons residing in group quarters (college dormitories, rooming houses, etc.) could not be evaluated because data from past years are not readily available. Trends in numbers of persons living in institutions (e.g., under care or custody in juvenile facilities, jails, correctional centers, or hospitals) are summarized as follows (note: numbers of total U.S. population are from Table 2 in the U.S. Bureau of the Census, 1995):

- The number of persons in jails has increased since 1978 (Table 348, U.S. Bureau of the Census, 1995), from 158,394 persons (0.07% of total population) in 1978 to 490,442 persons (0.19% of total population) in 1994.
- The rate (per 100,000 persons of the general population) of persons in Federal and State prisons (Table 2-17) has increased from 96.7 in 1970 to 352.9 in 1993.

3. LOCATION OF RESIDENCE AS A FACTOR LEADING TO HIGHLY EXPOSED POPULATIONS

Some populations may experience greater potential exposures due to either the location or condition of their residence, or the ambient environment surrounding their residence. This chapter presents the issues that may effect populations living in or near:

- Waste management facilities,
- Inner cities,
- Urban areas,
- Coastal areas,
- Native American reservations or trust areas, and
- Major highways.

3.1. POPULATIONS LIVING NEAR WASTE MANAGEMENT FACILITIES

Populations residing or working near a variety of waste management facilities may experience exposures higher than those of the general population. Types of waste management facilities include solid waste disposal landfills, municipal waste incinerators, medical waste incinerators, and Superfund or Brownfields sites.

Exposure assessors are reminded that factors such as age, cumulative number of years an individual has lived in his or her residence, hours per day spent at one's residence, daily activities, and proximity to waste management facilities can influence the type, duration, and degree of contact with hazardous chemicals (ATSDR, 1996). Data quantifying populations living near waste management facilities may not be readily available; however, data can be generated on a case-by-case or site-specific basis. Information on solid waste landfills, municipal waste incinerators, medical waste incinerators, and other types of waste management facilities can be obtained from Envirofacts. (See Section 11 for a description.)

Information on hazardous waste sites may be obtained from EPA information gathered under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and its 1986 Superfund Amendments and Reauthorization Act (SARA). Especially useful is the Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS) database that lists the approximately 40,000 hazardous waste sites to be screened by EPA for possible placement on the National Priorities List (NPL). The NPL lists inactive

hazardous waste sites eligible for federally funded cleanup. Data on the number of NPL sites per State in 1994 have been reported by the U.S. Bureau of the Census (1995) and are presented in Table 3-1. Information on locations of major industrial facilities (e.g., manufacturers/processors of steel, chemicals, concrete) is most readily available from trade associations concerned with the specific type of product. Estimates of emissions/releases of many hazardous pollutants to water, air, etc., are available from EPA-maintained databases, such as the Toxics Release Inventory (TRI). The Chemical Information System (CIS) contains information on specific chemical substances, including toxicological, carcinogenic, and environmental data. It also includes other EPA databases, such as ACQUIRE, CERCLIS, and RCRIS.

The U.S. Bureau of the Census is a major population database on size, distribution, and demographic characteristics of the Nation's population. These data can be used to help characterize populations near waste management facilities and other facilities that release chemicals into the environment. Population characteristics, such as sex, race, ethnicity, and household income can be determined from the census data. Population density within a selected proximity to a specific waste management facility can be estimated using the 1990 census data and tools such as a Geographic Information System (GIS). GIS maps can be produced that indicate the proximity of waste management facilities to nearby populations. Another source of demographic/economic information that can be used to characterize population groups are commercial marketing companies, which usually require a fee to provide information. For additional information sources in electronic format or on the Internet, please refer to information on accessing U.S. Bureau of the Census data in Section 11.

The following studies offer data that characterize the populations living near hazardous waste sites according to race/ethnicity and/or income. Some of the studies support the theory that hazardous waste sites are located in predominantly minority or low-income communities, while some do not. Table 3-2 provides a list of studies that evaluate populations living near hazardous waste sites. This table does not provide a complete listing of all sources available, but is presented to provide data sources with examples of various methodologies used to identify or quantify populations around hazardous waste sites. Most of the studies were developed or conducted to address issues of environmental justice. However, an assessor may find that the methodologies used may be useful for addressing population issues other than those related to environmental justice. It should be noted that studies that have been used to examine the residential proximity to a limited number of environmental hazards by race/ethnicity and socioeconomic status should be used with caution. The reader is directed to local, regional,

State, and/or Federal agencies maintaining the types of data needed for a site-specific study. No overall conclusion is presented in this document. Two key studies on this issue are described below in terms of their methodology, data source, conclusions, and limitations. The others are summarized in Table 3-2.

3.1.1. ATSDR Biennial Report to Congress 1991 and 1992 (ATSDR, 1996)

The National Research Council (NRC), using data from EPA, has estimated that approximately 41 million people live less than 4 miles from one or more of the Nation's 1,134 NPL sites. NRC also estimated that an average of 3,325 persons live within 1 mile of any given NPL site. The Agency for Toxic Substances and Disease Registry (ATSDR) conducted public health assessments in 1991 and 1992, and results showed that the number of people who are actually or potentially exposed to hazardous waste at a site can range from 0 to 735,000 people. The exposure of people living near hazardous waste sites can be affected by certain activities. For instance, activities such as children playing near the site and people eating fish and game animals exposed to site contaminants have been associated with an increased potential for exposure to certain contaminants. People living near hazardous waste sites are potentially exposed to multiple substances.

ATSDR, an agency of the U.S. Department of Health and Human Services (DHHS), provides information on effects of public health of hazardous substances in the environment. ATSDR data, documents, and toxicity information are accessible on the World Wide Web via the Internet. (See Section 11.)

3.1.2. Distribution of Industrial Air Emissions by Income and Race in the United States: An Approach Using the Toxics Release Inventory (Perlin et al., 1995)

This study examines several methodological approaches important in the planning and decision-making process relevant to facility emissions and their impact on health and risk to populations in the surrounding communities.

Perlin et al. (1995) conducted a national and regional comparison study to investigate the differences by ethnicity/race and household income using county-level air emissions of chemicals from certain industrial operations in the United States. This study made national and regional comparisons using emission estimates from the 1990 TRI, demographic data from the 1990 census, and 1990 income data from the Donnelley Marketing Information Services (DMIS). The 1990 census data (Public Law 94-171) were employed to enumerate the populations of all

U.S. counties by race and ethnicity. The races were categorized as white, black, Native American, Asian or Pacific Islander (A/P), and "other" races, while Hispanic was categorized as an ethnic group. The 1990 DMIS estimates were based on projections from the 1980 Census, adjusting the values whenever necessary using income data from the Internal Revenue Service and inflation data from the Consumer Price Index.

Table 3-3 presents the distribution of TRI facilities and racial/ethnic populations among EPA regions in 1990. Region 5 had the highest percentage of the Nation's white population (20%); Region 4 had the highest percentage of the black population (30%); Region 6 had the highest percentage of Native Americans (25%); and Region 9 had the highest percentage of Asian and Pacific Islanders (50%) and other races (44%), as well as the highest percentage of the Hispanic population (38%).

Perlin et al. (1995) stressed that residing in a county, Zip Code, or census tract with one or more potential sources of pollution (e.g., hazardous waste site, chemical plant) or with above-average pollutant emissions does not necessarily imply that residents are exposed to higher than average ambient concentrations of environmental agents. The study further states there may, in fact, be no direct relationship within a particular geographic unit of analysis between (1) the presence of potential sources and/or estimated contaminant releases to the environment and (2) actual ambient levels of pollution encountered by people living there (Perlin et al., 1995).

3.2. POPULATIONS LIVING IN THE INNER CITIES OF LARGE METROPOLITAN AREAS

The inner city is defined by researchers as the most densely populated, often older areas of a large metropolitan area, usually geographically located in the central part of the city. Tables 3-4 and 3-5 provide population data from the U.S. Bureau of the Census (1995) for large metropolitan areas nationwide. The population data are also available from the U.S. Bureau of the Census on the Internet. (See Section 11.) If more specific local data are needed, readers are referred to their State, local, and regional governmental agencies or to the U.S. Bureau of the Census population data for the specific study/assessment area. (See Section 11, Table 11-1.) Residing in the densely populated centers of metropolitan areas potentially may increase an individual's exposure to certain toxic agents. Residents of inner cities may have higher exposures to certain air pollutants that are more commonly found in large metropolitan areas. These problem air pollutants may include, for example, carbon monoxide and lead from automobile exhaust, ozone, particulates, and volatile organic compounds.

In addition, for economic reasons, the inner cities of large metropolitan areas may have a higher percentage of housing that generally is older and less well maintained. Individuals living in older homes (especially those in poor repair) may be more exposed to peeling paint, older and less efficient heating systems, lead water pipes, etc.

Inner cities, along with coastal, urban, rural, and Native American reservation or trust land areas, may each experience unique exposures related to the culture, resources, land use practices, or activities associated with that setting.

3.3. POPULATIONS LIVING IN URBAN AREAS

An urban area is defined by the U.S. Bureau of the Census as a place (city, town, village, borough, etc.) having more than 2,500 inhabitants, and an urbanized area is one or more places and the adjacent densely populated surrounding territory that together have a minimum population of 50,000 persons (U.S. Bureau of the Census, 1995). Any area not classified as urban is considered rural. If a specific contaminant is known to occur at higher levels in an urban environment (e.g., dioxins in air), these data can be used to obtain an estimation of the size of the urban population that potentially may be exposed. Table 3-6 presents the urban and rural population of the United States from 1960 to 1990 by region, division, and State. Full descriptions of divisions and regions are provided in Section 2.4 of this report.

3.4. POPULATIONS LIVING IN COASTAL AREAS

Populations living in coastal areas are defined by the U.S. Bureau of the Census as persons living in counties or equivalent areas with at least 15% of their total land in a coastal drainage area (U.S. Bureau of the Census, 1995). Information on coastal drainage areas is obtained from the National Oceanic and Atmospheric Administration (NOAA). Total coastal land area in the United States is more than 3.5 million square miles (U.S. Bureau of the Census, 1995), with major coastal areas existing in the Atlantic, Gulf of Mexico, Great Lakes, and Pacific regions. Populations living very near or in coastal areas may experience higher exposures to contaminants in air and water resulting from industries typically located there, such as petroleum refineries, chemical manufacturing plants, and import/export facilities. Table 3-7 presents the population living in the coastal counties of the United States from 1960 to 1994, along with the total land area of the coastal regions.

3.5. POPULATIONS LIVING ON NATIVE AMERICAN RESERVATIONS OR TRUST LANDS

Based on 1990 census data, the U.S. Bureau of the Census (1995) reports that a total of more than 800,000 persons either live on reservations and trust lands with 5,000 or more residents, or identify themselves as members of a Native American Tribe with 10,000 or more members. Table 3-8 presents these data by Tribe. The total Native American population numbers include those not living on reservations or trust lands.

The Department of Health and Human Services (DHHS), through the Indian Health Service (IHS) of the Public Health Service, provides federally funded health services to Native Americans and Alaska Natives (U.S. DHHS, 1993). IHS estimates its service population by counting those individuals who have identified themselves in the previous official U.S. census as American Indian, Eskimo, or Aleut and reside on or near reservations or trust lands. IHS's estimates of current and projected service population numbers by area are provided in Figure 3-1. The IHS population, estimated at 1.33 million for 1994, increases at a rate of about 2.35% per year (U.S. DHHS, 1993).

As cited by IHS (U.S. DHHS, 1993), numerous factors contribute to increased risk for individuals living on Native American reservations or trust lands. Some factors increasing risk for this population are as follows:

- Lower median household income;
- High percentage living below the poverty level;
- Higher birth rate; and
- High mortality rate from tuberculosis, alcoholism, diabetes, accidents, homicide, suicide, and pneumonia and influenza.

3.6. POPULATIONS LIVING NEAR MAJOR HIGHWAYS

Data are not readily available on the numbers of individuals living near major (interstate) highways. The most likely sources of data are State and/or local transportation offices or regional/local governmental organizations. For instance, in the Washington, DC, metropolitan area, the Council of Governments (COG) suggested that population numbers of persons living in the DC area near major highways could be determined from information available at its information office. COG uses census data to determine population numbers of small geographic units (subdivisions of counties) within its jurisdiction, maps produced from these data, and maps indicating locations of major highways to determine the numbers of persons living in the DC

area near major highways. An assessor could use the same approach as COG to estimate the specific population of concern.

Data are available from the U.S. Bureau of the Census (1995) on highway mileage for interstates and other roadways by State. These data are presented in Table 3-9. Information is also available for motor vehicle registrations and vehicle miles of travel by State as shown in Table 3-10. If an average population per highway mile or vehicle mile can be estimated or assumed, a potential highly exposed population could be determined. Readers are again referred to their State, local, and regional governmental agencies.

Table 3-2. Sources of Data Used in Major Studies Concerning Populations Living Near Hazardous Waste Sites

Study ^a	Study Focus	Hazardous Waste Site ^b Data Source	Population Data Source
Anderton et al., 1994 (study conducted at Univ. of Mass., sponsored by grant from Waste Management Institute)	Census tracts nationwide 454 privately owned/operated TSDFs in 48 contiguous States that opened before 1990, were operating in census tract during 1980, and still in operation at time of study. "Surrounding area" = 2.5 mile radius from center of tract.	Environmental Institute's 1992 "Environmental Services Directory"	Census data; census tract level (authors define tract as ≈ 4,000 persons)
U.S. General Accounting Office, 1983	U.S. Congress requested local study of four hazardous waste facilities in EPA Region 4.	Four off-site landfills (not industrial facilities) in AL, NC, SC	Census data
Geschwind et al., 1992	Authors evaluated possible correlations between congenital malformations in newborns with mother's proximity to hazardous waste sites in NY State.	New York State's Hazardous Waste Site Inspection Program - 917 waste sites in 62 counties of NY State	New York State Dept. of Health's Congenital Malformations Registry for 1983 and 1984, which listed 34,411 cases of congenital malformations
Glickman et al., 1994	Evaluates relationship between location of manufacturing facilities releasing air toxins with socioeconomic char. of communities for both communities with and without these facilities in Allegheny Co., PA (including Pittsburgh).	U.S. EPA's Toxic Release Inventory (TRI), 1990 emissions data	Socioeconomic and demographic data: 1990 census
Nieves and Nieves, 1992 (Authors from Argonne National Lab., Argonne, IL)	Facility types include: manufacturers of chemicals, petroleum products, plastics, rubber; pulp mills; smelters; incinerators; chemical weapons; radioactive waste disposal.	Potential air pollutants - 1985 National Acid Precipitation Assessment Program Inventory Commercial haz. waste - EPA's NPL list. Chemical weapon site data - Rouse, 1988. Radioactive waste sites - DOE 1991 Annual Report	1980 U.S. census data - 1983 County and City Data Book (county-level data; 3,109 counties in contiguous U.S.)
Perlin et al., 1995 (Authors with U.S. EPA)	Concerns environmental justice studies, discusses issues to address to strengthen scientific foundation of data. Evaluates nationwide TRI releases, Census data, income data	U.S. EPA's TRI, 1990 emissions estimates	Demographic data: 1990 Census Economic data: Donnelley Marketing Information Services ^c
Sosniak et al., 1994 (Authors from ATSDR and CDC, Atlanta, GA)	Evaluates possible correlation between low birth weight and mother's proximity to NPL sites. Mothers residing <1 mi of NPL were considered "exposed." Authors concluded merging large population data bases with environmental data is not an efficient method of evaluating low birth weight risks.	U.S. EPA's NPL list, 1990 Lat/Long of NPL site determined using EPA's 1987 Geographic Data File	Nationwide survey - 1988 National Maternal and Infant Health Survey (funded by ATSDR, National Center for Health Statistics) Postal Zip Codes determined for 17,407 mothers

Table 3-2. Sources of Data Used in Major Studies Concerning Populations Living Near Hazardous Waste Sites (continued)

Study ^a	Study Focus	Hazardous Waste Site ^b Data Source	Population Data Source
Stockwell et al., 1993	Characterizes releases of toxic chemicals using TRI data in southeastern U.S., by using geographic information system (GIS) mapping.	U.S. EPA's TRI, 1987 emissions data	Demographic data: 1980 census data
United Church of Christ, 1987 (Sponsored by United Church of Christ Commission for Racial Justice)	Nationwide study of 530 facilities and Zip Code areas. Facility site (vs. business address) identified with U.S. EPA's online Right to Know Network Facility Index Data System (FINDS).	U.S. EPA data compiled in "1992 Environmental Information Services Directory" by Environmental Information Ltd.	1990 census data updated to 1993 by marketing firm (Claritas, Inc.); 5-digit Zip code-level population data
Zimmerman, 1993	Distribution of NPL sites and socioeconomic characteristics of areas surrounding NPL sites are compared with national distribution/socioeconomic characteristics.	More than 800 inactive waste disposal sites on NPL	1990 census data; census tracts nationwide

^a Complete citations are provided in the reference listing for this section.

^b Facilities for treatment, storage, and disposal of hazardous wastes.

^c Donnelley Marketing Information Services used 1980 census data, adjusting values using income data from the Internal Revenue Service and inflation data from the Consumer Price Index.

M/W ^j						0.15		0.01		0.04		0.05		0.11		

^a Racial/ethnic subpopulation category definitions and counts are from the 1990 census, Public Law 94-171.

^b Total number of TRI facilities in the region and as a percent of the total number of U.S. TRI facilities. Total number of TRIs in the United States is 21,864.

^c Percent of the U.S. population of each racial/ethnic group that resides in the specified region.

^d Native American includes Inuits and Aleuts.

^e A/P Islander is Asian and Pacific Islanders.

^f Other races include the remaining races that constitute the nonwhite population. On a racial basis, the Census Bureau divides the total U.S. population into whites, blacks, American Indians, Asian or Pacific Islanders, and other races. On an ethnic basis, the Census Bureau divides the total United States population into people of Hispanic or non-Hispanic origin. Population counts by race do not distinguish between individuals of Hispanic and non-Hispanic origin. For example, a person identified as a white Hispanic would be counted as both white and Hispanic.

^g Hispanics are counted separately as they are considered to be an ethnic population, not a race, and they are counted separately by the Census Bureau.

^h For each region, the total U.S. population of all races (white, black, Native American, Asian and Pacific Islander, and other races).

ⁱ Total number of each racial/ethnic group residing in the specified region.

^j Ratio of minority to white population for the United States.

Table 3-4. Number and Population of Metropolitan Areas by Population Size-Class in 1990: 1980 to 1990

Level and Population Size-Class of Metropolitan Area in 1990	CMSAs and MSAs*				MSAs and PMSAs*		
	Number in 1990	Population in 1980 (mil.)	Population in 1990		Number in 1990	Population in 1990	
			Total (mil.)	Percent in each class		Total (mil.)	Percent in each class
Total, all metropolitan areas	269	177.0	197.8	100	324	197.8	100
Level A (1,000,000 or more)	40	118.7	132.9	67	51	118.7	60
2,500,000 or more	15	84.3	94.1	48	13	58.2	29
1,000,000 to 2,499,999	25	34.4	38.8	20	38	60.5	31
Level B (250,000 to 999,999)	96	41.2	46.4	23	119	56.9	29
500,000 to 999,999	33	21.4	24.3	12	41	29.4	15
250,000 to 499,999	63	19.8	22.0	11	78	27.5	14
Level C (100,000 to 249,999)	110	15.2	16.6	8	130	20.1	10
Level D (less than 100,000)	23	1.9	2.0	1	24	2.1	1

* [As of April 1. Data exclude Puerto Rico. CMSA = consolidated metropolitan statistical area. MSA = metropolitan statistical area. PMSA = primary metropolitan statistical area. Areas are as defined by the U.S. Office of Management and Budget, July 1, 1994.]

Source: U.S. Bureau of the Census, 1995.

Table 3-5. Metropolitan and Nonmetropolitan Population by States: 1980 to 1992

[As of April 1, except 1992, as of July. Metropolitan refers to 251 MSAs (metropolitan statistical areas) and 18 CMSAs (consolidated metropolitan statistical areas) as defined by the U.S. Office of Management and Budget, July 1, 1994.

Nonmetropolitan is the area outside metropolitan areas. Minus sign (-) indicates decrease.]

4. RESIDENTIAL FACTORS AFFECTING EXPOSURE

Many characteristics of a person's primary residence can contribute to increased exposures to environmental contaminants. This section presents population data for persons residing in homes that have varying characteristics, including the following: age of home; resident's tenure (renter, owner, etc.); housing type (public housing, multiple unit, single-family, mobile home, etc.); type of heating and cooking fuel used; presence of attached garage; use of chemicals for pest control, lawn care, etc.; and presence of recreational pools or spas. Data on these housing characteristics are useful for conducting indoor air risk assessments. For example, in areas with high levels of radon in the soils, build-up of radon gas may become a problem in homes with basements. For homes with attached garages, carbon monoxide from automobile exhaust may be an exposure concern. In addition, chemicals used for pest prevention can pose an indoor air exposure risk to persons living in the homes. Persons living in dilapidated, older housing (built prior to the 1978 lead-based paint ban) or persons renovating such a home may be at increased risk of exposure to lead by deteriorating lead-based paint and the dust it generates. The housing characteristics addressed in this section are presented as useful supplemental data for conducting many types of indoor air quality risk assessments. Other useful data may be found in U.S. EPA (1997), the *Exposure Factors Handbook*, Chapter 11.

4.1. POPULATIONS IN HOMES WITH DIFFERENT CHARACTERISTICS

This section presents population data on persons residing in homes with the varying characteristics listed above.

4.1.1. American Housing Survey for the United States in 1993 (U.S. Bureau of the Census, 1993); Statistical Abstract of the United States (U.S. Bureau of the Census, 1997)

The U.S. Bureau of the Census conducted the American Housing Survey from July through December 1993. About 55,000 personal interviews were conducted nationally. Household information was obtained from occupants of the homes; landlords, rental agents, or knowledgeable neighbors provided information on vacant homes. Results obtained from this

national survey are presented in Tables 4-1 through 4-4. Table 4-1 presents the household composition of occupied housing units. Table 4-2 presents the income characteristics of occupied units. Table 4-3 presents data on construction of housing units and location of units. Table 4-4 presents the number of housing units that use various types of fuels for cooking and heating, which may affect indoor air. Table 4-5 presents housing characteristics (e.g., basements, year built, heating equipment) by tenure and region. Figure 4-1 illustrates the percentage of housing units that are occupied and vacant. Figure 4-2 presents a variety of selected features of occupied housing units.

4.1.2. Screening Young Children for Lead Poisoning (CDC, 1997)

The guidance on childhood lead screening was developed by CDC in consultation with the Advisory Committee on Childhood Lead Poisoning Prevention. Lead-based paint in homes is the most important remaining source of lead exposure for U.S. children. Of all homes built in the United States before 1978, a large amount (83%) still contain some lead-based paint (CDC, 1997). The older the house, the more likely it is to contain lead-based paint and to have a higher concentration of lead in the paint. Housing built before 1950 poses the greatest risk of exposure to children (CDC, 1997). Such housing is present in every State as shown in Table 4-6. The following Department of Housing and Urban Development (HUD) calculation is used to determine the number of affordable housing units that are likely to contain lead-based paint (HUD, 1990):

$$[(\# \text{ units } < 1940 * 0.88) + (\# \text{ units } 1940-1960 * 0.92) + (\# \text{ units } 1961-1980 * 0.76)].$$

4.1.3. National Human Activity Pattern Survey (NHAPS) (Tsang and Klepeis, 1996)

The National Human Activity Pattern Survey (NHAPS), conducted by EPA, is the largest and most current human activity pattern survey available (Tsang and Klepeis, 1996). Data for 9,386 respondents in the 48 contiguous States were collected via minute-by-minute 24-hour diaries between October 1992 and September 1994. The survey collected information on duration and frequency of selected activities. Demographic information was collected for each respondent to allow for statistical summaries to be generated according to specific subgroups of

the U.S. population (e.g., by gender, age, race, employment status, census region, season). The participants' responses were weighted according to geographic, socioeconomic, time/season, and other demographic factors to ensure that results were representative of the U.S. population. The weighted sample matches the 1990 census population for each gender, age group, and census region. In addition, the day-of-week and seasonal responses are distributed equally.

NHAPS data on the time spent in selected activities and the corresponding population participating in these activities are presented in the *Exposure Factors Handbook*, Section 14, Tables 14-19 through 14-92. For example, data are included on the number of persons who spend time either running, walking, standing, or in a vehicle; time spent in indoor and outdoor parking lots and garages; and number of persons working in circumstances where one may come in contact with soil, such as gardening. The reader is referred to the *Handbook* for further information obtained from NHAPS. Advantages of the NHAPS data set are that it is representative of the U.S. population for all ages, genders, and races, and it has been adjusted to be balanced geographically, seasonally, and for day/time. Table 4-7 presents the percentage of the general population living in homes with attached garages. The advantage of NHAPS is that the data were collected for a large number of individuals and are representative of the U.S. general population.

4.2. POPULATIONS WHO USE PESTICIDES AND CHEMICALS FOR LAWN/GARDEN AND POOL/SPA MAINTENANCE

Section 4.2.1 presents the available information on populations using home and garden pesticides and chemicals for lawn/garden and pool/spa maintenance. This information is useful in estimating number of people receiving residential exposure to certain household chemicals, such as insecticides, rodenticides, and fungicides. Section 4.2.2 presents data that can be used to estimate the number of people who might have residential exposure to chlorinated compounds used to treat and disinfect household pools and spas.

4.2.1. National Home and Garden Pesticide Use Survey (Whitmore et al., 1992)

The National Home and Garden Pesticide Use Survey (NHGPUS) was conducted for EPA during August and September 1990. The purpose was to collect data on the use of pesticides in and around homes in the United States. The study was designed as a national probability-based sample of households, with personal interviews conducted at the participants' residence. The target population in the survey was housing units in the conterminous United States occupied as primary residences (home where a person lives for half the year or more), excluding institutions, group quarters, military reservations, and Native American reservations (Whitmore et al., 1992). NHGPUS used the U.S. Bureau of the Census definition of a housing unit as a room or groups of rooms occupied or intended for occupancy as separate living quarters in which the occupants (1) live and eat separately from any other persons in the building and (2) have direct access from the outside of the building or through a common hall. A sample of 2,674 housing units was selected, and 2,447 housing units were eligible for the survey. Individuals representing a total of 2,078 housing units participated in the survey (a response rate of 84.9 percent) and provided information on frequency and types of pesticide use and where and how they were used. Because of the high response rate, the potential for nonresponse bias is low (Whitmore, et al., 1992). NHGPUS is based on a sample of 29 States and 60 counties. Tables 4-8, 4-9, and 4-10 present data collected in NHGPUS. An assessor can develop numerical estimates of potential exposed populations by multiplying the number of households presented in Tables 4-8 thru 4-12 by 2.65 persons/household as provided in the Bureau of Census (1997). Table 4-8 presents the selected characteristics of households in the target population, including urbanization, type of housing, private lawn and swimming pool present, and hot tub present. Table 4-9 presents the number of households that used pest control services and received written precautions in the year preceding the survey. Table 4-10 presents the number of households reporting major pest problems or experiencing pest problems that were treated by a household member in the previous year. Table 4-11 also presents number of households where pesticides were not stored securely and had children <5 years old living there. Table 4-12 provides information on the number of households using pesticides by type of pesticide and site of

application. Table 4-13 presents estimated percentage of households using pesticides by type of pesticide and site of application.

4.2.2. 1993 Pool and Spa Market Study (National Spa and Pool Institute, 1993)

The National Spa and Pool Institute (NSPI) is a trade association that provides market data to its members. The statistical information provided by NSPI in Tables 4-14 and 4-15 is an overview and was extrapolated from the National Spa and Pool Institute Pool and Spa Market Study. This publication is available from NSPI Publications (703) 838-0083 for \$250.

The overview data are based on a household consumer survey. NSPI maintains a data base of households in selected U.S. geographic regions. Households were randomly selected, and the data were collected through mail surveys. From a total of 90,000 surveys mailed, 65,000 individuals responded: a response rate of 72%. Table 4-14 presents data for owners of residential pools, and Table 4-15 presents data for owners of residential spas. These data are presented by pool ownership. However, populations using pools/spas may be estimated conservatively by assuming one pool/spa per household and multiplying by the average number of persons per household using the U.S. Bureau of the Census data (2.65 persons/household in 1996) or by multiplying by number of persons per State, presented in Table 2-9.

Table 4-8. Selected Characteristics of Households in the Target Population

Population Characteristic		Estimated Thousands of Households	Estimated Percentage of All Households
All households		84,573	100.00
Urbanization ^a			
	Urban	70,468	83.32
	Rural	14,105	16.68
Type of dwelling			
	Single-family	63,335	74.89
	Multi-family	21,237	25.11
Have private lawn			
	Yes	66,828	79.02
	No	17,744	20.98
Have private swimming pool			
	Yes	5,978	7.07
	No	78,595	92.93
Have hot tub			
	Yes	2,500	2.96
	No	82,073	97.04
Grew edible fruit/nut trees or grape vines			
	Yes	18,421	21.78
	No	66,151	78.22
Grew tomatoes, vegetables, berries, or melons in past year ^b			
	Yes		
	No	23,180	27.41
		61,392	72.59
Grew roses in the past year ^b			
	Yes	27,150	32.10
	No	57,423	67.90

^a The interviewers were instructed to classify each residence as located in either an urban area or a rural area in their best judgment so that homes in suburban neighborhoods located adjacent to rural farmland would be coded as urban, while farm homes would be coded as rural.

^b Excluding any grown for sale.

Table 4-9. Number of Households That Used Pest Control Services and Received Written Precautions in the Previous Year

Type of Service/ Utilization/ Written Precautions	Estimated Thousands of Households	Estimated Percentage of Households
Commercial Lawn-Care Company Utilized ^a	8,003	12.07
Informed of Chemicals Used ^c	3,626	59.51
Informed of Safety Precautions ^c	3,746	50.42
Treatment for Fleas, Roaches, Ants Utilized ^b	16,557	19.58
Informed of Chemicals Used ^c	3,637	23.46
Informed of Safety Precautions ^c	3,216	20.67

^a The inference population for lawn care services is the population of all households with a private lawn.

^b The inference population for treatment of fleas, roaches, or ants is the population of all private households.

^c Conditional percentages, given that the service was used.

Source: Whitmore et al., 1992.

Molluscicide	43 ^d	6.45 ^d	660	100.00
Rodenticide	319 ^d	40.65	786	100.00
Herbicide	617	21.18	2,912	100.00
Repellent	1,261	24.30	5,189	100.00

Abbreviations: HH = Households.

- ^a For pesticide products (excluding those used exclusively for agricultural production, plant growth regulators, pool chemicals, and anti-fouling paints) in storage at residences in the target population at the time of the survey (Aug-Sept 1990).
- ^b Conditional percentage, given that at least one product of the designated type was in storage.
- ^c An individual pesticide product can be of more than one type (e.g., insecticide and fungicide). Therefore, the estimates for the individual types of pesticides sum to more than the total for all types of pesticides.
- ^d Estimate has poor precision because of the small number of observations in this cell.

5. BUILDINGS OTHER THAN RESIDENCES

Contaminants present inside buildings other than residences can pose a risk of exposure to persons occupying these buildings even for short periods of time. "Most people spend 90% or more of their time indoors (e.g., home, work, public, and commercial buildings), and some potentially susceptible subgroups, such as infants, the elderly, and the infirm, are inside virtually all the time" (Sexton et al., 1993). Examples of nonresidential buildings that potentially contain environmental pollutants are schools, colleges, day care centers, hospitals, and nursing homes. Populations in these types of buildings may be exposed to environmental pollutants from multiple sources. Contaminants found in these buildings may be the result of construction, operation, or the use of chemicals for regular maintenance or specific activities (e.g., laboratory work, sterilization) or the use of consumer products, combustion appliances, or from individuals smoking tobacco products. This section presents data enumerating populations found in nonresidential buildings who could potentially be exposed to environmental contaminants associated with these buildings. These data can be useful for conducting human health risk assessments for populations in these types of buildings.

5.1. POPULATIONS IN SCHOOLS/COLLEGES

The U.S. Department of Education regularly compiles statistics on numbers of persons in all types of educational situations, from kindergarten through graduate school (U.S. Department of Education, 1995). Data are collected by surveys and research conducted by both the Federal Government and the private sector. The most relevant data are presented in this section. Table 5-1 presents the estimated number of individuals participating in elementary, secondary, and higher education for the fall of 1995. Table 5-1 also presents the numbers of teachers, faculty, administrative, and support staff in these educational institutions. Table 5-2 presents the enrollment in all types of educational institutions from 1980, with projections to 2000. Enrollment in public and private schools by decade from 1869 to 1950, and by year from 1964 to the present, with projections to 2005 is displayed in Table 5-3. Enrollment in public elementary and secondary schools by race/ethnicity and by State for 1986 and 1993 is presented in Table 5-4.

Table 5-5 presents the enrollment of 3-, 4-, and 5-year-old children in preprimary programs yearly from 1965 to 1994.

The Center for Disease Control and Prevention's Agency for Toxic Substance and Disease Registry (ATSDR) published a National Alert warning of the "increasing numbers of metallic mercury spills and contamination involving schoolchildren" (ATSDR, 1997). The ATSDR National Alert (1997) listed six instances since 1994 in which metallic mercury contamination and possible exposure to school children occurred. The instances, which required decontamination of students and school facilities, occurred when children from elementary to college age found metallic mercury and shared it with other students (ATSDR, 1997).

The U.S. General Accounting Office (GAO) conducted a national survey of public schools and associated districts to determine the extent to which America's 80,000 schools have the physical capacity to support 21st century technology and education reform for all students (GAO, 1996). Questions in the survey addressed areas such as the physical condition of buildings and major building features, such as roofs, framing, floors, and foundations, and the status of environmental conditions, such as lighting, heating, and ventilation. These data are important because the physical and environmental conditions of buildings may contribute to higher exposures to pollutants. For example, inadequate ventilation could contribute to indoor air pollution, and chipped or peeling paint may potentially create exposures to lead in older, less maintained buildings. Questionnaires were sent to 9,956 sample schools in 5,459 associated districts in 50 States and the District of Columbia in May 1994. Of the 9,956 schools in the original sample, 393 were ineligible for the survey. The number of completed, usable school questionnaires returned was 7,478, yielding a school response rate of 78 percent (GAO, 1996).

The results of the survey are presented in Tables 5-6 through 5-11. Table 5-6 and 5-7 provide the number of students who attend schools with unsatisfactory environmental and physical conditions, respectively. Tables 5-8 and 5-9 provide data for the percent of schools and number of students attending schools with unsatisfactory environmental conditions by community type (central city, urban fringe/large town and rural/small town) and geographic region (Northeast, Midwest, South, West). Tables 5-10 and 5-11 present the same type information for schools with inadequate building features.

5.2. POPULATIONS IN DAY CARE CENTERS

Young children may be at increased potential risk of exposure to contaminants present in nonresidential buildings due to behavioral factors common to young children. Young children are much more likely than older children or adults to put objects into their mouths, resulting in increased occurrence and/or duration of oral contact with objects in their environment. In addition, children, unlike adults, often will sit or lie on the floor, thus increasing their potential exposure to contaminants associated with floor coverings. This section presents data useful for estimating exposure to children in day care, nursery schools, and other prekindergarten programs. The U.S. Department of Education's 1995 Digest for Education Statistics provides data on numbers of children in day care, nursery schools, and other prekindergarten programs (U.S. Department of Education, 1995). The percentage of preschool children attending center-based programs (including nursery school, prekindergarten, and Head Start programs) in 1992 is presented in Table 5-12.

5.3. POPULATIONS IN HOSPITALS

Populations receiving care in hospitals may have an increased risk of exposure to certain chemicals commonly used for hospital care. In addition, these individuals have greater exposure to other individuals who potentially may contribute to airborne infections agents, such as tuberculosis. The U.S. Bureau of the Census collects data quantifying frequency and length of hospital stays in the United States. Table 5-13 presents data on hospital utilization rates by the age of patient and by region from 1970 to 1993. Table 5-14 presents summary data by State on community hospitals, including number of facilities, beds, patients admitted, occupancy rates, personnel, and outpatient visits.

5.4. POPULATIONS IN NURSING HOMES

Individuals in nursing homes could potentially have an increased risk of exposure to contaminants in their environment resulting from their compromised health status and from the likely presence of chemicals commonly found in medical institutions, such as sterilization chemicals and/or antiseptics. The U.S. Bureau of the Census collects data enumerating

populations in nursing homes. This section presents data useful for estimating the human health risk of exposures to contaminants for individuals in nursing homes. Table 5-15 presents the numbers of persons receiving care in nursing homes for 1980 and 1990, and Table 5-16 presents the nursing home population by region, division, and State for 1980 and 1990. The U.S. Bureau of the Census subdivides the United States into four regions (Northeast, Midwest, South, and West) and further subdivides each region into divisions. The composition by State of the regions and divisions is presented in Section 2.4 of this report.

Table 5-1. Estimated Number of Participants in Elementary and Secondary Education and in Higher Education: Fall 1995
[In millions]

Participants	All Levels (Elementary, Secondary, and Higher Education)	Elementary and Secondary Schools			Institutions of Higher Education		
		Total	Public	Private	Total	Public	Private
Total	73.3	56.3	50.0	6.3	17.0	13.1	3.9
Enrollment^a	65.1	50.7	45.0	5.7	14.4	11.3	3.1
Teachers and Faculty	3.8	3.0	2.6	0.4	0.8 ^b	0.6 ^b	0.3 ^b
Other Professional, Administrative, and Support Staff	4.3	2.6	2.4	0.2	1.7	1.2	0.5

^a Includes enrollments in local public school systems and in most private schools (religiously affiliated and nonsectarian). Excludes subcollegiate departments of institutions of higher education, residential schools for exceptional children, and Federal schools. Elementary and secondary include most kindergarten and some nursery school enrollment. Excludes preprimary enrollment in schools that do not offer first grade or above. Higher education comprises full-time and part-time students enrolled in degree-credit and nondegree-credit programs in universities, other 4-year colleges, and 2-year colleges.

^b Includes full-time and part-time faculty with the rank of instructor or above.

Note: The enrollment figures include all students in elementary and secondary schools and colleges and universities. However, the data for teacher and other staff in public and private elementary and secondary schools are reported in terms of full-time equivalents. The staff data for institutions of higher education include all full-time and part-time professional, administrative, and support personnel. Because of rounding, details may not add to totals.

^a Preliminary.

^b Based on "Early Estimates" surveys for public elementary and secondary schools.

^c Includes enrollments in local public school systems and in most private schools (religiously affiliated and nonsectarian), but generally excludes pupils in subcollegiate departments of institutions of higher education, residential schools for exceptional children, and Federal schools. Excludes preprimary pupils in schools that do not offer first grade or above.

^d Estimated.

^e Includes kindergarten and some nursery school pupils.

^f Includes full-time and part-time students enrolled in degree-credit and nondegree-credit programs in universities and 2-year and 4-year colleges.

^g Includes unclassified students below the baccalaureate level.

^h Includes unclassified postbaccalaureate students.

Note: Higher education enrollment projections are based on the low and middle alternative projections published by the National Center for Education Statistics. Some data have not been revised from previously published figures.

^a Beginning in fall 1980, data include estimates for an expanded universe of private schools. Therefore, these totals may differ from figures shown in other tables, and direct comparisons with earlier years should be avoided.

^b Data for 1869-70 through 1949-50 include resident degree-credit students enrolled at any time during the academic year. Beginning in 1959, data include all resident and extension students enrolled at the beginning of the fall term.

^c Estimated.

^d Preliminary data.

^e Public elementary and secondary data are based on "Early Estimates" surveys. Other data are projected.

^f Projected.

Note: Elementary and secondary enrollment includes pupils in local public school systems and in most private schools (religiously affiliated and nonsectarian), but generally excludes pupils in subcollegiate departments of institutions of higher education, residential schools for exceptional children, and Federal schools. Elementary enrollment includes some nursery school pupils. Higher education enrollment includes students in colleges, universities, professional schools, teachers colleges, and 2-year colleges. Higher education enrollment projections are based on the low and middle alternative projections published by the National Center for Education Statistics. Some data have not been revised from previously published figures. Because of rounding, details may not add to totals.

— Data not available.

^a Data collected using revised procedures. May not be comparable with figures for earlier years.

Note: Data are based on sample surveys of the civilian noninstitutional population. Although cells with fewer than 75,000 children are subject to wide sampling variation, they are included in the table to permit various types of aggregations. Enrollment data for 5-year-olds include only those students in preprimary programs. Because of rounding, details may not add to totals.

^a Community hospitals are defined as non-Federal facilities providing short term (average stay length less than 30 days) general and special care, including obstetrics and gynecology; eye, ear, nose and throat; rehabilitation; etc., except psychiatric, tuberculosis, alcoholism, and chemical dependency. Excludes hospital units of institutions.

^b Inpatients receiving treatment each day; excludes newborn.

^c Ratio of average daily census to every 100 beds.

^d Includes full-time equivalents of part-time personnel.

Source: U.S. Bureau of the Census, 1990.

NA Not available.

Note. In the 1990 decennial census, "nursing homes" include skilled-nursing facilities, intermediate-care facilities, long-term care rooms in wards or buildings on the grounds of hospitals, or long-term care rooms/nursing wings in congregate housing facilities. Also included are nursing, convalescent, and rest homes, such as soldiers', sailors', veterans', and fraternal or religious homes for the aged, with or without nursing care.

6. OTHER ACTIVITIES INCLUDING SUBSISTENCE, FISHING, RECREATION, AND HOBBIES

Participation in certain types of activities can increase an individual's risk of exposure to environmental contaminants. Examples of these activities are subsistence fishing, hunting, gardening, recreation, or hobbies. Persons who fish and/or hunt for subsistence, cultural reasons, or recreation and then consume the animals caught could potentially be exposed to contaminants originally ingested by the animals. The habitat in which the animals lived is also important to consider when assessing contaminant exposure. Bottom-feeding fish (e.g., catfish) have greater exposure and higher body burdens of those contaminants found in sediments. Other common recreational activities, such as gardening, home maintenance/ repair, hobbies, and crafts, also can result in increased exposure to environmental contaminants. Gardeners may have greater exposure to pesticides and other chemicals due to dermal contact with soil and treated plants. Depending on the task involved, persons active in home maintenance/repair, hobbies, and crafts can be exposed to many chemicals, including paints, varnishes, solvents, and adhesives. This section presents estimates of the general U.S. population participating in various recreational activities that may increase exposure to environmental contaminants.

It should be noted that participation in an activity in which food items can be obtained, such as hunting, fishing, or gardening, does not necessarily mean that the individual participating is consuming the food items. Intake rates are presented in the Exposure Factors Handbook for the following food groups: fruits and vegetables (Section 9); fish (Section 10); meat and dairy products (Section 11); grain products (Section 12); home produced foods (Section 13); and breast milk (Section 14).

6.1. FISHING AND HUNTING

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation (U.S. DOI and U.S. DOC, 1993) was designed to provide estimates of the numbers of U.S. residents who participated in recreational hunting and fishing and other forms of wildlife-related activities known as nonconsumptive use in all 50 States and the District of Columbia. The survey was

conducted in two phases by the U.S. Bureau of the Census for the Fish and Wildlife Service. In the first phase, a nationwide sample of 129,500 households was interviewed over the telephone between January and February 1991. Information on household members 6 years old and older who had fished, hunted, or engaged in a nonconsumptive wildlife-related activity in 1990 and who planned to engage in these activities in 1991 were obtained from the interviews. A national response rate of 95.2% was achieved from eligible households. The second phase of the survey consisted of three detailed interviews conducted quarterly from May 1991 to March 1992 with subsamples of anglers, hunters, and nonconsumptive use participants identified in the first phase. Respondents in this phase of the survey were 16 years old and older. The survey was designed to provide State-level fishing, hunting, and nonconsumptive activities for 23,179 anglers and hunters and 22,723 nonconsumptive use participants. Sportsmen were defined in the survey as those who fish and hunt, fish only, or hunt only. Anglers were defined as licensed or unlicensed sportsmen who fish only or fish and hunt. Hunters were defined as licensed and unlicensed sportsmen who hunt only or hunt and fish. Assessors should be aware that the possibility of undersampling exists with telephone surveys (e.g., households without a telephone will not be sampled). The survey revealed that 108.7-million U.S. residents, 16 years old and older participated in some form of wildlife-related recreation activity in 1991. During that year, 35.6-million people in the United States fished, 14.1 million hunted, and 76.1-million had at least one type of nonconsumptive recreation activity involving wildlife as the primary purpose.

Results of the survey for persons 16 years and older are summarized in Tables 6-1 through 6-13. Table 6-1 shows the population estimates of anglers and hunters who participated in the survey, grouped by fishing and hunting activity and days of participation. Table 6-2 presents the angler population, grouped by fishing waterbody and days of fishing. Tables 6-3, 6-4, and 6-5 present freshwater angler, Great Lakes angler, and saltwater angler populations, grouped by types of fish caught and number of days fishing. Table 6-6 presents population estimates for hunters, grouped by type of hunting (i.e., big game, small game, migratory bird, other animals) and by State of residence. Tables 6-7, 6-8, 6-9, and 6-10 present population estimates for hunters of big game, small game, migratory birds, and other animals, respectively, grouped by type of game. Table 6-11 presents demographic characteristics of anglers and

hunters, grouped by total population, sportsmen, those who fished only, those who hunted only, and those who fished and hunted. Table 6-12 presents demographic characteristics of anglers 16 years and older by type of fishing. Table 6-13 presents demographic characteristics of hunters 16 years old and older by type of hunting. Table 6-14 presents demographic characteristics (i.e., age, sex, race, household income, and geographic location) of anglers and hunters 6 to 15 years old, grouped by total population, sportsmen, and those who fished only, hunted only, and fished and hunted in 1990. Table 6-15 presents population estimates of anglers and hunters ages 6 to 15 years old by sportsman's State of residence in 1990. Readers are reminded that the data in these tables present participation rates, not actual consumption rates. Consumption rates can be found in the *Exposure Factors Handbook* for the following: fish (Section 10) and meats (Section 11).

It is possible to further estimate populations involved in these activities by combining demographic census data from Section 2 in this document with the information provided in the handbook tables. As an example, Table 6-12 (U.S. DOI and U.S. DOC, 1993) does not include the number of freshwater anglers residing in New England who are black; however, this can be estimated from the data presented. Table 6-12 indicates that 1,188,000 freshwater anglers are in the New England Census geographic division. If that number is multiplied by the percentage of the population in that area who are black (5 percent) the resulting value of 59,400 provides an estimate of black freshwater anglers in New England.

6.2. HOME GARDENING

Ingestion of contaminated food is a potential pathway of human exposure to toxic chemicals. Local site contamination may lead consumers of home-produced food products to be at greater exposure risk. In addition, incomplete cleaning/preparation of produce may leave a residue of pesticides and other chemicals on the fruits and vegetables grown and prepared in private homes.

According to the Home and Garden Survey conducted by the National Gardening Association (1987), a total of 34-million (38%) U.S. households participated in vegetable gardening in 1986. Table 6-16 contains demographic data on vegetable gardening in 1986 by region/section, community size, and household size. Table 6-17 presents characteristics of

households that had a vegetable garden. Table 6-18 contains information on the types of vegetables grown by home gardeners in 1986. Tomatoes, peppers, onions, cucumbers, lettuce, beans, carrots, and corn are among the vegetables grown by the largest percentage of gardeners. As previously stated, readers are reminded that the data in these tables present participation rates, and not actual consumption rates. Consumption rates for home-produced foods can be found in the *Exposure Factors Handbook*, Section 13.

The U.S. Bureau of the Census (1995) collects data on various recreational and leisure time activities based on sample surveys from several sources. Statistics on U.S. household participation in lawn and garden activities from 1989 to 1993 are presented in Table 6-19. In 1990, 80% of U.S. households engaged in lawn and garden activities, compared with 71% in 1993. Table 6-20 presents the percentage of the U.S. population who participated in gardening in 1992 grouped by gender, race, age, and education. As shown in Table 6-20, 55% of the population participated in gardening in 1992. This represents an increase of 17% over the 1986 figures previously referenced.

6.3. DO-IT-YOURSELFERS

The Do-It-Yourselfers Research Institute (1983) conducted a study of the home improvement and repair do-it-yourselfers (DIY) market in September 1982. The study design provided a comprehensive profile of DIY consumers with particular emphasis on their shopping orientation, buying habits, and lifestyles. Telephone interviews were conducted with 2,000 consumers who were randomly selected throughout the United States. The survey determined that for 1982, 73.5% of all U.S. households could be considered "do-it-yourselfers." DIY households were defined as households with the household members involved with home improvement and repair activities. The population data obtained were based on estimated 1982 census figures. Table 6-21 presents the population estimates of DIY home improvement and repair projects undertaken between September 1981 and September 1982.

The U.S. Bureau of the Census (1995) presents the percentage of the U.S. population who participated in home improvement/repair in 1992. Table 6-22, which presents the percentage of the population grouped by gender, age, race, and education, indicates that 48% of the population

participated in home improvement/repair during 1992. This represents a decrease of 25.5% over the 1982 figures previously referenced.

6.4. HOBBYISTS

Individuals participating in certain hobbies and crafts (e.g., model building) may have an increased risk of exposure to certain chemicals in the products they use. Typically, these products, which include solvents, adhesives, paints, and varnishes, may be used in greater volumes and frequencies by specific populations resulting in higher levels of exposure to chemicals found in the products (U.S. EPA, 1985). Table 6-23 lists the hobbies that could potentially increase an individual's exposure to chemicals and the population estimates associated with these hobbies.

6.5. EXERCISE/SPORT ACTIVITIES

Participation in exercise and sporting activities can influence one's exposure to environmental contaminants. People engaging in outdoor exercise may experience greater than expected exposures to air pollutants due to increased respiration rates. These athletes are also likely to have increased water consumption rates, thereby increasing exposure to drinking water contaminants. Also, participation in water sports such as swimming may lead to increased exposure to trihalomethanes (THMs) from the chlorination of swimming pools.

The U.S. Bureau of the Census (1995) gathered data from the National Sporting Goods Association on participation of the U.S. population in various recreational sports activities. Table 6-24 presents the total numbers of the U.S. population who participated in selected sports activities in 1993 grouped by gender, age, and household income. Figure 6-1 shows the percent of population 7 years old and older who participated in the 10 most popular sports activities grouped by gender in 1993. Figure 6-2 shows the percentage of the population 18 years and older participating in various activities in 1992 including exercise, playing sports, various outdoor activities, home improvement, and gardening.

Table 6-7. Big Game Hunters and Days of Hunting, by Type of Game: 1991
 [Population 16 years old and older. Numbers in thousands.]

Type of Game	Hunters		Days of Hunting		Average Days per Hunter
	Number	Percent	Number	Percent	
Total, all big game	10,745	100	128,411	100	12
Deer	10,277	96	112,853	88	11
Elk	682	6	5,048	4	7
Bear	368	3	2,882	2	8
Wild turkey	1,720	16	13,483	10	8
Other	404	4	3,235	3	8

Notes: Detail does not add to total because of multiple responses.
 These data represent activity patterns, which do not represent consumption rates. Consumption rates for some game can be found in Exposure Factors Handbook, Section 11.

Source: U.S. DOI and U.S. DOC, 1993.

Table 6-8. Small Game Hunters and Days of Hunting, by Type of Game: 1991
 [Population 16 years old and older. Numbers in thousands.]

Type of Game	Hunters		Days of Hunting		Average Days per Hunter
	Number	Percent	Number	Percent	
Total, all small game	7,642	100	77,132	100	10
Rabbits, hares	3,980	52	35,624	46	9
Quail	1,694	22	13,511	18	8
Grouse/prairie chicken	1,375	18	10,629	14	8
Squirrels	3,569	47	29,602	38	8
Pheasant	2,285	30	16,136	21	7
Other	823	11	6,824	9	8

Notes: Detail does not add to total because of multiple responses.
 These data represent activity patterns, which do not represent consumption rates. Consumption rates for some game can be found in Exposure Factors Handbook, Section 11.

Source: U.S. DOI and U.S. DOC, 1993.

Table 6-9. Migratory Bird Hunters and Days of Hunting, by Type of Game: 1991
 [Population 16 years old and older. Numbers in thousands.]

Type of Game	Hunters		Days of Hunting		Average Days per Hunter
	Number	Percent	Number	Percent	
Total, all migratory birds	3,009	100	22,235	100	7
Geese	882	29	6,584	30	7
Ducks	1,164	39	8,800	40	8
Doves	1,851	61	9,480	43	5
Other	259	9	1,667	7	6

Notes: Detail does not add to total because of multiple responses.

These data represent activity patterns, which do not represent consumption rates. Consumption rates for some game can be found in Exposure Factors Handbook, Section 11.

Source: U.S. DOI and U.S. DOC, 1993.

Table 6-10. Hunters of Other Animals and Days of Hunting, by Type of Game: 1991
 [Population 16 years old and older. Numbers in thousands.]

Type of Game	Hunters		Days of Hunting		Average Days per Hunter
	Number	Percent	Number	Percent	
Total, all other animals	1,411	100	19,340	100	14
Groundhog (woodchuck)	471	33	4,851	25	10
Raccoon	408	29	7,196	37	18
Fox	204	14	2,157	11	11
Coyote	427	30	4,482	23	10
Other	312	22	3,238	17	10

Notes: Detail does not add to total because of multiple responses.

These data represent activity patterns, which do not represent consumption rates. Consumption rates for some game can be found in Exposure Factors Handbook, Section 11.

Notes: Percent who participated shows the percent of each row's population who participated in the activity named by the column (the percent of those living in urban areas who fished only, etc.). Percent columns show the percent of each column's participants who are described by the row heading (the percent of those who fished only, who lived in urban areas, etc.).

* Metropolitan Statistical Area

** States within each U.S. Census geographic region are listed in Section 2.4 of this document.

*** Estimate based on a small sample size.

--- Sample size too small to report data reliably.

(Z) Less than 0.5 percent.

These data represent activity patterns, which do not represent consumption rates. Consumption rates can be found in Exposure Factors Handbook, Section XX.

Note Percent who participated shows the percent of each row's population who participated in the activity named by the column (the percent of those living in urban areas who fished only, etc.). Percent columns show the percent of each column's participants who are described by the row heading (the percent of those who fished only who lived in urban areas, etc.). Data reported are from screening interviews in which one adult household member responded for all household members 6 to 15 years old. The screening interview required the respondent to recall 12 months worth of activity.

* Estimate based on a small sample size.

Sample size too small to report data reliably.

(Z) Less than .5 percent.

Note: U.S. totals include responses from participants residing "in the District of Columbia, as described in the statistical" reliability appendix. Data reported on this table are from screening interviews in which one adult household member responded for household members 6 to 15 years old. The screening interviews required the respondent to recall 12 months worth of activity.

* Estimate based on a small sample size.

... Sample size too small to report data reliably.

Table 6-21. DIY Home Improvement and Repair Projects Undertaken Within the Past 12 Months^a

Project	Millions of Households	Percent of DIY Households
Painted the interior of the home	37.5	60.9
Applied weatherstripping or caulking	26.4	43.0
Painted the exterior of the home	20.3	32.9
Varnished or stained woodwork/furniture	19.8	32.2
Repaired electrical wiring or outlets	14.7	23.9
Replaced bathroom faucets	14.2	23.1
Hung wallpaper	14.1	22.9
Repaired or replaced toilet	12.8	20.8
Replaced kitchen faucets	12.7	20.6
Added insulation	12.0	19.5
Repaired drywall	10.5	17.0
Installed carpeting	10.2	16.6
Installed vinyl floor covering	9.3	15.1
Repaired or replaced roof	8.2	13.4
Installed a ceiling fan	8.2	13.4
Installed paneling	7.6	12.3
Did brick or masonry work	5.9	9.6
Installed a bathroom vanity	5.0	8.2
Installed ceiling tile	4.7	7.6
Installed a water heater	4.2	6.9
Installed ceramic tile	3.1	5.0
Installed a kitchen sink	2.9	4.7
Replaced kitchen cabinets	2.3	3.8
Installed exterior siding	2.3	3.7

^a Between September 1981 and September 1982.

Table 6-23. Estimated Populations Involved in Various Hobbies

Hobby	Number of People	Remarks
1. Woodworking		
A. People involved in a leisure woodworking project	13.3 x 10 ⁶ (6.6% of total U.S. population)	SMRB does not indicate what percentage of this total are specifically involved in other specific woodworking projects.
B. People involved in furniture refinishing	12.2 x 10 ⁶	
C. Magazine subscribers ^a (Writers Market, 1985)		All four magazines are specifically directed at active amateur woodworkers.
• <i>Hands on</i>	750,000	
• <i>Woodworker's Journal</i>	100,000	
• <i>Popular Woodwork</i>	10,000	
• <i>Workbench</i>	825,000	
D. Persons who own power tools (SMRB, 1983)		Router is best indicator of number of hobbyists.
• Electric drill	27.4 x 10 ⁶	
• Electric router	5.8 x 10 ⁶	
• Gas chain saw	11.3 x 10 ⁶	
• Electric chain saw	3.3 x 10 ⁶	
• Portable electric circular saw	15.1 x 10 ⁶	
• Portable jig/sabre saw	13.0 x 10 ⁶	
• Stationary radial/arm saw	3.4 x 10 ⁶	
• Stationary bench/table circular saw	4.7 x 10 ⁶	
• Stationary jig/sabre saw	1.9 x 10 ⁶	
• Electric sander	15.0 x 10 ⁶	
• Portable workbench	4.1 x 10 ⁶	
2. Photography		
A. People who develop their own photographs (SMRB 1983)	6.2 x 10 ⁶	Most will be developing black and white film.
B. People participating in photography (SMRB, 1992)	72.2 x 10 ⁶ (11.5% of total U.S. population)	Participated in last 12 months.
C. Magazine subscribers ^a		Subscribers are people interested in darkroom techniques. Subscribers are advanced amateurs.
• <i>Darkroom Photography Magazine</i>	100,000	
• <i>Darkroom Techniques</i>	40,000	
• <i>Popular Photography</i>	925,000	80% of photo hobbyists are estimated to do black and white developing and 20% color developing.
D. <i>Kodak Consumer Department</i>	1 x 10 ⁶ 2 x 10 ⁶	

Table 6-23. Estimated Populations Involved in Various Hobbies (Continued)

Hobby	Number of People	Remarks
3. Lapidary Work		
• No population data found		
4. Glass/crystal working		
A. Magazine subscribers ^a		
• <i>Glass Craft News</i>	40,000	Subscribers are stained-glass hobbyists.
5. Textile and fiber dyeing		
A. Magazine subscribers ^a		
• <i>Handweaver</i>	25,000	Practicing weavers and dyers (includes some professionals).
• <i>Shuttle Spindle and Dyepot</i>	16,000	Practicing weavers and dyers (may include some professionals).
• <i>Spin-off</i>	6,000	Practicing spinners and dyers (may include some professionals).
6. Painting and drawing		
A. People who paint, draw, or sculpt (SMRB, 1983)	13.7 x 10 ⁶	
B. People participating in painting, drawing, sculpturing (SMRB, 1992)	12.1 x 10 ⁶	
C. Magazine subscribers ^a		
• <i>Art and Artists</i>	1,000	Subscribers are people interested in oil pastel.
• <i>Artist's Magazine</i>	110,000	Subscribers are serious amateurs.
7. Metalworking		
A. Magazine subscribers (Writers Market, 1985)		
• <i>Home Shop Machinist</i>	19,000	Subscribers include hobbyists active in sheetmetal work, machining, welding, and foundry.
• <i>Live Steam</i>	12,800	Subscribers include hobbyists active in constructing scale locomotives and other steam engineers.
8. Printing		
• No population data found		
9. Pottery and ceramics		
A. People participating in ceramics/pottery	4.4 x 10 ⁶ (1.6% of total U.S. population)	
B. Magazine subscribers		
• <i>American Ceramics</i>	3,200	Subscribers may be collectors as well as makers; the actual population is probably much greater.
10. Scale Models		

(continued on next page)

Table 6-23. Estimated Populations Involved in Various Hobbies (Continued)

Hobby	Number of People	Remarks
A. People participating in model building/miniature projects (SMRB, 1992)	4.9 x 10 ⁶ (2.7% of total U.S. population)	
B. People participating in model railroading (SMRB, 1992)	2.5 x 10 ⁶	
C. Magazine subscribers ^a (Writers Market 1985)		
• <i>Railroad Model Craftsman</i>	97,000	Most subscribers to railroad models thought to be collectors rather than builders.
• <i>Finescale Modeler</i>	30,000	
• <i>Mainline Modeler</i>	14,000	
• <i>Model Railroader</i>	178,000	
D. People who build model airplanes	300,000-400,000	<i>Model Aircraft</i> ; these are functional models.
11. Hunting and firearms		
A. Persons who own guns (SMRB, 1983)		
• Hunting rifle	24.4 x 10 ⁶	
• Shooting rifle	22.2 x 10 ⁶	
• Target gun	9.6 x 10 ⁶	
• Factory-loaded ammunition	18.9 x 10 ⁶	
B. Persons who have engaged in firearms-related hobby within the past year (SMRB, 1983)		
• Hunting	12.6	
• Target shooting	7.4	
C. Magazine subscribers ^a		
• <i>American Hunter</i>	150,000	
• <i>Guns & Ammo</i>	475,000	
• <i>Shotgun Sports</i>	105,000	
• <i>American Marksman</i>	8,000	
• <i>American Shotgunner</i>	120,000	
• <i>Guns Magazine</i>	135,000	
12. Leather Work		
A. Magazine subscribers		
• <i>Make It with Leather</i>	60,000	Subscribers are hobbyists who cut and carve leather (which has presumably already been treated and dyed) therefore, potentially exposed to tanning agents and dye.

(continued on next page)

Table 6-23. Estimated Populations Involved in Various Hobbies (Continued)

Hobby		Number of People	Remarks
13.	Needlework and fiber arts		
A.	Persons who sew or do other needlework as a hobby (SMRB, 1983)	29.1×10^6	This probably includes only persons exposed to dyes through handling material or threads already dyed.
B.	Magazine subscribers ^a		
	• <i>Needle and Thread</i>	750,000	Subscribers are users of already-dyed materials. However, some dye may potentially leach from thread.
	• <i>Needlecraft for Today</i>	1,200,000	
14.	Boat builders		
A.	People who build their own boats	20,000	Devlin Boat Building, Co.; approximately 20,000 people a year are involved in building their own boats.
15.	Plane builders		
A.	People who build their own planes	20,000	Homebuilt Experimental Aircraft Association.
16.	Jewelry making		
A.	People participating in jewelry making (SMRB, 1992)	2.8×10^6 (1.6% of total U.S. population)	

^a Assumed that persons who subscribe to the hobbyist-type magazines are persons involved/interested in that specific hobby. A percentage of this population can be used to estimate the potentially susceptible or exposed population.

7. ACTIVITIES (OCCUPATIONAL)

Working in certain occupations can increase an individual's risk of exposure to environmental contaminants. Some high-risk occupations are farm worker, factory and foundry worker, and mine worker. The U.S. Department of Labor's Bureau of Labor has documented the number of persons employed in a variety of occupations. Data presented in this section can be useful in evaluating an exposed population in a specified occupation or occupational category. The data also can be used to determine the time duration of exposures in certain categories of age, race, and sex and for the general population as well.

U.S. Department of Labor (DOL) data are accessible on the World Wide Web via the Internet. The Department's home page (Internet address: *www.dol.gov*) contains information on the kinds of data available and instructions on how to conduct data searches, extract data, and download data files in table format. Section 11 of this document contains information on how to locate U.S. Government data on the Internet.

All employment statistics generated by DOL are not accessible on the Internet. Some of these data are available in hardcopy format only. A copy of the table of contents from the Department's 1995 *Employment and Earnings* publication is presented in Appendix 7A at the end of this section to show examples of other data that are available. The *Employment and Earnings* document may be ordered by calling Superintendent of Documents at (202) 512-1800.

7.1. POPULATION EMPLOYED

DOL compiles statistics on the U.S. population by occupational categories. Tables presented in this section show population information by employment, annual average household data, and establishment data. Tables shown are presented as samples of the data compiled from household interviews and reports from employers and aggregated by DOL. More detailed data are provided in the publication. (See Appendix 7A.) The household interviews are obtained from the Current Population Survey, a sample survey of the population 16 years old and older, conducted each month. The household interview information is collected from about 60,000 households in 729 sample areas, which represent all counties and independent cities in the United

States with coverage in all 50 States, and the District of Columbia (U.S. DOL, 1995). The data collected are based on the activity or status reported for the calendar week, including the 12th of the month. A household consists of all persons who occupy a housing unit and have no other usual address. This includes related family members and all unrelated persons. A housing unit is regarded as a house, an apartment, a group of rooms, or a single room, when occupied or intended for occupancy as separate living quarters (U.S. DOL, 1995).

The establishment records are compiled each month from mail questionnaires and telephone interviews by the Bureau of Labor Statistics in cooperation with State agencies. These data are for the Nation, States, and metropolitan areas and represent 390,000 establishments employing more than 47-million nonfarm wage and salary workers. The household and establishment data complement one another, with each providing different information.

Population characteristics are obtained from the household surveyed and detailed industrial classifications as best obtained from the establishment reports (U.S. DOL, 1995).

Table 7-1 presents employment status of the total general U.S. population for the civilian labor force. It also presents information on whether this population is employed in agriculture or in nonagricultural industries. Table 7-2 presents employment data for persons of Mexican, Puerto Rican, and Cuban-origin by sex and age. Table 7-3 presents data for employed civilians by selected occupational categories for black, white, and Hispanic origin for years 1993 and 1994. Table 7-4 presents the same employment data as in Table 7-3 but for persons of Mexican, Puerto Rican, and Cuban origin. In Table 7-5, data are shown for persons employed in agriculture and nonagricultural industries by age and sex. Table 7-6 displays percent distribution of persons employed by six major occupational industry categories by race and sex.

The terms white, black, and other, used to describe a person's race, were taken directly from the primary source. Included in the "other" group are Native Americans (American Indians), Alaska Natives, and Asian and Pacific Islanders. Because of the relatively small sample size, data for other races were not published by DOL. Hispanic origin refers to persons who identify themselves as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent. Persons of Hispanic origin may be of any race and thus were included in both white and black population groups.

7.2. POPULATIONS EMPLOYED IN DETAILED INDUSTRIAL AND OCCUPATIONAL CATEGORIES

DOL also has compiled statistics for employment in numerous detailed industrial and occupational categories. Table 7-7 presents employment data for selected detailed industrial categories by sex, race, and Hispanic origin. The percent of whites or male categories can be estimated using the data presented. Annual averages for household data by detailed occupation, sex, race, and Hispanic origin are shown in Appendix 7B at the end of this section. Employment data by major industry and manufacturing group are presented in Appendix 7C at the end of this section.

7.3. POPULATIONS IN PUBLIC BUILDINGS

Populations of persons in public buildings can be estimated based on data collected by the U.S. Bureau of the Census (1995) on numbers and characteristics of commercial office space in the United States. Table 7-8 presents information for the population utilizing commercial office space in the largest metropolitan areas in the United States. The inventory of square foot of area used also is shown. Table 7-9 presents information on the characteristics of commercial buildings (>1,000 sq ft) in the United States. These characteristics include total number of buildings, principal activity within the buildings, fuels used, and number of workers.

7.4. OCCUPATIONAL STUDIES ADDRESSING MINORITY POPULATIONS

Numerous researchers, including Rios et al. (1993) and Moses et al. (1993), have evaluated the effects of certain high-risk occupations on certain minorities. Rios et al. (1993) summarized the various factors increasing susceptibility to environmental exposure for minority populations using data from published documents. The factors summarized include genetic, occupational, developmental, disease, and social inequality. According to the authors, workers who may have an increased susceptibility to environmental exposures are coke oven workers in the steel industry, farm workers, and child laborers. The highest exposure to by-products from coke ovens is to the "topside" worker population on top of the oven (Rios et al., 1993).

The authors reported that although it has been estimated that there are 1.5- to 2.5-million farm workers, the actual number may be as high as 4-million persons, including dependents of hired farm workers and undocumented aliens. In the West, Midwest, and Southwest areas of the United States, migrant farm workers are predominantly young Hispanic men with families; on the East Coast, farm workers often are the inner-city poor and their families or males of Hispanic descent (Rios et al., 1993).

The prevalence of child labor (children under 18 years of age) has increased, with children working in farm fields wet with pesticides (Rios et al., 1993). This is cause for concern because "children are known to be more susceptible than adults to the adverse effects of environmental pollutants and toxins" (Rios et al., 1993). Another high-risk group is those who may be secondarily exposed to occupational pollutants brought home on clothing or other articles by members of their household who work in high-risk occupations. Examples of workers who bring home occupational pollutants are farm workers with pesticide-laden work clothing, construction workers with asbestos, and smelter workers with toxic metals. The number of people can further be defined by ethnicity and gender.

Moses et al. (1993) collected data from scientific literature on human exposure to pesticides. Exposure data summarized include the number and types of pesticide used, rates of exposure to pesticide, exposure of agricultural workers, and exposure of children.

Minorities comprise most of the farm workers in the United States. In 1990, DOL surveyed United States farm workers and found that two-thirds of the farm workers not born in the United States (U.S. DOL, 1995). The ethnic groups comprising the two-thirds of the Nation's farm workers, who were not born in the United States, are as follows: Mexican--92%; other Latinos--4%; Asian--3%; and Caribbean--1%. Of the remaining one-third of the Nation's farm workers, who were born in the United States, 40% are minorities: Latinos--34%; African Americans--5%; and other ethnic groups--1%.

The authors noted that 25% of the summer-hire farm workers are children. This is a concern, because children are at higher risk from exposure to pesticides than are adults (Moses et al., 1993). This increased vulnerability is due to rapid growth rates and critically important sensitive developmental stages. Additional factors increasing a child's risk from exposure to

pesticides is a higher respiratory rate, greater exposed surface area, and greater fluid intake (relative to solid foods). Another possible route of exposure to pesticides for children is the indoor use of pesticides. When the authors calculated pesticide exposure within a child's breathing zone after the use of home foggers, they found pesticide exposure to the children far exceeded equivalent workplace standards for adults (Moses et al., 1993).

Friedman-Simenez (1989) noted that there is minority worker (black, Latino/Hispanic, Asian, Native American, and undocumented workers [most often Latino or Asian] over-representation in the more hazardous jobs, thereby leading to greater risk for occupational-related diseases. Included in the high-risk jobs (classified by the author) were (1) operators, fabricators, and laborers; (2) service occupation; (3) precision production, craft, and repair; and (4) farming, forestry, and fishing -- farm operators and managers, logging, other agricultural operations (Friedman-Simenez, 1989). The author noted that the evidence supporting his conclusion was not as rigorous or massive as most scientists would like, but the association between hazardous exposures and minority population is too consistent to be due to chance. For example, certain epidemics have been related to jobs such as coke oven workers, where the minority worker population on the topside (area of largest exposure) of the coke ovens is larger than for non-whites (Friedman-Simenez, 1989).

Not in labor force	6,429	6,715	4,748	4,907	1,323	1,360	855	1,010

^a Civilian noninstitutional population--persons 16 years of age and older residing in the 50 States and the District of Columbia who are not inmates of institutions (e.g., penal and mental facilities, homes of the aged) and not on active duty in the Armed Forces.

Note: Detail for the above race and Hispanic-origin groups will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both white and black population groups. Data for 1994 are not directly comparable with data for 1993 and earlier years. For additional information, see "Revisions in the Current Population Survey Effective January 1994" in the February 1994 issue of *Employment and Earnings*.

^a N.e.c. is an abbreviation for "not elsewhere classified" and designates broad categories of occupations that cannot be more specifically identified. Generally, data for occupations with fewer than 50,000 employed are not published separately but are included in the totals for the appropriate categories shown.

Note: Data for 1994 are not directly comparable with data for 1993 and earlier years. For additional information, see "Revisions in the Current Population Survey Effective January 1994" in the February 1994 issue of *Employment and Earnings*.

MSA = metropolitan statistical area.

PMSA = primary metropolitan statistical area.

^a Represents only the suburban portion of the metropolitan area.

^b Data are for area identified by source as New Jersey-Central/Northern with a market area of Bergen, Essex, Hudson, Morris, Passaic, Hunterdon, Mercer, Middlesex, Monmouth, Somerset, and Union Counties.

^c Represents primarily Brooklyn, Manhattan, Queens, Rockland, and Westchester Counties.

^d Represents only the Pennsylvania portion of the metropolitan area.

^e Represents only Bexar County.

^f Represents only the central business district portion of Seattle.

^g Represents only Pinellas and Hillsborough Counties.

^h Excludes the Maryland portion of the metropolitan area and some outlying counties in Virginia.

APPENDIX 7A
EMPLOYMENT AND EARNINGS
TABLE OF CONTENTS

Employment and Earnings

Editors: Gloria Peterson Green, Eugene H. Becker

Editors' Note

With this issue, seasonally adjusted unemployment and other labor force series derived from the Current Population Survey (household survey) have been revised to reflect updated seasonal adjustment factors. Because of the survey changes introduced in January 1994, only seasonally adjusted data for 1994 have been revised. Revised current data appear in summary table A, tables A-1 through A-12, and D-1 through D-10.

The article appearing on page 10 discusses the effect of the revisions, describes the seasonal adjustment method, and includes the seasonal adjustment factors to be used to calculate the major labor force series for January-June 1995.

Annual averages for 1994 may differ slightly from the results that would be obtained by averaging the 12 published monthly estimates, because they reflect the use of a revised set of survey data for January that incorporates corrections to some minor editing problems in the original survey data for that month.

^a = preliminary.

NOTE: Establishment survey estimates are currently projected from

March 1993 benchmark levels. When more recent benchmark data are introduced, all unadjusted data from April 1993 forward are subject to revision.

8. BEHAVIORAL AND/OR CULTURAL PRACTICES

The effects of lifestyle, personal behavioral, and/or cultural practices could be a source of contaminant exposure or could increase one's exposure to toxic environmental contaminants. Exposure to these contaminants due to either behavioral (e.g., smoking, alcohol consumption, drug use) or cultural practices may result in adverse health effects. The sections below summarize studies that provide population estimates of persons engaging in certain behavioral and/or cultural practices that are known to increase the risk of exposure to environmental contaminants.

8.1. ACTIVITY PATTERNS

This section presents population estimates on time activity patterns based on type of activity and presence in specific locations and microenvironments.

8.1.1. National Human Activity Pattern Survey (NHAPS) (Tsang and Klepeis, 1996)

The National Human Activity Pattern Survey (NHAPS) conducted by EPA, is the largest and most current human activity pattern survey available (Tsang and Klepeis, 1996). Data for 9,386 respondents in the 48 contiguous States were collected via minute-by-minute, 24-hour diaries between October 1992 and September 1994. The survey collected information on duration and frequency of selected activities. Demographic information was collected for each respondent to allow for statistical summaries to be generated according to specific subgroups of the U.S. population (e.g., by gender, age, race, employment status, census region, season). The participants' responses were weighted according to geographic, socioeconomic, time/season, and other demographic factors to ensure that results were representative of the U.S. population. The weighted sample matches the 1990 census population for each gender, age group, and census region. In addition, the day-of-week and seasonal responses are distributed equally.

NHAPS data on the time spent in selected activities and the corresponding population participating in these activities are presented in the *Exposure Factors Handbook*, Section 14, Tables 14-19 through 14-92. For example, data are included on the number of persons who

spend time either running, walking, standing, or in a vehicle; time spent in indoor and outdoor parking lots and garages; and number of persons working in circumstances where one may come in contact with soil, such as gardening. The reader is referred to the *Handbook* for further information obtained from NHAPS. Advantages of the NHAPS data set are that it is representative of the U.S. population for all ages, genders, and races, and it has been adjusted to be balanced geographically, seasonally, and for day/time.

8.1.2. Time Spent in Activities, Locations, and Microenvironments: A California- National Comparison (Robinson and Thomas, 1991)

Robinson and Thomas (1991) reviewed data from the 1987-88 California Air Resources Board (CARB) time activity study and compared that data set with data collected by a similar 1985 national study, "Americans' Use of Time." The CARB study sampled residents of the State of California. One adult 18 years old or older was randomly sampled in each household. In the 1985 national study, single-day diaries were collected from more than 5,000 respondents across the United States, who were 12 years old and older. To facilitate comparisons, Robinson and Thomas (1991) recorded data from the national study to be as comparable as possible to the CARB study, and they restricted comparative analyses to the 18- to 64-year-old age group in the two studies. The authors compared 10 major activity categories and three major locations from both the CARB and the 1985 national study and defined a set of 16 microenvironments based on the activity and location codes employed in both studies.

Table 8-1 shows the percentage of "doers" (i.e., those engaged in the specific activity the day the diary was compiled) who participated in 10 various activities, were present at 10 various locations, and were present in 16 various microenvironments.

8.2. PICA STUDIES

Pica is the ingestion of nonfood items (most commonly dirt) and can increase an individual's exposure to contaminants, especially if the material ingested is contaminated or has elevated levels of some elements (metals). Numerous articles have reported on the incidence of pica among various populations. However, most of these articles describe pica as the ingestion

of substances other than soil, including sand, clay, paint, plaster, hair, string, cloth, glass, matches, paper, feces, and various other items. These articles indicate that pica occurs in approximately one-half of all children between the ages of 1 and 3 years (Sayetta, 1986). The incidence of pica in children has been shown to differ for different populations, and the rate appears to be higher for black children than for white children. Danford (1982) reports that approximately 30% of black children aged 1 to 6 years are reported to have deliberate ingestion behavior, compared with 10 to 18% of white children in the same age group. Sex differences do not appear to influence the incidence rates (Kaplan and Sadock, 1985). Lourie et al. (1963) found a 50 to 60% pica rate among children in lower socioeconomic groups and a 30% pica rate among children from higher income families. Deliberate soil ingestion behavior appears to be more common in rural areas (Vermeer and Frate, 1979). A higher rate of pica also has been reported for pregnant women and individuals with poor nutritional status (Danford, 1982). In general, deliberate ingestion behavior is more frequent and more severe in mentally retarded children than in children in the general population (Behrman and Vaughan, 1983; Danford, 1982; Forfar and Arneil, 1984; Illingworth, 1983; Sayetta, 1986). Studies examining pica among populations are presented in this section.

8.2.1. Reported Incidence of Pica Among Migrant Families (Bruhn and Pangborn, 1971)

A review of literature indicates that pica has been observed among men, women, and children of all ages and races; however, reports show pica occurs most frequently among African Americans (Bruhn and Pangborn, 1971). Bruhn and Pangborn (1971) reported that pica was explained as a cultural trait of African Americans, and they cited other studies that found higher incidences of pica in pregnant African American women, compared with pregnant Caucasian women. The authors found that "pregnant women say they eat these substances [clay] because they simply crave them or because they will make the baby stronger, with a more suitable color, and without birthmarks" (Bruhn and Pangborn, 1971). To investigate the occurrence of pica in low-income families, the authors conducted food habit interviews in English and Spanish among 91 families in California from May through August 1969. The families were selected from three migrant labor camps operated by the Office of Economic Opportunity in Northern California,

and they included (1) 65 migrant agricultural families of Mexican descent, born in Texas or Mexico, and (2) 26 families of "Anglo" heritage, born in Texas, Arkansas, or Oklahoma. The interviews used questionnaires to ask the family spokesperson (usually the wife) to estimate the incidence of pica in these families. Table 8-2 presents results of the interviews. In the families of "Anglo" descent, 14 families (54%) observed pica in children, with 11 cases observed in their own or a relative's child. Table 8-2 also shows that 19 and 7% of the respondents reported pica in pregnant and nonpregnant women, respectively. The families of Mexican descent reported 32, 38, and 15% of pica incidences in children, pregnant women, and nonpregnant women, respectively. Pica in men was not reported by either group. The potential causes of pica were attributed to cultural, behavioral, and socioeconomic factors in the groups studied. The authors stated that apparently the urge for some women to eat clay and cornstarch represents a cultural practice passed down from generations and is an accepted behavior in their community (Bruhn and Pangborn, 1971).

8.2.2. Geophagia in Rural Mississippi: Environmental and Cultural Contexts and Nutritional Implications (Vermeer and Frate, 1979)

Vermeer and Frate (1979) investigated the environmental and cultural factors surrounding geophagia (deliberate consumption of earth/soil) in the black population in a rural county of Mississippi. Geophagia, the practice of eating earth, also referred to as pica, is known to have occurred since prehistoric times in all ethnic, social, and economic groups and was reported to occur most frequently in the rural South in both black and white populations. Early historical records indicate that geophagia was transferred primarily from Africa via slave trade into the New World (Vermeer and Frate, 1979). The authors reported that the custom continued when blacks migrated to the urban North, where laundry starch became a substitute for the clays commonly consumed.

The study was conducted in Holmes County, Mississippi, which at the time had a predominantly (71%) black population composed of rural small communities (200-500 people) where the social life centered on the church. Of the households sampled, females headed 41%. The survey questionnaires on geophagia were in three parts: the nutrition study, the perinatal

study, and the health utilization study. In the nutrition study, 500 black households were surveyed randomly, but geophagia questionnaires were administered to only 50 households (10%) of the sampled population. Of these 50 households, 229 individuals (56 women, 33 men, 115 children, and 25 adolescents) were surveyed. In the perinatal study, geophagia information was obtained from 142 pregnant women. The health utilization survey sampled 200 households, of which 20 were given the geophagia questionnaires. In all three studies, geophagia was defined as the consumption of clay on a regular basis over a period of weeks (Vermeer and Frate, 1979).

The nutrition study results presented in Table 8-3 show neither male adults nor adolescents practiced geophagia, but 57% of the women and 16% of the children (under 13 years) practiced geophagia (Vermeer and Frate, 1979). The perinatal study revealed that 28% of pregnant and postpartum women practiced geophagia. An additional 19% of respondents in this population group consumed other materials, mainly commercial products (e.g., laundry starch, dry powdered milk, and baking soda) (Vermeer and Frate, 1979).

8.3. SMOKING, DRUG USE, AND ALCOHOL CONSUMPTION

This section presents summaries of studies on behavioral and social practices, such as smoking, drug use, and alcohol consumption, which could potentially increase an individual's exposure to environmental contaminants.

8.3.1. Results From the National School-Based 1991 Youth Risk Behavior Survey and Progress Toward Achieving Related Health Objectives for the Nation (Kann et al., 1993)

The Centers for Disease Control and Prevention (CDC) developed the Youth Risk Behavior Surveillance System (YRBSS) as an ongoing project to evaluate priority high health risk behaviors among adolescents nationwide. Kann et al. (1993) presented partial results from that 1991 survey, which employed a three-stage cluster sample design that consisted of students in public, parochial, and other private schools in grades 9 through 12, in all 50 States and the District of Columbia. The questionnaires administered to the students collected information on priority health risk behaviors related to unintentional and intentional injury, tobacco use, alcohol

and other drug use, sexual behavior (i.e., unintended pregnancies and sexually transmitted diseases, including HIV infection), dietary behavior, and physical activity.

The survey sampled 13,568 students, of which data from 12,272 (90%) of the students were usable. Of the survey respondents, 14% were blacks, 9% were Hispanic, 70% were white, and 7% were from other ethnic groups. The data obtained from the survey were based on either a 30-day or 12-month recall. The percentages of white, black, and Hispanic youths who reported engaging in the specific high-risk behaviors during the survey period are presented in Table 8-4. A higher percentage of whites (15%) frequently smoked cigarettes, compared with Hispanics (7%) and blacks (3%). Table 8-4 also indicates that 54% of Hispanic, 53% of white, and 42% of black students consumed at least one drink of alcohol during the 30 days before the survey. Three percent of Hispanics, 2% of whites, and 1% of blacks used cocaine during the 30 days preceding the survey. Table 8-5 presents results in percentages of the dietary behavior and physical activity among the students grouped by gender, grade level, and race. A higher proportion of male students (15%) consumed five or more servings of fruits and vegetables than female students (10%).

8.3.2. Cigarette Smoking and Cessation Behaviors Among Urban Blacks and Whites (Hahn et al., 1990)

Hahn et al. (1990) studied smoking behavior among blacks and whites in a population-based sample of 2,626 residents aged 35 to 74 years in the Minneapolis-St. Paul area. Surveys of the general population conducted in this area were of two parts: the first series was conducted from 1980 to 1982, and the second series was initiated in December 1985. The second series of surveys conducted used a two-stage sample design and updated census information. Individuals in a cluster sample of households in the seven-county area were randomly selected. Home interviews were conducted in which information on health behaviors, attitudes, and knowledge were collected. Following the home interviews, survey clinics were conducted in neighborhood churches in which questionnaires were completed. These questionnaires provided physiological measurements related to risk factors.

Results from the survey are presented in Tables 8-6 through 8-8 (Hahn et al., 1990). Ratios in these tables are the presented value out of 100 percent. Table 8-6 shows that more blacks (aged 35 to 74 years) were current smokers than whites in the same age group. Table 8-6 also shows that the ratio of former smokers to those who had ever smoked was greater for white men than for black men and greater for white women than for black women. Table 8-7 indicates that persons with educations beyond high school smoked less, regardless of their race or sex. Table 8-8 presents data on current smokers' smoking cessation behavior. Whites were more likely than blacks to attempt to quit smoking. Among men, whites were more likely than blacks to successfully quit smoking. More black men than white men planned to reduce the number of cigarettes smoked per day, and more white women than black women tried brands with low nicotine and tar. Hahn et al. (1990) concluded that important factors preventing smokers from quitting included the number of cigarettes smoked daily, lack of desire to cease smoking, and the physiological difficulty of quitting.

8.3.3. Sociodemographic Characteristics of Cigarette Smoking Initiation in the United States (Escobedo et al., 1990)

Escobedo et al. (1990) estimated the age-specific incidence of cigarette smoking initiation by race/ethnicity, sex, and educational attainment by analyzing the smoking history data of young adults, aged 18 to 35 years, in the 1987 National Health Interview Survey (NHIS) and the 1982-1984 Hispanic Health and Nutrition Examination Survey (HHANES). Both NHIS and HHANES were based on personal interviews of households in the United States. Escobedo et al. (1990) noted that HHANES was not representative of the Hispanic population in the United States; however, the geographic areas surveyed included a substantial proportion of Hispanics. Data from 14,764 out of 44,123 individuals surveyed in NHIS and 3,123 out of 9,643 individuals surveyed in HHANES were employed in the analysis conducted by Escobedo et al. (1990).

The incidence of smoking initiation at a specific age was determined as being the number of individuals who had started smoking cigarettes at that age divided by the number of individuals who had not started smoking regularly before that age (Escobedo et al., 1990). The authors reported that from both surveys "ever smokers" were considered to be those respondents

who answered yes to the question, "Have you smoked at least 100 cigarettes in your entire life?" Among all race/ethnic groups, smoking initiation occurred at ages as young as 9 years of age, increased rapidly after 11 years of age, peaked at 17 to 19 years of age, and declined substantially after 19 years of age (Escobedo et al., 1990).

Escobedo et al. (1990) calculated age-specific smoking initiation rates by gender and educational attainment. Table 8-9 presents the smoking initiation rates (percent) by gender, age, and race/ethnicity. Of all men who started smoking at 18 years old or younger, Hispanic men had the highest smoking initiation rate, and black men had the lowest rate. Table 8-9 also shows that smoking initiation rates were similar among men who started smoking between the ages of 19 and 35 years, with black men showing the highest rate (22%). Among the females who started smoking at 18 years or younger, white and Puerto Rican American women had the highest initiation rate. Compared with men of both age groups, women had lower smoking initiation rates in all race/ethnic groups. Table 8-10 summarizes the smoking initiation rates by age, race/ethnicity, and educational attainment. A comparison of respondents with more than a high school education to those who had less than high school education showed that respondents with less than high school education had higher smoking initiation rates for all age groups and all races and ethnic groups. Table 8-10 also shows that among all race/ethnic groups, initiation rates were highest during adolescence (12 to 18 years old) and lowest during childhood (11 years old and younger).

8.3.4. Statistical Abstract of the United States (U.S. Bureau of the Census, 1995)

The U.S. Bureau of the Census provides summary statistics on social, political, and economic characteristics of the U.S. population. Table 8-11 presents data on persons who used certain drugs in 1993 grouped by age of user, gender, race/ethnicity, and region. Table 8-11 also shows the users in 1993 of cigarettes, alcohol, marijuana, cocaine, smokeless tobacco, crack cocaine, inhalants, hallucinogens, stimulants, sedatives, tranquilizers, and analgesics.

8.3.5. Trends in Indian Health (U.S. Department of Health and Human Services, 1993)

The U.S. Public Health Service, through the Indian Health Service (IHS), provides health care to Native Americans and produces annual information on the health status of the people it serves. IHS population statistics are based on U.S. Bureau of the Census data and include American Indians, Eskimos, and Alaska Natives residing in or near reservations (U.S. DHHS, 1993). Mortality rates, by age and gender, resulting from alcoholism and drug-related incidents were collected for the IHS population and are presented in Tables 8-12 and 8-13. It should be noted that mortality rates cited in this section are indirect estimates of exposure. Mortality (as compared to incidence or prevalence) is influenced by other factors, such as general health and nutrition and access to medical care.

Table 8-12 indicates that mortality rates from alcohol consumption are much higher for Native Americans and Alaska Natives than for all other races in the United States for all age groups and both genders. Table 8-13 presents data on drug-related deaths and indicates that the rates are higher for Native Americans than for other races at ages 15 to 24 years. At ages 25 to 34 years, the rate of drug-related deaths for Native Americans is higher than the rate for whites. At ages 45 to 54 and 55 to 64 years, drug-related death rates are higher for Native Americans than for all other races in both genders, and at ages 65 to 74 and 75 to 84 years, the rate is lower for Native Americans than for all other races in both genders.

8.4. CULTURAL USE OF MERCURY

Another example of behavioral or cultural practices that could increase a population's exposure to toxic environmental contaminants is the cultural use of mercury for religious, medical, or cosmetic purposes (TDH, 1993). The Center for Disease Control and Prevention's Agency for Toxic Substance and Disease Registry (ATSDR) published a National Alert warning of the "continued pattern of metallic mercury exposure in persons using certain folk medicines or participating in certain ethnic or religious practices" (ATSDR, 1997). Mercury exposures may be potentially greater for populations of Caribbean and Hispanic/Latino descent, who use mercury for religious and/or medicinal purposes as well as in cosmetics (CDC, 1996). Sales persons working in botanicas stores that specialize primarily in selling religious items and herbs

used for preparing folk medicines and also for promoting good health estimated that Puerto Ricans, Dominicans, and 'other Hispanics' make up about 90% of mercury buyers and that more than two-thirds of buyers are women (Zayas and Ozuah, 1996).

These practices may present opportunities for increased exposures to a percentage of the adult Caribbean and Hispanic populations (Hispanic Health Council, 1993). Children may be subject to greater exposures from the practice of sprinkling mercury on the floor near children's beds to bring good luck, which could result in increased exposures to children who crawl and play on the floor (U.S. EPA, 1993).

Zayas and Ozuah (1996) identified 41 botanicas in Hispanic neighborhoods in Bronx, New York, and in 1995, researchers surveyed botanica workers on the cost, sale, uses, and purchasers of mercury.

From the Zayas and Ozuah (1996) report, Wendroff (1996) estimates that the 35 New York botanicas sell a total of 157 mercury capsules per day. Wendroff (1996) estimated that "annual sales totaling 47,000 [capsules] could result in 13,800 individual dwellings each having a dose of some 9 grams of mercury (the mean weight of a mercury capsule) sprinkled on their respective floors in the course of one year."

9. DRINKING WATER AND FOOD

The ingestion of contaminated food and water is a potential source of human exposure to toxic compounds. This section focuses on the available data for populations consuming water from specific sources, populations who breastfeed, and populations who consume certain foods.

9.1. POPULATION CONSUMING DRINKING WATER BY SOURCE OF WATER SUPPLY

The consumption of contaminated drinking water is a potential source of exposure to toxic compounds. Contaminants may be present in drinking water before, during, and after treatment. The majority of public water systems treat their water as necessary to ensure that the water is safe to drink. Contaminants may differ depending on the source of water supply (i.e., surface water or groundwater).

EPA established a National Public Water Systems Supervision Program in 1974 under the authority of the Safe Drinking Water Act. Table 9-1 presents data for populations served from public water systems for 1994 (U.S. EPA, 1995). The table presents these data for the number of systems and the population served by community water systems, nontransient noncommunity water systems, and transient noncommunity water systems. The data also are presented by the source of water (i.e., ground or surface). Table 9-2 presents the same type of data for 1993 (U.S. EPA, 1994).

In 1994, a total of 186,822 water systems in 50 States, on Native American lands, and in U.S. territories were classified as public water systems. The largest percentage of the population is served by community water systems (Table 9-1).

9.2. POPULATION USING BOTTLED WATER

Through the National Human Activity Pattern Survey (NHAPS) (Tsang and Klepeis, 1996), information was collected for the general population on the duration and frequency of selected activities and the time spent in selected microenvironments via 24-hour diaries. More than 9,000 individuals from 48 contiguous States participated in NHAPS. The survey was

conducted between October 1992 and September 1994. Participants were selected using a Random Digit Dial (RDD) method and Computer Assisted Telephone Interviewing (CATI). Individuals were interviewed to categorize their 24-hour routines (diaries) and/or answer follow-up exposure questions related to exposure events. The response rate was 63 percent, overall. Data were collected for a maximum of 91 different activities based on selected socioeconomic (gender, age, race, education, etc.) and geographic (census region, State, etc.) factors and time/season (day of week, month) and weighted to ensure that results were representative of the U.S. population. The weighted sample matches the 1990 U.S. census population for each gender, age group, census region, and the day-of-week and seasonal responses are equally distributed (Tsang and Klepeis, 1996). As part of the survey, data also were collected for the source of water used in the household and for the population in the survey who used bottled water for drinking water. These data are presented in Tables 9-3 and 9-4.

9.3. POPULATION BREASTFEEDING

Breast milk is a potential source of exposure to toxic chemicals among nursing infants. Some chemical compounds accumulate in fatty tissues and may be transferred to breastfed infants in the lipid portion of breast milk. In many cases, nursing infants obtain most of their dietary caloric and fluid intakes from breast milk, thus they have high risk of exposure to contaminants in breast milk. Information on the volume of breast milk consumed over a period of time is required to estimate the potential breast milk contaminant dose in infants. (See *Exposure Factors Handbook* (U.S. EPA, 1997), Section 14.) In addition, identification of the population who breastfeeds is needed. The available data for the percentage of the population who breastfeeds are presented below.

The National Academy of Sciences (NAS) Institute of Medicine reviewed the published literature to determine the incidence of breastfeeding in the United States by different demographic characteristics. Statistics on breastfeeding in the United States were obtained from a 1989 survey entitled, "Nutrition During Lactation" (NAS, 1991).

Results from the survey (NAS, 1991) indicated that 52.2% of women who delivered babies in 1989 breastfed their newborn infants. The NAS report also revealed that 19.6% of these infants were still breastfed at the age of 5 to 6 months. The data presented in Table 9-5 show the percentage of mothers who breastfeed among whites, blacks, and Hispanics grouped by marital status, education, maternal age, employment, family income, and U.S. regions. The data show that of the three racial/ethnic groups, more white mothers breastfed infants (58.5%), while the lowest percentage were black mothers (23%), followed by Hispanic mothers at 48.4%. According to the data in Table 9-5, breastfeeding of newborns and at 5 to 6 months is directly related to family income (i.e., the higher the income, the higher the rate of breastfeeding in all three ethnic groups). The highest percentage of mothers who breastfeed were found in the Mountain and Pacific regions for all racial/ethnic groups. A conservative estimate for the breastfed population could be developed by applying these percentages to the number of live births in a year, assuming all of the live births will have a lifespan of at least 1 year. This estimate would capture breast-fed infants up to 12 months. The Bureau of Census provide vital statistics data by year, race, and location (State, Region) in the yearly statistical abstracts publications. Breast milk ingestion rates are presented in *Exposure Factors Handbook*, Section 13.

9.4. POPULATION CONSUMING SELECTED FOODS/FOOD GROUPS

Ingestion of contaminated foods is a pathway of human exposure to toxic chemicals. Fruits and vegetables and grain products may become contaminated, for example, from deposition of ambient pollutants in the air, irrigation waters, soil additives, pesticides, and fertilizers. Fish and shellfish may become contaminated from pollutants in the surface waters and sediments. Meat, poultry, and dairy products can become contaminated if the animals are exposed to contaminated media such as soil, water, or feed crops.

EPA analyzed 3 years (1989, 1990, and 1991) of data from the U.S. Department of Agriculture's Continuing Survey of Food Intakes by Individuals to generate distributions of intake rates for various (1) fruit and vegetable items/groups; (2) grain products; (3) meat, poultry, and dairy products; and (4) fish and shellfish. As part of this analysis, the percentages of

populations consuming the various foods were estimated. These populations are presented with the corresponding intake tables in the *Exposure Factors Handbook* (U.S. EPA, 1997). A discussion of how the analyses were performed and the caveats also are presented in the handbook in their respective sections. Information on various food groups can be found in the *Exposure Factors Handbook* (U.S. EPA, 1997) as follows:

- Fruits and vegetables: Section 9, Tables 9-3 to 9-11;
- Fish and shellfish: Section 10, Tables 10-7 to 10-44;
- Meat, poultry, and dairy products: Section 11, Tables 11-1 to 11-4;
- Grain products, Chapter 12, Tables 12-1 to 12-10; and
- Homeproduced food items: Section 13, Tables 13-8 to 13-70.

^a CWS--Community water systems - Provides drinking water primarily to residential areas; provides water to the same population year round.

^b NTNCWS--Nontransient noncommunity water systems. A PWS that regularly serves at least 25 of the same people at least 6 months of the year; includes places such as schools, factories, and hospitals that have their own water supplies.

^c TNCWS--Transient noncommunity water systems. For transitory customers in nonresidential areas such as campgrounds, motels, and gas stations.

^d Includes systems that obtain their drinking water from other PWS.

^e Because an individual can be served by more than one category of PWS, the total population served by all PWS is not cumulative and therefore cannot be determined.

Note: NA = Not applicable.

(%) = Percent of total systems in that specific system category or percent of total population in a system category (i.e., 10,625 CWS is 19% of 56,747 total systems and 152,491,000 is 63% of total population served (243,049,000 people) by CWS.

^a Mothers were surveyed when their infants were 6 months of age. Mothers were asked to recall the method of feeding the infant when in the hospital, at age 1 week, at months 1 through 5, and on the day preceding completion of the survey. Numbers in the columns labeled "5-6 Mo Infants" are an average of the 5-month and previous-day responses.

^b Based on data from Ross Laboratories.

^c Hispanic is not exclusive of white or black.

^d College includes all women who reported completing at least 1 year of college.

^e States within each census region are listed in text sec. 2.4.

Source: NAS, 1991.

10. SOCIOECONOMICS

A variety of socioeconomic and demographic factors (such as income and poverty level) may be associated with increased exposure to environmental contaminants. A growing concern exists among physicians, researchers, and social scientists that people with low incomes and who reside in minority neighborhoods are more likely than other Americans to suffer adverse health effects from pollution and other environmental contaminants (Hearn, 1993). Other areas of concern for increased risk are hazardous occupations, unsatisfactory diets, and inadequate education.

10.1. POVERTY THRESHOLD ESTIMATES

The U.S. Bureau of the Census (1996) has estimated the poverty thresholds for 1995 in its publication, *Preliminary Estimates of Poverty Thresholds in 1995*. These data, presented in Table 10-1, are based on size of family unit and income. The Census Bureau data are accessible on the World Wide Web via the Internet. The U.S. Census Bureau's home page (Internet address: www.census.gov) contains information on the kinds of data available and instructions on how to conduct data searches, extract data, and download data files. Section 11 contains information on how to access U.S. Government data on the Internet.

10.2. INCOME LEVEL

Low income negatively affects many aspects of an individual's life, including housing, unemployment, diet, and access to education and medical care. The combined effects of living on a low income contribute to an increased risk of exposure to environmental pollutants. For a variety of reasons, often a greater percentage of minorities in the United States are living in poverty than are whites--the majority population.

U.S. Bureau of the Census data indicate that in 1990 the percentage of persons in the United States living below the poverty level (defined by the Census Bureau as \$13,359 per year in 1992 for a nonfarm family of four) was 13.5% for all races, 10.7% for whites, 31.9% for blacks, and 28.1% for Hispanics (U.S. Bureau of the Census, 1992).

10.2.1. Digest of Education Statistics (U.S. Department of Education, 1995)

The U.S. Department of Education (1995) presented information on poverty rates and income by State for 1990 and 1993. These data are based on the U.S. Bureau of the Census

Current Population Reports. Data for household income and poverty rates by State are presented in Table 10-2. Poverty status of persons, families, and children under 18, by race/ethnicity are presented in Table 10-3.

10.2.2. March Current Population Survey (U.S. Bureau of the Census, 1995b)

The U.S. Bureau of the Census (1995) characterized the poverty status of persons in the United States by gender. Data are presented for the years 1966 to 1994 in Table 10-4.

10.2.3. Trends in Indian Health (U.S. Department of Health and Human Services, 1993)

A more complete economic profile of ethnic groups in the United States, including level of education attained, rate of unemployment, household income, and percentage of age groups living below the poverty level, is presented in Table 10-5. This study was conducted to specifically evaluate the Native American and Alaska Native populations. However, data for other population subgroups were evaluated for comparison purposes. The data in Table 10-5 indicate that blacks, Hispanics, and Native Americans have a greater percentage of their populations living below the poverty level than do whites. Most significantly, for blacks, Hispanics, and Native Americans, approximately one-third to almost one-half of the total population under the age of 18 are living in poverty (U.S. DHHS, 1993). Table 10-5 also indicates that the percent of unemployed blacks, Hispanics, Native Americans, and Alaska Natives are significantly higher than the unemployment levels for whites and higher than for all races (U.S. DHHS, 1993).

10.2.4. Inner-City Asthma--*The Epidemiology of an Emerging U.S. Public Health Concern* (Weiss et al, 1992)

Weiss et al. (1992) addressed the problems lower income groups often experience in obtaining consistent medical care. The authors suggest that this factor contributes to the increased severity of childhood asthma in inner-city children. Lower income inner-city residents often lack transportation needed to get to medical facilities, and once there, they may experience communication problems with the medical providers (Weiss et al., 1992). In addition, language barriers and lack of education can result in an inability to follow instructions necessary to ensure recovery from an illness or chronic medical condition (Weiss et al., 1992).

10.2.5. Nutrition Intakes of Individuals from Food-Insufficient Households in the United States (Rose and Oliveira, 1997)

Low income can affect the diet by limiting the selection of foods purchased. Recent efforts by the U.S. Department of Agriculture (USDA) and U.S. Department of Health and Human Services have focused on measuring the prevalence of hunger and food insecurity in the United States (Rose and Oliveira, 1997). The USDA analyzed the diets of preschoolers, adult women, and the elderly with 24-hour recall data from the 1989-1991 Continuing Survey of Food Intake by Individuals (CSFII). The study estimated the extent to which individuals in food-insufficient households were likely to have low intakes of nutrients (Rose and Oliveira, 1997). Dietary intake is affected by factors that are social, cultural, and economic. The study considered variables such as race and ethnicity, household size, and the economic status of the household. Table 10-6 presents descriptive statistics on selected socioeconomic characteristics. It shows that household income and education level of the household head were lower for individuals from the food-insufficient households. Table 10-7 presents weighted means nutrient intakes for both household types expressed as a percentage of the recommended dietary allowance (RDA).

10.3. HOMELESS POPULATION

According to the National Coalition for the Homeless (NCH) (1997), poverty and homelessness are inextricably linked. "Poor people are frequently unable to pay for housing, food, childcare, health care, and education. Often it is housing, which absorbs a high proportion of income, that must be dropped" (NCH, 1997).

To measure homelessness with 100% accuracy is impossible (NCH, 1997). NCH (1997) reported the following estimates:

Year	Number of People	How Estimated
1988	500,000 - 600,000	People found in shelters, soup kitchens, and congregating in the street for 1 week
1996	760,000/night 1.2 - 2 million/1-year	Based on a projected annual increase of 5% using the 1988 estimate
1985-1990	4.95 - 9.32 million	1990 national telephone survey with former homeless people

It appears, according to NCH (1997) "that 12 million of adult residents in the U.S. have been literally homeless at some point in their lives." Survey response rates and estimate errors were not provided in the fact sheet.

The U.S. Conference of Mayors (U.S. COM) (1997) surveyed 29 cities in the U.S. to assess the status of hunger and homelessness. The data were collected from November 1996 through October 1997. Percentages reported for survey questions do not include non-responses (U.S. COM, 1997). Results of the survey showed that substance abuse and lack of needed services led the list for cause of homelessness in the survey cities. Other causes (in order of frequency) were lack of affordable housing, mental illness and lack of needed services, low paying jobs, domestic violence, and changes and cuts in public assistance (U.S. COM, 1997). In the survey cities, people remain homeless an average of 5 months (U.S. COM, 1997). The composition of the homeless population in the survey cities is presented in Table 10-8, and the population, poverty, and unemployment data are presented in Table 10-9. A survey response rate was not provided.

11. ELECTRONIC AND OTHER DATA SOURCES

This section presents Internet data sources useful for identifying and enumerating populations who potentially may be at risk of exposure to chemicals/contaminants at a greater rate than the general population. The sources in this section are Federal Government departments and agencies; however, many other types of Internet sources are available to the assessor. Examples include State, local, and regional governments and organizations; trade associations; and advocacy groups. Readers of this document are encouraged to explore the Internet using any of the available search engines (e.g., Alta Vista, Yahoo, etc.) to locate additional Internet data sources.

It is assumed that the reader will have some familiarity with the use of the Internet. The information in this section is provided to assist the reader in easily and quickly locating data on the Internet and is not intended to be a comprehensive guide to using the Internet. For this reason, detailed directions are not provided. Many standard references exist to guide the reader in use of the Internet.

It should be noted that, like all Internet resources, this information is time sensitive. Internet information (home pages, etc.) is continually updated by the responsible organization. The content of information the reader is able to access may differ from the information contained in this section.

11.1. U.S. ENVIRONMENTAL PROTECTION AGENCY

The U.S. EPA's home page (<http://www.epa.gov>) provides access to many of the Agency's environmental databases. Examples of databases available include (but are not limited to) the Aerometric Information Retrieval System (AIRS), containing national air pollution data; and the Better Assessment Science Integrating Point and Nonpoint Sources (BASINS), integrating national watershed data and geographic information system (GIS) mapping capabilities. ENVIROFACTS (<http://www.epa.gov/enviro>) is an especially useful tool available on EPA's home page. ENVIROFACTS allows the user to integrate data from seven of EPA's major environmental databases with Census data using GIS capabilities to produce site-specific maps. The user can submit specific queries and reports can be generated. For example, maps can be produced with population density, percent minority, percent below poverty, and per capita income. LandView™ III is a CD-ROM publication that provides database abstracts from EPA, the U.S. Bureau of the Census, the U.S. Geological Survey, the Nuclear Regulatory Commission,

the U.S. Department of Transportation, and the Federal Emergency Management Agency (FEMA). These databases are presented in a geographic context on maps that contain jurisdictional boundaries (e.g., census tracts, block group, Indian lands); detailed networks of roads, rivers, and railroads; census block group and tract polygons; schools; hospitals; churches; cemeteries; airports; dams; environmental sites; and other landmark features. LandView software performs display, query, and analysis of maps and data. LandView III is available on CD-ROM from the Bureau of the Census (301-457-4107) or the Census Webpage: <http://www.census.gov/geo/waw/tiger>. The Chemical Information System is one of the world's largest sources of online chemical information. With more than 30 linked databases, CIS contains information on specific chemical substances, including toxicological and/or carcinogenic research data, hazardous materials handling information, regulatory information, spectroscopic data, pharmaceutical data, and environmental issues. CIS includes popular databases such as AQUIRE, the TSCA Inventory, CERCLIS, and RCRIS. Accessible worldwide via international communications networks, CIS has subscribers on five continents. For product information, see <http://www.oxmol.com/prods/cis/> or E-mail cissupport@oxmol.com.

11.2. U.S. DEPARTMENT OF COMMERCE

The home page of the Commerce Department (<http://www.doc.gov>) offers STAT-USA, which is a source of economic data. While data available through STAT-USA (<http://www.stat-usa.gov>) pertain to economic and financial factors, these kinds of data can be useful for identifying and enumerating populations in certain economic and financial categories.

11.2.1. U.S. Bureau of the Census

The U.S. Bureau of the Census is a subagency of the Department of Commerce. Many of the data presented in this document were collected by the Bureau of the Census. Its home page (<http://www.census.gov>) provides access to a wide range of demographic data. Data files may be downloaded directly from the Internet or through the interactive tools provided on the Census Bureau's Web site, and can be used to generate mapped data for a specific area or region. The Census Bureau's home page provides a connection to FEDSTATS (<http://www.fedstats.gov>), which offers access to more than 70 Federal statistical agencies. Examples of various data that are contained in FEDSTATS from different Federal agencies are shown below:

Topic	Data Source	Agency
Agriculture	Crops county data	National Agricultural Statistics Service
Demographic/ Economic	County profiles Demographic/economic state/county profiles	Central Intelligence Agency Bureau of the Census
Crime	State data centers	Bureau of the Census
Education	Crime and justice Public school student, staff, and graduate counts by State	Bureau of Justice Statistics National Center for Education Statistics
Energy/Environment	State energy data	Energy Information Administration
Health	Atlas of the United States Mortality	National Center for Education Statistics
Labor	Regional information	Bureau of Labor Statistics
National Accounts	Personal income by State	Bureau of Economic Analysis

11.3. U.S. DEPARTMENT OF LABOR

The Department of Labor's (DOL) home page is located at <http://www.dol.gov>. Its home page offers connections to DOL subagencies that offer data and statistics, including the Bureau of Labor Statistics (BLS) and the Occupational Safety and Health Administration (OSHA).

11.3.1. Bureau of Labor Statistics

The Bureau of Labor Statistics' home page (<http://stats.bls.gov>) offers data on persons in the labor force, persons who are on nonfarm payrolls, and local area unemployment statistics. In addition, safety and health statistics are available organized by Standard Industrial Classification (SIC) codes.

11.3.2. Occupational Safety and Health Administration

The Occupational Safety and Health Administration (OSHA) is another DOL subagency. OSHA's home page (<http://www.osha.gov>) offers statistics and data searchable by type of working establishment, SIC code of establishment, workplace inspection, and workplace injury/illness.

11.4. U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES

The home page of the Department of Health and Human Services (DHHS) (<http://www.dhhs.gov>) offers connections to its subagencies, which collect health-related data.

These include the Centers for Disease Control and Prevention (CDC), Agency for Toxic Substances and Disease Registry (ATSDR), National Center for Health Statistics (NCHS), Indian Health Services (IHS), National Institutes of Health (NIH), National Institute of Mental Health (NIMH), and Substance Abuse and Mental Health Service Administration (SAMHSA).

11.4.1. Centers for Disease Control and Prevention

The home page of the Centers for Disease Control and Prevention (CDC) (<http://www.cdc.gov>) has connections to CDC data and statistics. CDC's home page has a connection to the *Morbidity and Mortality Weekly Report*, which has health-related data.

11.4.2. Agency for Toxic Substances and Disease Registry (ATSDR)

The ATSDR's home page (<http://atsdr1.atsdr.cdc.gov:8080/atsdrhome.html>) presents the following ATSDR data sets and resources: ATSDR Science Corner, Toxicology and ToxFAQs, Health Assessments and Consultations, Health Education and Consultations, Urban Environmental Issues, and Special Initiatives and Projects (Child Health, Great Lakes, Mississippi Delta, and Minority Health).

11.4.3. National Center for Health Statistics (NCHS)

Another subagency of DHHS is the National Center for Health Statistics. The home page of the NCHS (<http://www.cdc.gov/nchswww/index.htm>) offers connections to statistics and data available through its Data Warehouse and FASTATS.

11.4.4. National Institutes of Health (NIH)

The NIH home page (<http://www.nih.gov>) offers health information such as CancerNet, AIDS information, and the Women's Health Initiative. Scientific resources also are available in the form of research training information and on-line library journals. NIH's home page offers connections to the home page of the National Institute of Mental Health (<http://www.nimh.nih.gov>), which presents information on mental disorders and treatment. Substance abuse statistics are available on the home page of the Substance Abuse and Mental Health Services Administration (SAMHSA) (<http://www.samhsa.gov>).

11.4.5. Substance Abuse and Mental Health Services Administration (SAMHSA)

Another subagency of DHHS is the Substance Abuse and Mental Health Services Administration. The National Clearinghouse for Alcohol and Drug Information (NCADI), a service of SAMHSA, hosts Prevention Online or PREVLIN (<http://www.health.org>). This site contains up-to-date and comprehensive information, facts, and statistics on substance abuse.

11.5. ENVIRONMENTAL DEFENSE FUND (EDF)

The EDF, an environmental special interest group, has an Internet service that allows anyone to enter a ZIP Code and see a map highlighting local sources of pollution, as well as Federal filings and contact information (<http://www.scorecard.org>).

11.6. STATE ENVIRONMENTAL PROTECTION AGENCIES

The State Environmental Protection Agencies may be a source of information when site-limited data are not readily available. The addresses and telephone numbers for these agencies are presented in Table 11-1.

11.7. ENCYCLOPEDIA OF ASSOCIATIONS

The Encyclopedia of Associations is a guide to over 30,000 national and international organizations, including trade, business, and commercial; agricultural and commodity; legal, governmental, public administration, and military; scientific, engineering, and technical; educational; cultural; social welfare; health and medical; public affairs; fraternal, foreign interest, nationality, and ethnic; religious; veterans', hereditary, and patriotic; hobby and avocational; athletic and sports; labor unions, associations, and federations; Chambers of Commerce and trade and tourism; Greek letter and related organizations; and fan clubs.

A supplemental guide is also available for more than 47,000 regional, State, and local nonprofit organizations in 50 States, the District of Columbia, and the U.S. territories of Guam, Puerto Rico, and the Virgin Islands.

This document can be found in the reference section of most libraries. It is published by Gale Research, New York.

APPENDIX I

U.S. Census Bureau Internet Information

NOTICE

The following describes examples of the various types of information available on the Census Bureau's website. It should be noted that, like all Internet resources, this information is time sensitive. Internet information (home pages, etc.) are continually updated by the responsible organization, in this case, the federal government's Department of Commerce. The information in this appendix is provided to assist the reader in easily and quickly obtaining data collected by the federal government and made available on the Internet. It is not intended to be a comprehensive guide to using the Internet. Many standard references exist to guide the reader in use of the Internet.

U.S. Census Bureau Home Page Description

<http://www.census.gov>

The Census Bureau Website provides tables, maps, raw data and publications pertaining to U.S. populations, businesses and geography. Information for various segments of the U.S. population include, but are limited, the following categories age, household and family types, income and poverty, travel to work, occupation, and school enrollment. Census statistics for unemployment, government, and manufacturing are included under the homepage's general heading of 'business'. Within the site's geographic section, users can access tools to create and view maps (i.e. Tiger, Gazetteer and LandView). This section also provides links for geographical information systems (GIS) resources. Also of interest on the Census homepage are links to minority data, and publication search tools such as FedStats <http://www.fedstats.gov/> which locates Census publications as well as documents published by other federal agencies.

insert printed home page graphic

Select hot button marked **User Manual** http://www.census.gov/main/www/man_main.html

The User Manual presents a brief introduction to help users understand and use the Census Bureau's web site. It also lists the functioning "hot buttons" that may be selected to go to additional resources on their web site.

Select hot button marked **Census Home** <http://www.census.gov>

Return to the Census Bureau's home page to select another function.

Select hot button marked **Search** <http://www.census.gov/main/www/srchtool.html>

The reader may search the Census Bureau information by word, place, geographically, or search for Census Bureau staff members phone numbers and Email addresses.

Select hot button marked **Census Home** <http://www.census.gov>

Return to the Census Bureau's home page to select another function.

Select hot button marked **Access Tools**

<http://www.census.gov/mani/www/access.html>

The Census Bureau's web site offers the reader the use of Data Access Tools that can be used to access Census information. These include: Map Stats; Census Lookup; Tiger Map Server; US Gazetteer (to search by place name or Zip code); CD-ROM version of Census data; Ferret Data Extraction and Review Tool; and browsing all public directories and files.

Select hot button marked **Census Home**

<http://www.census.gov>

Return to the Census Bureau's home page to select another function.

Select hot button marked **Subjects A-Z**

<http://www.census.gov/main/www/subjects.html>

Search Census Bureau data by a wide range of subject topics, including: agriculture, births, children, county profiles, economics, families, etc.

Select hot button marked **Census Home**

<http://www.census.gov>

Return to the Census Bureau's home page to exit their web site.

NOTICE

The following information has been printed directly from the Internet. The Home Page of the organization is presented on the first page, followed by the "hot keys" to be selected in the order in which they were selected to produce this Appendix. Internet addresses are provided (in italics) so that the reader may access the same information. The sequence in which information was accessed for this appendix is offered as a suggestion, and the reader is encouraged to sequence the information in the way most useful to them.

It should be noted that, like all Internet resources, this information is time sensitive. Internet information (home pages, etc.) are continually updated by the responsible organization, in this case, the federal government's Department of Labor. The exact information, content, and appearance of information the reader is able to access may differ from the pages contained in this appendix. The information in this appendix is provided to assist the reader in easily and quickly obtaining data collected by the federal government and made available on the Internet. It is not intended to be a comprehensive guide to using the Internet. Many standard references exist to guide the reader in use of the Internet.

What's New

The ATSDR Communities Web pages are now available. These new pages were designed to answer common questions and help you find the information you are looking for.

The paper Public Health Implications of Exposure to PCBs is now available on the ATSDR Web site.

The ATSDR Web site is now hosting the Environmental Health in the U.S. Public Health Service web pages which are sponsored by the Sanitarian Professional Advisory Committee (SPAC).

ATSDR's Minimal Risk Levels (MRLs) of hazardous substances has been updated.

The recently released ToxFAQ Sheet for Dioxins has been added to ATSDR's Web server.

Media Advisory: April 19, 1999 - ATSDR Updates its Toxicological Profile for Mercury.

The Draft Agenda for Public Health Activities for FY 1999 and FY 2000 at U.S. Department of Energy Sites has been released for public review and comment.

Industrial Chemicals and Terrorism is a paper that presents a 10-step procedure to analyze, mitigate, and prevent public health hazards resulting from terrorism involving industrial chemicals.

Chemical Hazards During the Recent War in Croatia summarizes the many uses of chemicals as weapons in the recent conflict between Croatia and Yugoslavia.

ATSDR's Toxicological Profile Information Sheet is now available with current information on all of ATSDR's Toxicological Profile publications.

Public Health Concerns At Department of Energy Sites: Progress Report highlights the activities and accomplishments of ATSDR in addressing public health issues in the communities near Department of Energy hazardous waste sites. The document is also available as an Adobe Acrobat PDF File (929K).

You can sign up to receive a copy of ATSDR's Public Health Assessment for the Hanford nuclear site when it is released for public comment by filling out the online form.

Dioxin and Dioxin-Like Compounds in Soil, Part I: ATSDR Interim Policy Guideline has been adopted by ATSDR to assess the public health implications of dioxin and dioxin-like compounds in residential soils near or on hazardous waste sites.

The Proceedings of the PCB Expert Panel Workshop evaluates all pertinent information related to the public health implications of human exposure to PCBs.

The Toxicologic Hazard of Superfund Hazardous Waste Sites is a

The Toxicologic Hazard of Superfund Hazardous Waste Sites is a scientific analysis of the threat posed to public health by uncontrolled hazardous waste sites.

About ATSDR

The mission of the Agency for Toxic Substances and Disease Registry (ATSDR), as an agency of the U.S. Department of Health and Human Services, is to prevent exposure and adverse human health effects and diminished quality of life associated with exposure to hazardous substances from waste sites, unplanned releases, and other sources of pollution present in the environment.

ATSDR is directed by congressional mandate to perform specific functions concerning the effect on public health of hazardous substances in the environment. These functions include public health assessments of waste sites, health consultations concerning specific hazardous substances, health surveillance and registries, response to emergency releases of hazardous substances, applied research in support of public health assessments, information development and dissemination, and education and training concerning hazardous substances.

ATSDR's mission and the goals of ATSDR are reflected within its organizational structure and its statement of values.

Definitions of words and phrases used by ATSDR can be found in the ATSDR Glossary of Terms.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for a systematic approach to data collection and the importance of using reliable sources of information.

3. The third part of the document describes the process of identifying and addressing potential risks and challenges. It stresses the importance of proactive risk management and the need to develop effective strategies to mitigate potential threats.

4. The fourth part of the document discusses the role of communication and collaboration in achieving the organization's goals. It emphasizes the importance of clear communication and the need for all team members to work together effectively.

5. The fifth part of the document outlines the various metrics and indicators used to measure the organization's performance. It highlights the need for a balanced scorecard approach that considers both financial and non-financial factors.

6. The sixth part of the document discusses the importance of continuous improvement and the need to regularly review and update the organization's processes and procedures. It emphasizes the importance of learning from mistakes and using feedback to drive positive change.

7. The seventh part of the document outlines the various challenges and opportunities facing the organization. It highlights the need for a strategic approach to addressing these challenges and the importance of staying up-to-date on industry trends and developments.

8. The eighth part of the document discusses the importance of maintaining a strong corporate culture and the need to foster a sense of ownership and commitment among all team members. It emphasizes the importance of leading by example and the need to create a positive work environment.
