Environmental Protection Technology Series

SOURCE ASSESSMENT:
OVERVIEW AND PRIORITIZATION OF
EMISSIONS FROM TEXTILE MANUFACTURING

Industrial Environmental Research Laboratory
Office of Research and Development
U.S. Environmental Protection Agency
Research Triangle Park, North Carolina 27711

RESEARCH REPORTING SERIES

Research reports of the Office of Research and Development, U.S. Environmental Protection Agency, have been grouped into five series. These five broad categories were established to facilitate further development and application of environmental technology. Elimination of traditional grouping was consciously planned to foster technology transfer and a maximum interface in related fields. The five series are:

1. Environmental Health Effects Research
2. Environmental Protection Technology
3. Ecological Research
4. Environmental Monitoring
5. Socioeconomic Environmental Studies

This report has been assigned to the ENVIRONMENTAL PROTECTION TECHNOLOGY series. This series describes research performed to develop and demonstrate instrumentation, equipment, and methodology to repair or prevent environmental degradation from point and non-point sources of pollution. This work provides the new or improved technology required for the control and treatment of pollution sources to meet environmental quality standards.

EPA REVIEW NOTICE

This report has been reviewed by the U.S. Environmental Protection Agency, and approved for publication. Approval does not signify that the contents necessarily reflect the views and policy of the Agency, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

This document is available to the public through the National Technical Information Service, Springfield, Virginia 22161.

PREFACE

The Industrial Environmental Research Laboratory (IERL) of EPA has the responsibility for insuring that pollution control technology is available for stationary sources to meet the requirements of the Clean Air Act, the Federal Water Pollution Control Act and solid waste legislation. If control technology is unavailable, inadequate, uneconomical or socially unacceptable, then financial support is provided for the development of the needed control techniques for industrial and extractive process industries. The Chemical Processes Branch of the Industrial Processes Division of IERL has the responsibility for investing tax dollars in programs to develop control technology for a large number (>500) of operations in the chemical industries.

Monsanto Research Corporation (MRC) has contracted with EPA to investigate the environmental impact of various industries which represent sources of pollution in accordance with EPA's responsibility as outlined above. Dr. Robert C. Binning serves as MRC Program Manager in this overall program entitled "Source Assessment," which includes the investigation of sources in each of four categories: combustion, organic materials, inorganic materials, and open sources. Dr. Dale A. Denny of the Industrial Processes Division at Research Triangle Park serves as EPA Project Officer. Reports prepared in this program are of three types: Source Assessment Documents, State-of-the-Art Reports, and Special Project Reports.

Source Assessment Documents contain data on emissions from specific industries. Such data are gathered from the literature, government agencies and cooperating companies. Sampling and analysis are also performed by the contractor when the available information does not adequately characterize the source emissions. These documents contain all of the information necessary for IERL to decide whether a need exists to develop additional control technology for specific industries.

State-of-the-Art Reports include data on emissions from specific industries which are also gathered from the literature, government agencies and cooperating companies. However, no extensive sampling is conducted by the contractor for such industries. Sources in this category are considered by EPA to be of insufficient priority to warrant complete assessment for control technology decision making. Therefore, results from such studies are published as State-of-the-Art Reports for potential utility by the government, industry, and others having specific needs and interests.

Special projects provide specific information or services which are applicable to a number of source types or have special utility to EPA but are not part of a particular source assessment study. This special project report, "Source Assessment: Overview and Prioritization of Emissions from Textile Manufacturing" was prepared to provide a general summary of textile manufacturing, and to furnish information on individual textile subcategories.

SECTION I

INTRODUCTION

This report provides an overview and prioritization of mass emissions from textile manufacturing in order to permit selection of specific pollution sources for detailed assessment.

Operations in textile manufacturing are defined as any processes which take a yarn, filament, fiber, or tow and create a final or intermediate product. In this study, such operations are limited to those which occur on the plant site and which emit air pollutants.

With respect to the Source Assessment Program, textile manufacturing was originally included in the two source types "Fabric Scouring" and "Surface Coating - Fabric Treatment." These sources were contained in the organic chemicals category of the Overview Matrix.¹ Subsequently, these two textile source types were replaced by various textile sub-categories and incorporated into a revised Overview Matrix.²

¹Special Project Report,Overview Matrix. Monsanto Research Corporation, Dayton, Ohio, EPA Contract 68-02-1874.
7 July 1976. 52 p.

²Quill, R. P., and E. C. Eimutis. Source Assessment: Overview Matrix for National Criteria Pollutant Emissions. EPA-600/2-77-107c, U.S. Environmental Protection Agency, Research Triangle Park, July 1977. 63 p.

In order to begin detailed assessments of air pollution from textile manufacturing sources, each subcategory requires an overview of mass emissions and a prioritization of hazard potentials. The size and complexity of the textile industry necessitates the creation of special source listings to provide the in-depth review of emissions. At present, data were compiled only for those sources for which emissions information was readily available. Hence, this report presents a preliminary source listing and prioritization of textile sources. A more comprehensive and organized listing would require a more intensive research effort.

SECTION II

SOURCE LISTINGS AND PRIORITIZATION

A. SOURCE LISTING

In the Source Assessment Program, emissions data for criteria pollutants from various source types are listed in special formats. In addition, a relative ranking (prioritizing) of source types based on their potential environmental impact is developed. In this project, special source and prioritization listings were produced specifically for use in evaluating textile manufacturing sources. The listings used in the Source Assessment Program and the special listings produced for the textile industry are briefly compared below.

1. Overview Matrix

In the Source Assessment Program, the Overview Matrix^{1,2} is an alphabetized listing of all sources in MRC's data base and their mass of criteria emissions (particulates, sulfur dioxide, nitrogen oxides, hydrocarbons, and carbon monoxide). For each source type, the following information is provided: (1) annual mass of criteria emissions, (2) percent contribution of a particular criteria pollutant based on the total amount of that pollutant emitted from all stationary source types in our data base, and (3) percent contribution of a particular criteria pollutant based on the amount of that pollutant emitted from stationary and mobile sources. The

Overview Matrix is revised periodically as additional or improved data become available.

2. Special Textile Source Listings

For the purpose of this report, special listings of textile source types were prepared in order to provide a general summary of textile manufacturing and to provide information on individual textile subcategories. As shown later in Section III.C, operations were tabulated by Standard Industrial Classification (SIC)³ for potential sources of air pollution in textile manufacturing. Two special listings, different from the Overview Matrix, were compiled: (1) A state-by-state listing of criteria emissions from textile manufacturing was developed, which shows the percent contribution of a particular criteria pollutant based on the total amount of that pollutant emitted from all textile sources in the state; and (2) a national listing of criteria emissions from textile manufacturing was developed, which shows the percent contribution of a particular criteria pollutant based on the total amount of that pollutant emitted from all textile sources in the nation and, similarly, from all stationary sources in our data base. The method used for preparing these special textile source listings and the listings themselves are provided in Section III.C.

B. PRIORITIZATION

1. Source Assessment Program

In the Source Assessment Program, prioritization listings were developed to aid in the selection of specific sources

³Standard Industrial Classification Manual 1972. U.S. Government Printing Office, Washington, D.C., 1972. 649 p.

of emissions for detailed assessment.⁴ Air pollution sources were rank ordered or prioritized by computing a relative environmental impact factor for each source type. A priority listing was thus developed for each of the four categories: combustion, organic materials, inorganic materials, and open sources.

2. Textile manufacturing Prioritization

For the purpose of this report, special prioritization listings of textile source types by SIC Code and by specific source type were developed to further aid in selecting specific sources for detailed study. The procedure used for these special prioritizations and the resultant listings are provided in Section III.D.

⁴Eimutis, E. C. Source Assessment: Prioritization of Stationary Air Pollution Sources - Model Description. U.S. Environmental Protection Agency, Research Triangle Park, EPA-600/2-76-032a. February 1976. 77 p.

SECTION III

TEXTILE MANUFACTURING

A. CLASSIFICATION OF SOURCE TYPES

The SIC Manual³ defines industries in accordance with the composition and structure of the economy and covers the entire field of economic activities. The Census of Manufactures, published individually by the U.S. Department of Commerce, provides statistics for groups of related industries. In the SIC system, industries and the operations within industries are coded. Statistics on production, consumption, and other parameters are compiled for each of the codes.

The coding system begins with a 2-digit Major Group code, and groupings become more specific up to a 7-digit code. Major Group 22, "Textile Mill Products," approximately covers the textile manufacturing industry, with the exception of asbestos textiles. Within Major Group 22, there are nine 3-digit codes. These 3-digit codes are usually further subdivided with the addition of digits. Major Group 22 is thus further classified and ultimately results in 7-digit codes.

In order to determine the degree of subdivision that most appropriately fits the pattern of the Source Assessment Program, it was necessary to examine the codes with respect to their coverage of the individual operations as well as the industry. The nine 3-digit codes within the Major

Group 22 are listed in Table 1. Total mass production rates and percentage by weight of the textile manufacturing industry are provided for each 3-digit code. Production rates were obtained by applying conversion factors to the linear yardage statistics reported by the U.S. Department of Commerce's Census of Manufactures.⁵⁻¹⁰ The conversion factors in Table 2 were used.¹¹

Table 1 indicates that SIC Code 223 contains less than 1% of the total production. Therefore, a further breakdown of this source group will not be necessary. SIC Codes 221, 222, and 224 cannot be broken down further since only one 4-digit code is listed for each group. (SIC Codes 2211, 2221, and 2241). SIC Code 225 contains seven 4-digit codes which are listed

⁵1972 Census of Manufactures, Industry Series (SIC Industry Groups 221, 222, 223, and 224), Weaving Mills. MC72(2)-22A, U.S. Department of Commerce, Washington, D.C., January 1975. 35 p.

⁶1972 Census of Manufactures, Industry Series (SIC Industry Group 225), Knitting Mills. MC72(2)-22B, U.S. Department of Commerce, Washington, D.C., April 1975. 42 p.

⁷1972 Census of Manufactures, Industry Series (SIC Industry Group 226), Dyeing and Finishing Textiles, Except Wool Fabrics and Knit Goods. MC72(2)-22C, U.S. Department of Commerce, Washington, D.C., January 1975, 25 p.

¹¹Personal communication. Dr. John J. Porter, Clemson University, College of Industrial Management and Textile Science, Department of Textiles, March 21, 1976.

Table 1. BREAKDOWN OF MAJOR GROUP 22, TEXTILE MILL PRODUCTS

SIC Code	Title	Annual production rate, ^{a,b}		Percentage of total
		10^9 kg/yr	(10^6 tons/yr)	
221	Cotton Weaving Mills	2.2	(2.4)	7
222	Man-made Fiber and Silk Weaving Mills	3.9	(4.3)	12
223	Wool Weaving and Finishing Mills	0.09	(0.1)	<1
224	Narrow Fabric Mills	1.6	(1.75)	5
225	Knitting Mills	2.3	(2.55)	7
226	Dyeing And Finishing Textiles, Except Wool Fabrics and Knit Goods	4.5	(4.95)	14
227	Floor Covering Mills	1.8	(2)	5
228	Yarn and Thread Mills	3.5	(3.85)	11
229	Miscellaneous Textile Goods	<u>12.7</u>	<u>(14)</u>	<u>39</u>
TOTAL		32.6	(35.9)	100

^aFiber, yarn and fabrics.

^b1 kg = 10^3 grams = 2.205 pounds = 0.0011 short tons (short tons are designated "tons" in this document); other conversion factors are presented in Section V.

Table 2. TEXTILE WEIGHTS PER LINEAR UNIT¹¹

Cotton	0.35 kg/m (0.702 lb/yd)
Man-made fiber	0.66 kg/m (1.34 lb/yd)
Wool	0.58 kg/m (1.16 lb/yd)

in Table 3. The operations within each of these 4-digit codes are basically identical, and the 3-digit code 225 will be retained in categorizing the industry.

Table 3. FOUR-DIGIT CODES WITHIN SIC CODE 225, KNITTING MILLS

SIC Code	Title
2251	Women's Hosiery, Except Socks
2252	Hosiery, N.E.C. ^a
2253	Knit Outerwear Mills
2254	Knit Underwear Mills
2257	Circular Knit Fabric Mills
2258	Warp Knit Fabric Mills
2259	Knitting Mills, N.E.C. ^a

^aNot elsewhere classified.

SIC Code 226 (Table 1) can be further divided into SIC Codes 2261, Cotton Finishing Plants; 2262, Man-Made Fiber and Silk Finishing Plants; and 2269, Finishing Plants, N.E.C. (not elsewhere classified). These groupings contain different operations and as such will be categorized separately within the textile industry. SIC Code 227, Floor Covering Mills, contains three 4-digit codes: SIC Codes 2271, Woven Carpets and Rugs; 2272, Tufted Carpets and Rugs; and 2279, Carpets and Rugs, N.E.C. SIC Code 2272, Tufted Carpets and Rugs, accounts for 97% of the yarns and fibers consumed in SIC Code 227. However, the SIC Code 227 classification will be retained due to the similarities of operations within the 4-digit codes. If a detailed assessment of this source is undertaken, SIC Code 2272 could represent all of SIC Code 227. In SIC Code 228, Yarn and Thread Mills, there are four 4-digit codes: SIC Codes 2281, Yarn Mills Except Wool; 2282, Throwing and Winding Mills; 2283, Wool Yarn Mills; and 2284, Thread Mills. Within SIC Code 229, Miscellaneous Textile Goods, there are nine 4-digit

codes. Due to the lack of similarities in operations, all nine codes must be used in the categorization. The 4-digit codes within SIC Code 229 are listed in Table 4.

Table 4. FOUR-DIGIT CODES WITHIN SIC CODE 229,
MISCELLANEOUS TEXTILE GOODS

SIC Code	Title
2291	Felt Goods Except Woven Felts and Hats
2292	Lace Goods
2293	Paddings and Upholstery Filling
2294	Processed Textile Waste
2295	Coated Fabrics Not Rubberized
2296	Tire Cord and Fabric
2297	Nonwoven Fabrics
2298	Cordage and Twine
2299	Textile Goods, N.E.C.

The final degree of subdivision of the textile industry that most appropriately fits the Source Assessment Program is shown in Table 5. Five-digit codes will not be used to subdivide the industry since these codes generally specify products and not operations. Definitions of these source groups (Table 5) comprising the textile industry are presented in Table 6.

B. AIR POLLUTION SOURCE TYPES

1. Textile Industry Operations

The various types of fibers used in the textile industry are categorized in Figure 1.¹² These fibers, with the exception

¹²Cook, J. Gordon. Handbook of Textile Fibers - I. Natural Fibers, fourth edition. W. S. Cowell, Ltd., Great Britain, 1968. p. xxvii.

Table 5. CATEGORIZATION AND PRODUCTION RATES OF SOURCES WITHIN THE TEXTILE INDUSTRY

SIC Code	Title	Production rate,		Percentage of industry ^a
		10 ⁶ kg/yr	(10 ³ tons/yr)	
2211	Cotton Weaving Mills	2,200	(2,400)	6.7
2221	Man-Made Fiber and Silk Weaving Mills	3,900	(4,300)	12.0
2231	Wool Weaving and Finishing Mills	95	(105)	0.3
2241	Narrow Fabric Mills	1,600	(1,800)	4.9
225	Knitting Mills	2,324	(2,556)	7.1
2261	Cotton Finishing Mills	1,400	(1,540)	4.3

^a Percentages rounded off.

Table 6. DEFINITIONS OF SOURCE GROUP
CATEGORIES IN THE TEXTILE INDUSTRY

SIC code	Source	Definition
2211	Cotton Weaving Mills	Mills weaving fabrics over 12 in. in width, wholly or chiefly cotton
2221	Man-Made Fiber and Silk Weaving Mills	Mills weaving fabrics over 12 in. in width, wholly or chiefly of silk and man-made fibers, including glass
2231	Wool Weaving and Finishing Mills	Mills weaving fabrics over 12 in. in width, wholly or chiefly by weight of wool, mohair, or similar animal fibers; in dyeing and finishing woven wool fabrics or in dyeing wool, tops, or yarn; and in shrinking and sponging wool goods for the trade
2241	Narrow Fabric Mills	Mills weaving or braiding fabrics 12 in. in width or narrower of cotton, wool, silk, and man-made fibers, including glass fibers. Mills also weaving or braiding fabrics 12 in. in width or narrower of fabric covered elastic yarn are also included in this industry.
225	Knitting Mills	Mills knitting, dyeing, or finishing hosiery, outerwear, underwear, circular knit fabric, warp knit fabric, and other knitted articles
2261	Cotton Finishing Plants	Mills finishing purchased cotton broadwoven fabrics or finishing such fabrics on a commission basis. This includes bleaching, dyeing, printing, mechanical and chemical finishing, and sponging and shrinking cotton for the trade.
2262	Man-Made Fiber and Silk Finishing Plants	Mills finishing purchased man-made fiber and silk broadwoven fabrics or finishing such fabrics on a commission basis. This includes bleaching, dyeing, printing, and mechanical finishing.

(continued)

Table 6 (continued).

SIC code	Source	Definition
13	2269 Finishing Plants, N.E.C.	Mills dyeing and finishing textiles not elsewhere classified, such as bleaching, printing, and finishing raw stock, yarn, braided goods, and narrow fabrics except wool and knit fabrics
	227 Floor Covering Mills	Mills weaving carpets and rugs from yarn, tufting carpets and rugs from fiber, and manufacturing rugs, carpets, art squares, floor mattings, doormats and matting from twisted paper, grasses, reed, coir, sisal, jute, or rags
	2281 Yarn Mills Except Wool	Mills spinning yarn wholly or chiefly by weight of cotton, man-made fibers, or silk staple
	2282 Throwing and Winding Mills	Mills texturizing, throwing, twisting, winding, or spooling yarn chiefly (by wt) cotton, man-made fibers, or silk
	2283 Wool Yarn Mills	Mills spinning, twisting, winding, or spooling yarn (including carpet and rug yarn) wholly or chiefly (by wt) wool, mohair, or similar animal fibers
	2284 Thread Mills	Mills manufacturing thread from natural or man-made fiber except flax and wool
	2291 Felt Goods Except Woven Felts and Hats	Mills manufacturing pressed felt, regardless of fiber, by means of heat, moisture, and pressure; and making punched felt for rugs, cushions, and other products from hair, jute, wool, or other fibers by the needle loom process
	2292 Lace Goods	Mills manufacturing lace machine products and those primarily engaged in dyeing and finishing lace goods

(continued)

Table 6 (continued).

SIC code	Source	Definition
2293	Paddings and Upholstery Filling	Mills manufacturing batting, padding, wadding, and filling for upholstery, pillows, quilts, and apparel from curled hair, cotton mill waste, moss, hemp tow, flax tow, kapok, and related materials
2294	Processed Textile Waste	Mills processing textile waste for spinning, padding, batting, or other uses; and in recovering textile fibers from dippings and rags; in cutting flock from waste, recovered fibers, or raw fiber stock; and in manufacturing oakum and twisted jute packing
2295	Coated Fabrics Not Rubberized	Mills manufacturing coated and impregnated textiles and in the special finishing of textiles such as varnishing and waxing
2296	Tire Cord and Fabrics	Mills manufacturing cord and fabric for use in reinforcing rubber tires, industrial belting, fuel cells, and similar uses
2297	Nonwoven Fabrics	Mills manufacturing nonwoven fabrics (by bonding and/or interlocking of fibers) by mechanical, chemical, thermal, or solvent means or combinations thereof
2298	Cordage and Twine	Mills manufacturing rope, cable, cordage, twine, and related products from abaca, sisal, henequin, hemp, cotton, paper, jute, flax, man-made fibers including glass and other fibers
2299	Textile Goods, N.E.C.	Mills manufacturing linen goods, jute goods except felt, and other textile goods not elsewhere classified

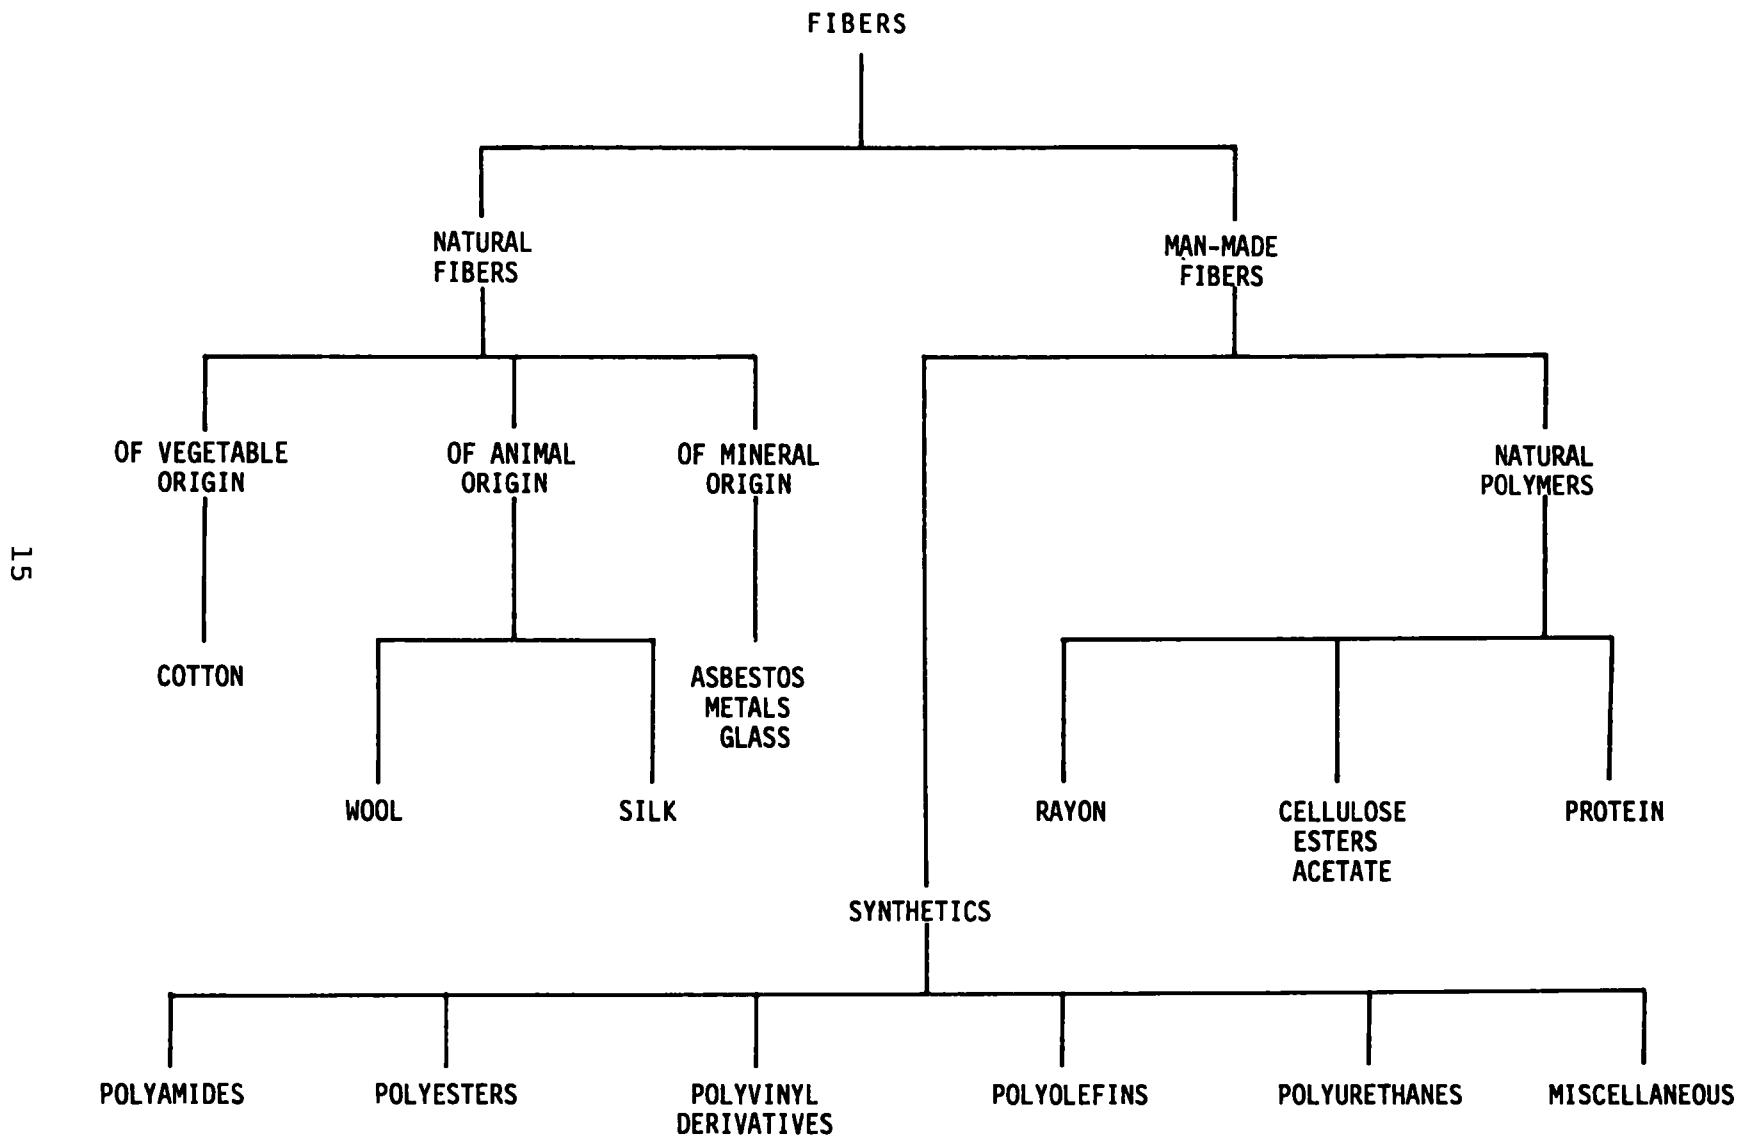

Figure 1. Fibers used in the textile industry.¹²

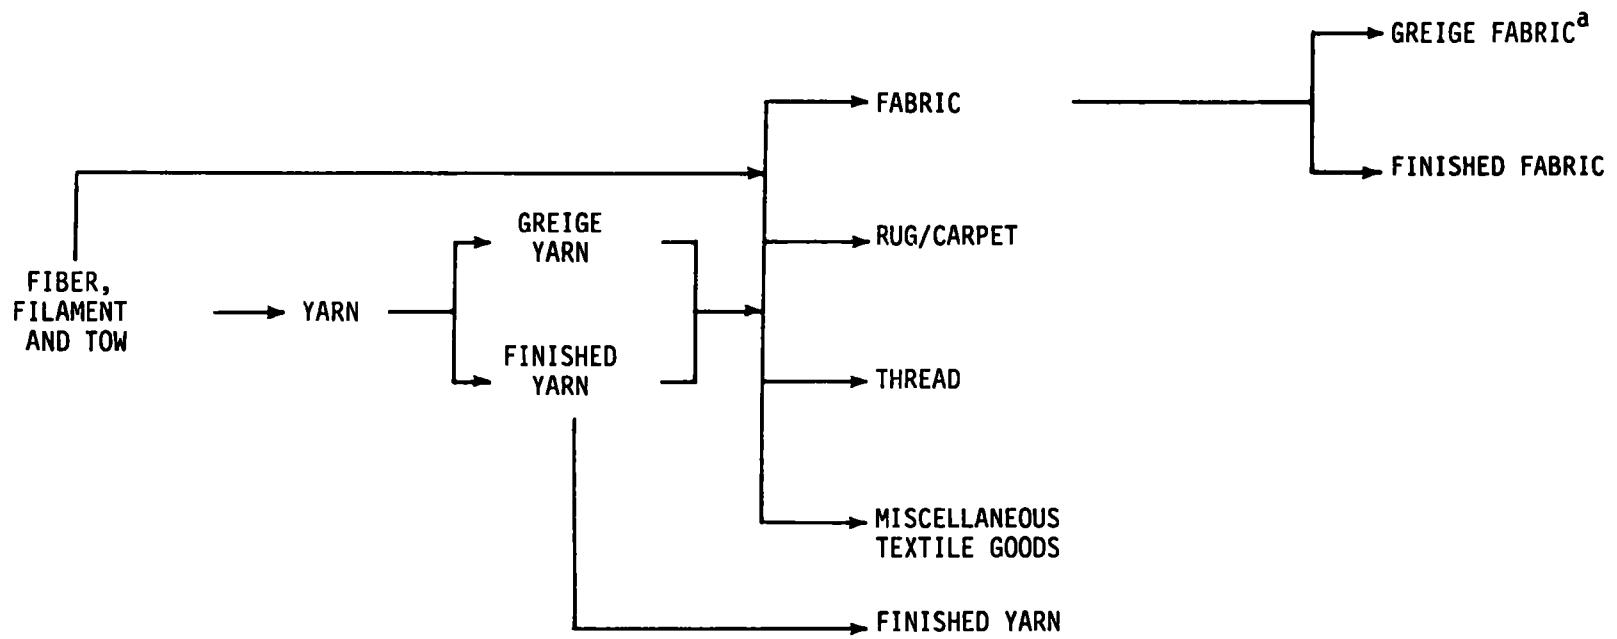

of the mineral fibers, generally follow three basic manufacturing procedures. These basic procedures are illustrated in Figure 2, which represents the general flow of materials through the textile industry, and includes: (a) converting fiber, filament, and tow into yarn; (b) converting yarn into fabric; and (c) converting fabric into finished fabric. The operations for each of these procedures were flow charted in Figures 3, 4, and 5 (A, B, and C) for man-made, vegetable, and animal fibers, respectively. For each fiber, individual flows of: (A) filament, fibers and tow to yarn; (b) yarn to fabric; and (C) fabric to finished fabric, are provided.

2. SIC Classifications of Operations

The flows of man-made, vegetable, and animal fibers in the textile industry (primary production routes) are represented in Figures 6, 7, and 8, respectively, for each of the SIC Codes listed in Table 5. Therefore, each SIC Code listed in Table 5 represents a group of operations in Figures 3, 4, and 5. For this reason, the textile industry was divided into air pollution source types by combining the SIC Codes (Table 5) with the operations given in Figures 3, 4, and 5. The resulting air pollution source types for these SIC Codes are listed in Tables 7 through 28.

C. STATE-BY-STATE AND NATIONAL LISTINGS

State-by-state and national listings refer to compilations of mass emissions of criteria pollutants by textile source type for specific states and for the nation. These data are computed through use of the prioritization forms shown in Figures 9 and 10. These forms were completed after an extensive study of the literature. Only literature data of "C" confidence level or higher (as defined in Reference 4) were used.

^aGREIGE REFERS TO YARN/FABRICS NOT PROCESSED THROUGH FINISHING OPERATIONS.

Figure 10. Prioritization form used for state-by-state and national listings.

To obtain the total mass emissions of a specific criteria pollutant in a particular state, the emission factor for the pollutant was multiplied by the annual production rate in the state. Similarly, the total mass emissions of a criteria pollutant in the nation was obtained by multiplying the emission factor for the pollutant by the annual total production in the U.S.

The state-by-state listing of emissions of criteria pollutants from textile manufacturing sources is shown throughout Table 29. In each state, for each source and criteria pollutant, the first number in each criteria pollutant column is the annual mass emissions. For example, the source entitled "Breaking and Scutching Flax Fibers" emits 1.5×10^3 kg/yr of particulates in Alabama. The second number in each criteria pollutant column refers to the percentage that the annual mass emissions represents in relation to emissions of that pollutant from all textile sources in that state. For that same source type, "Breaking and Scutching Flax Fibers," 1.5×10^3 kg/yr represents 0.065% of all particulates emitted from textile manufacturing sources in Alabama.

A review of Table 29 indicates that emissions of criteria pollutants from textile operations are confined to a few sources. In most states, cotton handling activities were responsible for 95+% of the particulate matter generated from textile industries. Synthetic polymer particulates normally amounted to 5% to 10% of the total. However, in New Jersey over two-thirds of the particulates from textile sources were associated with synthetic polymer operations. In Illinois, Wisconsin, Vermont, Maine, and Oregon 50% to 100% of the textile particulates could be attributed to wool operations. Asbestos and flax emissions were the sole textile particulates emitted in Missouri and Louisiana.

STATE EMISSIONS REPORT FOR WYOMING

SOURCE -----	PART ----	MASS OF EMISSIONS (1000 KG/YR) PERCENT OF STATE EMISSIONS				
		SO2 ---	NOX ---	HC --	CO --	T -

Textile printing operations are the source of most of the hydrocarbon emissions from textile manufacturing in all the states except Indiana, Oklahoma, Texas, and California. In these states, carpet dyeing operations account for the hydrocarbon emissions. Approximately two-thirds of the hydrocarbons from textile printing operations in half the states are attributed to the printing of cotton. The largest textile manufacturing states, Georgia, South Carolina, and North Carolina, in addition to Kentucky, Wisconsin, and Arkansas, generate 60+% of the state textile hydrocarbon emissions from the printing of rayon and natural polymers. Mississippi, California, Missouri, Ohio, and Maine have large hydrocarbon levels from silk and linen printing. The New England states have significant hydrocarbon levels from wool printing operations.

Mass emissions of nitrogen oxide, sulfur oxide, and carbon monoxide are minor from textile processing operations. They are primarily a result of the singeing of cotton and linen.

A state totals list, shown in Table 30, was generated to show the total mass emissions from all textile sources per state and the percentage that their emissions represent with respect to all textile sources in the nation. For example, the state of Alabama emits $2,332 \times 10^3$ kg/yr of particulates from all textile sources. This amount accounts for 6.74% of the particulate emissions from all textile sources in the nation as shown in the second entry under particulates for Alabama.

Textile manufacturing in eight states (Georgia, Massachusetts, New Jersey, New York, North Carolina, Pennsylvania, Rhode Island, and South Carolina) accounts for 87% of the total hydrocarbon emissions and 70% of the total particulate. Nitrogen oxide, sulfur oxide, and carbon monoxide mass levels are

9/2/76

low, with 50+% of the total emanating from North and South Carolina.

The total state emissions from textile manufacturing (Table 30) divided by the state totals for each criteria pollutant from all air pollution sources (from Table 31) yields the percentage attributed to the textile industry per state. For example textile plants in Alabama emit $2,332 \times 10^3$ kg/yr of particulate, whereas $2,118,000 \times 10^3$ kg (Table 31) are emitted from all sources in the state. Therefore, 0.1% of the particulates in the state are from textile sources.

In Table 31, the percentage value below the mass emission value represents the state's contribution to the national burden of a specific criteria pollutant expressed as a percent of the U.S. total. Using the example in Alabama, the $2,118,000 \times 10^3$ kg of total particulates emitted account for 1.64% of the total mass emission of particulates from all sources in the U.S.

The national listing of criteria pollutants emitted from each textile manufacturing source is shown in Table 32. For each source and each criteria pollutant, the first line represents the annual mass emissions of each pollutant from each source. For example, the source "Breaking and Scutching Flax Fibers" emits 21.4×10^3 kg/yr of particulates in the U.S. The second line represents for each source and criteria pollutant, the percentage that the source represents with respect to all textile sources. For the source "Breaking and Scutching Flax Fibers" the 21.4×10^3 kg/yr of particulates represents 0.0617% of the particulate emissions from all textile sources in the U.S. The third line for this same source shows the percent of emissions from all sources of air emissions. Hence, 21.4×10^3 kg/yr of

particulates from the source "Breaking and Scutching Flax Fibers" represents 0.00002% of the total national particulate emissions.

Approximately 81% of particulates from textile operations are caused by cotton handling activities (carding, combing, preparation, and fabric manufacturing). Particulates from all textile operations account for 0.025% of the national total. Approximately 75% of the mass hydrocarbon loads are generated by the printing of cotton and rayon. Textile hydrocarbon emissions comprise 0.0078% of the national total. Singeing cotton generates the nitrogen oxides, sulfur oxides, and carbon monoxide emissions from textile processes. Pollutants from this operation represent <<0.001% of the national mass emissions.

D. PRIORITIZATION

Preliminary prioritizations were compiled with respect to the source types and SIC Codes shown earlier. The methodology used to generate impact factors for the prioritizations of these location sensitive sources is explained in Reference 4. As previously stated, a source type listing, shown in Table 33, was first used to represent only that data available in the literature from which estimates could be made. The SIC Code listing developed subsequently was found to provide a more comprehensive, logical, and organized basis for prioritizing sources within textile manufacturing. The source types were included under the appropriate SIC Codes shown in Table 34 to obtain the present SIC prioritization (Table 35). Any further investigations of textile manufacturing sources should use SIC Codes as the basis for defining source type.

2297	Nonwoven Fabrics	-
2241	Narrow Fabric Mills	-

Asbestos emitting sources, which are not part of Major Group 22, are contained in the prioritization listing because of the significance of this mineral fiber in the environment.

Cotton textiles represent the top five source types having the greatest potential environmental impact as shown in Table 33. Four of these source types are concerned with the handling of cotton. These operations occur at yarn mills, SIC 2281 (Table 34), and at cotton weaving mills, SIC 221 (Table 34), and account for the top ranking of these two industries in the prioritization listing by SIC Code shown in Table 35. The other source type with an impact factor in the top five in Table 33 is the printing of cotton fabrics. This operation occurs in SIC 221, cotton weaving mills, and in SIC 2261, cotton finishing plants. These two industries are ranked second and third in the SIC Code prioritization listing in Table 35.

SECTION IV

GLOSSARY

AGEING - Process in which fabric is allowed to dry prior to washing.

AMMONIATING - Process in which yarn or fabric is passed through a weak solution of ammonia then through hot water as it is stretched, thus increasing the strength, luster, dimensional stability, and affinity for dyes.

BLEACHING - Process in which all the natural color is removed from yarns and fabric.

BLENDING - Combination of different types of fibers in formation of blended fibers, or mixing together parts of several bales of cotton resulting in greater uniformity.

BRAIDING - A form of fabric construction that is made by interfacing three or more strands of yarn so that each strand passes over and under one or more of the others.

BRUSHING - Process which removes loose, short-cut fibers which have dropped into the nap, and lays the nap in one direction.

BURLING - Process in which snarls, snubs, straws, etc., are removed from the warp threads and the filling threads.

CARBONIZING - The process whereby vegetable matter is chemically removed from wool by means of acids or salts.

CARDING - The initial process used in disentangling and combing out fibers of wool, flax, etc., preparatory to spinning.

COATING - Any finish applied to a tufted carpet or rug to create certain desirable properties.

COMBING - An operation, in addition to carding, in which fibers are straightened and arranged with a high degree of parallelism by the use of fine-tooth combs.

CRABBING - An operation in which fabric is stretched or loosened where necessary and set such that there is no strain on any portion of the fabric. The cloth passes over rollers into hot water or steam, then into cold water, after which it is pressed.

CRIMPING - Process in which straight fibers are made wavy.

CUTTING - Operation in which filament fibers are sheared into staple fiber lengths.

DAMPENING - A process by which goods are wetted. Dampening is one of three operations used in cold-water shrinking.

DESIZING - An operation in which the size is dissolved from woven fabric. (See Slashing)

DRAWING - An operation in which slivers of fibers are doubled and redoubled. The process draws, twists, and winds the stock.

DYEING - A process in which a fiber, yarn, or fabric is impregnated with a dyestuff.

FABRIC - A cloth made by weaving, knitting, or felting fibers.

FELTING - Process by which fibers are pressed, rather than woven, into a compact fabric.

FIBER - A fine threadlike piece, as of cotton, jute or asbestos.

FILAMENT - A single element of a textile fiber (as silk), or mechanically produced fiber (as rayon or nylon).

FRAMING - Stretching of fabrics on a rack structure to apply finishes or treatments, especially tenter framing which dries and evens the fabric width.

FULLING - An important operation in the finishing of wool fabrics which actually operates as a preshrinking process for wool. The fibers are cleaned, scoured, and condensed by a combination of moisture, heat, soap, and pressure.

GARNETTING - A picking and shredding operation by which re-processed and reused wool fibers are obtained by separately reducing the unused and used materials to a fibrous mass.

GILLING - Operation in which yarn is run through comb-like spikes to effect parallelization of the fibers.

GRAY GOODS - A term used to denote fabric which is discolored due to exposure.

GREY GOODS - A term also known as greige goods, used to denote any unfinished fabric as it comes from the loom.

HACKLING - A simple combing process whereby flax fibers are straightened and long staple is separated from the short staple.

KNITTING - Operation by which fabric is formed by looping a continuous yarn.

MERCERIZING - A process in which cotton yarns or fabric is treated with caustic alkali under tension, thus increasing strength, luster, and affinity for dyes.

NEEDLING - The insertion of barbed needles into fiber webs in order to entangle the fibers.

OILING - Treatment of fiber with one of various oils, including animal, vegetable, and mineral, or a blend of these to keep it from becoming brittle and to lubricate it for the spinning operation.

OPENING - Process in which bales of cotton move through an opening machine where the compressed masses of raw fiber are loosened and exposed to the atmosphere.

PICKING - Inserting of filling yarn by means of casting a shuttle from one side of the loom to the other.

PRINTING - Process in which a pattern or design is imprinted on a fabric in one or more colors by using dyes in a paste form or some related means.

ROVING - A strand of loosely assembled fibers, wool, cotton, etc., preparatory to spinning.

SCOURING - A step preparatory to manufacturing in which goods are thoroughly washed in an alkaline solution to remove impurities.

SCUTCHING - Removal of small pieces of bark, called shives, thus releasing flax fiber from the stalk.

SHEARING - An operation in which fabrics are processed through rotating spiral blades to promote an attractive smooth surface to the cloth.

SHORT-STAPLE - A particular length, degree, and fineness of cotton, wool, flax, and other natural fibers.

SINGEING - Rapidly passing gray goods over gas flames to burn off lint and threads as well as all fuzz and fiber ends.

SLASHING - Also known as sizing - an operation in which yarn is coated (for example with starch) to prevent chafing or breaking during the weaving process.

SLIVER - A product of the cotton process, a sliver is a continuous, untwisted strand of cotton fibers.

SOFTENING - Process of applying a finish to the fibers or yarn to improve the "hand" of the fabric.

SORTING - The arranging of wool fleece by color into various piles for processing.

SPINNING - Technique for changing fibrous substances into yarn or thread.

SPOOLING - Operation in which yarn is wound on a spool or cone for use in weaving.

STIFFENING - The application of pressure and steam to saturated batts of wool to harden the fibers through increased interlocking.

TEXTURIZING - The operations which change the surface or shape and texture of filament fibers.

THROWING - Process in which reeled silk is transferred into silk yarn. Throwing is analogous to the spinning process that manufactures cotton, linen, or wool fibers into yarn.

TOW - Short-staple fibers straightened and formed into a sliver for further processing.

TUFTING - Process in which yarn is punched through a ground fabric (backing), used in rug and carpet production.

TWISTING - Combining two or more strands or threads by winding together.

WARPING - Operation in which yarns are placed on a large rack or frame and immersed in a solution.

WASHING - Detergent operation which removes dirt and excess dyes and printing materials from fabric.

WEAVING - Interlacing threads, yarns, strips, fibrous material, etc., in order to form a fabric or texture.

WEB BONDING - Process that applies adhesive to fabric or yarns causing a permanent bond between materials.

WEB FORMATION - The creation of an interlaced network of fibers (including waste) for bonding.

WINDING - Wrapping yarn or thread onto spools, bobbins, or reels.

YARN - Fibers drawn, twisted, and spun together to form the basis to fabrics used in knitting and weaving.

SECTION V
CONVERSION FACTORS¹³

<u>To convert from</u>	<u>to</u>	<u>Multiply by</u>
kilogram (kg)	pound-mass (lb mass avoirdupois)	2.205
kilogram (kg)	ton (short, 2,000 lb mass)	1.102×10^{-3}
kilogram (kg)	metric ton	1.000×10^{-3}
meter (m)	yard	1.094
metric ton	pound	2.205×10^{-3}

<u>Prefix</u>	<u>Symbol</u>	<u>Multiplication factor</u>	<u>Example</u>
kilo	k	10^3	1 kg = 10^3 grams

		13. TYPE OF REPORT AND PERIOD COVERED Task Final; 2/76-1/77			
		14. SPONSORING AGENCY CODE EPA/600/13			
15. SUPPLEMENTARY NOTES IERL-RTP task officer for this report is Max Samfield, Mail Drop 62, 919/541-2547. Earlier reports in this series are also in the EPA-600/2-76-032 series.					
16. ABSTRACT The report gives an overview of air pollution emission levels and a ranking of the public health hazard potential of textile manufacturing operations. The textile industry was defined and categorized by Bureau of the Census Standard Industrial Classification (SIC) Codes. Flow charts of production were developed along with production rates per SIC code. Sources of emissions were defined and emission quantities computed on the basis of an extensive literature survey and engineering analysis. Mass emissions from textile sources were determined on a state-by-state and national basis for criteria pollutants (carbon monoxide, particulate matter, nitrogen oxides, hydrocarbons, and sulfur dioxide). The health hazard potential of each source was quantified through impact factors based on downwind exposure to concentrations of pollutants in relation to hazard factors for those pollutants.
