NORTHEAST CORRIDOR REGIONAL MODELING PROJECT ANNUAL EMISSION INVENTORY COMPILATION AND FORMATTING Volume XVI: West Virginia Emission Inventory

LIBRARY
U. S. ENVIRONMENTAL PROTECTION AGENCY
EDISON, N. J. 07037

This report is the result of an EPA/State/
Contractor effort and is an accurate
description of the NECRMP data base work
to date. Data revision and improvement
are expected as the Project continues,
so the contents of this document should
be considered an interim step toward the
finally modeled data base.

NORTHEAST CORRIDOR REGIONAL MODELING PROJECT ANNUAL EMISSION INVENTORY COMPILATION AND FORMATTING

Volume XVI: West Virginia Emission Inventory

by
GCA Corporation
Bedford, MA

Contract No. 68-02-3510

EPA Project Officers: James H. Southerland
Thomas F. Lahre

Prepared For
U S. Environmental Protection Agency
Office of Air, Noise and Radiation
Office of Air Quality Planning and Standards
Research Triangle Park, NC 27711

October 1982

This report has been reviewed by the Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, and approved for publication as received from GCA Corporation, Bedford, MA. Approval does not signify that the contents necessarily reflect the views and policies of the U.S. Environmental Protection Agency, nor does mention of trade names or commercial products constitute endorsement or recommendation for use. Copies of this report are available from the Air Management Technology Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, NC 27711

SECTION 1

INTRODUCTION

BACKGROUND

On a nationwide basis, nonattainment of the National Ambient Air Quality Standard (NAAQS) for ozone is one of the most serious and widespread air pollution problems facing the air quality management community. The Northeast Corridor, a megalopolis of urban and suburban areas extending from Washington, D.C. to Boston, bears a large extent of the ozone problem. The United States Environmental Protection Agency (USEPA), in cooperation with the northeastern states, local agencies and Metropolitan Planning Organizations (MPOs), has undertaken the Northeast Corridor Regional Modeling Project (NECRMP) to develop regional and urban ozone control strategies through the use of photochemical air quality simulation models.

To employ a regional model, an inventory of point and area source emissions covering the entire NECRMP study area had to be assembled and placed into a common format. Unfortunately, existing data bases were inadequate to either properly test or validate a regional model. To this end, USEPA's Office of Air Quality Planning and Standards retained GCA/Technology Division to complete an annual inventory for use in NECRMP. The study area, shown in Figure 1, includes the entire northeast quadrant of the United States from longitude 69 degrees to 84 degrees West and latitude 38 degrees to 45 degrees North.

OBJECTIVES

The objective of the effort reported in this volume was to assemble the most current, comprehensive and accurate emission inventory possible for the portion of the State of West Virginia that falls within the bounds of the regional modeling area, shown in Figure 2. This was achieved through the cooperation of the U.S. Environmental Protection Agency's Region III Office, EPA/National Air Data Branch (NADB) and the West Virginia Air Pollution Control Commission (WVAPCC). The intent of the program was to avoid direct contact between GCA and individual facilities in West Virginia. It was intended that GCA work directly with the WVAPCC, who would in turn contact individual sources if and when such contact was necessary. For reasons discussed in Section 2, such contacts were not warranted. The major pollutants of interest were VOC and NO_x, although TSP, SO_x and CO emissions were also compiled for point sources. Because of this emphasis, quality assurance checks focused primarily on sources of VOC and NO_x.

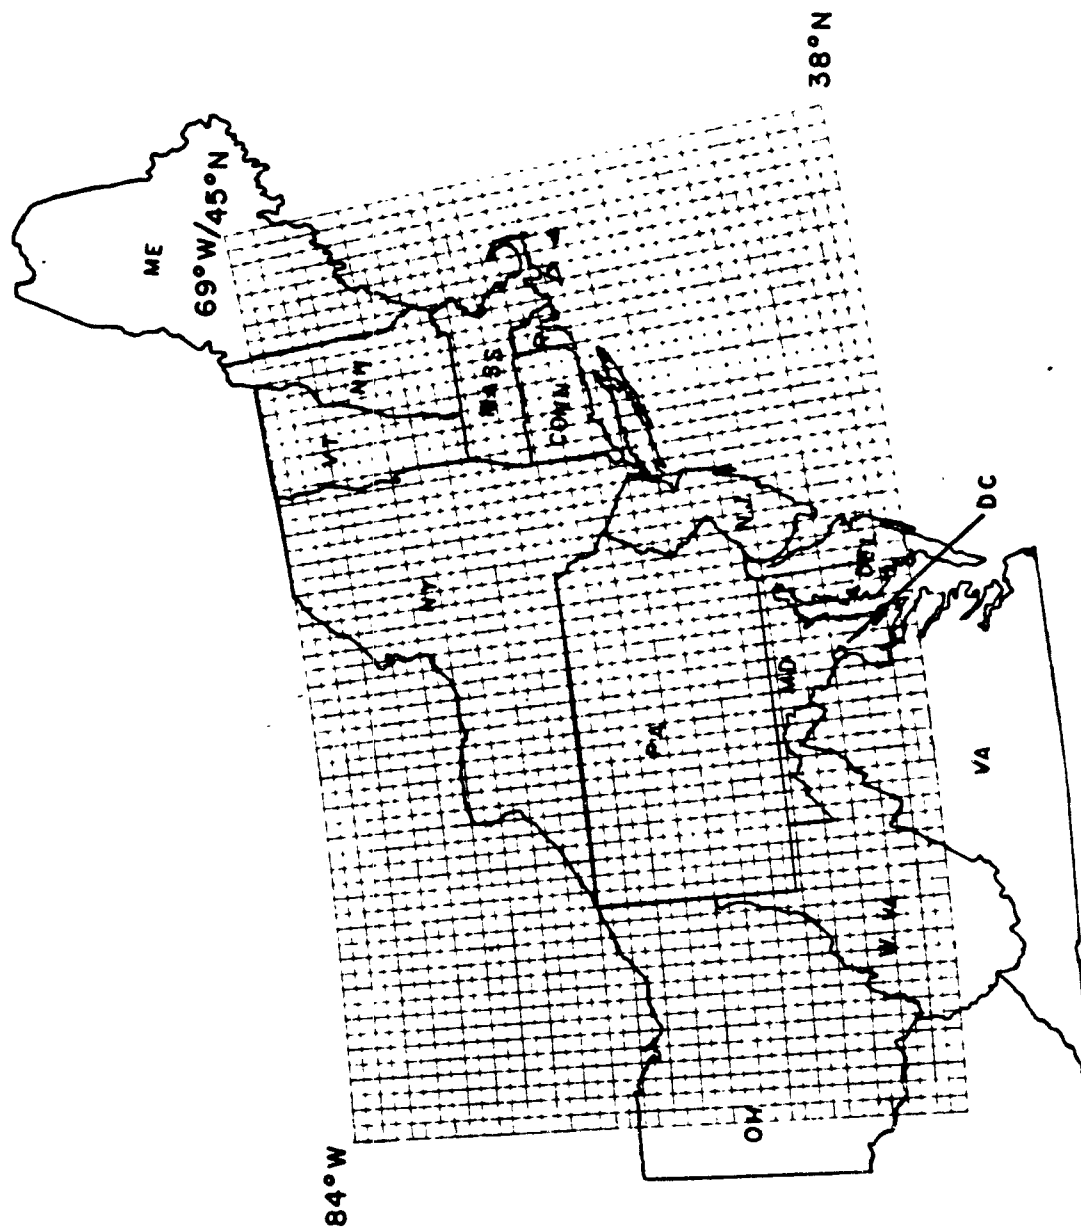

Figure 1. Boundaries of regional model grid system.

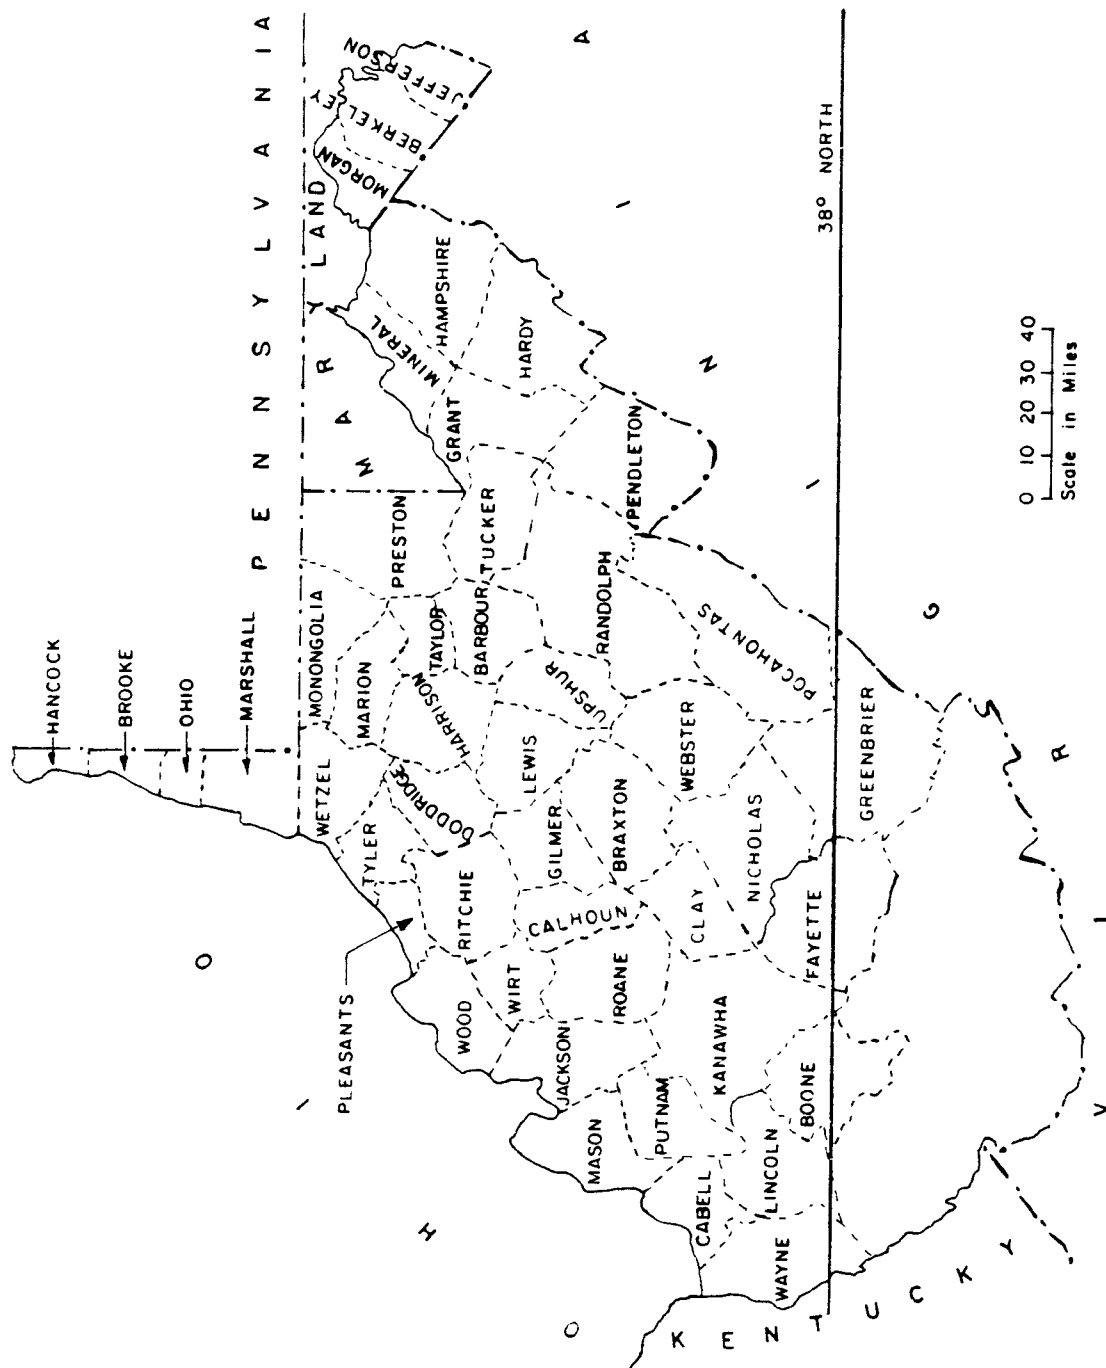

Figure 2. West Virginia Counties in the NECRMP Study Area.

The completed inventories were computerized for further use in the NECRMP study. Point source data were computerized in the format specified in the Emission Inventory System/Point Source (EIS/PS) User's Guide¹ and area source data were coded into EIS/AS² format.

REPORT ORGANIZATION

The results of the NECRMP annual emission inventory are reported in an 18 volume set of documents. Volume I in this series describes the background of the program and discusses the methods used to compile and verify the annual emission inventory. Volumes II through XVI present a more detailed discussion of each state's inventory effort. Volume XVII describes the spatial, temporal, and species allocation factors developed to allow for the creation of modeler's tapes from the completed inventory. Volume XVIII presents a summary of the point and area source inventories for the entire study area. Also included in Volume XVIII is a detailed analysis of the overall quality of the data base and an assessment of the data's suitability for use in photochemical modeling. A directory of the NECRMP annual emission inventory reports is presented in Table 1.

This volume, which presents a discussion of the annual emission inventory for West Virginia, consists of five sections. Section 2 describes the project history and includes a summary of the major events that relate to the West Virginia inventory development. Section 3 discusses in greater detail the point source inventory task while the area source inventory development is covered in Section 4. All references cited in the volume are identified in Section 5. Appendices A and B present county emissions for point and area sources, respectively. The computer routine used to fix a "generic" problem with the West Virginia data is provided in Appendix C.

SECTION 2

PROJECT HISTORY

AGENCY CONTACTS

The EPA Project Officer provided agency contacts in the West Virginia Air Pollution Control Commission (WVAPCC) and the Environmental Protection Agency, Region III (EPA/Region III). The West Virginia APCC was to have been responsible for confirming data, supplying required corrections or additional data, interfacing with individual sources as necessary, and concurring on the comprehensiveness and accuracy of the final data base. However, during the period of performance of the project, the WVAPCC was unable to provide the basic input data needed for the inventory. Therefore, as an interim measure, alternative data sources were agreed upon between GCA and the EPA Project Officer, as described below. The West Virginia APCC contact was Ms. Ellen Shapiro (304) 348-4022.

SUMMARY OF EVENTS

Summaries of major milestones pertaining to the West Virginia portion of the NECRMP annual emission inventory are provided separately for the point source and area source data, as follows.

Point Sources

Work on the West Virginia point source inventory occurred sporadically between December 1980 and May 1982. During most of the time, GCA's involvement primarily entailed monitoring the progress of the WVAPCC toward the completion of the point source inventory. The EPA Project Officer concurred, on December 10, 1981, that the WVAPCC would not likely complete their point source inventory in sufficient time to be used in the initial applications of the NECRMP inventory. It was decided that the West Virginia point source inventory developed in 1978 for the Sulfate Regional Experiment (SURE)³ probably reflected the most current, comprehensive, and accurate point source data available and was then accessed for interim use in NECRMP while the WVAPCC completes their inventory update. The completed interim inventory was forwarded to EPA on March 3, 1982. However, EPA experienced some difficulties in processing the data tape. The data were resubmitted on May 5, 1982. Other major milestones are identified below.

- Contact made with WVAPCC to confirm data availability dates

12/02/80

- WVAPCC contact sends draft of emission inventory/
registration form to GCA for critical review 11/04/81
- GCA reviews above form, forwards comments 11/23/81
- GCA and EPA Project Officer concur on alternative data
source for WV point source inventory 12/10/81
- SURE data accessed, converted into EIS/PS format, master
file created (1978)* 12/30/81
- Completed EIS/PS Master File forwarded to EPA on computer
tape 3/03/82
- Copy of tape resubmitted to EPA 5/05/82

Area Sources

The same difficulties that were encountered in obtaining point source emissions data were also experienced in seeking area source data. Area source data from the SURE³ inventory were accessed in January 1982 and were converted from NEDS format into EIS/AS format between February and May 1982. The completed inventory was forwarded to EPA on June 4, 1982. Major milestones are identified below.

- Contact made with WVAPCC to confirm availability dates 12/02/80
- GCA and EPA Project Officer concur on alternative data
source for WV area source inventory 12/10/81
- SURE data accessed for WV area source inventory 1/15/82
- Emissions and activity data on railroad locomotives, on-
highway vehicles and off-highway vehicles sent by EPA/NADB 3/30/82
- Area source data coded/keypunched into EIS/AS format 4/23/82
- EIS/AS Master File (1978/1980) created 5/21/82
- Completed EIS/AS Master File sent to EPA on computer tape 6/04/82

*Actually reflects primarily 1975 data, see Section 3.

SECTION 3

POINT SOURCE INVENTORY

DATA PROCUREMENT

Initial contact was made with the West Virginia Air Pollution Control Commission (WVAPCC) on December 2, 1980 to confirm data availability dates. Numerous delays were experienced by the WVAPCC in developing the 1980 point source inventory. Also, during the course of the project, the previous nonattainment portions of West Virginia were reclassified as being in attainment of the National Ambient Air Quality Standard for ozone,⁴ presumably reducing the priority of the inventory from the standpoint of the WVAPCC.

By early November 1981, the WVAPCC had completed a draft emission inventory/registration form, which was forwarded to GCA for critical review. GCA provided comments on the instructions for preparation and submittal, general company information, plot plan instructions, major emission points survey, fugitive dust survey, and the section specific to chemical process and petroleum industries. GCA's comments were forwarded to the WVAPCC on November 23, 1981.

At the December 10, 1981 Status Review Meeting in Durham, N.C., the GCA Program Manager and the EPA Project Officer concurred that a suitable inventory would not likely be developed by the WVAPCC in sufficient time to be used in the initial applications of the NECRMP annual emission inventory. A decision was reached to utilize the 1978 Sulfate Regional Experiment (SURE)³ inventory on an interim basis because: (a) the data were already "online" at GCA; (b) the data had undergone considerable QA checking in relation to SURE; and (c) the data were in a convenient format (NEDS) for conversion to EIS/PS.

The SURE³ data for West Virginia were accessed and converted into EIS/PS format using the GCA-modified version of the NEDS-to-EIS/PS Conversion Editor¹ described previously in Volume I.⁵ Since the SURE data had previously been subjected to essentially the same set of QA checks that are incorporated in the GCA version of the NEDS-to-EIS/PS Conversion Editor, relatively few error messages were encountered.

One problem that was encountered related to confidential data within the West Virginia file. Specifically, the boiler design capacity, process rate, emission estimation method, hourly design rate, and percent space heat fields for certain facilities had been claimed confidential. In the SURE³ inventory, these fields were "masked out" with alphabetic characters. Since EIS/PS would not permit non-numeric or blank characters in these fields, they had to be changed to numeric characters to enable conversion. The emissions

estimation fields were changed to "5" (special emission factor) and the remaining fields were changed to zeros using the computer program which is presented in Appendix C.

To document the completeness of the West Virginia data, sources listed in the Directory of Volatile Organic Compound (VOC) Sources Covered by Reasonably Available Control Technology Requirements (RACT)^b and the "Organic Chemical Producers Data Base"^c were cross-checked against those facilities included in the West Virginia point source inventory. Table 2 identifies sources listed in the above two references which could not be identified in the West Virginia point source inventory. The facilities listed in Table 2 should be considered potential omissions only since many appear to be small sources and others may be listed under different names in the West Virginia data.

RESULTS

For reporting purposes, point source emissions for West Virginia were aggregated into 70 categories based on specific SCC-SIC combinations. A complete description of the codes used to aggregate emissions is presented in Volume I.⁵ For points with multiple SCCs, no attempt was made to split emissions into more than one category. In these instances, the primary SCC was used to account for all emissions at that point.

Point source emissions (1978)* for the West Virginia portion of the NECRMP study area are presented, by category, in Table 3. County-specific point source emissions are presented, by category, in Appendix A. Point source totals for some categories appear somewhat suspicious. For example, no point source VOC emissions are shown for organic chemical manufacturing. A number of other point source categories which would be expected to exist in West Virginia also show no emissions in Table 3. These shortfalls should be resolved in the WVAPCC's inventory update, currently in progress. Therefore, the current NECRMP inventory for West Virginia should be used only as an interim measure while the WVAPCC completes their more comprehensive inventory.

A list of "major" facilities was developed by totaling emissions at each facility using a criteria of 100 tons/year of VOC or NO_x to define a major source. These facilities, and their reported 1978 emissions for all five criteria pollutants, are presented in Table 4.

The completed West Virginia point source inventory was written onto computer tape for delivery to EPA. Included on the tape, which was forwarded on March 3, 1982, were the following files:

- NEDS (1978) from the SURE Inventory
- NEDS (1978) after computerized corrections
- EIS/PS Master File (1978)
- "New" NEDS (1978) (Converted from EIS/PS Master File)

Due to difficulties with the tape sent in March, a duplicate tape was submitted on May 5, 1982. Further evaluation of this inventory and improvements made can be found in Volume XVIII.

*Although the base year of the inventory is 1978, most data reflect 1975.

SECTION 4

AREA SOURCE INVENTORY DEVELOPMENT

OBJECTIVES

The area source emission inventory task entailed reviewing area source inventories prepared by the states for technical accuracy and consistency with EPA-prescribed procedures and developing these source inventories where state-developed inventories were unavailable. The major objective of this effort was to ensure that all emissions of VOC and NO_x were accounted for and that the procedures used to develop the inventories were consistent from state to state. It was also important that the inventories be disaggregated into sufficient categories to allow for application of temporal and pollutant allocation factors and the evaluation of control scenarios in subsequent modeling efforts.

DATA PROCUREMENT AND REVIEW

As discussed in Section 2, the West Virginia Air Pollution Control Commission (WVAPCC) did not complete an area source inventory, despite earlier commitments. In December of 1981, a decision was reached to utilize the area source data contained in the SURE³ inventory, as an interim measure until more current emissions data become available from the WVAPCC.

The SURE³ data were accessed and coded directly into EIS/AS² format. The following categories were adjusted to maintain conformity with the other NECRMP states' inventories.

Gasoline Marketing

The SURE³ inventory did not disaggregate gasoline marketing into the subcategories being used in NECRMP: Stage I gasoline evaporation, Stage II gasoline evaporation, storage tank breathing, and gasoline loading/transit. GCA computed VOC emissions separately for the above gasoline marketing subcategories by applying the West Virginia gasoline sales data to the following emission factors:

- Stage I Evaporation - 8.35 #/10³ gal (assumes 25 percent splash/75 percent submerged fill tanks)

- Stage II Evaporation - 9.7 #/10³ gal
- Storage Tank Breathing - 1.0 #/10³ gal
- Loading/Transit - 6.87 #/10³ gal (assumes 25 percent splash/75 percent submerged fill tanks)

Per-Capita Emissions

GCA calculated VOC emissions from the following categories utilizing the per-capita emission factors from Procedures for the Preparation of Emission Inventories for Volatile Organic Compounds - Volume I⁸ and the 1980 Census:⁹

- | | |
|-----------------------------------|---------------|
| ● Degreasing | 7.59 #/capita |
| ● Dry Cleaning | 1.5 #/capita |
| ● Architectural Surface Coating | 4.6 #/capita |
| ● Autobody Refinishing | 1.9 #/capita |
| ● Graphic Arts | 0.8 #/capita |
| ● Commercial/Consumer Solvent Use | 6.3 #/capita |

Mobile Source Emissions

The following mobile source categories were not covered by the SURE³ inventory in sufficient detail to allow for their incorporation into the EIS/AS system:

- On-Highway Light-Duty Vehicles
- On-Highway Light-Duty Trucks - I
- On-Highway Light-Duty Trucks - II
- On-Highway Heavy-Duty Gasoline Trucks
- On-Highway Heavy-Duty Diesel Trucks
- On-Highway Motorcycles
- Off-Highway Gasoline Vehicles
- Off-Highway Diesel Vehicles
- Railroad Locomotives

Data on these categories for West Virginia were obtained from EPA/NADE¹⁰ and were directly coded for entry into EIS/AS.

Pesticides

The SURE³ inventory did not contain data on emissions from pesticide application. GCA calculated pesticide application emissions using data on harvested acreage from the County and City Data Book¹¹ and a 3.5 #VOC/harvested acre emission factor.⁸

DEVELOPMENT OF THE EIS/AS MASTER FILE

After emissions were verified for all area source categories on a countywide basis, the completed inventory was coded and keypunched in EIS/AS format and subjected to the series of computerized QA checks included in the EIS/AS System.² The completed Master File was then manually verified for accuracy before the finalized data were written onto computer tape for delivery to EPA.

Table 5 presents a list of the area source categories included in the West Virginia portion of the NECRMP inventory. Also identified for each category is the type of VOC represented by the emission factor (total or reactive).

RESULTS

Regionwide totals of VOC and NO_x emissions from area sources in the West Virginia portion of the NECRMP study area are provided in Table 6. Countywide summaries are presented in Appendix B.

TABLE 5. AREA SOURCE CATEGORIES INVENTORIED FOR WEST VIRGINIA

APPENDIX C

DOCUMENTATION OF COMPUTER ROUTINE USED FOR THE WEST VIRGINIA POINT SOURCE INVENTORY

As described in Section 3, certain fields in the SURE³ inventory NEDS data had been "blanked" out with alphabetic characters due to their confidentiality. In converting the NEDS code into EIS/PS format, these alphabetic characters had to be replaced with numeric characters. The routine used to address this problem is presented as follows.

```

/** PROGRAM TO REPLACE CONFIDENTIALITY DEFAULTS IN THE EST. METH,
/** 3 SPACE HEAT, BOILER DESIGN CAPACITY, PROCESS RATE, AND H.D.P. TO
/** ZERO'S TO ENABLE CONVERSION TO EIS/PS FORMAT.. FMS, 12/28/81

ABSTRACT

This report discusses the development of the Northeast Corridor Regional Modeling Project (NECRMP) annual regional emission inventory. The inventory reflects 1979/1980 data and focuses on point, area and mobile source emissions of Volatile Organic Compounds (VOC) and Nitrogen Oxides (NO_x), although particulate, sulfur oxides and carbon monoxide emissions were also compiled for point sources. The study area includes the entire northeast quadrant of the United States from longitude 69° to 82° West, and latitude 38° to 45° North. This Volume discusses the emission inventory for West Virginia.
