National Listing of Fish and Wildlife Consumption Advisories

The National Listing of Fish and Wildlife Consumption Advisories (NLFWCA) is distributed as a Microsoft Windows® program that includes a wide range of reporting and mapping capabilities. Some of these capabilities include:

A flexible search and query system. You can select advisories by any combination of State, EPA Region, Pollutant, Species, Population Affected, and Status (active or rescinded). An example would be "all active mercury advisories in the U.S."

A wide range of reports, listing all advisories or just the advisories that meet your search criteria. These reports include a summary report and reports of the percentage of each State's waterbodies affected by fish consumption advisories and the relative increase or decrease in numbers and the size of advisories by State. A report listing the general method, contact, and phone number by State is also included.

On-screen maps showing the traces or counts of all advisories or your selected advisories. These maps can be produced on a National, EPA Regional, or State-wide basis. You can "zoom" down to particular areas, "click" on individual advisories to get detailed information, and even overlay different searches in color. The maps can be printed, with your own titles. You can set up several maps, and then move back and forth between them in one session.

Installation

The NLFWCA requires a PC running Microsoft Windows 3.0 or later, a minimum of 4 MB of RAM, and approximately 25 MB of disk space.

To Install the Program under Windows 3.0, 3.1, or NT (from floppy diskettes):

1. Place the diskette labeled Disk1-Setup in drive A: (or B:).
2. Start Microsoft Windows.
3. In the Program Manager, click on file, and then Run.
4. Type "A:setup" (or "B:setup") without the quotes, in the command box.
5. Click the OK button.
6. Follow the instructions on the screen.

To install under Windows 95:

1. Click the Start button, then Run.
2. Type a:setup in the Open edit box, and then click OK.
3. Follow the instructions on the screen.

Once the installation process is complete, you are ready to run the program:

1. Start Microsoft Windows 3.11 or earlier (not necessary in Windows 95).
2. Double click on the NLFWCA icon (select from Start/Programs in Windows 95).
3. That's it! You are now in the NLFWCA.

Uninstalling the 1994 NLFWCA

The 1994 NLFWCA can be uninstalled if you no longer wish to use it. If you have installed it in the directory \FAMAP, issue the commands `cd\`, and then `DEL TREE\FAMAP`, from the DOS prompt.

Printer Hints

The NLFWCA uses the Windows printer drivers for printing maps and reports. The maps can be printed in color if you have a color printer set up in your Windows Print Manager. You may also select map orientation using the Print Manager.

Quick Tutorial

To get a feel for the NLFWCA, try the following sequence. We will examine active (as of December, 1995) Mercury advisories in the U.S. The results of this quick tutorial will be maps showing the location of Mercury advisories and counts of Mercury advisories by State, and a full report of the associated data.

Step 1: Querying

On the main menu, click **Search**, and then **by Parameter**. This brings up all of the search criteria available. Under **Select Pollutant**, use the scroll bars to locate "Mercury". Click **Mercury** with the left mouse button. Mercury should now be highlighted. (By default, only active Mercury advisories will be selected. Click **Rescinded** in the Status box to override.) At the bottom of the window; click the **View Data** button. The first 250 records for all active mercury advisories in the U.S will appear in spreadsheet format. Scroll through the list, both up and down and sideways to see the available information. Then click **More** to see additional data. **Close** this window to return to the Search window.

Step 2: Reporting

Leave Mercury highlighted in the **Select Pollutant** box. Now Click the **Reports** button. The buttons will change to show all of the types of available reports. Click the **Full Advisory Report** button; the full report for Mercury advisories will now be on the screen. The directional buttons let you move back and forth through the report, view the full page (by clicking the "Magnifying glass" icon), and send the report to the printer. **Close** the report window. You may want to limit records to a particular state. In the Search window, click on a state of interest and then the **Reports** and **Full** buttons to view. **Close** the report window.

Step 3: Map of Advisories

With the Select window still open, make sure that Mercury is still highlighted. Now, click on the **Map Advisories** button. This action will close the Select window, and prepare the system for mapping the selected Mercury advisories.

Since Mercury advisories span the entire U.S., the U.S. map will appear with the selected advisories, in red (by default). At this point, you may choose to display information about each advisory, one at a time, by clicking on the trace of your choice. You may also scroll through the advisories in alphabetical order using the arrow icons on the speedbar.

Step 4: Map Overlays

At this point, you may wish to add, say, PCB advisories to your map of Mercury advisories. You can do this by selecting **Search/by Parameter** option from the main menu again, and highlighting PCBs from the Pollutant list. Now click the **Map Overlay** button. Then select **Options/Colors/ Selected Advisories** from the menu and change the color from red to green (or any available color other than red). Finally, click the **Pencil** icon on the speedbar. This will map the nationwide PCB advisories, in green, on top of your Mercury advisories. Note that any Mercury and PCB advisories that overlap will be green.

Step 5: Map of Advisory Counts

Now we will make a map showing counts of active Mercury advisories by State. Select **Search/by Parameter** from the main menu. Highlight Mercury from the pollutant list as before. Click on the **Map Counts** button, and a new map showing counts by State will now be drawn. You can move back and forth between your maps by selecting **Window**, then the name of the window to view.

This completes our brief tutorial. To exit the NLFWCA, select **File/Exit**, or double click the "slash" in the upper left corner of the window button (the NLFWCA icon in the upper left corner or the X icon in the upper right corner in Windows 95).

Main Menu

The NLFWCA follows standard Windows protocols for user interfaces. The entire system is run using mouse "point and click" options.

- File** has one option, **Exit**. Exit will immediately end your NLFWCA session.
- Search** opens the mapping and reporting capabilities of the NLFWCA. There are two options: **Search by Parameter** and **by Advisory Name**. For example, if you want to examine Mercury advisories nationwide, select **Search/by Advisory**. When the Search window appears, go down the Pollutant list and Click on "Mercury". Your selection is highlighted on the screen. To deselect something, just click on it again. You can click on more than one item in a list. For instance you may want to group the pollutants "DDD", "DDE", and "DDT" in one query; simply click on all three pollutants. If you do not click anything, the query will return all advisories. You may also select parameters in any combination from the other lists. Click on **View Data** to display all advisories meeting your criteria. **Map Advisories** prepares a map of selected advisories in red by default. **Map Counts** will show the number of advisories meeting the criteria by State. **Overlay Map** is useful when you want to show the results of more than one query on a map, such as Mercury and PCB advisories nationwide.

The **Reports** button provides tabular access to your data, based on your selected parameters. When you select a report, it will be displayed on screen to view. You can print it by selecting the printer icon. By **Advisory**, the other **Search** menu option, displays an alphabetical, incrementally searchable list of all advisories. You can search through this list by typing the first few characters of the advisory name. After selecting advisories, you can view the data or map them.

- Options** controls the map display, including the type of map to display (advisory traces or counts). You can choose to **Draw All** or just the **Selected** advisories, display latitude/longitude coordinates, **Overlay Cities** on the map, what **Colors** to use on the maps, and whether or not to display the **status bar** at the bottom of the screen. Simply point and click on your desired choices.
- Maps** generates color maps on the screen. You can select the entire U.S., an EPA Region, or a specific State map. These maps will include **all** of the advisories for the selected geographical unit. **Search** can then be used to overlay selected advisories on these maps if you desire. The **Options** settings control what initially displays on the map. The map window consists of a viewing area and a speedbar. On the map area, the left mouse button can be used to select an individual advisory; you may have to try a couple of times to get the mouse right on the advisory, especially for smaller traces. When you have successfully clicked the advisory, the data for that advisory will appear. The right mouse button places a “zoom” box on the screen, centered on the mouse cursor. There is a set of speedbar buttons at the bottom of the map. These buttons can be used to **Zoom in**, **Zoom out**, **Zoom out to top level**, **Zoom box smaller**, **Zoom box larger**, **Next**, **Previous advisory**, **Note selection criteria**, **Print** the map, **Draw** advisories, and **Close** the map window. Note that the “zoom” features will not work if there is more than one map window in your NLFWCA session.
- Window** is used when you have more than one map open in a session. You can select which map to view when more than one map has been created by selecting its name from the drop down menu. You can also choose to **Tile**, **Cascade**, or **Arrange Icons** for your maps.
- Help** is available from the menu, and is also context-sensitive. This means that you can get help from wherever you are in the program by pressing F1, and the help will be related to your current activity! The Help menu is divided into **Contents**, **Search for Help On**, which displays an incrementally searchable list of keywords, **Help on Help**, which provides help for whatever Windows version is installed on your machine, and **About the NLFWCA**, which provides brief information on the system, including points of contact, available system resources remaining, the EXE file creation date, and the version number of the program.
