Office of Mobile Source Air Pollution Control
Emission Control Technology Division
Ann Arbor, Michigan 48105

August 1980

This report is issued by the Environmental Protection Agency to report technical data of interest to a limited number of readers. Copies are available free of charge to Federal employees, current contractors and grantees, and nonprofit organizations - in limited quantities - from the Library Services Office (MD-35), Research Triangle Park, North Carolina 27711; or, for a fee, from the National Technical Information Service, 585 Port Royal Road, Springfield, Virginia 22161.

This report was furnished to the Environmental Protection Agency by Automotive Environmental Systems, Westminster, California 92683, in fulfillment of Contract No. 68-03-2881, Task 1. The contents of this report are reproduced herein as received from Automotive Environmental Systems. The opinions, findings, and conclusions expressed are those of the author and not necessarily those of the Environmental Protection Agency. Mention of company or product names is not to be considered as an endorsement by the Environmental Protection Agency.

ABSTRACT

This report presents and summarizes exhaust emissions test data and other related information obtained in the testing and inspection of 116 in-use passenger cars. The test fleet consisted of 1979-1980 automobiles equipped with three-way catalyst emission control systems. The test vehicles were obtained randomly from private owners in the Los Angeles and Orange County areas. The testing was completed August 1980.

Each vehicle was tested in as-received condition and given an underhood emissions control component inspection. The test sequence consisted of the 1975 Federal Test Procedure, a Highway Fuel Economy test, a Bagged Idle test, a 50 MPH Cruise test, a Four-Speed Idle test and a Loaded Two-Mode test. Twenty-five of the 116 vehicles received an evaporative emissions test using the SHED technique. Nineteen of the 116 vehicles received restorative maintenance repairs and additional testing. Twenty-three of the 116 vehicles were specially selected Cadillacs with four of these undergoing selective malperformance testing.

ACKNOWLEDGEMENTS

Automotive Environmental Systems, Inc. wishes to extend its appreciation and special thanks to Mr. Matthew M. Macocha, Task Officer, Mr. Thomas Tupaj, Project Officer, and Mr. John T. White, Program Manager, for providing counsel, technical guidance, and understanding throughout the program.

We also wish to recognize the assistance of the manufacturers of the automobiles which were tested in this project.

SECTION 1

INTRODUCTION

The U.S. Environmental Protection Agency (EPA), through authority provided by the Clean Air Act, is responsible for the control and prevention of air pollution. As provided by the Act, one of the charges of the EPA is the design, conduct and promotion of surveys and studies of the sources of air pollution. The Emission Control Technology Division (ECTD) of the EPA develops, implements and administers a national program to characterize, quantify and reduce the air pollution caused by mobile sources. Included in the division's responsibilities is the collection of emissions data from in-use vehicles and the development and evaluation of alternatives for the control of vehicle emissions. These in-use vehicle data are utilized by the EPA in calculating and projecting motor vehicle emissions from light-duty vehicles. The emission factors generated by this process are also used in developing transportation control procedures and contingency programs to cover emergency situations. Outside of the EPA, these data and the emission control alternatives are used by various state and local agencies in their air pollution control programs. In carrying out its responsibilities, the EPA regularly conducts in-use vehicle emission factors programs and emission control alternative studies. In order to support the states in their efforts to implement their air quality programs, the Emission Control Technology Division will use the data generated by this project to assess the effectiveness of new technology vehicle exhaust emissions systems in Los Angeles.

This report describes a program conducted by Automotive Environmental Systems, Inc. (AESI) to gather information on three-way catalyst vehicles in the Los Angeles area. The testing was conducted between January 1980 and August 1980.

Section 2 of this report describes the objectives, design, and conduct of the program. Section 3 presents summary results. Detailed listings of data are presented in the Appendices by vehicle number. Data packets and punched computer cards, with EPA-defined data formats, were submitted to the Project Officer.

SECTION 2

TECHNICAL DISCUSSION

2.1 PROGRAM OBJECTIVES

This report describes a program conducted by Automotive Environmental Systems, Inc. (AESi) to gather information on three-way catalyst vehicles in the Los Angeles area. The testing was conducted between January 1980 and August 1980.

2.2 PROGRAM DESIGN

The emphasis of this project was in gathering exhaust emissions information on 3-way catalyst equipped vehicles, due to their projected rapid increase in the vehicle population. The test fleet was made up of 116 (1979-1980) model year three-way catalyst vehicles. Each vehicle received a Federal Test Procedure (FTP) test, a Highway Fuel Economy test (HFET), a Bagged Idle test, a 50 MPH Cruise test, a Four-Speed Idle test and a Loaded Two-Mode test.

2.3 TEST VEHICLE PROCUREMENT

A list of vehicle makes and engine families certified for sale in California and equipped with 3-way catalytic converter systems and 3-way catalytic converter plus oxidation catalysts was provided by EPA. General guidelines were provided as to the quantities desired from each of these engine families. However, due to the low population of some of these engine families, not all were available for testing.

In an effort to avoid biasing the sample, the number of vehicles procured from members of commercial, civic, fraternal, or religious organizations was limited to fifty percent of the vehicles from any one model year. The use of rental, leased or fleet vehicles was limited to twenty percent of the vehicles tested. Groups of vehicles were not obtained from organizations which are automobile oriented.

2.3.1 Test Vehicle Selection

Test vehicles were selected based on guidelines provided by the EPA Project Officer.

Test vehicles were solicited using various methods. The primary method was from vehicle registration lists purchased from a market information service company, from which mailings were prepared. Vehicles were also solicited using news releases in local papers and paid advertisements in newspapers and flyers.

2.3.2 Incentives for Participation

The owner of a suitable test vehicle was provided the following incentives for his participation:

A \$100 U.S. Savings Bond. Bonds were mailed to participants within one month following the test on their vehicle.

The use of a late-model, fully insured loaner automobile during the time their vehicle was undergoing testing.

The owner's automobile was returned with a full tank of fuel.

2.3.3 Test Vehicle Handling

In most cases, the vehicle was scheduled to be delivered to AESi in Westminster by appointment. In some cases, vehicles were picked up and/or delivered at a participant's home or place of business. An inspection was performed to ensure proper vehicle match and to establish the physical condition of the vehicle. A loan vehicle exchange agreement, the savings bond application and the Vehicle Owner Use Questionnaire were also completed at this time. Once the vehicle was accepted into the program it then followed the sequence illustrated in Figure 2.

2.4 FACILITIES AND EQUIPMENT

2.4.1 Test Location

All tests were performed at AESi's test facility at 7300 Bolsa Avenue in Westminster, California. The facility is located approximately 25 miles south of downtown Los Angeles at an elevation of 45 feet above sea level.

The test facility environment, including testing and vehicle soak areas, was maintained within the requirements of the contract. A permanent record was maintained for the ambient temperature in the soak and test areas for all phases of testing. The vehicle soak area is inside the same building as is the test area and is free from precipitation.

2.4.2 Constant Volume Sampler

A positive displacement pump type constant volume sampler (CVS) built by AESi was used in this program. This CVS meets or exceeds all specifications defined in the Code of Federal Regulations Title 40, Part 86, Subparts

A and B (40 CFR Part 86). The system contains six sample bags switched by computer in sample/background pairs for all dilute exhaust sample testing.

All plumbing in the sampling, analytical and calibration systems is either stainless steel or teflon. This includes all sample, calibration and zero gas lines and the valves and regulators for NO gases. Leak-tight stainless steel convoluted tubing is used between the CVS and the vehicle tail pipe for exhaust gas sampling. An appropriate leak-tight boot was used to connect the tail pipe to the convoluted tubing. A stainless steel heat exchanger with a temperature controlled cold water inlet was used to provide essentially a constant exhaust gas temperature throughout the entire test.

The sample and dilution air bags are made of Dupont Tedlar material and are of a volume compatible with the CVS unit (i.e., no pressure build up in the bag when filling with sample or background gas).

2.4.3 Emission Analysis Console

An AESi exhaust gas analytical system meeting or exceeding the specifications of 40 CFR Part 86, was used for dilute gas measurements. Similar laboratory type instrumentation, with additional ranges, was used for analysis of raw NO gas. In addition, a Chrysler Model III garage-type analyzer was used for measurement of raw HC and CO. The console contains the following instrument types and ranges:

<u>Analyzer</u>	<u>Ranges</u>
Bendix Model 8501-5C NDIR (Lo CO - Dilute Exhaust)	0-100, 0-500 ppm (11 1/4" Cell Length)
Beckman 315B NDIR (Hi CO - Dilute Exhaust)	0-.3% (2 1/2" Cell Length) 0-3%, 0-5% (1.4" Cell Length)
Beckman 315B NDIR (CO ₂ - Dilute Exhaust)	0-2.5%, 0-4% (1/4" Cell Length)
Beckman 400 FID (Lo HC - Dilute Exhaust)	0-50, 0-100, 0-300 ppm Carbon
Beckman 400 FID (Hi HC - Dilute Exhaust)	0-1,000, 0-3,000 ppm Carbon
Teco 10AR Chemiluminescent (NOx - Dilute Exhaust)	0-100, 0-250 0-1,000, 0-2,500 ppm
Teco 10AR Chemiluminescent (NO - Raw Exhaust)	0-250, 0-1,000, 0-2,500 0-4,000 ppm

Chrysler Model III Garage	
(HC - Raw Exhaust)	0-300, 0-2,000 ppm Hexane Equivalent
(CO - Raw Exhaust)	0-.5%, 0-10%

2.4.3.1 Laboratory Standard Calibration & Working Gases

Laboratory standard calibration gases, previously approved by EPA, were used for defining instrument calibration curves and assigning concentration values for the working gases. Each cylinder of standard gas and each working gas cylinder was equipped with its own pressure regulator as specified by the contract. All gases were plumbed to a quick-disconnect panel for ease in selecting the gas desired during calibration and testing.

Calibration gases for each range of the HC and NOx analyzers were chosen such that three points were used across the curve (zero and approximately 45% and 90% of full scale concentration). CO and CO₂ calibration points were at zero and approximately 15, 30, 45, 60, 75 and 90 percent of full scale. All span gases were 80-100 percent of full scale.

The diluents used in the calibration and working gases are:

HC, ppmC	Propane in HC free air
NOx, ppm	In zero grade nitrogen
CO, mole %	In zero grade nitrogen
CO ₂ , mole %	In zero grade nitrogen

2.4.4 Sealed Housing For Evaporative Determinations (SHED)

Evaporative emissions tests were performed using an AESI SHED and its associated operator console. The SHED meets all requirements of 40 CFR Part 86. The console includes a Beckman 400 FID analyzer with ranges of 0-100, 0-300, 0-1000 and 0-3000 ppmC; a Linear Instruments chart recorder for analyzer output; a Leeds and Northrup SPEEDOMAX multipoint temperature recorder; and a variable voltage source and heating element (blanket) for applying heat to the vehicle gas tank for the diurnal heat build. A cooling package is installed to ensure operation of the SHED within the temperature range of 68°F to 86°F. The cooling package consists of a 1680 CFM fan and a heat exchanger utilizing cold water (68°F) to maintain the ambient temperature within the SHED.

2.4.5 Chassis Dynamometer

The chassis dynamometer was equipped to simulate vehicle inertia and road load horsepower as required in 40 CFR Part 86.

The dynamometer used is a Clayton ECE-50 with 17 1/4 inch roll spacing and 8 5/8 inch diameter rolls. Direct drive variable inertia loading weights were employed, with 250 pound increments from 1,750 through 3,000 pounds and 500 pound increments from 3,000 through 5,500.

A speed meter which indicates mi/hr was used to monitor the speed of the dynamometer roll. The rear dynamometer roll is equipped with a tachometer generator which provides the speed signal during testing. The meter response was linear with speed and the accuracy was within ± 2.0 km/hr (± 1.2 mph) over the range of 0-95 km/hr (0-59 mph). The dynamometer is equipped to measure actual distance traveled for each segment of the FTP testing sequence. However, the theoretical distance for each segment was used in the exhaust emissions calculations.

The power absorption unit was monitored by a power meter accurate and readable to ± 0.25 hp (0.187 kw) over the range of intended use.

2.4.6 Data Acquisition System

Data were obtained from the analyzers, CVS and dynamometer via an AESi Data Acquisition Control Computer (DACC). A Data General NOVA computer was used for generating driver traces for the various driving schedules, for sample bag management and for calculation and presentation of the emission test results. The data were printed by a Data General Dasher printer immediately following sample analysis.

The output from the analyzers was also wired to four Hewlett-Packard Model 7130A two-pen recorders. One recorder was used for dilute HC and NO_x, one for dilute CO and CO₂, one for undiluted HC and CO and one for undiluted NO.

2.4.7 Driver's Aid

A two-pen Hewlett-Packard Model 7130A Driver's Aid (speed vs time recorder) was employed to permanently record the driver's performance during the test. The driving trace was generated by the NOVA computer on this recorder in agreement with the specifications of 40 CFR Part 86.

2.4.8 Miscellaneous Equipment

Miscellaneous equipment used in conjunction with the major items of equipment included the following:

Two Teco Model 100 NO_x Generators. The generator in the raw gas analysis bench was not used since only NO is reported.

One Rustrak Chart Recording Psychrometer, Model 2133B with continuous recording of wet/dry bulb temperatures.

One Rustrak Chart Recorder, Model AD 101-462-2A for continuous recording of CVS temperature.

One Weathermeasure M701 continuous recording temperature recorder for soak area temperature.

One Princo Mercurial Barometer.

One Meriam 50 MC2-4SF Laminar Flow Element for CVS calibration.

One Sartorius Model 2257 Balance used for weighing the propane cylinders for propane recovery tests.

One Strobotach for dynamometer speed calibration.

Horiba GSM and MEXA 300A garage analyzers were used for vehicle inspection by the mechanic.

2.5 EQUIPMENT QUALIFICATION, CALIBRATION AND CROSSCHECK

This section describes the qualification, calibration, and crosscheck procedures utilized by AESi and verified by EPA technical personnel to ensure that valid test data were generated throughout the test program. Initial qualification included complete demonstration of individual instrument calibration, zero air and nitrogen purity, CVS calibration, dynamometer calibration, and inspection of all daily, weekly and monthly logs.

2.5.1 Constant Volume Sampler

The CVS was calibrated with a laminar flow element (Meriam Model 50-MC2-6SF) using the basic procedures specified in the Federal Register. CVS air flow, measured using the laminar flow element on the inlet side of the mass pump (CVS blower) and was controlled by throttling. Air flow rates were measured at five incremental changes in pump differential pressure on each side of the normal operating point. Flow rates at a total of at least ten points were measured. The nominal air flow of the CVS is 345 cfm. Auxiliary devices employed in the calibration included a mercury barometer to measure absolute ambient pressure, a close tolerance mercury thermometer to measure pump inlet air temperature, a U-tube water manometer to measure pressure drop across the pump and pump inlet pressure and a close tolerance inclined water manometer to measure pressure drop across the laminar flow element. Once this calibration was completed, data from these devices were computer processed and the mid-range blower operating point was determined. Propane recovery tests using instrument grade propane were made after the calibration to confirm its accuracy. A copy of the calibration data was provided to the EPA Project Officer as a part of the qualification data package.

Calibration of the laminar flow element (LFE) is traceable to the National Bureau of Standards, and a certified copy of the LFE calibration curve was furnished to the Project Officer at the time of Laboratory Qualification.

Daily propane recovery tests were made to confirm continued calibration of the CVS system. The measured propane mass recovered by the CVS had to be within ±2.0 percent of the injected mass of up to 20 grams of

instrument grade propane as determined gravimetrically. The recovered amount of propane was measured on the 0-300 ppmC FID range. A Rustrak chart recorder was used to continuously record CVS temperature during these tests.

2.5.2 Emission Analysis Console

2.5.2.1 Dilute Exhaust Analysis Console

Complete calibrations of the mass emission analysis console instruments were performed initially and checked each week thereafter until testing was completed. Calibration curves for the mass emission analysis console CO, CO₂, HC and NOx instruments were established using the gases previously identified. The CO and CO₂ instruments were calibrated at seven somewhat evenly spaced points (zero and six upscale points) across each operating range. Calibration of the HC and NOx instruments was performed at three somewhat evenly spaced points (zero and two upscale points) across each operating range. Calibration of these instruments was established and maintained within one percent of full scale for each range, respectively, or five percent of the measured value, whichever was smaller. A computer program provided by the EPA was used in the generation of the calibration curves.

In connection with each test, the CVS sample bags were purged with nitrogen, evacuated and leak-checked. These operations were performed in a bag evacuate, N₂ purge, evacuate and leak-check sequence by means of a manual push-button selection of solenoids located within the CVS. A leak in the system is indicated by a non-zero flow in the flow meters on the operator's console.

Other activities included setting zero and span points immediately prior to exhaust sample analysis and zero and span point verifications immediately following exhaust sample analysis. Strip chart recorders were operated continuously throughout the zero and span set-point calibration, sample analysis and zero and span verification sequence. Verification tolerances were maintained within ± 1 deflection from the set-point for the range in use. Converter efficiency of the NOx converter was maintained above 90 percent. The noise level of analyzer outputs as indicated on the strip chart was maintained within ± 0.5 percent of full scale for the range used during both calibration and analysis.

2.5.2.2 Raw Exhaust Analysis Console

The NOx instrument used in the undiluted (raw) emission analysis console is a laboratory instrument calibrated using the same gases, calibration points, tolerances and verification frequency described above in connection with the NOx instrument used in the mass emission analysis console. Efficiency of the tail pipe raw exhaust NOx laboratory instrument thermal converter was not checked daily because NO (Nitric Oxide) was measured and reported, not NOx (Oxides of Nitrogen).

The tail pipe HC/CO measurement instrument was operated in accordance with the manufacturer's recommendations except that this instrument was zeroed with nitrogen and the HC and CO span-points calibrated with

appropriate gases immediately prior to each test. Each analyzer was checked for zero and span point drift immediately following each test.

2.5.2.3 Daily Qualification Checks

Daily qualification checks included:

Leak-check of each instrument as well as the system.

Recording of zero, gain and tune, as applicable, for each instrument.

Hang-up and leak-checks for background and sample bags and sample line.

NO_x analyzer vacuum and converter efficiency checks.

Propane recovery tests to ensure proper FID operation as well as verification of the CVS calibration.

Recording of FID fuel and air pressure.

Recording of cylinder number, concentration, deflection, cylinder pressure for each working gas.

In addition to the above daily checks, weekly calibration curve checks were made for each range of each instrument.

Appropriate calibrations, leak-checks, etc., were also made whenever maintenance was performed which could change instrument or system operation.

2.5.3 Sealed Housing for Evaporative Determinations (SHED)

The volume of the SHED used was determined by physical measurement. Calibration of thermocouples used in the SHED was verified by an ASTM thermometer as was the temperature recording instrument. Calibration curves were generated for each range of the Beckman 400 FID used in the analytical console. These curves were verified weekly.

For initial calibration, the FID was zeroed on zero grade prepurified air and calibrated at two upscale points (i.e. 45% and 90% of full scale) on each of the ranges used. The same hydrocarbon gas standards previously described were employed for this calibration. Curve fit tolerances and verification frequency were the same as those applied to the dilute emission analysis console instruments.

The SHED was subjected to a background hydrocarbon check, a calibration check and a retention check prior to testing the first vehicle.

The background emissions check was performed by sealing the enclosure and allowing it to remain sealed for a period of four hours. Initial and final hydrocarbon readings were taken. The background emission rate was

acceptable when it was less than the maximum increase of 0.4 grams for the four hours, as defined in 40 CFR Part 86.

The SHED was calibrated by first purging with fresh air and then sealing the enclosure. Approximately 4 grams of instrument grade propane was injected into the enclosure after the enclosure was sealed. The mixing fans were operating during this injection. After five minutes of mixing, the stabilized hydrocarbon level of the enclosure was measured and the mass calculated. The quantity of the calculated recovery was within $\pm 2\%$ of the injected amount.

The propane retention (leak) check was performed following the calibration. In this check the SHED was allowed to remain sealed for a minimum of four hours with the mixing blowers operating. At the end of this period the hydrocarbon level of the enclosure was measured and the mass calculated. For this check, the hydrocarbon level was within $\pm 4\%$ of the initial reading as calculated. The SHED calibration and retention tests were performed monthly thereafter.

2.5.4 ECE-50 Chassis Dynamometer

Dynamometer speed was verified initially and bi-weekly with a Strob-otach. Road load force was determined using calibrated weights. Coastdowns were performed initially and bi-weekly thereafter to verify the road load force versus inertia weight relationships as given in 40 CFR Part 86.

2.5.5 Data Acquisition System

The data acquisition system was verified by performing manual checks of equipment performance and hand calculations from strip chart data and comparing these with the data provided by the DACC. This activity is verified by a Quality Assurance inspection for each test. A reasonableness check is performed for each critical data element. Any suspect data was verified by strip chart or calculation. Any data found to be in error was independently recalculated wherever possible or the test is rejected.

2.5.6 Miscellaneous Equipment

All miscellaneous equipment was calibrated or verified according to manufacturer's recommended practices. The CVS laminar flow element and barometers were calibrated by Meriam Instruments Company.

2.6 TEST PROCEDURES

2.6.1 Vehicle Preparation

Each vehicle received a preliminary safety inspection as part of the procurement activity. This was done to ensure that the vehicle was safe to operate on the street. Upon acceptance for testing, the vehicle's fuel tank was drained and refueled with appropriate test fuel to 40% of tank capacity. Vehicles receiving a SHED test were further prepared by locating a point on the side of the fuel tank that approximated the midpoint of the

40% fuel volume. A Type J thermocouple was then soldered to the tank at that point. To ensure that test fuel had purged the fuel system, the vehicle was driven for ten minutes on city streets or on the dynamometer for the first 505 seconds of the FTP. After the preconditioning run, the vehicle was driven or pushed into the soak area for the required 12 to 24 hour soak at temperatures between 68°F and 86°F. Drive wheel tire pressure was set to 45 psi prior to dynamometer testing to prevent tire damage.

Figure 2 presents a flow chart of testing activities.

2.6.1.1 Driveability Evaluation

An evaluation of the driveability of each vehicle was performed prior to and during each FTP. The evaluation is essentially the same as that performed on previous EPA light duty vehicle projects. Appendix J lists the items evaluated and the results for individual vehicles.

2.6.2 Equipment Preparation

Prior to the first test of the day and following any shut-down, equipment which had been idle or in a stand-by condition was activated to begin warm-up. This included the CVS water heater, mass pump and each of the analytical instruments. Following the warm-up of the respective instruments, efficiency of the NO_x instrument thermal converter was checked and the propane recovery test involving the CVS sample system and the FID hydrocarbon instrument was conducted. Subsequent to these checks, analyzer outputs, as indicated by the strip chart recorders and the DACC computer and printer, were checked for correlation by calibrating at zero and five volts. Prior to the first exhaust emissions test of the day or following any extended shut-down, the dynamometer was warmed-up. The prescribed 15 minutes of 30 mile per hour operation of the dynamometer was the warm-up procedure followed. Following warm-up, the speed calibration of the dynamometer, driver's aid recorder and associated indicating devices were also checked and calibrated as necessary.

Prior to each test, all charts were properly stamped to show, among other things, the vehicle number, run number, date and persons involved in the test.

2.6.3 Federal Exhaust Emission Test Procedure

The Federal Test Procedure as described in 40 CFR Part 86 was performed on all vehicles in the as-received condition. The evaporative emissions portion of the procedure was performed on 25 vehicles in this program. The exhaust emission portion of the Federal Test Procedure is comprised of cold transient, cold stabilized and hot transient phases. The cold transient portion is 505 seconds long, covering a distance of 3.59 miles with an average speed of 25.6 mph. The cold stabilized portion is 869 seconds in length, 3.91 miles in distance and a 16.2 mph average speed. The hot transient portion is identical to the cold transient portion except that it is preceded by a 10 minute soak. The evaporative emissions testing consisted of a diurnal heat build as described in 40 CFR Part 86 paragraph

86.133-78. This was followed by FTP testing and a Hot Soak test per 40 CFR paragraph 86.138-78.

The cold soak period used for the test vehicles was 12 to 24 hours. The starting procedures and shift points used for the test vehicles were as recommended by each manufacturer.

2.6.4 Bagged Idle

This test immediately follows the FTP. The test begins with a 6 minute "engine-off" soak period with the cooling fan off and the hood closed. At the end of the soak period the engine is restarted and operated for 3 minutes at idle in drive (manual transmission vehicles in neutral with the clutch engaged). During the 3 minutes a dilute sample is collected and then analyzed. The sample period begins when the starter is engaged and includes crank time. However, if an evaporative emissions test was performed on the test vehicle, this test is preceded by a preconditioning cycle consisting of the first 505 seconds of the FTP driving cycle.

2.6.5 50 MPH Cruise

This test takes advantage of the 3 minute preconditioning run before the HFET. Tailpipe emissions are recorded and measured continuously throughout the period although the official sampling period ends 30 seconds after the speed and load have stabilized at 50 MPH.

2.6.6 Highway Fuel Economy Test

Starting with each vehicle in a warmed-up condition (at least 7.5 miles of cyclic operation within the last thirty-five minutes) each vehicle was operated on the chassis dynamometer at 50 miles per hour for three minutes. Within one minute after the end of the 50 mile per hour cruise period, the vehicle commenced operation over the 10.242 mile, 765 second driving schedule. A CVS sample bag was used to gather the dilute exhaust for emissions analysis and fuel economy calculations. HC, CO, CO₂ and NOx emissions were measured and reported in grams per mile. Fuel economy was calculated by the carbon balance method and reported in miles per gallon.

2.6.7 Four-Speed Idle Test

This test followed the HFET and required additional analytical instruments, aside from those required for the basic FTP test, to measure undiluted exhaust emissions. The instruments used for measurement of undiluted HC, CO and NO emissions are specified in Section 2.4.3.

This short test consisted of volumetric sampling of undiluted exhaust emissions during four steady state operating conditions, with the hood open and the cooling fan on. The first operating mode was basic idle with the transmission in neutral. The second operating mode was at 2500 engine RPM, also in neutral. The third mode was again normal curb idle in neutral and the fourth mode (automatic transmission vehicles only) was curb idle in Drive with brakes applied.

Four-Speed Idle tests were preceded by a six minute idle soak period with transmission in neutral, the hood open and the auxiliary cooling fan on. At the end of the soak period the vehicle was operated at idle in neutral, then at 2500 RPM, again at idle in neutral and then idle in Drive for automatic transmission vehicles. Equilibrium of engine speed and the CO, HC and NO analyzer output meters was maintained for 30 seconds before the readings were recorded. CO, HC and NO were measured and reported in % CO, ppm Hexane and ppm NO respectively. Engine RPM from the last idle mode was written on the vehicle data packet.

2.6.8 Loaded Two Mode Test

The six minute soak period and the undiluted exhaust analysis instruments described under the Four-Speed Idle test were also used for this test. This test followed the HFET and Four-Speed Idle Test so the engine, dynamometer and analyzers were at normal operating temperature. Inertia weight was set at 1750 pounds. The dynamometer load was set to 9.0 actual horsepower at 30 miles per hour regardless of vehicle weight. Using Drive for automatic and third gear for manual transmissions, the vehicle was operated at 30 miles per hour roll speed. The concentrations of HC, CO and NO emissions were recorded continuously during this time and analyzed after a maximum of 30 seconds or when stabilized. Following this, the vehicle was allowed to idle until emissions once again stabilized or for a maximum of 30 seconds before the concentrations were again analyzed.

2.6.9 After-Test Procedures

After the completion of testing and acceptance of the data by Quality Assurance, each vehicle was taken to the inspection and maintenance area. Here the mechanic measured and recorded engine parameters which included initial timing, idle speed, undiluted idle CO and undiluted idle HC emissions. When possible the procedures outlined in the owner's manual and on the vehicle's emission sticker were followed in performing these inspections. If the owner's manual and emissions sticker were missing, the shop manual, or other available publication was used to determine vehicle specifications. In some cases, the vehicle manufacturer was called upon to aid in determining specifications.

2.6.9.1 Propane Enrichment

Each dynamometer test series was followed by a Propane Enrichment test. A copy of the test procedure and a copy of the data sheet for this test are attached to this report (Figure 3).

2.6.9.2 Maladjustment and Disablement Inspection

All vehicles were given an extensive underhood inspection to determine the condition and proper installation of each emission control component. Procedures used were those detailed in manufacturers shop manuals. These procedures were supplemented by other manufacturer supplied information where necessary. The systems inspected and the inspection re-

sults are listed in Appendix K. The results of the many subsystem inspections were submitted to EPA but are not listed in this report.

2.6.9.3 Fuel Tank

Prior to returning the vehicle to the owner, tire pressure was set to manufacturer's specifications, and the fuel tank was filled to full capacity with fuel currently being marketed in the test area. This fuel was suitable for use in the particular vehicle.

2.6.10 Restorative Maintenance

Nineteen vehicles received the 5-step Restorative Maintenance test sequence. To assess improvements, the vehicles were retested following each repair step using the as-received dynamometer test sequence. The complete 5-step Restorative Maintenance sequence is presented in Figure 4.

2.6.11 Selective Malperformance

Four Cadillacs were subjected to Selective Malperformance test sequence. These tests were conducted to determine the effects of component disablement on the exhaust emissions control system. The Selective Malperformance test sequence is presented in Figure 5.

2.6.12 Daily Test Schedule

Test shifts were generally limited to the first and second shifts of the day. Vehicles scheduled for test the next day were usually preconditioned on the second shift. Daily calibration checks and system preparation (as described in Section 2.5) were performed prior to the first test of the day and tests were scheduled with this in mind.

2.7 DATA HANDLING

2.7.1 Data Collection

Various forms were developed for the recording of significant test information. These data forms are supported by various strip charts and computer printouts from the AESi DACC. The forms were designed to enable direct keypunching in the formats defined by EPA.

The information included a thorough description of each test vehicle, its test results and inspection parameters, its driveability characteristics and its use characteristics.

2.7.2 Data Processing

Diluted exhaust emissions test results include ambient temperature, barometric pressure, humidity, and mass equivalent (grams per mile) of total HC, CO, CO₂, and of NOx both as-measured and corrected for relative humidity. Undiluted exhaust emissions were recorded as ppm Hexane for hydrocarbons, percent CO for carbon monoxide and ppm NO for nitric oxides. Fuel consumption, in miles per gallon, was calculated from bag data accord-

ing to the carbon balance technique and reported for each vehicle. The carbon balance technique used was provided by the Project Officer.

All of the exhaust emissions data were calculated at the time of test by the AESi DACC. This computer was checked at least monthly using independent calculations from the analyzer strip charts to ensure its validity.

These results were reported on a weekly and a cumulative monthly basis using the keypunched cards prepared for submittal to EPA.

2.7.3 Quality Control

The quality assurance program applied to this project monitors every aspect of each emissions test. This includes operator and driver performance, the sampling system, ambient test conditions, analyzer performance, gases, fuel, dynamometer settings and all data processing. In addition, all other data submitted as part of this project received the inspection of the Quality Assurance section. Any discrepancies noted during the review process were resolved in an appropriate manner.

Figure 6 presents a flow chart of the Quality Assurance activities.

2.7.4 Calculation of Results

2.7.4.1 Federal Test Procedure

Test results were calculated based on the procedure presented in 40 CFR Part 86. Theoretical distance was used in the grams per mile calculation for each test phase. Fuel consumption was calculated using the carbon balance method and was reported in miles per gallon.

2.7.4.2 Bagged Idle

The mass emissions were calculated according to 40 CFR Part 86 and are reported in grams.

2.7.4.3 50 MPH Cruise

Emissions from the 50 MPH Cruise tests, performed with the vehicle on the dynamometer, consisted of a five second analyze time after stabilization of HC, CO and NO had occurred. The DACC collects ten readings per second, averages them and prints the average value for each pollutant.

2.7.4.4 Highway Fuel Economy Test

HC, CO, CO₂ and NOx were measured and reported in grams per mile. The mass emissions were calculated according to 40 CFR Part 600.

Fuel economy was calculated by the carbon balance method and reported in miles per gallon.

2.7.4.5 Four-Speed Idle Emissions Test

Emissions from the Four-Speed Idle tests, performed with the vehicle on the dynamometer, consisted of a five second analyze time after stabilization of HC, CO and NO had occurred. The DACC collects ten readings per second, averages them and prints the average value for each pollutant. This procedure was followed for each test mode.

2.7.4.6 Loaded Two Mode Emissions Test

All Loaded Two Mode emissions tests were performed with the vehicle on the dynamometer using the same computer procedure described for the Four-Speed Idle test.

SECTION 3

DISCUSSION OF TEST RESULTS

3.1 TEST FLEET DESCRIPTION

The test fleet was made up of a total of 116 vehicles. The final vehicle matrix by make and model year is shown in Table 1. The characteristics of these vehicles by inertia weight, engine displacement and number of engine cylinders is shown in Table 2.

The vehicle numbering system groups all model year vehicles by the leading digit of the vehicle (e.g. 0120 would be a 1980 vehicle, 9007 would be a 1979 vehicle).

Descriptive information regarding individual vehicles is included in Appendixes A and B.

3.2 FEDERAL TEST PROCEDURE EMISSIONS AND FUEL ECONOMY

The FTP emissions and fuel economy data are summarized by model year in Table 3. A listing of FTP emissions for each vehicle is found in Appendix C. A summary of exhaust emissions and fuel economy results and improvements at successive stages of maintenance is presented in Table 5.

Table 6 presents a summary and comparison of exhaust emissions and fuel economy results as a result of several malperformance actions. Each is compared to the baseline test. Degradation is shown as a negative percent improvement.

3.3 VEHICLES MEETING EXHAUST EMISSION STANDARDS

Table 4 presents the summary of 1979 and 1980 vehicles passing one or more of the California emissions standards for that model year.

3.4 EVAPORATIVE EMISSIONS

A summary of the evaporative emissions (by model year) is presented in Table 7. The listing of results by individual vehicles is given in Appendix D.

3.5 BAGGED IDLE

A summary of Bagged Idle test emissions results is presented in Table 9. A listing of Bagged Idle emissions data for individual vehicles is presented in Appendix F.

3.6 50 MPH CRUISE

A summary of 50 MPH cruise emissions data (by model year) is presented in Table 10. A listing of 50 MPH Cruise emissions data for individual vehicles is presented in Appendix G.

3.7 HIGHWAY FUEL ECONOMY TEST EMISSIONS

The Highway Fuel Economy test data are summarized in Table 8 and listed for individual vehicles in Appendix E.

3.8 FOUR-SPEED IDLE TEST EMISSIONS

The Four-Speed Idle emissions data are summarized in Table 11 and listed for individual vehicles in Appendix H.

3.9 LOADED TWO MODE TEST EMISSIONS

The Loaded Two Mode test data are listed for individual vehicles in Appendix I. A summary of Loaded Two Mode emissions data (by model year) is presented in Table 12.

3.10 MALADJUSTMENT AND DISABLEMENT INSPECTION RESULTS

A summary of vehicle emission component inspection results is given in Table 13. A summary of vehicles with some malperformance is presented by model year and make in Table 14. These summaries are extracted from the data on individual vehicles presented in Appendix K.

**Figure 3 Propane Injection Diagnostic Procedure
for Three-Way Catalyst Vehicles**

The purpose of this procedure is to identify a failed feedback control system. If a running engine with a functioning feedback control system is suddenly given a volume of propane gas, the engine should give a characteristic response: the emissions, and possibly engine speed, should first increase, then return to normal as the carburetor compensates for the richer mixture.

For this experimental procedure, four propane gas flow rates were used for each vehicle: 1, 2, 3, and 4 cubic feet per hour (cfh). Each flow rate was pre-set through a flowmeter, and then quickly presented to the carburetor through an inlet to the air cleaner.

The vehicle was at curb idle in Neutral or Park gear, fully warmed-up with all accessories off. Before each measurement the engine speed was increased to approximately 2500 rpm in Neutral gear for 30 seconds. The propane shall be admitted within 30 seconds after the engine returned to idle. Readings were taken within 60 seconds after propane was induced into the carburetor. The propane flow was then shut off and additional readings taken and recorded.

One data sheet was filled out for each flow rate. In the event that a flow rate caused the engine to stall, notation of that was made at step 3 of the data sheet and the procedure stopped for that vehicle.

Figure 3 (Continued)

Vehicle # _____

Make/Model _____

Date _____

CID _____

1. Preset Flow Rate. Record Flow Rate _____ cfm
Operate engine at 2500 RPM for 30 seconds, then return to idle.
2. Record: Idle RPM _____ (Neutral/Park gear, no propane flowing)
ICO _____
3. Induce propane quickly, observe vehicle behavior over a period not longer than 60 seconds.

Check one:

- RPM rises smoothly
- RPM decreases smoothly
- RPM rises smoothly to _____ (record RPM), then falls.
- RPM falls smoothly to _____ (record RPM), then rises.
- Engine runs rough, then stabilizes
- Engine dies (stop procedure here)

4. When engine stabilizes (maximum 60 seconds) record: RPM _____
ICO _____

5. Withdraw propane quickly, observe vehicle behavior

Check one:

- RPM rises smoothly
- RPM decreases smoothly
- RPM rises smoothly to _____ (record RPM), then falls.
- RPM falls smoothly to _____ (record RPM), then rises.
- Engine runs rough, then stabilizes
- Engine dies

6. When engine stabilizes record: RPM _____
ICO _____

Propane Injection Diagnostic Procedure for Advanced Technology Vehicles

Figure 4 5-Step Restorative Maintenance Sequence
 3-Way Catalyst Vehicles
 (25 Vehicles Only)

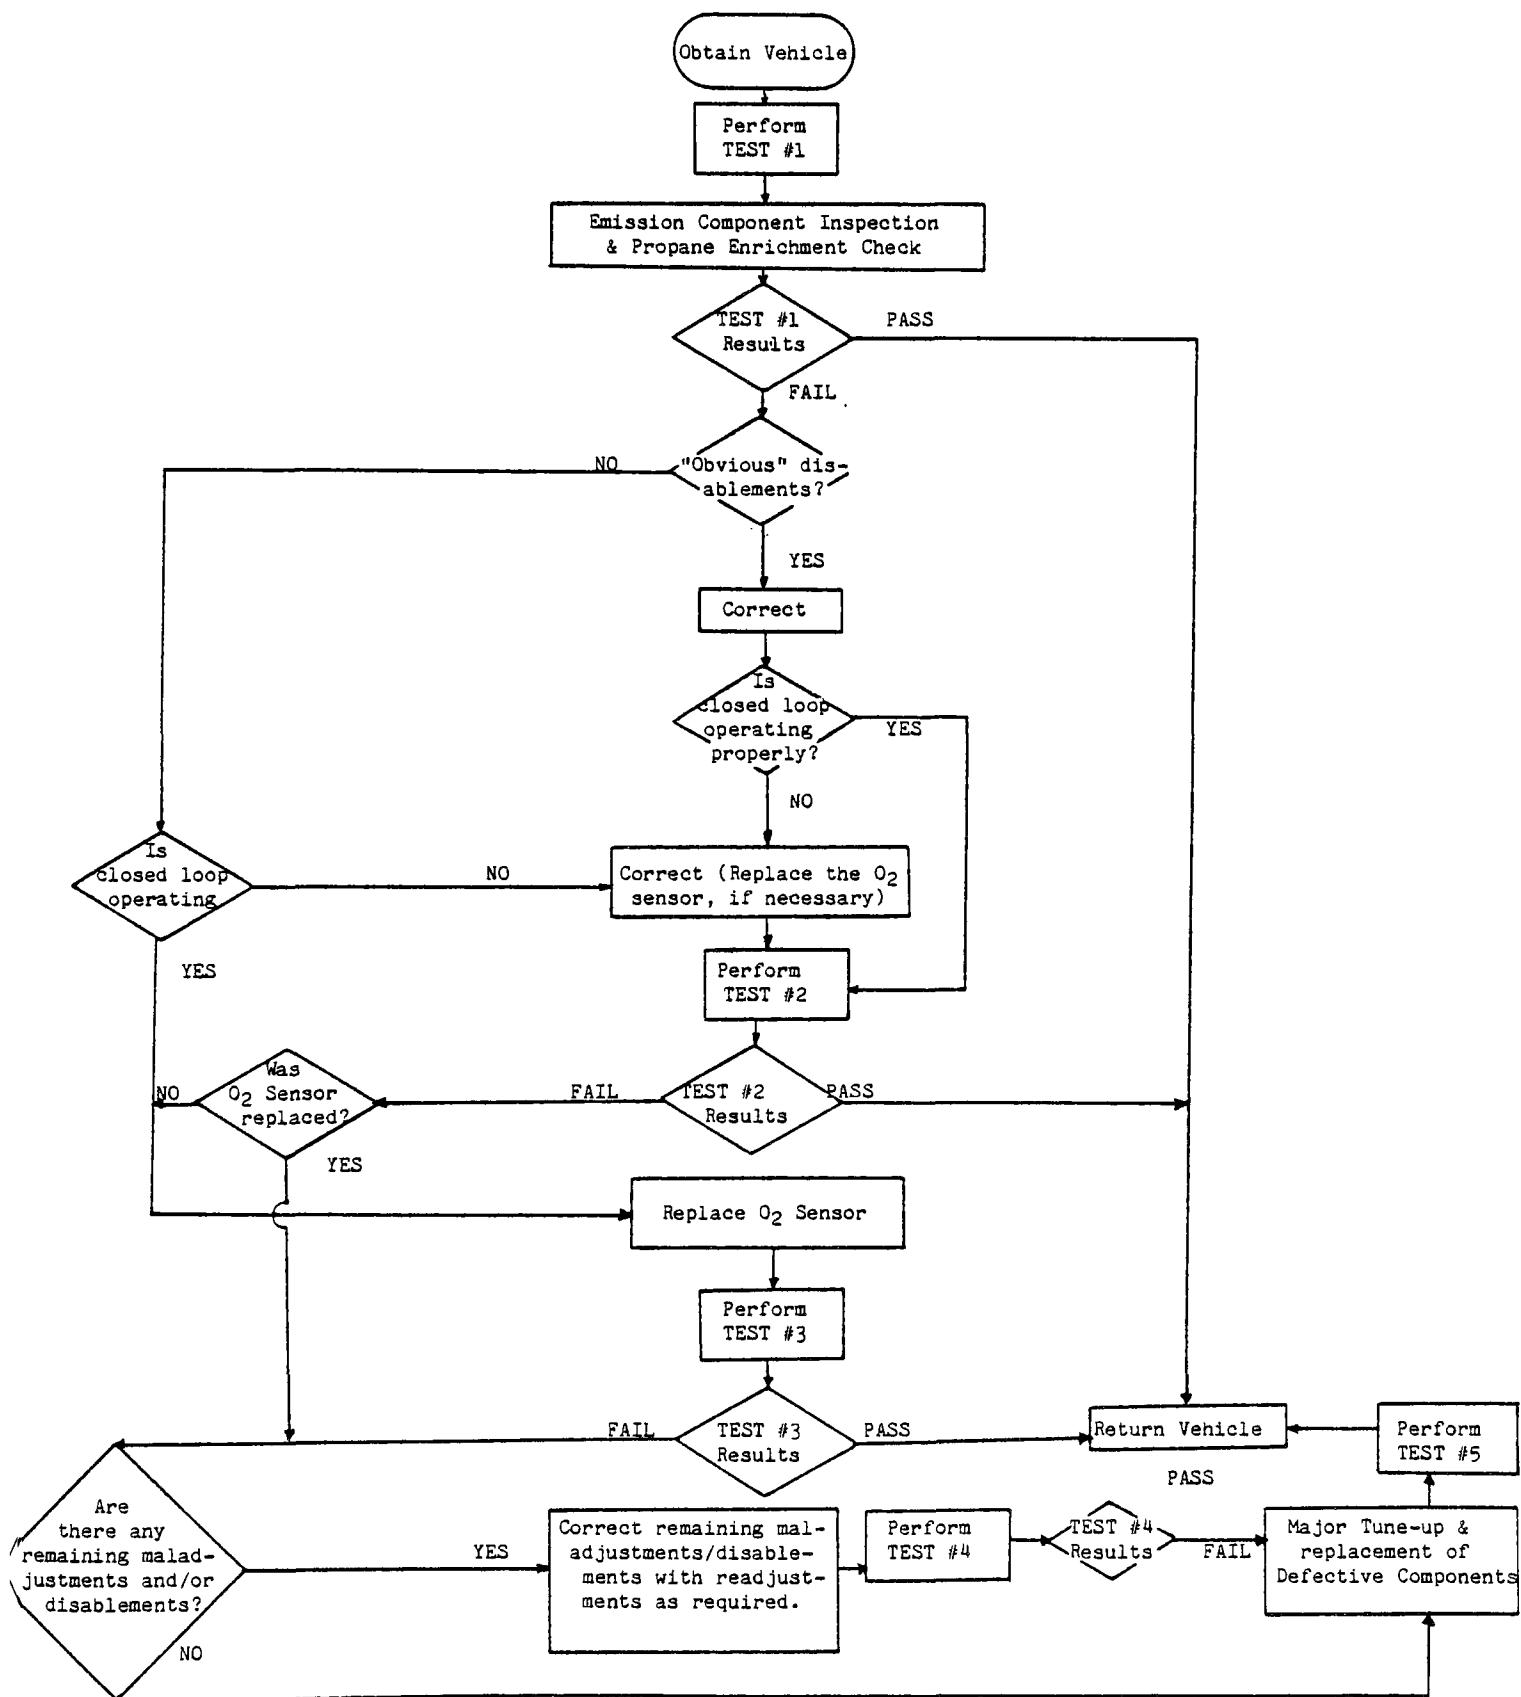

Figure 5

After each car has completed its as-received test sequence (FTP, HFET, 50 MPH Cruise, Four Mode Idle, Loaded Two Mode), the following sequence was initiated:

1. Perform a complete C-4 System Diagnostic check and record the results in the form of narrative comments.
2. If a car fails the Diagnostic check or exceeds its HC, CO or NO_x standard by 150%, any and all repairs necessary for it to pass the check were performed. Records were kept in detail of all repairs performed. Test Sequence Two was performed next. The test sequence was the same as the as-received test sequence.
3. Selective Malperformance was performed on four vehicles equipped with the 06R4RCZ engine family (carbureted version). These four vehicles passed the FTP and had received an emission component function check. The vehicles had the malfunctions introduced one item at a time. The vehicles received a complete test sequence before continuing to the next step. The following five malfunctions were introduced with the engine ignition "off".

Test #6. Disconnect the power inputs to the Electronic Control Module (ECM). This resulted in the vehicle operating in the inhibit mode.

Test #7. Disconnect the oxygen sensor lead. A paper clip in the shape of a U was inserted into the lead leading back to the ECM. The effect of the paper clip was to complete the circuit in the oxygen sensor circuit, and thereby prevent the lead from picking up stray signals. This resulted in the vehicle operating in the open loop mode.

Test #8. Disconnect the battery terminals for 10 minutes. Then disconnect the oxygen sensor lead and complete the circuit with a paper clip as in Test #7. The effect of disconnecting the battery terminals was to clear the adaptive memory stored in the ECM.

Test #9. Disconnect the Coolant Temperature Sensor. This resulted in the vehicle operating in the open loop mode and also without the benefit of temperature compensation.

Test #0. Disconnect the Throttle Position Switch located on the throttle body. This resulted in the vehicle operating closed loop but without the benefit of a load sensor.

Any time the C-4 "check engine" light came on the diagnostic code was obtained and noted. The lack of a light at the start of the test sequence was also noted.

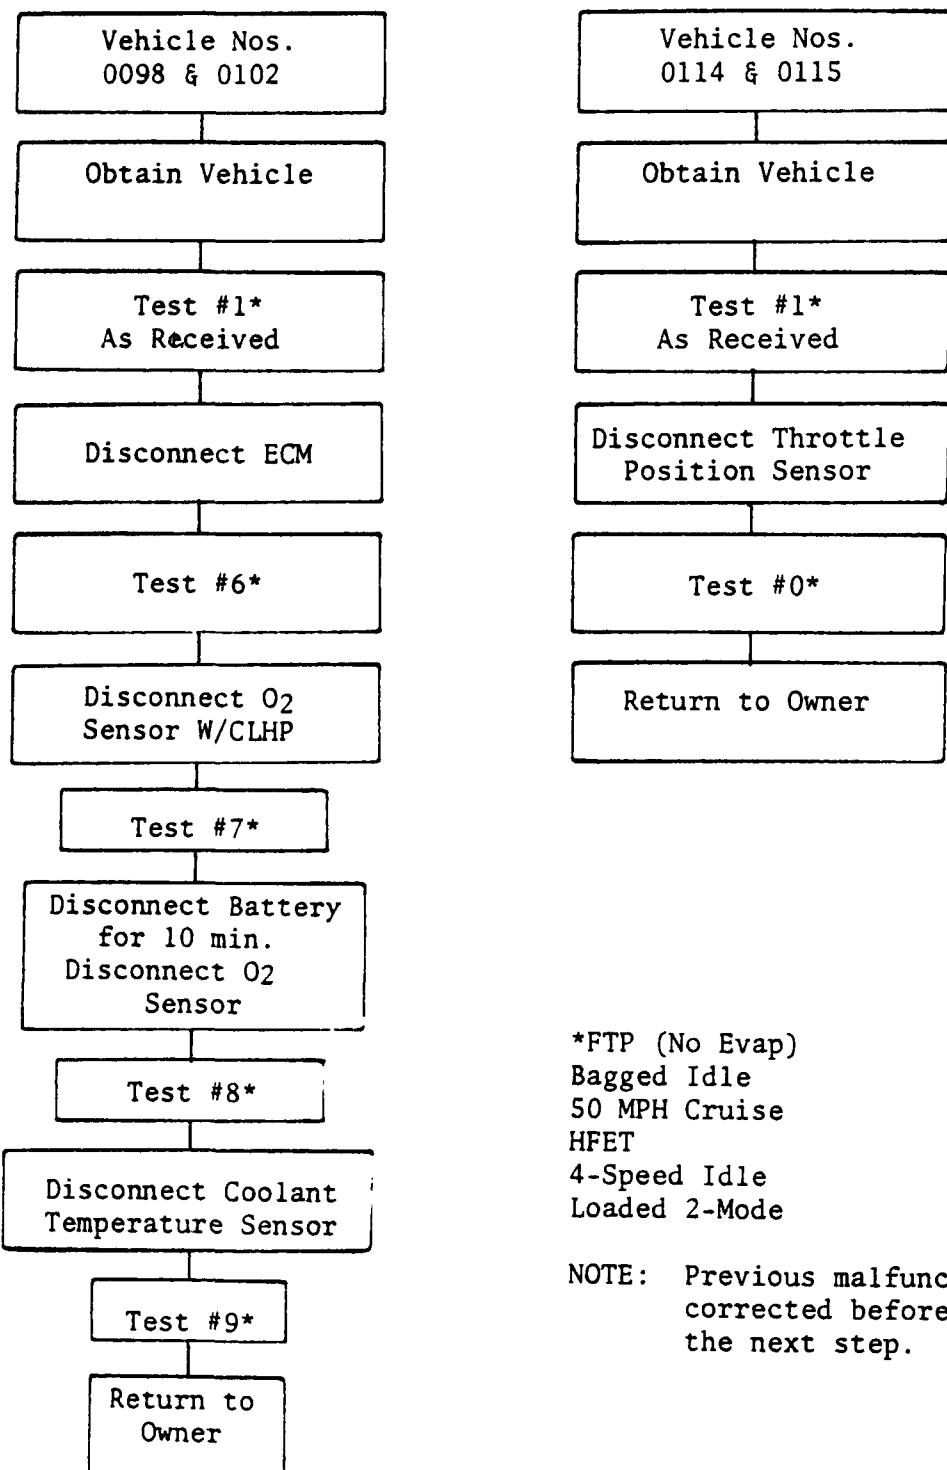

Cadillac Selective Malperformance/Restorative
Maintenance Program

Figure 5 (Continued)

<u>Code</u>	<u>Explanation</u>
12	<u>No Tach Signal to ECM.</u> This code will be present only when fault is present. It will not be stored with an intermittent problem.
13	<u>O2 Sensor Circuit.</u> Engine must run about 5 minutes at part throttle before this code will show.
15	<u>Open Coolant Sensor Circuit.</u> Engine must operate about 5 minutes before this code will show.
21	<u>Throttle Position Sensor - W.O.T. Error.</u> After 10 seconds and below 800 RPM.
43	<u>Throttle Position Sensor Adjustment.</u> Part throttle - After 10 seconds.
44	<u>Lean O2 Sensor.</u> The engine has to run about 3 minutes in closed loop and part throttle at road load before this code will show.

- Appendix E Listing of Highway Fuel Economy Test Results on Individual Vehicles
- Appendix F Listing of Bagged Idle Emissions on Individual Vehicles
- Appendix G Listing of 50 MPH Cruise Test Results on Individual Vehicles
- Appendix H Listing of Four-Speed Idle Test Results on Individual Vehicles
- Appendix I Listing of Loaded Two Mode Test Results on Individual Vehicles
- Appendix J Listing of Driveability Evaluations on Individual Vehicles
- Appendix K Listing of Emission Component Inspection Information on Individual Vehicles

APPENDIX A - LISTING OF VEHICLE AND TEST PARAMETERS

Legend

VEH	Vehicle Number
RUN	Run Number
DATE	Date of Test (month, day, year)
YR	Model Year
MAKE	Vehicle Make
MDL	Vehicle Model
ENGINE FAMILY	Engine Family
C	Number of Cylinders
CID	Engine Displacement in Cubic Inches
V	Number of Carburetor Venturis (0: fuel injection)
T	Type of Transmission (1: automatic; 2: semi-automatic; 3: 3-speed manual; 4: 4-speed manual; 5: 5-speed manual)
AC	Air Conditioning: (1: Yes; 2: No)
FT	Fuel Tank Capacity in Gallons
CAT	Catalyst (1: Oxidation; 2: Three-way; 3: None; 4: Three-way plus Oxidation)
IRPM	Idle RPM, Measured
IRPMS	Idle RPM, Manufacturer's Specification
IGN	Ignition Timing in Degrees, actual (plus sign indicates before top dead center; negative sign indicates after top dead center; 0 indicates top dead center)
IGNS	Ignition Timing in Degrees, Manufacturer's Specification (plus sign indicates before top dead center; negative sign indicates after top dead center; 0 indicates top dead center)
INRT	Dynamometer Inertia Weight Setting
RLHP	Actual Road Load Horsepower Setting
L	Was 10% RLHP added to simulate air conditioner (1: Yes; 2: No; 3: Manufacturer supplied)
DB	Dry bulb temperature (degrees Fahrenheit)
WB	Wet bulb temperature (degrees Fahrenheit)
BAROM	Barometric Pressure (inches Hg)
TEST	Test Number

APPENDIX B - LISTING OF TEST VEHICLE USE AND MAINTENANCE DATA

Legend

VEH	Vehicle Number
YR	Model Year
MAKE	Vehicle Make
MODL	Vehicle Model
VIN	Vehicle Identification Number
ODOM	True Mileage
N	Purchased New or Used (1: New; 2: Used)
Y	Yearly Vehicle Miles Traveled (1: 0-5,000; 2: 5,001-10,000; 3: 10,000-15,000; 4: 15,001-20,000; 5: 20,001-30,000; 6: over 30,000)
C	Major City Street Driving (1: all; 2: most; 3: some; 4: little/none)
E	Rural Expressway Driving (1: all; 2: most; 3: some; 4: little/none)
S	Rural Road Driving (1: all; 2: most; 3: some; 4: little/none)
W	Driving to and from Work (1: all; 2: most; 3: some; 4: little/none)
G	Shopping (1: all; 2: most; 3: some; 4: little/none)
B	Business not to and from Work (1: all; 2: most; 3: some; 4: little/none)
V	Social, Vacation, etc. (1: all; 2: most; 3: some; 4: little/none)
TD	Number of Trips made on a Typical Day (one trip is defined as starting the engine, traveling some distance and stopping the engine).
W	Number of Wide Open Throttle accelerations used per week (1: seldom; 2: once or twice; 3: 3-6 times; 4: Everyday)
H	Hard Starting (1: Yes; 2: No)
ST	Stalling (1: Yes; 2: No)
R	Rough Idle (1: Yes; 2: No)
M	Engine Misfiring (1: Yes; 2: No)
A	Poor Acceleration (1: Yes; 2: No)
SB	Stumbling (1: Yes; 2: No)
DS	Dieseling (1: Yes; 2: No)

APPENDIX B - (CONTINUED) LISTING OF TEST VEHICLE USE AND MAINTENANCE DATA

LO Date of Last Oil change (1: too new; 2: due but not done; 3: 0-6 mos; 4: 6-12 mos; 5: over 1 year; 6: don't know)

LT Date of Last Tune Up (1: too new; 2: due but not done; 3: 0-6 mos; 4: 6-12 mos; 5: over 1 year; 6: don't know)

MAR Vehicle maintained Manufacturer's Recommended Specifications (1: yes; 2: no; 3: not sure; 4: don't know)

NW Number of Warranty repairs (1: no warranty; 2: never returned; 3: once; 4: twice; 5: 3 or more; 6: don't know)

PB Was vehicle returned for Performance Problems (1: yes; 2: no problems)

UL Unleaded fuel required (1: Yes; 2: No)

L Number of times Leaded fuel was used (1: not required; 2: never; 3: seldom; 4: occasionally; 5: frequently; 6: don't know)

H2S Have you or others noticed a Hydrogen Sulfide (rotten eggs) odor in this vehicle's exhaust? (1: never; 2: seldom; 3: occasionally; 4: frequently; 5: don't know)

U Vehicle operated 50% of the time on unpaved roads, in competitive events, or in hauling or transporting loads heavier than for which it was designed (1: yes; 2: no; 3: don't know)

D Has vehicle ever had major damage to: (a) cooling system; (b) engine; (c) fuel tank; (d) exhaust system; (e) no damage; (f) don't know (1: yes; 2: no)

MD Altered engine and/or exhaust components (1: yes; 2: no)

APPENDIX C

LISTING OF FEDERAL TEST PROCEDURE RESULTS ON INDIVIDUAL VEHICLES

Legend

<u>PHRASE</u>	<u>EXPLANATION</u>
LIMITER CAP OK	Limiter cap correctly installed
LIMITER CAP MIS	Limiter cap missing
LIMITER CAP BRKN	Limiter cap broken
LIMITER CAP NA	Limiter cap N-A (e.g., fuel inj.)
MIXTURE ADJ PLUG OK	Sealed carb adjustment plug OK
MIXTURE ADJ PLUG MIS	Sealed carb adjustment plug missing
TIMG OFF $\pm X$	Timing off $\pm x$ degrees
IRPM OFF $\pm XXX$	Idle RPM off $\pm xxx$ RPM
CHOKE OFF XNR (OR NL)	Choke off by x notches on rich side (or lean)

<u>ACRONYM</u>	<u>EXPLANATION</u>
BRKN	Broken
DEF	Defective
PLGD	Plugged
RERTD	Rerouted
DISCNCTD	Disconnected
CNCTD	Connected
DIST	Distributor
VAC	Vacuum
ADV	Advance
VLV	Valve
SOL	Solenoid
FLTR	Filter
BPT	Back Pressure Transducer
SNSR	Sensor
CNSTR	Canister

APPENDIX C

**LISTING OF FEDERAL TEST PROCEDURE RESULTS

DRIVEABILITY EVALUATION

Make _____ Model _____

2 3 4 5 6 7 9
 [2] [0] [9] [5] [1] [0] [4] []
 test seq.
 Site Veh. No.

Eng., Trans., Carb. _____

	Yes	No	Number	Quality Code
A. Constant Speed Phase				
1. Stalls, pass-outs* upon part throttle ----- 1	2(13)		<input type="checkbox"/>	(14)
acceleration to road speed				
2. Acceleration Quality -----			<input type="checkbox"/>	(15)
3. Cruise Quality -----			<input type="checkbox"/>	(16)
4. Slight acceleration response (passing) -----			<input type="checkbox"/>	(17)
5. Idle quality at stop - w/air "on" (enter "9" if not equipped) ----- w/air "off"			<input type="checkbox"/>	(18)
			<input type="checkbox"/>	(19)
B. Acceleration from stop phase				
6. Quality of acceleration under 1/4 throttle -----			<input type="checkbox"/>	(20)
7. Quality of acceleration under 1/2 throttle -----			<input type="checkbox"/>	(21)
8. Quality of acceleration under 2/3 throttle -----			<input type="checkbox"/>	(22)
9. Quality of acceleration under 3/4 throttle -----			<input type="checkbox"/>	(23)
C. Re-start Phase	sec.			
10. Cranking time to start after 10 min. -----		<input type="checkbox"/> <input type="checkbox"/>		(24-25)
11. Idle quality after re-start -----			<input type="checkbox"/>	(26)
D. Cold start & idle phase (Dynamometer)	sec.			
12. Initial cranking time -----			<input type="checkbox"/> <input type="checkbox"/>	(27-28)
13. Engine die-outs* after start ----- 1	2(29)		<input type="checkbox"/>	(30)
14. Engine stalls after gear selection ----- 1	2(31)		<input type="checkbox"/>	(32)
15. Hesitation, lag upon slight acceleration -- 1	2(33)			
16. Idle quality -----			<input type="checkbox"/>	(34)
E. Drive-away Phase (Dynamometer)				
17. Stalls, pass-outs upon slight ----- 1	2(35)		<input type="checkbox"/>	(36)
acceleration to road speed				
18. Acceleration quality -----			<input type="checkbox"/>	(37)
19. Idle quality after 0.2 mile @ stop -----			<input type="checkbox"/>	(38)
20. Stalls, pass-outs upon slight ----- 1	2(39)		<input type="checkbox"/>	(40)
acceleration to road speed				
21. Acceleration quality -----			<input type="checkbox"/>	(41)
22. Idle quality after 0.4 mile @ stop -----			<input type="checkbox"/>	(42)

Quality Code

5 = Excellent, 4 = Good, 3 = Fair, 2 = Poor, 1 = Fail

APPENDIX K

LISTING OF EMISSION COMPONENT INSPECTION INFORMATION ON INDIVIDUAL VEHICLES

Legend

Emission Components Inspected

INDUC	Induction System
FUEL	Fuel Subsystem - Carburetor & Fuel Systems
CHOKE	Carburetor & Fuel Systems - Choke Subsystem
IGN	Ignition System
EGR	EGR System
AIR	Air Pump System
PCV	PCV System
EXH	Exhaust System
EVAP	Evaporative Control System
MISC	Engine Assembly - Miscellaneous Accessories
3-WAY	3-Way Catalyst Systems
MAN HRS	Time required to complete inspection

System Evaluation Code

- 1 No Malperformance
- 2 Some Malperformance
- 3 Not Applicable
