## FOR E W O R D

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

#### ACKNOWLEDGEMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Texas Water Quality Board for professional involvement, to the Texas National Guard for conducting the tributary sampling phase of the Survey, and to those Texas wastewater treatment plant operators who voluntarily provided effluent samples.

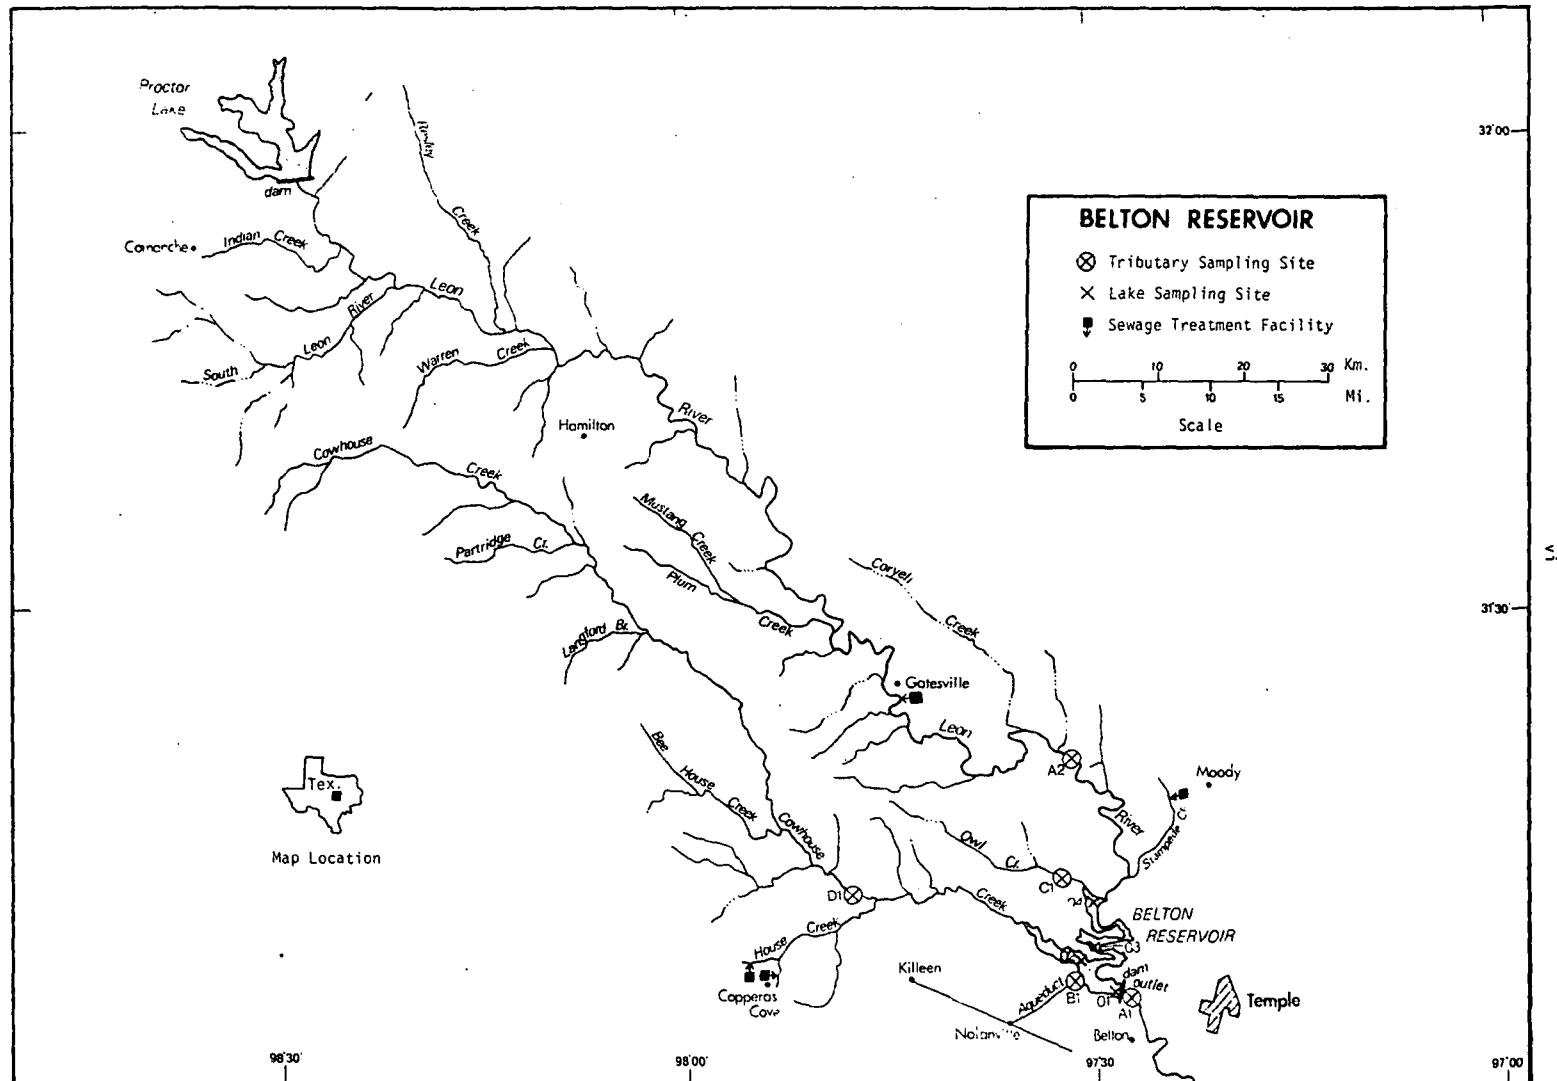

Hugh C. Yantis, Jr., Executive Director of the Texas Water Quality Board, and John B. Latchford, Jr., Director, and the staff of the Field Operations Division provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Thomas Bishop, the Adjutant General of Texas, and Project Officer Colonel William L. Seals, who directed the volunteer efforts of the Texas National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

BELTON RESERVOIR

STORET NO. 4803

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Belton Reservoir is meso-eutrophic; i.e., moderately well supplied with nutrients and productive. Whether nutrient enrichment is beneficial or deleterious depends on the actual or potential effect on the uses of the reservoir. In this regard, no nuisance conditions are known to personnel of the Texas Water Quality Board and there is little or no impairment of the designated beneficial uses of Belton Reservoir.

Belton Reservoir ranked eleventh in overall trophic quality when the 39 Texas reservoirs sampled in 1974 were compared using a combination of six parameters\*. Three of the reservoirs had less median total phosphorus, two had less and five had the same median dissolved orthophosphorus, 28 had less median inorganic nitrogen, 12 had less mean chlorophyll a, and one had greater mean Secchi disc transparency. Marked depression of hypolimnetic dissolved oxygen occurred at all four sampling stations in May and August.

Survey limnologists did not observe macrophytes or algal blooms during any sampling time, but chlorophyll a concentrations were somewhat high at station 4 in May, August, and November and at station 1 in August (see page 9).

---

\* See Appendix A.

B. Rate-Limiting Nutrient:

The algal assay results indicate phosphorus was the limiting nutrient when the assay samples were collected in May and November. The reservoir data indicate phosphorus limitation at all sampling times.

C. Nutrient Controllability:

1. Point sources--The phosphorus contribution of known point sources amounted to 12.2% of the total load to Belton Reservoir during the sampling year. Most of the point-source load was contributed by Copperas Cove (8.7%) and Gatesville (2.5%).

The present phosphorus loading of  $3.95 \text{ g/m}^2/\text{yr}$  is over seven times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 16), and all phosphorus inputs to Belton Reservoir should be minimized to the greatest practicable degree to slow the aging of the reservoir.

2. Non-point sources--Non-point sources contributed 87.8% of the total phosphorus load to the reservoir. The Leon River contributed 16.8% of the total; Cowhouse Creek, 65.3%; and the ungauged tributaries contributed an estimated 5.3%.

The phosphorus export rates of the Leon River and Cowhouse Creek were 5 and  $71 \text{ kg/km}^2/\text{yr}$ , respectively (see page 15). The export rate of the Leon River compares quite well to rates of tributaries of other Texas reservoirs, but the export rate of Cowhouse Creek was considerably higher. This higher rate may be due to unidentified point sources rather than to non-point source inputs. There are a

number of small communities served by septic tanks that may be impacting Cowhouse Creek, but more extensive sampling would have to be done to establish the significance of these possible sources.

## II. RESERVOIR AND DRAINAGE BASIN CHARACTERISTICS<sup>†</sup>

### A. Morphometry<sup>††</sup>:

1. Surface area: 50.27 kilometers<sup>2</sup>.
2. Mean depth: 10.8 meters.
3. Maximum depth: >25.6 meters.
4. Volume: 545.188 x 10<sup>6</sup> m<sup>3</sup>.
5. Mean hydraulic retention time: 1.6 years (based on 1972-1976 mean outflow).

### B. Tributary and Outlet:

(See Appendix C for flow data)

#### 1. Tributaries -

<u>Name</u>	<u>Drainage area (km<sup>2</sup>)*</u>	<u>Mean flow (m<sup>3</sup>/sec)*</u>
Leon River	6,728.8	10.11
Cowhouse Creek	1,815.6	5.41
Minor tributaries & immediate drainage -	<u>636.6</u>	<u>2.80</u>
Totals	9,181.0	18.32

#### 2. Outlet -

City of Killeen aqueduct	0.0	0.70**
Leon River	<u>9,230.8</u>	<u>16.41</u>
Totals	9,230.8***	17.11***

### C. Precipitation\*\*\*\*:

1. Year of sampling: 89.1 centimeters.
2. Mean annual: 86.4 centimeters.

<sup>\*\*</sup> White, 1976.

<sup>\*\*\*</sup> Includes area of reservoir; lesser outflow due to evaporation.

<sup>\*\*\*\*</sup> See Working Paper No. 175.

### III. RESERVOIR WATER QUALITY SUMMARY

Belton Reservoir was sampled four times in 1974 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at four stations on the reservoir (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the March and November visits, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 25.3 meters at station 1, 25.6 meters at station 2, 25.3 meters at station 3, and 11.0 meters at station 4.

The sampling results are presented in full in Appendix D and are summarized in the following table (the August nutrient samples were not preserved properly and were not analyzed).

Control	0.005	0.132	0.3
0.050 P	0.055	0.132	4.1
0.050 P + 1.0 N	0.055	1.132	16.5
1.0 N	0.005	1.132	0.2

## 2. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate that the potential primary productivity of Belton Reservoir was low at the times the assay samples were collected. Both assays yielded similar results. There was a significant growth response when phosphorus was added alone, but no change in yield occurred with the addition of only nitrogen. These results indicate that phosphorus was limiting at the times of sample collection (03/13/74 and 11/01/74).

The reservoir data substantiate the assay findings. The mean inorganic nitrogen to orthophosphorus ratios were 25 to 1 in March, 32 to 1 in May, and 15 to 1 in November.

IV. NUTRIENT LOADINGS  
(See Appendix E for data)

For the determination of nutrient loadings, the Texas National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page vi), except for the months of April and May when two samples were collected. Sampling was begun in September, 1974, and was completed in August, 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Texas District Office of the U.S. Geological Survey for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were calculated using mean annual concentrations and mean annual flows. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the mean concentrations in the Leon River at station A-2 and the mean annual ZZ flow.

The operators of the Copperas Cove and Moody wastewater treatment plants provided monthly effluent samples and corresponding flow data. The communities of Gatesville and Morgan's Point did not participate; nutrient loads were estimated at 1.134 kg P and 3.401 kg N/capita/year, and flows were estimated at  $0.3785 \text{ m}^3/\text{capita/day}$ .

## D. Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km<sup>2</sup>/yr</u>	<u>kg N/km<sup>2</sup>/yr</u>
Leon River	5	70
Cowhouse Creek	71	129

## E. Mean Nutrient Concentrations in Ungaged Stream:

<u>Tributary</u>	<u>Mean Total P Conc. (mg/l)</u>	<u>Mean Total N Conc. (mg/l)</u>
Owl Creek	0.013	0.991

F. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m <sup>2</sup> /yr	3.95	3.60	19.0	9.4

Vollenweider phosphorus loadings  
(g/m<sup>2</sup>/yr) based on mean depth and mean  
hydraulic retention time of Belton Reservoir:

"Dangerous" (eutrophic loading)	0.52
"Permissible" (oligotrophic Loading)	0.26
