## Exhaust Emission Factors for Nonroad Engine Modeling: Spark-Ignition

# Exhaust Emission Factors for Nonroad Engine Modeling: Spark-Ignition NR-010e 

Assessment and Standards Division<br>Office of Transportation and Air Quality<br>U.S. Environmental Protection Agency

## NOTICE

This technical report does not necessarily represent final EPA decisions or positions. It is intended to present technical analysis of issues using data that are currently available.

The purpose in the release of such reports is to facilitate the exchange of technical information and to inform the public of technical developments which may form the basis for a final EPA decision, position, or regulatory action.

## Purpose

This report describes and documents exhaust emission factors, crankcase estimates, and brake specific fuel consumption (BSFC) estimates used for spark ignition (SI) engines in EPA's final NONROAD2005 emission inventory model. It covers engines powered by gasoline, natural gas and liquefied petroleum gas.

Additional EPA reports describe other issues relating to emission factors including NONROAD evaporative emission rates (NR-012c), refueling emissions (NR-013b), adjustments to emission rates due to variations in fuel and temperature (NR-001c), speciation of hydrocarbon emissions (NR-002c), and adjustments to emission rates as equipment deteriorates due to time and use (NR-011c). Emission factors for compression ignition (diesel) engines are covered in a separate report (NR-009c).

## Introduction

The U.S. EPA's NONROAD model computes county-level emission inventories for nonroad engines. These calculations rely on emission factors -- estimates of the amount of pollution emitted by a particular type of equipment during a unit of use. Typically emission factors for nonroad sources are reported in grams per horsepower-hour (g/hp-hr), but they also may be reported in grams per mile ( $\mathrm{g} / \mathrm{mile}$ ), grams per hour, grams per gallon, etc. The SI exhaust emission factors in the NONROAD model are reported in $\mathrm{g} / \mathrm{hp}-\mathrm{hr}$, with the exception of nonroad motorcycles and all-terrain vehicles, which are reported in $\mathrm{g} / \mathrm{mile}$. The SI BSFCs are reported in lb/hp-hr, with the exception of nonroad motorcycles and all-terrain vehicles, which are reported in lb/mile.

The pollutants covered by this report include exhaust total hydrocarbons (HC), carbon monoxide $(\mathrm{CO})$, oxides of nitrogen $\left(\mathrm{NO}_{\mathrm{x}}\right)$, total particulate matter $(\mathrm{PM})$, carbon dioxide $\left(\mathrm{CO}_{2}\right)$, and sulfur dioxide $\left(\mathrm{SO}_{2}\right)$. For nonroad engines, all PM emissions are assumed to be smaller than 10 microns (PM10), and $92 \%$ of the PM from gasoline fueled engines is assumed to be smaller than 2.5 microns (PM2.5). For gaseous fueled engines (LPG/CNG), 100\% of the PM emissions are assumed to be smaller than PM2.5. The NONROAD Reporting Utility allows the user to select the desired size range.

Zero-mile, steady-state emission factors for $\mathrm{HC}, \mathrm{CO}, \mathrm{NO}_{x}, \mathrm{PM}$, and steady-state BSFCs are discussed first, followed by adjustments (where applicable) to account for transient operation. Technology distributions by model year, to account for changes in emission factors over time, are then discussed. Derivation of $\mathrm{CO}_{2}$ and $\mathrm{SO}_{2}$ emission factors follows. Crankcase emissions are then discussed.

As explained in NR-006c, spark-ignition engine equipment population under 25 horsepower will be combined into one source classification code (SCC) per application to handle expected shifts in market share between 2 and 4 -stroke gasoline, LPG, and CNG engines. In the model, the distinction between two- and four-stroke spark-ignition engine emission factors will be maintained using the technology groups described in this report. In this current document, the

SCC distinction between 2 and 4-stroke gasoline, LPG, and CNG engines is maintained; however, in the model, we will distinguish emission factors between them by using the technology group methodology.

## Background

Prior to the NONROAD model, there have been three major efforts to estimate nonroad spark ignition emission inventories. We have reviewed these efforts in our work to select emission factors for the final version of NONROAD. The three inventories/models are:

- EPA's Nonroad Engine and Vehicle Emission Study ("NEVES").[1] Published in November, 1991, this study was mandated by Congress to determine whether nonroad sources made a significant contribution to urban air pollution. The study covers emissions from all nonroad engines and includes hydrocarbons ( HC ), carbon monoxide $(\mathrm{CO})$, nitrogen oxides $\left(\mathrm{NO}_{\mathrm{x}}\right)$, total particulates $(\mathrm{PM})$, sulfur dioxide $\left(\mathrm{SO}_{2}\right)$ and other pollutants. It provides inventories for 19 ozone and 16 CO nonattainment areas.
- California Air Resources Board's nonroad model ("OFF-ROAD") [2], designed to estimate nonroad emissions for the state of California only. A draft version of this model was released August 1, 1997. The model covers HC, $\mathrm{CO}, \mathrm{NO}_{\mathrm{x}}$, PM , sulfur dioxide ( $\mathrm{SO}_{2}$ ), and carbon dioxide $\left(\mathrm{CO}_{2}\right)$ for all nonroad engines. ARB periodically revises components of the OFF-ROAD model.
- EPA's "Small Engine Model"--designed as an internal tool for evaluating various control scenarios, EPA has used this model to estimate the effect of regulations on small sparkignition (SI) engines under 19 kW ( 25 hp ). This model has evolved over time, but the pre-control exhaust emission factors have not changed since the model was documented in 1995.[3] The model computes national-level inventories of nonroad HC, CO, and $\mathrm{NO}_{\mathrm{x}}$.

The emission factors used in these prior efforts have been based on a very small number of engine studies, particularly when compared to the large body of data available for highway vehicles.

## Emission Factor Categories

NEVES defines emission factors by the equipment use (i.e., by "application") but does not assign different emission factors to engines of different sizes within the same application. On the other hand, OFF-ROAD and the Small Engine Model define emission factors by engine size (by horsepower in OFF-ROAD and by displacement in the Small Engine Model), but do not assign different emission factors to engines used in different applications that are of the same size. Given the structure of emission control regulations and the design similarities between engines of the same horsepower used in various applications, we define emission factors primarily by power level in final NONROAD2005. Appendix A provides a comparison of the power categories in OFF-ROAD, the Small Engine Model, and NONROAD. The NONROAD
model allows for the use of application-specific emission factors if there is sufficient information to justify their use. We use application-based emission factor categories only to distinguish recreational marine engines and selected recreational vehicles.

## Emission Standards

In addition to estimating emissions from pre-controlled engines, the NONROAD model is designed to account for the effect of federal emissions standards. The model does not cover California emission standards and federal standards that are not yet final. Thus, NONROAD will include emission factors under the following final regulations that cover SI engines at or below 19 kilowatts ( 25 hp ) and SI marine engines:

- Emissions for New Nonroad Spark Ignition Engines at or below 19 Kilowatts. ("Small Engine Rule, Phase 1") [4]
- Phase 2: Emission Standards for New Nonroad Nonhandheld Spark-Ignition Engines At or Below 19 Kilowatts. ("Small Engine Nonhandheld Rule, Phase 2") [5]
- Phase 2: Emission Standards for New Nonroad Spark-Ignition Handheld Engines At or Below 19 Kilowatts and Minor Amendments to Emission Requirements Applicable to Small Spark-Ignition Engines and Marine Spark-Ignition Engines. ("Small Engine Handheld Rule, Phase 2") [6]
- Final Rule for New Gasoline Spark-Ignition Marine Engines; Exemptions for New Nonroad Compression-Ignition engines at or Above 37 Kilowatts and New Nonroad Spark-Ignition Engines at or Below 19 Kilowatts ("Marine Rule") [7]
- Control of Emissions From Nonroad Large Spark-Ignition Engines and Recreational Engines (Marine and Land-Based); Final Rule [8]

For final NONROAD2005, there have also been additional revisions to inputs for SI recreational marine engines to account for more recent information available since the regulations were issued. These revisions are described in the following memorandum:

- "Updates to Technology Mix, Emissions Factors, Deterioration Rates, Power Distribution, and Fuel Consumption Estimates for SI Marine Engines in the NONROAD Emissions Inventory Model," Memo from Mike Samulski to Docket OAR-2004-0008, November 30, 2005. [9]

## Zero-Hour, Steady-State Emission Factors for HC, CO, NO $\mathbf{x}, \mathbf{P M}$, and Steady-State BSFCs

This section describes the zero-hour, steady-state emission factors and steady-state BSFCs that are used in final NONROAD2005. Pre-controlled (baseline) and controlled (where applicable) emission factors are described for each of the following regulatory equipment
categories: small SI engines $\leq 25 \mathrm{hp}$, large SI engines $>25 \mathrm{hp}$, land-based recreational engines, and recreational marine engines.

## Spark-Ignition (SI) Engines $\leq 25 \mathrm{hp}$

This category includes all engines $\leq 25 \mathrm{hp}$ except those used for recreational applications (such as motorcycles or snowmobiles), for marine propulsion, or for toy boats and airplanes. The engines in this category are used primarily in lawn and garden equipment.

For this category, engines are segregated by the class of the engine (I-V). Each class is determined by the use of the engine, i.e., handheld or nonhandheld, and engine displacement. Classes I and II refer to nonhandheld small SI engines; classes III, IV, and V refer to handheld small SI engines. The classes have the following displacements: Class I ( $<225 \mathrm{cc}$ ); Class II ( $\geq$ 225 cc ); Class III ( $<20 \mathrm{cc}$ ); Class IV ( $\geq 20 \mathrm{cc}$ and $<50 \mathrm{cc}$ ); Class V ( $\geq 50 \mathrm{cc}$ ).

Each class in turn is subject to two phases of regulation (Phase 1 and Phase 2). Under the Phase 1 regulations, new engines have had to meet emission standards for $\mathrm{HC}, \mathrm{CO}$, and $\mathrm{NO}_{\mathrm{x}}$ since 1997. For nonhandheld applications (such as lawn and garden tractors and lawnmowers), more stringent Phase 2 standards phase in between 2001 and 2007. For handheld applications (such as leaf blowers and chainsaws), more stringent Phase 2 standards phase in between 2002 and 2007. The test procedure used for these regulations is the Small SI Engine Federal SteadyState Test Procedure.

Tables 1-5 contain the baseline and Phase 1 and 2 controlled emission factors for these five classes of engines. There are no LPG or CNG engines less than 25 hp in final NONROAD2005; therefore, the emission factors in these tables are used for gasoline engines in the model.

In order to account for the effect of the rulemaking and the phase-in of the new standards, engines meeting the new standards were defined by the technology types in Tables 1-5. (A complete list and description of SI technology types used in final NONROAD2005 is provided in Appendix B, Table B3.) Handheld engines (Classes III-V) are not expected to include any 4stroke engines (but emission factors are supplied for users) but are expected to include a small fraction of catalyst equipped engines. Nonhandheld engines include both 2 and 4 -stroke engines, but manufacturers are expected to build only 4 -stroke engines with the advent of the new regulations. Nonhandheld 4-stroke engine production is split between two technical types, sidevalve and overhead valve systems, which have been shown to exhibit significantly different emission characteristics.

In general, for baseline emissions, NONROAD uses emission factors based on those in the Small Engine Model. [3] Also, the PM emission factors for the entire category (both baseline and controlled) are based on values in NEVES. [1]

For nonhandheld (class I and II) engines, NONROAD uses the brake-specific fuel consumption (BSFC), $\mathrm{HC}, \mathrm{CO}$, and $\mathrm{NO}_{\mathrm{x}}$ emission factors for Phase 1 and 2 that are contained in
the final regulatory impact analysis. [10] (The baseline emission factors are also contained in this reference.) The Phase 1 emission factors were based on values obtained from the EPA 1998 Phase 1 Certification database. For Phase 2, the emission factors were back-calculated using 1) the Phase 2 standards, and 2) a multiplicative deterioration factor for each pollutant. The deterioration factors are described in more detail in NR-011c.

For handheld (class III, IV, and V) engines, NONROAD also uses the BSFC, HC, CO, and $\mathrm{NO}_{\mathrm{x}}$ emission factors for Phase 1 and 2 that are contained in the final regulatory impact analysis. [11] (The baseline emission factors are also contained in this reference.) For Phase 1, the emission factors were back-calculated using 1) the Phase 1 standards, and 2) a multiplicative deterioration factor for each pollutant. For Phase 2, the emission factors were determined using the same methodology. As mentioned above, the deterioration factors are described in more detail in NR-011c.

Table 1. Emissions and BSFCs for Class III Handheld Small SI Engines (<20cc)*

| Engine Tech Type | HC <br> g/hp-hr | CO <br> g/hp-hr | $\mathbf{N O} \mathbf{x}_{\mathbf{x}}$ <br> g/hp-hr | PM <br> $\mathbf{g / h p}-h r$ | $\mathbf{B S F C}$ <br> $\mathbf{l b / h p}-\mathbf{h r}$ |

* Assigned NONROAD hp range: 6-25 hp

## Spark-Ignition Engines > 25 hp

Nonroad SI engines above 25 hp are generally found in industrial equipment and are used in a wide variety of applications, including forklifts, airport ground-service equipment, terminal tractors, generators, compressors, welders, aerial lifts, and ice grooming machines. These
engines may operate on gasoline, LPG, or CNG. Emission standards for SI engines $>25 \mathrm{hp}$ have recently been finalized. [9] Both uncontrolled and Phase 1 and 2 controlled emission factors are included in NONROAD2005.

Summaries of the precontrolled, Phase 1 controlled, and Phase 2 controlled emission factors used for this equipment category are provided in Tables 6 through 8. Emission factors for the gasoline 4 -stroke, LPG, and CNG engines were taken from the regulatory support document for the final rule, and are based on a summary of available test data. [12]

Table 6. Emission Factors and BSFCs for Spark-Ignition Engines > 25 HP

| Engine Tech Type | HC <br> g/hp-hr | $\begin{gathered} \text { CO } \\ \text { g/hp-hr } \end{gathered}$ | $\begin{aligned} & \mathbf{N O}_{\mathbf{x}} \\ & \text { g/hp-hr } \end{aligned}$ | $\begin{gathered} \text { PM } \\ \text { g/hp-hr } \end{gathered}$ | BSFC <br> lb/hp-hr |

| LGT252 (LPG) | 0.10 | 3.92 | 0.85 | 0.05 | 0.406 |
| NGT252 (CNG) | 1.57 | 3.92 | 0.89 | 0.05 | 0.406 |

## Motorcycles, All-Terrain Vehicles (ATVs), and Snowmobiles

These engines differ significantly from other SI engines in their basic design, operating characteristics, and emission rates. Emission standards have recently been finalized for these engines. [8]

A summary of the emission factors for these engines is provided in Table 7. The HC, CO , and $\mathrm{NO}_{\mathrm{x}}$ emission data for ATVs and motorcycles were provided by a manufacturer and represent various makes, models, model years, and engine sizes. The emission factors for ATVs and motorcycles are expressed as gram/mile ( $\mathrm{lb} / \mathrm{mile}$ for BSFC). The HC, CO , and $\mathrm{NO}_{\mathrm{x}}$ test data used for snowmobiles came from the International Snowmobile Manufacturers Association (ISMA) and Southwest Research Institute (SwRI). The emission factors for snowmobiles are
expressed as gram/hp-hr (lb/hp-hr for BSFC). The emission factors are documented in regulatory support documents for the final rule. [12,13]

Table 7. Emission Factors and BSFCs for Offroad Motorcycles, ATVs, and Snowmobiles

| Equipment/Tech Type | HC g/mile | $\begin{gathered} \text { CO } \\ \text { g/mile } \end{gathered}$ | $\mathbf{N O}_{\mathbf{x}}$ $\mathrm{g} / \mathrm{mile}$ | $\begin{gathered} \text { PM } \\ \text { g/mile } \end{gathered}$ | BSFC <br> lb/mile |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Precontrol 2-stroke offroad motorcycles (R12S) | 55.70 | 54.10 | 0.150 | 2.10 | $\begin{gathered} 0.268 \\ 0.201 * \end{gathered}$ |
| Precontrol 4-stroke offroad motorcycles (R14S) | 2.40 | 48.50 | 0.410 | 0.06 | 0.158 |
| Phase 14 -stroke offroad motorcycles (R14S1) | 2.10 | 30.60 | 0.340 | 0.06 | 0.158 |
| 2-stroke all terrain vehicles (R12S) | 53.90 | 54.10 | 0.150 | 2.10 | $\begin{gathered} 0.213 \\ 0.160^{*} \end{gathered}$ |
| 4-stroke all terrain vehicles (R14S) | 2.40 | 48.50 | 0.410 | 0.06 | 0.167 |
| Phase 14 -stroke all terrain vehicles (R14S1) | 1.60 | 30.60 | 0.260 | 0.06 | 0.167 |
|  | HC g/hp-hr | CO <br> g/hp-hr | $\mathrm{NO}_{\mathrm{x}}$ g/hp-hr | $\begin{gathered} \text { PM } \\ \text { g/hp-hr } \end{gathered}$ | BSFC <br> lb/hp-hr |
| Precontrol 2-stroke snowmobiles (R12S) | 111.0 | 296.0 | 0.86 | 2.70 | 1.660 |
| Modified 2-stroke snowmobiles (R12S1) | 53.70 | 146.9 | 0.86 | 2.70 | 1.660 |
| Direct Injection 2-stroke snowmobiles (R12S2) | 21.80 | 90.0 | 2.80 | 0.57 | 1.245 |
| 4-stroke snowmobiles (R14S) | 7.80 | 123.0 | 9.20 | 0.15 | 1.245 |

* The standards for off-road motorcycle and ATV recreational engines allow the engine manufacturers to meet the controlled 4stroke engine standard with a 2 -stroke engine. If a manufacturer succeeds in meeting the 4 -stroke controlled standard with a twostroke engine, this is the estimate of what the BSFC for the controlled 2-stroke engine would be.

## Recreational SI Marine Engines

Recreational SI marine engines are divided into three categories: outboard, personal watercraft (PWC), and sterndrive/inboard (SD/I) engines. For outboard and PWC, final NONROAD2005 contains updated emission factors developed using certification data from eight model years (1998-2005). In addition, updated fuel consumption estimates were developed based on test data. [9]

Emission factors ( $\mathrm{HC}, \mathrm{CO}$, and $\mathrm{NO}_{\mathrm{x}}$ ) for $\mathrm{SD} / \mathrm{I}$ engines have not changed since draft NONROAD2004. They were taken from work accomplished in support of the 1996 rulemaking for new emission standards for these engines, as well as newer information and analysis related to SD/I engines. [14,15] BSFCs and PM emission factors were derived from NEVES. [1] Table 8 shows how the power level ranges used in the 1996 rulemaking analysis were matched to the power levels used in NONROAD.

Table 8. Mapping of Recreational Marine Engine Power Ranges

|  | EPA-RIA | NONROAD Model |
| :---: | :---: | :---: |
| Outboard | <3.9 hp | 0-3 hp |
|  | 3.9-9.9 | 3-11 |
|  | 9.9-29.9 | 11-25 |

To determine the effect of the Federal rulemaking for these types of engines, technical types were defined to reflect new technologies that would be employed to meet the emission levels required. ${ }^{1}$ These new technologies would be employed to various degrees to reflect the phase-in of the new emission standards. Technical types were defined to incorporate the emission reductions expected and the phase-in of the standards. For final NONROAD2005, the list of technology classes was changed using information in the certification database to better reflect actual production. Table 9 presents a comparison of the NONROAD2004 and NONROAD2005 technology designations for recreational SI marine engines.

The updated designations are comprised of 4-5 characters. The first character is " M " for marine. The second character is either "O", "P" or "S" for outboard, personal watercraft, or sterndrive/inboard. The third character refers to the cycle (2 or 4-stroke), and the fourth character refers to the fuel system ("C" for carbureted, " I " for indirect injection, and "D" for direct injection). The final character denotes aftertreatment with an "A." For two-stroke engines, "indirect injection" refers to any fuel injection that is not directly injected into the cylinder (such

[^2]as throttle body fuel injection). For four-stroke engines, "direct injection" includes port fuel injection.

Table 9. Marine Engine Technology Class and Designations

| Technology Class Differentiation |  |  |  | Class Designation |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

In NONROAD, the technology types for SD/I engines are MS4C for carbureted engines and MS4D for direct injection engines. Table 13 presents the emission factors and fuel consumption estimates for SD/I engines.

Table 13. Emissions and Fuel Consumption for Inboard Engines (MS4C and MS4D tech types)*

| Tech Type | $\underset{\text { g/hp-hr }}{\text { HC }}$ | $\begin{gathered} \text { CO } \\ \text { g/hp-hr } \end{gathered}$ | $\underset{\text { g/hp-hr }}{\mathbf{N O}_{\mathbf{x}}}$ | $\underset{\text { g/hp-hr }}{\text { PM }}$ | $\begin{gathered} \text { BSFC } \\ \text { lb/hp-hr } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| MS4C | 5.88 | 153.8 | 5.35 | 0.06 | 0.657 |
| MS4D | 3.02 | 71.8 | 8.48 | 0.06 | 0.567 |

* These rates apply to all hp bins.

## Accounting for In-Use Operation

Many nonroad engines operate under transient loads, but the engines are typically tested with steady-state tests. For small SI engines ( $\leq 25 \mathrm{hp}$ ), three studies have compared transient and steady-state emissions in SI engines, but they have not found consistent results and, in most cases, transient and steady-state have produced equivalent emission factors. [16,17,18] At present, EPA believes there is not sufficient information to justify an in-use transient adjustment factor (TAF) for small SI engines, so the NONROAD model will use emission factors based on unadjusted steady-state test results. Similarly, TAFs are not applied to the zero hour, steady-state emission factors for recreational equipment and SI marine engines.

For large SI engines $>25 \mathrm{hp}$, based on emission measurements from highway engines comparable to uncontrolled large SI engines, transient emission levels are 30 percent higher for HC and 45 percent higher for CO relative to steady-state measurements. [12, 19] The

NONROAD model therefore multiplies steady-state emission factors for SI engines $>25 \mathrm{hp}$ by a TAF of 1.3 for HC and 1.45 for CO to estimate emission levels during normal, transient operation. Test data do not support adjusting $\mathrm{NO}_{\mathrm{x}}$ emission levels for transient operation and so a TAF of 1.0 is used for $\mathrm{NO}_{\mathrm{x}}$ emissions. Also, the model applies no TAFs for generators, pumps, or compressors, since engines in these applications are less likely to experience transient operation. A summary of the TAFs used for large SI engines $>25 \mathrm{hp}$ is provided in Table 20.

Table 20. Transient Adjustment Factors (TAFs) for Spark-Ignition Engines >25 hp

| Tech Types | HC g/hp-hr | $\begin{gathered} \text { CO } \\ \text { g/hp-hr } \end{gathered}$ | $\begin{gathered} \mathrm{NO}_{\mathbf{x}} \\ \mathrm{g} / \mathrm{hp}-\mathrm{hr} \end{gathered}$ | $\begin{gathered} \text { PM } \\ \text { g/hp-hr } \end{gathered}$ | BSFC <br> lb/hp-hr |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Pre-control TAFs |  |  |  |  |  |
| Gasoline | 1.3 | 1.45 | 1.0 | 1.0 | 1.0 |
| LPG | 1.3 | 1.45 | 1.0 | 1.0 | 1.0 |
| CNG | 1.3 | 1.45 | 1.0 | 1.0 | 1.0 |
| Phase 1 Control TAFs |  |  |  |  |  |
| Gasoline | 1.7 | 1.7 | 1.4 | 1.0 | 1.0 |
| LPG | 2.9 | 1.45 | 1.5 | 1.0 | 1.0 |
| CNG | 2.9 | 1.45 | 1.5 | 1.0 | 1.0 |
| Phase 2 Control TAFs |  |  |  |  |  |
| Gasoline | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 |
| LPG | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 |
| CNG | 1.0 | 1.0 | 1.0 | 1.0 | 1.0 |

TAFs are applied to gasoline 2-stroke (G2GT25), gasoline 4-stroke (G4GT25), LPG (LGT25), and CNG (NGT25) engines. TAFs are not applied to generator sets, pumps, or air compressors, as these are less likely to experience transient operation.

## Technology Distributions

NONROAD accounts for changes in sales fractions and emissions from the advent of emission standards or other changes by assigning technology groups to each Source Classification Code (SCC). Each technology group has its own emission factors as described above, and the fraction of the population assigned to each group can change over time. These "technology fractions" by year are contained in an input file in NONROAD called tech.dat.

The regulations previously discussed for small SI and SI recreational marine engines are expected to influence the sales fraction of various technology types and the emission rates of those technologies. These anticipated changes are described in the regulatory support documents
for the rulemakings and were used directly in NONROAD2004. For NONROAD2005, the technology mixes for recreational SI marine have been updated, as described below. [9]

The outboard and PWC exhaust emission standards are phased in over nine years from 1998-2006. For model years before 1998, no changes were made to the technology mix for NONROAD2005. The technology mix for model years 1998-2005 was revised, however, using the certification data. For the 2006 model year, the technology mix was extrapolated based on the trend in technology development observed in the previous years for each power bin. For the 2007 and later model years, the 2006 technology mix is assumed to remain constant because this is the final year of the standards phase-in.

The SD/I technology fractions in NONROAD2004 were developed based on information available in 2000. At that time, about half of new SD/I sales were estimated by industry to use electronic fuel injection. Industry projections were that most, if not all, SD/I engines would be fuel injected by 2004.

For SD/I engines, we do not have an EPA certification database because there are currently no federal exhaust emission standards in place for these engines. However, the first Tier of California exhaust emission standards for SD/I engines began in 2003. Six SD/I manufacturers certified in California for 2003. We estimate that these six manufacturers make up more than 90 percent of the total national SD/I engine sales. Therefore, we believe it is reasonable to use the California data to estimate the SD/I technology mix for 2003.

The California certification database shows that about $40 \%$ of the engines certified in 2003 are still equipped with carburetors. Based on this information, we have updated the technology mix for SD/I engines to reflect this slower introduction of electronic fuel injection.

The technology fractions by SCC in tech.dat are provided in Appendix B.

## Carbon Dioxide Emission Factors

Emission factors for $\mathrm{CO}_{2}$ are rarely measured; instead, they typically are calculated based on brake-specific fuel consumption (BSFC). The NONROAD model uses BSFC to compute $\mathrm{CO}_{2}$ emissions directly, as shown in the equation below. The carbon that goes to exhaust HC emissions is subtracted. This does not require a $\mathrm{CO}_{2}$ emission factors input file.

$$
\mathrm{CO}_{2}=(B S F C * 453.6-\mathrm{HC}) * 0.87 *(44 / 12)
$$

where
$\mathrm{CO}_{2}$ is in $\mathrm{g} / \mathrm{hp}$-hr
BSFC is the fuel consumption in lb/hp-hr
453.6 is the conversion factor from pounds to grams

HC is the in-use adjusted hydrocarbon emissions in g/hp-hr
0.87 is the carbon mass fraction of gasoline and diesel fuel
$44 / 12$ is the ratio of $\mathrm{CO}_{2}$ mass to carbon mass

## Sulfur Dioxide Emission Factors

Sulfur dioxide emissions are rarely measured. Instead, they typically are calculated from fuel consumption and fuel sulfur content. We have retained this approach for the NONROAD model. Sulfur dioxide emission factors for gasoline engines are calculated using the following equation:

$$
\mathrm{SO}_{2}=(B S F C * 453.6 *(1-\text { soxcnv })-\mathrm{HC}) * 0.01 * \text { soxbas } * 2
$$

where
$\mathrm{SO}_{2}$ is in $\mathrm{g} / \mathrm{hp}$ - hr
BSFC is the fuel consumption in lb/hp-hr
453.6 is the conversion factor from pounds to grams
soxcnv is the fraction of fuel sulfur converted to direct PM (soxcnv $=0.03$ for gasoline engines)
$H C$ is the in-use adjusted hydrocarbon emissions in $\mathrm{g} / \mathrm{hp}-\mathrm{hr}$
0.01 is the conversion factor from weight percent to weight fraction
soxbas is the episodic weight percent of sulfur in the fuel (default value for gasoline is 0.0339)
2 is the grams of $\mathrm{SO}_{2}$ formed from a gram of sulfur

The calculation for CNG/LPG engines is similar, with an average default fuel sulfur weight percent (soxbas) of 0.008 and the same sulfur conversion rate (soxcnv $=0.03$ ).

The $\mathrm{SO}_{2}$ emission factors are calculated based on the default fuel sulfur contents listed here. NONROAD users may use the model interface to adjust the fuel sulfur content without changing the input files.

## Crankcase Emissions

Crankcase emissions are those emissions that escape from the combustion chamber past the piston rings into the crankcase of four-stroke spark-ignition engines. Crankcase emissions from 2-stroke engines do not exist due to the free flow of gases from the crankcase to the combustion chamber in these engines. EPA Phase I regulations require closed crankcases for all 1997 and later spark-ignition engines under 19 kilowatts ( 25 hp ), so these are assumed to have zero crankcase emissions.[20] Also, all 4-stroke engines used in marine vessels are assumed to have closed crankcases, including inboard, sterndrive, and 4-stroke outboards. All other gasoline 4 -stroke equipment are assumed to have open crankcases, except lawn and garden equipment produced prior to 1997. The final NONROAD2005 model uses the estimate that 21
percent of pre-1997 lawn and garden equipment have open crankcases. In addition, the model assumes that all compression ignition diesel engines have crankcase emissions.

Regarding crankcase emissions from chippers/stump grinders, previous versions of this technical report stated: "All pre-1997 chippers/stump grinders are assumed to have open crankcases." However, it should be noted that prior versions of the draft NONROAD model did not conform to the technical report, using the $21 \%$ estimate applied to pre-1997 lawn and garden equipment mentioned above. EPA corrected the draft NONROAD2002 model and all subsequent versions to assume that all pre-1997 chippers/stump grinders have open crankcases.

It should be noted that the final Nonroad Diesel Engine Tier 4 Rule assumes zero crankcase emissions for Tier 4 nonroad engines, and this is reflected in the draft NONROAD2004 and final NONROAD2005 models.

Crankcase Emissions: Sources of Values Used in NONROAD
Due to lack of any other sources of crankcase emission data, the final NONROAD2005 model uses the crankcase emission factors from NEVES for all engines produced without closed crankcases. NEVES uses data from on-highway engines to estimate nonroad crankcase emission rates. Using the NEVES data, NONROAD assumes the crankcase HC emission factor is equal to $33 \%$ of the exhaust HC emission factor for 4 -stroke engines with open crankcases. For diesel engines with open crankcases, NONROAD assumes the HC emission factor is equal to $2.0 \%$ of the exhaust HC emission factor. These percentages are applied to the final calculated exhaust emission factors, so the resulting crankcase emission factors include the same percentage deterioration as used for exhaust HC.

Although NEVES also provides diesel crankcase emission factors for CO ( $0.2 \%$ of exhaust CO) and NOx ( $0.05 \%$ of exhaust NOx), there is no provision within NONROAD for modeling these since they are so small. Comments are welcome regarding the need for inclusion of CO and NOx crankcase emissions either within the model or as a manual addition to the exhaust estimates produced by the model.

## Appendix A Cross-Inventory Comparison of SI Emission Factors

Comparing emission factors between inventory models (NEVES, OFF-ROAD, EPA's Small Engine Model) is not straightforward because the different models and inventories use different units and different categories in distinguishing emission factors. To compare the factors, all factors were converted to list emission factors in $\mathrm{g} / \mathrm{hp}-\mathrm{hr}$ by engine type, application and horsepower. This conversion required mapping both the ARB horsepower groups and the Small Engine Model's displacement classes to the horsepower groups used by the NONROAD model (see Tables A1 and A2). It was also necessary to combine the Small Engine Model's overhead-valve and side-valve categories into a single category by using a sales-weighted average, using the sales mix listed in Table A3.

Table A1. Mapping of small engine groupings used in the Small Engine Model and ARB's OFFROAD model to the small engine groupings used in the NONROAD model

| Small Engine Model <br> Class/Displacement | ARB Power <br> Range | NONROAD <br> Power Range | NONROAD <br> source classification |
| :--- | :---: | :---: | :--- |
| Non-Handheld, I <br> $<225 \mathrm{cc}$ | $2-5 \mathrm{hp}$ | $3-6 \mathrm{hp}$ | All engines except 2-stroke <br> trimmers/edgers/cutters, chainsaws, <br> leafblowers, and snowblowers |
| Non-Handheld, II <br> $>225 \mathrm{cc}$ | $5-15 \mathrm{hp}$ <br> $15-25 \mathrm{hp}$ | $6-16 \mathrm{hp}$ <br> $16-25 \mathrm{hp}$ | All engines except 2-stroke <br> trimmers/edgers/cutters, chainsaws, <br> leafblowers, and snowblowers |
| Handheld, III <br> $0-20$ cc | $\leq 2 \mathrm{hp}$ | $0-1 \mathrm{hp}$ | All engines |
| Handheld, IV <br> $20-50 \mathrm{cc}$ | $\leq 2 \mathrm{hp}$ | $1-3 \mathrm{hp}$ | All engines |
| Handheld, V <br> $>50 \mathrm{cc}$ | $2-15 \mathrm{hp}$ | $3-6 \mathrm{hp}$ | All 2-stroke trimmers/edgers/cutters, <br> chainsaws, leafblowers, and <br> snowblowers |

Table A2. Mapping of large engine groupings used in ARB's OFF-ROAD model to the large engine groupings used in the NONROAD model.

| ARB hp range | NONROAD hp Range |
| :--- | :--- |
| $5-15$ | $6-11 \& 11-16$ |
| $15-25$ | $16-25$ |
| $25-50$ | $25-50$ |
| $50-120$ | $50-100$ |
| $120-175$ | $100-175$ |
| $175-250$ | $175-250$ |
| $250-500$ | $250-500$ |
| $500-750$ | $500-750$ |
| $750-9999$ | $750-3000+$ |

Table A3. Sales Mix for Small Engine Model, Pre-control [1]

| Application | Sales Mix |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2-stroke handheld |  |  | 2-stroke nonhandheld |  | 4-stroke non-handheld, overhead- and side-valve |  |  |  |
|  | Class 3 | Class 4 | Class 5 | Class 1 | Class 2 | Class 1 <br> OHV | $\begin{aligned} & \text { Class 1 } \\ & \text { SV } \\ & \hline \end{aligned}$ | $\begin{aligned} & \text { Class 2 } \\ & \mathrm{OHV} \end{aligned}$ | $\begin{aligned} & \text { Class 2 } \\ & \mathrm{SV} \\ & \hline \end{aligned}$ |
| Lawn Mowers |  |  |  | 0.1 |  | 0.065 | 0.835 |  | 0.0014 |

## Appendix B

## Technology Groups and Distributions by Year

NONROAD accounts for changes in sales fractions and emissions from the advent of emission standards or other changes by assigning technology groups to each Source Classification Code (SCC). (SCC descriptions are given in NR-006d.) Each technology group has its own emission factor and the fraction of the population assigned to each group can change over time. These "technology fractions" are contained in an input file in NONROAD called tech.dat. A sample record for 4 -stroke lawnmowers might show a shift in engine sales from side-valve engines (Tech Group 1) to overhead valve engines (Tech Group 2) as illustrated in Table B1, which shows side-valve engines declining from $90 \%$ of sales in 1991 to $50 \%$ of sales in 1997.

Table B1. Sample Technology Fractions

| SCC/Year | Horsepower <br> Range | Tech <br> group/fraction | Tech <br> group/fraction |
| :--- | :--- | :--- | :--- |
| 2260004010 | $3-6 \mathrm{hp}$ | 1 | 2 |
| 1990 |  | 0.90 | 0.10 |
| 1997 |  | 0.50 | 0.50 |

Each technology group has an associated emission factor given in the emission factor input file for that pollutant. This emission factor can change with time. For example, CO emissions from Technology Group 1 (side-valve engines) might decrease from $819 \mathrm{~g} / \mathrm{hp}$-hr for model year engines 1990 through 1996 to $387 \mathrm{~g} / \mathrm{hp}-\mathrm{hr}$ for model years 1997 and later as shown in Table B2. The year listed in the emission factor input file is the first year in which the new emission factor applies.

Table B2. Sample Emission Factors

| SCC/Year | Horsepower <br> Range | Technology <br> group/emissions | Units | Pollutant |
| :--- | :--- | :--- | :--- | :--- |
| 2265004010 | $3-6 \mathrm{hp}$ | 1 | $\mathrm{~g} / \mathrm{hp}-\mathrm{hr}$ | CO |
| 1990 |  | 819 |  |  |
| 2265004010 | $3-6 \mathrm{hp}$ | 1 | $\mathrm{~g} / \mathrm{hp}-\mathrm{hr}$ | CO |
| 1997 |  | 387 |  |  |

For pre-controlled engines, the only technology groups currently identified are those used to combine SCCs for spark-ignition engines <25 hp as described in NR-006d. Technology groups primarily will be used for engines subject to emissions regulations. The regulations discussed in the main body of this report (for small SI engines $\leq 25 \mathrm{hp}$ and SI recreational marine engines) are expected to influence the sales fraction of various technology types and the emission rates of those technologies. The technology types meeting the new standards (with appropriately lower emission factors) then gain market share during the appropriate model years which represent the start year of the regulations. These anticipated changes are described in EPA's rulemakings.

Table B3 provides a list and description of the SI technology groups used in final NONROAD2005. Table B4 contains the technology fractions in tech.dat.

If new emission factors are developed for other parts of the inventory (e.g., larger SI engines) to reflect distinctions between different engine technologies with different emission levels, then appropriate technology groups, technology fractions, and emission factors will be added to the model. Similarly, appropriate emission factors will be added to the model if new emission standards are implemented.

Table B3. Spark-Ignition Technologies in the Final NONROAD2005 Model

| Engine Tech <br> Type Code | SI Engine Category | Description |
| :--- | :--- | :--- |
| G2GT25 | Large SI $>25 \mathrm{hp}$ | Gasoline, 2-stroke, Baseline |
| G2H3 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class III (<20cc), Baseline |
| G2H31 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class III (<20cc), Phase 1 |
| G2H3C1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class III (<20cc), Phase 1 with <br> catalyst |
| G2H32 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class III (<20cc), Phase 2 |
| G2H3C2 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class III ( $<20 \mathrm{cc})$, Phase 2 with <br> catalyst |
| G2H4 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class IV ( $\geq 20 \mathrm{cc}$ and $<50 \mathrm{cc})$, Baseline |
| G2H41 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class IV ( $\geq 20 \mathrm{cc}$ and $<50 \mathrm{cc}$ ), Phase 1 |
| G2H4C1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class IV $(\geq 20 \mathrm{cc}$ and $<50 \mathrm{cc})$, Phase 1 <br> with catalyst |
| G2H42 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class IV ( $\geq 20 \mathrm{cc}$ and $<50 \mathrm{cc})$, Phase 2 |
| G2H4C2 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class IV $(\geq 20 \mathrm{cc}$ and $<50 \mathrm{cc})$, Phase 2 <br> with catalyst |

Table B3. Spark-Ignition Technologies in the Final NONROAD2005 Model

| Engine Tech Type Code | SI Engine Category | Description |
| :---: | :---: | :---: |
| G2H5 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class V ( $>50 \mathrm{cc}$ ), Baseline |
| G2H51 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class V (>50cc), Phase 1 |
| G2H5C1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class V ( $>50 \mathrm{cc}$ ), Phase 1 with catalyst |
| G2H52 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class V (>50cc), Phase 2 |
| G2H5C2 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, handheld Class V (>50cc), Phase 2 with catalyst |
| G2N1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, nonhandheld Class I (<225cc), Baseline |
| G2N11 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, nonhandheld Class I (<225cc), Phase 1 |
| G2N2 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 2-stroke, nonhandheld Class II ( 2225 cc ), Baseline |
| G4GT25 | Large SI > 25hp | Gasoline, 4-stroke, Baseline |
| G4GT251 | Large SI > 25hp | Gasoline, 4-stroke, Phase 1 |
| G4GT252 | Large SI > 25 hp | Gasoline, 4-stroke, Phase 2 |
| G4H41 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, handheld Class IV ( 220 cc and $<50 \mathrm{cc}$ ), Phase 1 |
| G4H42 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, handheld Class IV ( 220 cc and $<50 \mathrm{cc}$ ), Phase 2 |
| G4N1O | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4 -stroke, overhead-valved, nonhandheld Class I (<225cc), Baseline |
| G4N1O1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, overhead-valved, nonhandheld Class I (<225cc), Phase 1 |
| G4N1O2 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, overhead-valved, nonhandheld Class I (<225cc), Phase 2 |
| G4N1S | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4 -stroke, side-valved, nonhandheld Class I ( $<225 \mathrm{cc}$ ), Baseline |
| G4N1S1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, side-valved, nonhandheld Class I (<225cc), Phase 1 |
| G4N1SC1 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, side-valved, nonhandheld Class I (<225cc), Phase 1 with catalyst |
| G4N1S2 | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, side-valved, nonhandheld Class I (<225cc), Phase 2 |
| G4N2O | Small SI $\leq 25 \mathrm{hp}$ | Gasoline, 4-stroke, overhead-valved, nonhandheld Class II ( $\geq 225 \mathrm{cc}$ ), Baseline |

Table B3. Spark-Ignition Technologies in the Final NONROAD2005 Model
