## DISCLAIMER

This Final Report was furnished to the U.S. Environmental Protection Agency by PEI Associates, Inc., Cincinnati, Ohio, in fulfillment of Contract Number 68-02-3890, Assignment Number 40. The opinions, findings, and conclusions expressed are those of the authors and not necessarily those of the Environmental Protection Agency or of cooperating agencies. Mention of company or product name is not to be considered an endorsement by the Environmental Protection Agency.

## SECTION 1

### INTRODUCTION

The Clean Air Act Amendments of 1977 require all states to submit state implementation plans for demonstrating the attainment of National Ambient Air Quality Standards (NAAQS) by December 31, 1982. States that could not demonstrate attainment by 1982 could receive an extension to meet the automotive-related NAAQS (ozone and/or carbon monoxide) by December 31, 1987. To receive this extension, a state must require all reasonably available control technology, including inspection and maintenance (I/M) of motor vehicles. To meet this requirement, 30 states now operate I/M programs. Thirteen of these programs are decentralized with noncomputerized data collection (manual) emission analyzers. During the FY-84 and FY-85 audits of these I/M programs, EPA found that all of the manual data collection systems had low failure rates.

The Missouri I/M program began January 1, 1984. The I/M program is a decentralized program with manual emission analyzers. Missouri's data collection system in the past consisted of an analysis of approximately 1 in 20 motor vehicle inspection forms.

Missouri is similar to the other states which operate decentralized I/M programs with manual data collection systems. The state was found to have a low failure rate. This report presents a computerized QA data entry and evaluation system to assist in the management of manual I/M programs.

The system has been designed for use primarily in Missouri. However, the system is adaptable to other state programs. Once the primary data items and various assumptions are specified, adapting the system to another program would be a relatively simple task. Modifying the program would primarily require changes to the data base structure. If the same variable names are used, only minor changes to the analysis programs would be required.

The report is divided into a number of additional sections. Section 2 provides an overview of the QA system. Included are the hardware and software

requirements and a brief discussion of each of the menu items. Section 3 through 10 present detailed descriptions and instructions for utilizing the various program options.

## SECTION 2

### QA SYSTEM OVERVIEW

#### 2.1 GETTING STARTED

##### Hardware and Software Requirements

The Missouri QA system has been designed to run on IBM compatible personal computers. The hardware requirements are essentially the same as those for dBASE III:

- ° 256K bytes of internal memory, and
- ° One 360K floppy diskette drive and  
a hard disk drive.

In addition the software requirements are:

- ° MS-DOS or PC-DOS version 2.0 or later, and
- ° dBASE III.

##### Configuring the System

A personal computer normally allows up to eight files to be open at one time. It uses five of those files itself. dBASE III allows up to 10 data files or 20 program files to be open at a time. Therefore, when using dBASE III, more files may need to be open than the computer allows. In order to solve this problem, a file CONFIG.SYS must be created on the DOS diskette or on the hard disk's root directory, so that the file is automatically loaded in the computer every time it is turned on. CONFIG.SYS is set by storing the following commands in the file:

```
Files = 20
Buffers = 24
```

Buffers allow dBASE III to work faster by keeping more information in the computer's memory. More information on creating a CONFIG.SYS file is available in both the dBASE III and other computer manuals. It should be noted that buffers occupy computer memory. Therefore, users should be careful not

to set the number of buffers too high.

### Installing the Program

The authors recommend that the program be run from a hard disk. If a floppy disk is used, only very small data bases can be created. The maximum size data base that will fit on a floppy disk has not been determined but it is probably only a few hundred records.

To install the program onto the hard disk, put the diskette that came with this manual into drive A. At the DOS prompt enter the command:

COPY A:.\*.\* D:

where D is the drive designation of the hard disk. To insure that all of the files are copied properly, display a directory of the hard disk. The following 23 files must appear in the directory in addition to the dBASE III program.

STATION.FRМ

## Starting the Program

The Missouri QA system provides all of the commands and structures to exercise all of the program options. To use the program, dBASE III must first be loaded with the following commands:

d > DBASE [CR]

("d >") is the DOS prompt that indicates the drive ("d") containing the dBASE III program. "[CR]" is used throughout this manual to denote the "enter" or "carrier return" key. dBASE III responds with a dot (.) prompt. If the QA program is in a different drive than dBASE III enter the following command:

. SET DEFAULT TO d: [CR]

where "d" is the drive that contains the Missouri QA program. This command directs dBASE III to the appropriate drive for data and program files. If dBASE III and the QA program are on the same disk (i.e., a hard disk) this step is unnecessary.

Finally, to call up the program, enter the following command:

. DO MISSOURI [CR]

## 2.2 PROGRAM OPTIONS

Following the .DO MISSOURI [CR] command the computer screen will display the menu options shown in Figure 1. Each of these options is discussed below.

### Option 1

Selecting option 1 allows the user to enter data from the Missouri Motor Vehicle Inspection form MVI-2 and data from the Low Emission Tune-Up form SHP-522. The program was designed to minimize data entry errors. It validates the data entered wherever possible. Also, to quantify the accuracy of the data entered, the program includes a system to check five percent of the records entered. This program option is discussed in Section 3.

### Option 2

The error correction program creates an index of unique vehicle makes including all misspellings of the various makes. It offers suggested dBASE III statements for correcting misspellings in the data base. This option is presented in Section 4.

**Missouri Automobile Emission Inspection  
Data Management Program**

**\*\*\*\*\* Main Menu \*\*\*\*\***

- 1. Data Entry**
- 2. Error Correction**
- 3. Overall Summary**
- 4. Make Summary**
- 5. Year Summary**
- 6. Station Summary**
- 7. Error Analysis**
- 8. Return to dBASE III**

**Please enter your selection (1-8):**

**Figure 1. Menu of program options**

### Option 3

The overall data summary program enables the user to obtain a detailed data summary of all data contained in the data base. Examples of the program output and a discussion of the program can be found in Section 5.

### Option 4

Selection of this option allows the user to obtain a data summary of all vehicles that match a user-selected model year or model year group. Refer to Section 6 for details.

### Option 5

Similar to option 4, this option provides a data summary for a specific vehicle make selected by the user. This option is discussed in Section 7.

### Option 6

Option 6 presents a summary by vehicle inspection station. The user specifies the station of interest and the program generates the appropriate summary statistics. See Section 8 for details.

### Option 7

Option 7 is an error analysis program. During data entry, a 5 percent sample of the data base is entered twice to evaluate entry accuracy. This program compares the duplicate entries and prints a summary of the errors encountered. This option is discussed in Section 9.

### Option 8

Selecting option 8 allows the user to leave the program and return to dBASE III. This option can be selected anytime the menu appears on the screen.

## SECTION 3

### DATA ENTRY

The data entry program is designed for use with MVI-2 and SHP-522 forms. The program is designed to minimize data entry errors by restricting data entries in certain key fields. Also, to quantify the accuracy of the data entered, the program includes a system to check five percent of the records entered.

When Option 1 is selected, the program displays the screen shown in Figure 2. These codes are used to indicate exhaust leaks, tampering items, and inspection/maintenance items. These codes will be discussed later in the program description.

After the codes are displayed, pressing any key will display the instructions to specify the month and year of the inspections. If the bulk of the forms are from a given month, then the user will only need to enter the day of the month to complete the date. It is possible to enter dates that occur outside of the specified month. Instructions for this are included in the program and will be displayed on the screen at the appropriate time.

#### 3.1 MVI-2 FORM

The data entry screen, shown in Figure 3, was designed to look similar to the MVI-2 form. To minimize errors, some of the data are determined by the computer. For example, the user enters the year, make, and VIN of the car and the hydrocarbon and carbon monoxide readings from the first inspection. The computer then determines if the car passed or failed. If the car passed, the computer skips the reinspection data. If a user enters a body style greater than 2 or a fuel type other than gas, the computer aborts that record and informs the user to go on to the next record. Likewise, if the inspection station begins with something other than:

- ° 050,
- ° 092,

The following are the codes used within this program  
to indicate the cause for a vehicle failing an inspection:

Exhaust System	Inspection/Maintenance
E1 = Exhaust leak	M0 = Not specified
	M1 = Air filter element
	M2 = TAC
Tampering	M3 = Idle speed
	M4 = Air /fuel mixture
T0 = Not specified	M5 = Dwell
T1 = Catalytic converter	M6 = Timing
T2 = PCV valve	M7 = Spark plugs
T3 = EGR valve	M8 = Spark plug wires
T4 = Air pump	M9 = Vacuum hose
T5 = Carbon canister	N0 = Electronic controls
T6 = Fuel inlet resistor	N1 = Low emission tune-up
T7 = Other	N2 = Other

Press any key to continue...

- 115, or
- 296

the computer aborts that record and informs the user to go on to the next record. Finally, the computer determines if the vehicle was exempt, waived or in compliance under Section 207(b).

### 3.2 OPERATING INSTRUCTIONS

Table 1 provides the maximum lengths, types and requirements for each item entered. The names for the data fields are those used by the program. Users enter only those data listed in Table 1. The data are entered in the order shown in the table. The computer will highlight the areas on the screen where data are entered. A flashing cursor indicates which item to enter.

Users should be careful NOT to press the escape (ESC) key as this will advance the program and confuse the user. If the user makes a mistake when entering data, it is sometimes possible to go back to previous items with the up arrow key or the backspace key. However, these keys will not always work; therefore, they should be used with care.

The year, make, inspection station, and inspector must not be left blank as this will cause problems in the data analysis programs.

When all of the data from a form are entered, the computer will ask the user if the data are correct. If the user responds "Y" the data will be saved. If the user responds "N" the data are not saved; and, the user must reenter all of the data from that form. The computer does nothing if the user responds with anything but "Y" or "N."

The program was designed so that if a given field is filled, the computer will go on to the next item. For example, the year is entered as two digits. When a user enters "85" the computer will then immediately prompt the user to enter the make. The user does not press the "enter" key. However, when entering the odometer reading the user may not fill all of the spaces provided. The enter key must then be pressed to continue. By not requiring the enter key be pressed, the number of keystrokes has been minimized to speed data entry and minimize entry errors.

TABLE 1. DATA REQUIREMENTS FOR MVI-2 FORM

Data	Maximum length	Type	Comments
Year	2	Numeric	Last two digits with range of 71-98; enter 99 to end program. <u>DO NOT</u> leave this field blank.
Make	4	Character	First four letters (e.g., CHEV for Chevrolet). <u>DO NOT</u> leave this field blank.
Odometer	3	Numeric	In thousands of miles. Automatically right justifies entry.
VIN	18	Character	Digits and/or letters.
Body	1	Numeric	Any number greater than 2 will abort that record.
Fuel	1	Character	Any letter other than G (gasoline) will abort that record.
First Inspection HC_First	4	Numeric	Number between 0 and 2000.
CO_First	4	Numeric	Number between 0.00 and 9.99.
Reinspection HC_RE	4	Numeric	Not entered if vehicle passed first inspection.
CO_RE	4	Numeric	Not entered if vehicle passed first inspection.
Codes	38	Character	Series of 2 character codes. Each code has 1 letter (E, T, M or N) and 1 number (0-9). The codes are not separated. A maximum of 19 can be entered. See Figure 2.
Cost	3	Numeric	In dollars. Automatically right justified.
Station_1	6	Numeric	Must begin with 050, 092, 096, 115, or 296. <u>DO NOT</u> leave this field blank.
Inspect_1	9	Numeric	Inspector for initial inspection. <u>DO NOT</u> leave this field blank.

(continued)

TABLE 1. (continued)

Data	Maximum Length	Type	Comments
Date_1	2	Date	Enter only the day. The month and year are provided. If a different month is desired press the F10 key and enter the date.
Reinspect	9	Numeric	Reinspector number not entered if vehicle passed first inspection.
Re_Date	2	Date	Reinspection date not entered if vehicle passed first inspection.
Decal	8	Character	Must begin with the letter "E". Other characters are numbers.

The computer will not accept letters when numbers are required. Likewise, it will not accept numbers where letters are required.

Figures 4 and 5 show completed data entry screens for vehicles that passed and failed the first inspection, respectively. A listing of the Missouri data entry program source code is provided in Appendix A. The data base structure is shown in Appendix B.

Pass or fail determinations for the initial inspection and the reinspection are automatically made by the program, regardless of the indication on the MVI-2 form. The standards used for this determination are:

<u>Year</u>	<u>HC, ppm</u>	<u>CO, %</u>
1971-74	700	7.0
1975-79	600	6.0
1980	300	3.0
1981+	220	1.2

The computer also determines the exempt, waived, and 207 (b) compliance status of each vehicle.

The program also remembers the last inspection station, inspector, reinspector, and decal number input to the program. For the first three items the operator need only press the [CR] if no changes are needed. The decal number is incremented by one for each new form, based on the number for the previous form. For example, if the first form had decal number E0000001 then the number displayed on the screen for the second form is E0000002. If this number is correct the operator need only press [CR] to accept the displayed value.

### 3.3 QUALITY ASSURANCE

In addition to minimizing data entry errors, the Missouri data entry program includes a system to quantify the accuracy of the data entered. Users will be prompted to enter one of every 20 records twice. The first time these records are entered they will be saved in the main data base (MISSOURI.DBF). The same records will also be saved in a second data base called DOUBLE.DBF. The computer then prompts the user to reenter the data. The reentered data are saved in a third data base (REENTER.DBF).

Ideally there would be no errors and the DOUBLE.DBF and REENTER.DBF files

Are the above data correct (Y/N)?

Figure 5. Completed data entry screen for failed inspection

would be identical. However, this is unlikely; and, by comparing the two files users can determine the frequency and types of data entry errors. This analysis is discussed under Option 8 (see Section 9 of this report).

### 3.4 LOW EMISSION TUNE-UP FORM (SHP-522)

Vehicles that were waived should have also submitted a low emission tune-up form. The data entry screen shown in Figure 6 was designed to look similar to the SHP-522 form. The data entry program automatically displays this screen when a vehicle fails both the initial inspection and the reinspection.

To minimize errors, many of the data fields on the screen will contain data from the MVI-2 form. Specifically, the VIN, make, year, station, before tune-up readings, adjustments, and cost will contain the same values as were entered from the MVI-2 form. To accept the values, the user need only press [CR] as each field is highlighted. If needed, any value can be modified.

Table 2 provides the maximum lengths, types and requirements for each data field. The data are entered in the order shown in the table. The computer will highlight the areas on the screen where data are to be entered. A flashing cursor indicates which item to enter.

Users should be careful NOT to press the escape (ESC) key as this will advance the program and confuse the user. If the user makes a mistake when entering data, it is sometimes possible to go back to previous items with the up arrow or backspace key. However, the keys will not always work; therefore, they should be used with care.

When all of the data from a form are entered, the computer will ask the user if the data are correct. If the user responds "Y" the data will be saved and the MVI-2 data entry screen will reappear. If the user responds "N" the data are not saved; and, the user must reenter all of the data from that form. The computer does nothing if the user responds with anything but "Y" or "N." The program was designed so that if a given field is filled, the computer will go on to the next item. The program will not accept letters when numbers are required. Likewise, it will not accept numbers where letters are required.

VIN : 9999999999

Make : CHEV

Year : 85

Figure 6. Data entry screen SHP-522 form

TABLE 2. DATA REQUIREMENTS FOR SHP-522 FORM

Data	Maximum length	Type	Comments
VIN	18	Character	Vehicle ID. NO. digits and/or letters. Not entered.
Make	4	Character	First four letters. Not entered.
Year	2	Numeric	Last two digits. Not entered.
Mechanic No.	11	Character	Inspector's number.
Station No.	6	Numeric	
Date	8	Date	Entire the entire date.
Before tune-up			
HC	4	Numeric	Number between 0 and 2000.
CO	4	Numeric	Number between 0.00 and 9.99.
Adjustments	38	Character	Series of 2 character codes. Each code has 1 letter. (E,T,M, or N) and 1 Number (0-9) The codes are not separated. A maximum of 19 can be entered. See Figure 3-1.
Cost	3	Numeric	In dollars.
Control No.	6	Character	Control No. from SHP-522 form.

Figure 7 shows a completed data entry screen for a waived vehicle. The program source code is contained in Appendix A. The data base structure is shown in Appendix B.

Two caveats are needed here. First, if only one inspection was performed prior to the low emission tune-up then the initial inspection data should also be entered as the reinspection data. Second, in the case where no low emission tune-up data are provided, artificial data will need to be entered into the low emission data base and the record will need to be deleted by hand later.

### 3.5 EXITING THE PROGRAM

To leave the data entry program, press the F10 key or enter a "99" for the year of the vehicle. The program will then prompt for making a back-up copy of the data bases prior to leaving the program. If a back-up is desired, either the DOS "Backup" command must be in the same directory as dBASE III or the DOS "Path" command must have been used to specify another directory. Following the backup operation or if no backup was desired, the program will return to the main menu.

VIN : 9999999999 Make : CHEV Year : 85

Mechanic No. : 123-45-6789

Station No. : 096001

Cost : 200

Control No. : 123456

Are the above data correct (Y/N)?

Figure 7. Completed data entry screen for waived vehicle

## SECTION 4

### ERROR CORRECTION ROUTINE

The second option in the main menu offers the opportunity to obtain a listing of all vehicle makes presently in the data base. In this program, the computer generates an index and listing of all unique vehicle makes including all misspellings.

Once Option 2 is selected, the program automatically produces a summary table similar to that presented in Figure 8. As there is no way to automatically correct all of the misspellings, they must be corrected outside of the program. Following the summary table, example dBASE III statements are presented. Also included are instructions for performing the necessary corrections. These same steps would be used to correct any other errors noted in the data analysis programs discussed in the next sections.

## INSTRUCTIONS FOR MAKING CORRECTIONS TO THE DATA BASE

This program provides users with a list of all the vehicle makes in the Missouri data base, including misspellings. Users can then use the dBASE III 'Replace' command to correct the misspelled vehicle makes. Examples of how to use the 'replace' command are given below:

1. To correct one misspelling at a time use the command -

```
REPLACE ALL MAKE WITH '(correct spelling)' FOR MAKE =  
'(incorrect spelling)'
```

Note: You must use the quotation marks; however the '(' and the ')' must NOT be used.

EXAMPLE: REPLACE ALL MAKE WITH 'FORD' FOR MAKE = 'FODR'

2. To correct several misspellings of the same make at the same time use the command -

```
REPLACE ALL MAKE WITH '(correct spelling)' FOR MAKE = '(first  
incorrect spelling)'.AND. MAKE = '(second incorrect  
spelling)'.AND. MAKE = ....
```

EXAMPLE: REPLACE ALL MAKE WITH 'FORD' FOR MAKE = 'FODR'.AND.  
MAKE = 'FROD'.AND. MAKE = 'FOSD'

These commands must be issued from the dBASE III dot(.) prompt. First exit this program. Then to avoid confusion, and prepare dBASE III enter the following commands:

```
.CLEAR ALL  
.USE MISSOURI
```

You are now ready to make the appropriate corrections to the data base. Other corrections and changes can be made with dBASE III commands, e.g. EDIT and BROWSE. Users should refer to the dBASE III manual for a full discussion of these commands.

Figure 8. Example output - error correction program

**LISTING OF ALL THE MAKES IN THE MISSOURI DATA BASE**

**Note: Most of the makes listed appear  
in the data base more than once.**

AMER	AUDI	BENZ	BMW	BUIC	CADI
CAPR	CHEV	CHRY	DATS	DODG	FIAT
FORD	GMC	HOND	INTE	JEEP	LINC
MAZD	MERC	MG	MITS	NISS	OLDS
OLED	PLYM	PONT	PORS	RENA	ROLL
SAAB	SPEC	SUBA	TOYO	TRIU	VOLK
VOLV					

**Figure 8. (continued)**

## SECTION 5

### OVERALL DATA SUMMARY

Selecting Option 3 from the main menu will cause output similar to that shown in Figure 9 to be generated. The data summaries will be generated from the entire active data base. Consequently, care should be exercised in selecting the active data base. The data base to be used for the summary must be named MISSOURI.DBF.

There are no user options in this program; however, it is imperative that a printer be connected to the computer. After the data have been processed the program will prompt the user to strike a key to initiate the printed output.

Following execution of the program, the main menu will once again appear on the screen.

The execution time for the program will depend on the size of the data base. Execution of the program for a 3000 record data base will take 15-30 minutes depending on the hardware (computer) used. The user should not interrupt the program during processing.

## FAILURE RATE SUMMARY REPORT

11/13/86

Page 1

This report summarizes data for vehicle model years 1971 through 1990.  
 There were 11 vehicle(s) that failed  
 at least one of the initial inspections but were not reinspected.

## \*\*\*\*\* General Summary \*\*\*\*\*

Description	Total	1971 - 1974	1975 - 1979	1980	1981 +					
	No. Percent

Figure 9. Example output - overall data summary program

**FAILURE RATE REPORT BY INSPECTION STATION**

The average failure rate is 11.74.

This report summarizes data for vehicle model years 1971 through 1986.

An asterisk (\*) next to a station number indicates that the failure rate is more than 2 standard deviations from the mean.

The station must also have inspected at least 30 automobiles.

## SECTION 6

### DATA SUMMARY BY MODEL YEAR

If Option 4 is selected the computer will generate summary statistics for a user selected model year or group of model years. The program prompts the user to enter the beginning year and ending year of the vehicles of interest. This is indicated in the example screen shown in Figure 10. Any number between 71 and 86 can be entered as the beginning year. If only one year is desired then the ending year is left blank. Otherwise the ending year must be greater than the beginning year.

In this fashion the user could evaluate a single year such as 71, or a group of years such as 77-79. If the group 71-86 is selected, then the entire data base will be evaluated. An example output is shown in Figure 11 for the 1971 vehicles in a data base.

Once again the user is cautioned not to interrupt the program during processing. The processing time varies as function of the size of the MISSOURI.DBF file and will take 15-20 minutes for a 3000 record data base. An 80-column printer is required to obtain the output from this program.

Please select the model year or range  
of model years that you wish to analyze.

Enter only the last two (2) digits; e.g. enter '86' for 1986

Starting year: 0

Ending year: 0

To select only one year, enter it in the starting year;  
leave the ending year blank.

Figure 10. Example screen - data summary by model year

### FAILURE RATE REPORT BY VEHICLE MAKE

This report summarizes data for vehicle model years 1976 through 1980.

## SECTION 7

### DATA SUMMARY BY VEHICLE MAKE

Option 5 allows the user to generate a summary report for a particular vehicle make. Once the option is selected, the computer prompts the user for the desired make. The four character make is entered and then [CR] is pressed. The computer then generates a summary similar to that shown in Figure 12.

The program should not be interrupted during processing. Processing time is dependent on the size of the data base. Also, an 80-column printer is needed to obtain the output.

## SECTION 8

### DATA SUMMARY BY INSPECTION STATION

The selection of Option 6 will generate a dBASE III data base and a summary of data for a user-selected inspection station. The six-digit inspection station of interest is input and a summary similar to that shown in Figure 13 is obtained. Also if desired, the program will generate a separate ASCII data file for transfer to another computer.

Processing speed is dependent on the size of data base. An 80-column printer is required and the program should not be interrupted during processing.

## SECTION 9

### ERROR ANALYSIS PROGRAM

The basic process used for data entry quality assurance is to take a 5 percent random sample from the data base (1 out of 20). Then the two separate entries are compared. The actual steps in the process are as follows:

1. The operator enters a set of data consisting of about 20 forms.
2. After the 20th form is entered the computer program requires the operator to re-enter the last set of data.
3. The operator re-enters the 20th data set and goes on to the next form.
4. This process repeats every 20 forms.

In the computer, three separate data bases are used. The primary data base (A) contains all of the records. The secondary data base (B) contains a copy of those records randomly selected for the audit. The last data base (C) contains the second entry for the selected sample.

A separate program has been developed to compare the records in data bases B and C (Option 7). These records are compared field-by-field to determine the types of errors and their frequency for each field.

An example of this process is shown in Figure 14. The program processed the results upon selection of Option 7 from the main menu. Since the data bases used for this analysis are only 5 percent of the large data base processing will proceed rather quickly. A 132-column printer is needed for the output and the program must not be interrupted during processing.

SUMMARY REPORT

ERROR ANALYSIS

Out of 75 records there were a total of 168 errors.  
There were 67 records that did not have any errors.

Entry	No. of errors	Entry	No. of errors

16. ABSTRACT		
<p>The St. Louis, Missouri, decentralized I/M program has experienced a low failure rate (FR) since the program started on January 1, 1984. This contract evaluated one-half month's I/M data for the actual FR. (The state has been determining the FR by evaluating data records from a 1 of 20 random sample.) The contract also produced a program to evaluate the I/M data for problems (Quality Assurance evaluations of inspector, inspections, models, model years, etc.)</p>
