August 1975

This report is issued by the Environmental Protection Agency to report technical data of interest to a limited number of readers. Copies are available free of charge to Federal employees, current contractors and grantees, and nonprofit organizations - as supplies permit - from the Air Pollution Technical Information Center, Environmental Protection Agency, Research Triangle Park, North Carolina 27711; or, for a fee, from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161.

This report was furnished to the Environmental Protection Agency by Bendix Launch Support Division, Cocoa Beach, Florida 32931, in fulfillment of Contract No. 68-03-0453. The contents of this report are reproduced herein as received from Bendix Launch Support Division. The opinions, findings, and conclusions expressed are those of the author and not necessarily those of the Environmental Protection Agency. Mention of company or product names is not to be considered as an endorsement by the Environmental Protection Agency.

Publication No. EPA-460/3-75-009-b

## PREFACE

The purpose of this report is to present findings, conclusions, and substantiating data gathered by the Bendix Corporation, Launch Support Division, during a 1-year contract performance period, 9 May 1974 through 9 May 1975, on the actual and recommended maintenance practices for light-duty vehicles for 1975 and later-model years.

The report consists of two volumes. Volume I contains ten chapters which encompass the Introduction, Summary, Conclusions, the discussion of the performance of six of the seven tasks enumerated in the Introduction, and finally, Survey Findings. It also contains two appendixes, an automotive diagnostic equipment index, and the individual tally sheets on which the results of the consumer, commercial, and dealer surveys have been consolidated.

Volume II contains the seventh task listed in the Introduction, the review and analysis of the 1974 Durability Test scheduled service records.

This study was performed for the U. S. Environmental Protection Agency (EPA), Office of Air and Water Programs, Office of Mobile Source Pollution Control, Certification and Surveillance Division. The Technical Project Officer was Mr. L. D. Verrelli. The report will provide EPA with valid, current information on consumer and commercial automotive activities.

## CHAPTER XI

### DEVELOP A METHOD TO REVIEW AND ANALYZE THE 1974 ENVIRONMENTAL PROTECTION AGENCY DURABILITY TEST MAINTENANCE RECORDS (TASK 7)

#### A. INTRODUCTION

In 1974, the EPA conducted a durability test on all vehicles manufactured and/or sold in the United States. The task attempted in this chapter is to review, to show the variances, records of scheduled maintenance operations recommended by automobile manufacturers, owners' handbook recommendations, and the scheduled maintenance actually performed during the 1974 durability tests.

#### B. DEVELOPMENT OF THE METHOD

It was determined that a practical way to properly evaluate the manufacturers' maintenance programs was to perform an individual analysis of the manufacturers' historical records for every engine family subjected to the durability test.

An interim worksheet was developed and completed for each engine within each engine family of each manufacturer. The information was recorded according to the actual mileage intervals at which scheduled maintenance was performed.

The basic information from each interim worksheet was totalled, collated, and transferred to individual corresponding charts (Durability Test Comparison Charts). These charts are shown at the end of this chapter.

Each chart is identified by manufacturer, model, engine CID, and identification number, and contains at the bottom of the chart the 47 most common maintenance functions found in the owners' handbooks for the automobiles and engine families listed. Under each maintenance function are listed the following: Durability test (the recommended durability maintenance schedule), Owner's Handbook (owner's manual), and Actual (the scheduled maintenance actually performed during the 1974 Durability Test. The numbers at the left of the chart (1 through 9, or 2 through 18) represent the actual number of times the particular maintenance function was performed during a 50,000-mile period.

#### C. SUMMARY

The durability records obtained from the EPA consisted of 72 engine families encompassing 162 vehicles from 32 vehicle manufacturers. Data accumulated from the durability records is displayed in the Durability Test Comparison Charts which are shown at the end of this chapter.

#### D. CONCLUSIONS

The differences in the vehicle manufacturers' durability test reporting did not provide adequate or significantly consistent variances to allow values to be assigned to highlight a condition. As a result, each chart must be reviewed independently. To illustrate this point, one of the most frequent and basic maintenance requirements (oil change) was reviewed; it provided the following results: 25 percent of the vehicle manufacturers

accomplished oil changes as recommended in the handbook; 45 percent failed to accomplish the changes; 5 percent changed the oil more frequently than recommended; and 25 percent could not be determined because of insufficient data.

Durability test records that were provided indicate that not one manufacturer accomplished all the maintenance operations as recommended in the vehicle owner's handbook.

Type of Report & Period Covered Final Report July 1974 to July 1975  14.		
15. Supplementary Notes				
16. Abstracts A survey was made to determine the actual and recommended maintenance practices for light-duty vehicles for 1975 and later-model years. Data was gained through consumers, new-car dealerships, manufacturers, service stations, diagnostic centers, specialty shops, independent service stations, and mass merchandisers, literature research, and data evaluation. The following conclusions were reached. Automotive service requirements are becoming more complex. Diagnostic centers are diversifying into diagnostic, service, and repair facilities. Automobile dealerships employ the highest percentage of classified or rated mechanics and are more fully equipped than other classifications. Current and future requirements can be met by the diagnostic equipment industry. The majority of automobile owners are unwilling to voluntarily replace a malfunctioning catalytic converter
