USER GUIDE TO THE MOLECULAR FORMULA INDEX

The *Molecular Formula Index* lists the molecular formulas for all substances appearing on the Initial Inventory with molecular formulas. Where two or more substances share the same molecular formula, their preferred names are ordered alphabetically by the principles described in the *User Guide to the Substance Name Index*. Each name is accompanied by a CAS Registry Number.

Element symbols in the molecular formulas are arranged according to the Hill system. (Refer to the section entitled "Elements of Identification," which appears in the introduction to Volume I of the Initial Inventory.) The resulting complete molecular formulas are arranged in alphabetical order in the *Molecular Formula Index*, with each chemical element and its particular numerical suffix being considered a separate unit. Thus, H_4 is ordered before H_6, and all formulas beginning with CH appear ahead of all those beginning with CH_2.

EXAMPLE:

$Al_2Ca_3O_{12}$
CCl_4
$CHCl_3$
$CHNO$
CH_4O
CH_3Cl
CO
C_2Ca
$C_2H_4O_3$
$C_2H_4AlBr_3$
CaO_3Ti
H_4Sn

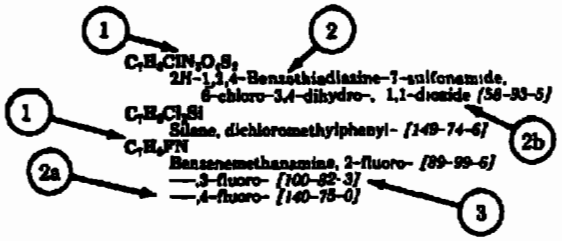
Copolymers derived from only Class 1 monomers appear in the *Molecular Formula Index* at the molecular formulas for each of the component monomers. Thus, the copolymer derived from acrylonitrile, butadiene and styrene would be found at the molecular formulas C_3H_3N, C_4H_6 and C_8H_8.

Salts and molecular addition compounds are represented in the *Molecular Formula Index* by the molecular formula for only one of their components, rather than by a summation formula which includes all the components. The molecular formula chosen to represent a substance of this type is the formula of the component whose name is selected as the principal heading for the substance in the CA Chemical Substance Index[1]. For example, the morpholine salt of hydroxyacetic acid would be found in the *Molecular Formula Index* only at the molecular formula of its principal component, hydroxyacetic acid ($C_2H_4O_3$).

In general, metal salts of acids appear at the molecular formulas of the acids; salts of organic bases with inorganic acids or common organic acids appear at the molecular formulas of the bases; molecular addition compounds appear at the molecular formula of the component chosen to receive the principal index name for the substance by the nomenclature policies used for CA indexes.

Thus, a user of the *Molecular Formula Index* who wishes to find an entry for a salt or molecular addition compound is advised to consult entries at the molecular formulas for each of the components before concluding that the substance is not cited in the *Molecular Formula Index*.

ILLUSTRATIVE KEY TO ENTRIES AS THEY APPEAR IN THE MOLECULAR FORMULA INDEX



1. The molecular formula is the heading and appears in boldface type.
2. The substance names(s) appear in lightface type, arranged in alphabetic order below the heading. When the name or entry is not completed on one line, the second and subsequent lines are indented. A long dash (2a) replaces the heading parent name when it is repeated. When a modification phrase (2b) is required to complete the substance description, it is half-indented under the parent substance name.
3. The CAS Registry Number appears in lightface italic type, enclosed in brackets.

[1]Information regarding CA Index name selection principles and order of precedence of compounds may be found in the Chemical Abstracts 1977 Index Guide, Appendix IV, Paragraphs 105 and 106.
