PUREWORD

This research was performed for the Division of Stationary Source Enforcement (DSSE), Environmental Protection Agency under Task Order No. 40, EPA Contract No. 68-01-4146. Mr. Howard Wright, Compliance Monitoring Branch, Division of Stationary Source Enforcement was the EPA Task Hanager.

Because this document is a product of the efforts of many individuals, it is impossible to acknowledge each person who has contributed. However, special recognition is given to the fifty states, three territories, and twelve local agencies who provided the information that served as the foundation of this research.

DISCLAIMER

This report is issued by the Office of Enforcement, Environmental Protection Agency. Copies are available for a nominal cost from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA. 22161. The opinions expressed in this report are those of the producing contractor and are not necessarily those of the U.S. Environmental Protection Agency. This report is not to be used as an all inclusive reference document for existing SIP regulations for selected sources and pollutants.

EXECUTIVE SUMMARY

Current copies of the air pollution control regulations of all fifty states, three territories, and twelve local agencies were reviewed for the purpose of compiling information on a nationwide basis relevant to emission standards, compliance test methods, and continuous emission monitoring, as applied to existing stationary sources. Specific pollutants of interest were opacity, SO₂, NO_x, and sulfur compounds other than SO₂. For the primary focus of this review and compilation, DSSE identified the following existing source categories and associated pollutants for which details of the applicable emission standards are of primary concern:

OPACITY

- o Fossil fuel-fired steam generators (FFFSG)
- o Portland cement plants
- Catalyst regenerators of fluid bed catalytic cracking units (FBCCU)
- o Hog fuel-fired boilers
- o Kraft recovery furnaces
- o Basic oxygen process furnaces (BOPF)
- o Ferroalloy electric submerged arc furnaces

SO₂ NO

o FFFSG

- o FFFSG
- o Sulfuric acid
- o Nitric acid plants

o Smalters

Most state and local agencies' regulations contain a provision restricting visible emissions for a generalized, non-specific grouping of sources
and equipment herein referred to as "all existing sources". Inclusion of
such a broad-based opacity standard within an agency's regulations virtually
assures widespread applicability of that visible emission limitation.

Sources not subject to a specific emission standard addressed especially to a select source group are, nevertheless, usually governed by the all-en-compassing standard for "all existing sources". The state agencies of New Hampshire and New Jersey together with the Boston local agency were the only agencies of those reviewed that did not have some form of generalized opacity standard for "all existing sources". For this nonspecific source grouping the agencies are rather evenly divided between an opacity standard of 20% and one of 40%. The District of Columbia enjoys the unique distiction of being the only agency to prohibit visible emissions (i.e., 0% opacity) from all existing stationary sources within its jurisdiction. Maryland prohibits visible emissions from existing sources in certain "Areas" of that state. Seven of the agencies surveyed express their visible emissions limitation for this wide-ranged category solely in units of the Ringelmann scale. Table 1 summarizes the variation in the standards for visible emissions from "all existing sources".

Ten of the agencies reviewed provide for no exception to the opacity standard for "all existing sources". The remaining 52 agencies with this type of opacity standard allow some period during which the visible emissions standard may be exceeded. Generally, this exception period for intermittent excursions ranges from 3-5 minutes per hour. In addition to providing for emissions above the standard, some of the agencies specify (1) how high above the standard the emissions may extend as well as (2) how long of a period the emissions may remain above the standard each day. Table 2 summarizes each state's opacity standard, allowable exception and permissible periods above the standard for the generalized category of "all existing sources".

The situations concerning opacity standards for existing Fossil Fuel-Fired Steam Generators (FFFSG) and for existing Hog Fuel-Fired Boilers are very similar. In both cases the agencies rarely use these specific terminologies as the subject source caetgory for a visible emissions standard. Florida is the only agency for which there is a specific opacity standard for existing FFFSG, and Washington has the only opacity standard addressed specifically to Hog Fuel Boilers. In both instances these kinds of facilities are included within a more general grouping of sources for which an opacity standard has been adopted by an agency. Such source groupings as "fuel burning equipment", "indirect heating equipment" and "combustion installations" are the common denominators used by the agencies from which FFFSG and Hog Fuel Boilers both comprise sub-sets. Under these circumstances 13 states and 3 locals have specific opacity standards capable of being directly translated to FFFSG. Similarly, 12 states and 3 locals have opacity standards directly applicable to Hog Fuel-Fired Boilers. Section II elaborates on the details of these specific agency regulations pertinent to the two source groups.

For the other five categories of existing stationary sources and associated opacity standards of interest to DSSE, the extent of visible emissions standards is rather minimal. Four states (Arizona, Georgia, Minnesota, New York) currently have visible emissions standards applicable to existing Portland Cement Plants. Likewise, four states (Louisiana, Minnesota, New Mexico, Washington) have opacity standards expressly for existing Catalyst Regenerators at Fluid Bed Catalytic Cracking Units (FBCCU). Washington is the only agency with a visible emissions standard prescribed for Kraft Recovery Furnaces. None of the state or local agency regulations contain specific provisions for opacity standards for either existing Basic Oxygen Process Furnaces (BOPF) or existing Ferroalloy Electric Submerged Arc Furnaces. The specifics on the few regulations pertinent to these source categories are detailed in Section II.

The most widespread means used by state and local agencies for specifying SO_2 emission standards for existing FFFSG is either on the basis of heat input, as pounds of SO_2 per million Btu, or in terms of restrictions on the amount of sulfur contained in the fuel. Of the 65 agencies reviewed, 36 agencies specify a $1b/10^6$ Btu standard and 28 agencies define the allowable fuel sulfur content. SO_2 emission standards for existing FFFSG in terms

of concentration, ppm SO_2 , or of mass emission rate, 1b SO_2 /hour, are used to a much lesser extent. Only the states of Arkansas, Maine and Rhode Island are without some form of SO_2 emission limitation on existing FFFSG.

SO₂ emission standards for existing sulfuric acid plants are expressed in terms of 1b SO₂ per ton of 100% acid and ppm as SO₂. The most prevalent usage for standards directly applicable to this source category is the 1b/ton expression. The units of ppm are used in most cases of a generalized SO₂ emission standard applicable to a variety of industrial processes including sulfuric acid manufacturing. Of the 46 agencies with an SO₂ emission standard applicable to sulfuric acid plants, 25 of those standards are written expressly for that group of affected facilities.

Similar to the units used for sulfuric acid plant emission limitations, emission standards for existing non-ferrous smelters are written in terms of ppm as SO₂ and 1b SO₂/hr. In most cases the units of 1b SO₂/hr are used when the standard applies specifically to smelters, while ppm is a more commonplace unit for standards restricting SO₂ from a variety of sources. Of the 14 agency emission standards directly addressing smelters, 12 of those standards are expressed in units of 1b SO₂/hr while only 2 are written in terms of ppm SO₂. Table 3 is a tabular summary of agency SO₂ emission standards for the source categories of FFFSG, sulfuric acid plants and non-ferrous smelters.

Nitrogen oxides (NO $_{\rm X}$) emission standards for existing FFFSG are usually written in terms of 1bs NO $_{\rm X}/10^6$ Btu. All but one of the 16 state agencies with this particular emission standard have used that system of units. Similarly, state emission standards for existing nitric acid plants are usually expressed in units of 1b NO $_{\rm X}$ per ton of 100% acid. Although 2 states have adopted standards in ppm NO $_{\rm X}$ for existing nitric acid plants, 14 states have adopted the 1b NO $_{\rm X}$ /ton expression as the emission standard for that group of existing facilities. Table 4 is a tabular summary of agency NO $_{\rm X}$ emission standards for the source categories of FFFSG and nitric acid plants.

Section II of this report contains more of the specific details pertinent to the opacity, SO_2 and NO_X emission standards for these source categories in question.

A rather commonplace provision of visible emission standards is the exception period whereby a source is permitted to intermittently exceed the standard during brief periods of time. Most agencies also have a general, across-the-board provision which allows excess emissions during periods of equipment malfunction and for control equipment maintenance. Of the 65 agency regulations reviewed, only 8 states and 3 locals were lacking some form of regulation which specifically addresses malfunction and/or maintenance occurrences and their associated excess emissions. The majority of these types of provisions are neither specific to a given pollutant nor directed to a given source group.

Almost all of the agencies with malfunction/maintenance provisions require agency notification of such occurrences. Although the information required for notification of a scheduled maintenance shutdown are somewhat universal, the remaining details of malfunction/maintenance provisions are extremely variable. While some agencies require notification within 24 hours, others allow 10 days for notification of malfunctions. Although some agencies have provisions for follow-up reporting of remedial actions, others do not even have a requirement for agency notification upon correction of the incident and termination of the excess emissions. None of the agencies have enforcement provisions directing the affected source operations to be immediately shutdown during malfunction or maintenance events, but a few agencies do have explicit conditions that will allow the source to continue operation either for only a brief time or for an indefinite period of time. Section II of this report summarizes the variation in the agency regulations dealing with malfunctions and scheduled maintenance.

A survey of the extent to which individual state and local agencies have complied with the requirement for provisions of continuous monitoring

regulations in accordance with 40 CFR 51 confirmed that the agencies' status range from one extreme to the other. Some agencies currently comply with all facets of the Part 51 "Minimum Emission Monitoring Requirements" of Appendix P, and in a few cases have more comprehensive regulations than the minimal requirements. Conversely, some agencies have yet to adopt any of the required Part 51 CM provisions. As shown in Table 5, the agencies have been ranked from Class I and IA to Class IV, depending upon the degree to which they currently comply with the specifications of 40 CFR 51, Appendix P. Details of each agency's continuous monitoring regulations are highlighted in Section III of this report. Although most of the agencies which have adopted CM regulations have followed the minimal requirements of Appendix P, a few of those agencies have specific exemptions and/or exceptions peculiar to a given agency's regulations. Those unique characteristics of an agency's CM provisions, such as extended time for compliance, additional sources required to monitor, etc., are also detailed in Section III.

15. SUPPLEMENTARY NOTES

16. ABSTRACT

Current copies of the air pollution control regulations of all fifty states, three territories, and twelve local agencies were reviewed for the purpose of compiling information on emission standards, compliance test methods, and continuous emission monitorine, as applied to existing stationary sources. Specific pollutants of interest were opacity 50, NO, and sulfur compounds other than SO,. The intent of this review was to identify the assortment of types, formats, and exemptions which prevail in existing SIP regulations for selected sources and pollutants, thereby providing guidance to EPA for writing future continuous emission monitoring regulations. This report is not to be used as an all inclusive reference document for such information.

The primary focus of this review and compilation was the following existing source categories:

INSTRUCTIONS

1 REPORT NUMBER

Insert the EPA report number as it appears on the cover of the publication.

2. LEAVE BLANK

3. RECIPIENTS ACCESSION NUMBER

Reserved for use by each report recipient.

4. TITLE AND SUBTITLE

Title should indicate clearly and briefly the subject coverage of the report, and be displayed prominently. Set subtitle, if used, in smaller type or otherwise subordinate it to main title. When a report is prepared in more than one volume, repeat the primary title, add volume number and include subtitle for the specific title.

5. REPORT DATE

Each report shall carry a date indicating at least month and year. Indicate the basis on which it was selected (e.g., date of issue, date of approval, date of preparation, etc.).

6. PERFORMING ORGANIZATION CODE

Leave blank.

7. AUTHOR(S)

Give name(s) in conventional order (John R. Doe, J. Robert Doe, etc.). List author's affiliation if it differs from the performing organization.

B. PERFORMING ORGANIZATION REPORT NUMBER

Insert if performing organization wishes to assign this number.

PERFORMING ORGANIZATION NAME AND ADDRESS

Give name, street, city, state, and ZIP code. List no more than two levels of an organizational hirearchy.

10. PROGRAM ELEMENT NUMBER

Use the program element number under which the report was prepared. Subordinate numbers may be included in parentheses.

11. CONTRACT/GRANT NUMBER

Insert contract or grant number under which report was prepared.

12. SPONSORING AGENCY NAME AND ADDRESS

Include ZIP code.

13. TYPE OF REPORT AND PERIOD COVERED

Indicate interim final, etc., and if applicable, dates covered.

14. SPONSORING AGENCY CODE

Insert appropriate code.

15. SUPPLEMENTARY NOTES

Enter information not included elsewhere but useful, such as: Prepared in cooperation with, Translation of, Presented at conference of, To be published in, Supersedes, Supplements, etc

16. ABSTRACT

Include a brief (200 words or less) factual summary of the most significant information contained in the report. If the report contains a significant bibliography or literature survey, mention it here.

17. KEY WORDS AND DOCUMENT ANALYSIS

(a) DESCRIPTORS - Select from the Thesaurus of Engineering and Scientific Terms the proper authorized terms that identify the major concept of the research and are sufficiently specific and precise to be used as index entries for cataloging.

(b) IDENTIFIERS AND OPEN-ENDED TERMS - Use identifiers for project names, code names, equipment designators, etc. Use open-ended terms written in descriptor form for those subjects for which no descriptor exists.

(c) COSATI FIELD GROUP - Field and group assignments are to be taken from the 1965 COSATI Subject Category List. Since the majority of documents are multidisciplinary in nature, the Primary Field/Group assignment(s) will be specific discipline, area of human endeavor, or type of physical object. The application(s) will be cross-referenced with secondary Field/Group assignments that will follow the primary posting(s).

18. DISTRIBUTION STATEMENT

Denote releasebility to the public or limitation for reasons other than security for example "Release Unlimited." Cite any availability to the public, with address and price.

19. & 20. SECURITY CLASSIFICATION

DO NOT submit classified reports to the National Technical Information service.

ZI. NUMBER OF PAGES

Insert the total number of pages, including this one and unnumbered pages, but exclude distribution list, if any.

22. PRICE

Insert the price set by the National Technical Information Service or the Government Printing Office, if known.

OPACITY

- o Fossil (uel-fired steam generators (FFFSG)
- o Portland cement plants
- o Catalyst regenerators of fluid bed catalytic cracking units (FBCCU)
- o dog fuel-fired boilers
- o Kraft recovery furnaces
- Basic oxygen process furnaces (SOPF)
- o Ferroalloy electric submerged arc furnaces

	<u>NO</u> _X	\underline{so}_2	
0	FFFSG	O	FFFSG
O	Witric acid plants	0	Sulfuric acid plants

The report is organized into a separate Executive Summary and three volumes. The first volume contains an analysis of state adopted emission standards for opacity, 50., NO, malfunctions and scheduled maintenance, and continuous monitoring regulations for existing stationary sources. Volume II provides a tabular summary of key components of the applicable emission standards and regulations including source category, minimum source capacity, averaging time of standard, exemptions, etc. Volume III of the report contains the complete text of the regulations cited.
