1.0 Overview

This document provides detailed information on the data sources, calculation methods, and assumptions used within the 2022 SmartWay Online Truck Tool – Short Form (referred to as the Short Form Tool in this document), version 1.0. The Short Form Tool utilizes up-to-date emission factors, in combination with detailed vehicle activity data, to estimate emissions and associated performance metrics. The primary purpose of the Short Form Tool is to help fleets with 20 or fewer trucks (of a single truck class and using only diesel or gasoline fuel) easily input their fleet information, calculate pollutant emissions, and track their emissions performance over time.

The Short Form Tool allows users to evaluate their fleet's performance in terms of different mass-based metrics for CO₂, NOx, PM (PM₁₀ and PM_{2.5}), and black carbon (BC) including grams per mile and grams per average payload ton-mile. The Short Form Tool is restricted to fleets of 20 or fewer diesel or gasoline powered trucks of a single weight class (e.g., 6, 8b). Please use the all-carrier version of the tool, available through the SmartWay Partner Portal, to enter data for larger fleets and/or fleets using alternative fuels such as natural gas, LPG, and electricity.

The Short Form Tool also collects information on fleet operations and truck body types, allowing accurate assignment of Partner fleets to their appropriate SmartWay Category (e.g., Truckload Dry Van, Dray, Mixed, etc.).

2.0 Data Inputs and Sources

The Short Form Tool user provides vehicle characteristic, operational, and activity data needed for emissions performance estimation (see Section 3 for more information). The Short Form Tool calculates emissions by multiplying fleet activity data with EPA-approved emission rate factors that are stored in look-up tables.

The Short Form Tool contains different types of emission rate factors for different pollutants. CO₂ factors are expressed in grams of CO₂ per gallon of fuel.¹ NOx, PM, and BC factors are expressed in grams of pollutant per mile traveled for running emissions, and in grams per hour for idle emissions. The CO₂ factors are independent of the truck types, classes, and operational practices in a fleet. NOx, PM and BC factors, however, vary depending upon truck class and engine model year/emission certification standard.

PM and BC emissions will also vary with the application of PM control retrofits. However, SmartWay partners must use the online – all carrier version of the tool to account for these effects.

2.1 CO₂ FACTORS

The CO₂ factors used in the Short Form Tool are based on fuel consumption. These factors and their sources and are summarized below in Table 1.

Table 1. CO₂ Factors by Fuel Type*

	g/gal	Source ²
Gasoline	8,887	(i)
Ethanol	5,764	(ii)
Diesel	10,180	(iii)

* 100% combustion (oxidation) assumed

Today's gasoline contains 10 percent ethanol, or E10. The CO₂ factors for E10 are based on a volumetric weighting of the gasoline and ethanol factors (8,575 g/gal).

¹ At this time other greenhouse gases such as methane (CH₄) and nitrous oxide (N₂O) are not included in the current Short Form Tool.

² i) Final Rule on Light-Duty Vehicle Greenhouse Gas Emissions Standards and Corporate Average Fuel Economy Standards (75 FR 25324, May 7, 2010). The gasoline factor used in this rule was sourced from the California Air Resources Board and is based on measurement of carbon from a gasoline test fuel (indolene).

ii) Final Rule on Mandatory Reporting of Greenhouse Gases (70 FR 56260, October 30, 2009). Full source documentation is available on pp. 31-32 in the Technical Support Document, *Petroleum Products and Natural Gas Liquids: Definitions, Emission Factors, Methods and Assumptions*, available at <https://www.epa.gov/sites/production/files/2015-07/documents/subpartmproductdefinitions.pdf>, accessed 12-12-2021.

iii) Fuel economy calculations in 40 C.F.R 600.113 available at http://edocket.access.gpo.gov/cfr_2004/julqtr/pdf/40cfr600.113-93.pdf.. accessed 12-12-2021.

2.2 NO_x, PM AND BC FACTORS

The Short Form Tool contains NO_x, PM₁₀, PM_{2.5} and BC³ emission factors for running operation (i.e. gram per mile factors) derived from EPA's MOVES3.0.1 model for diesel and E10⁴ for all heavy truck classes (2b – 8b) under national default temperature and fuel conditions, for model years 1992 through 2022, for the 2021 calendar year.⁵ See Section 2.3 for a detailed discussion of how the MOVES gram per mile emission factors were developed for each SmartWay Category for use in the Tool.

Short-duration (less than 60 minutes) idle emission factors for NO_x, PM and BC were developed separately by model year, truck class, and fuel type (diesel and gasoline). MOVES3.0.1 provides short duration idle in terms of grams and hours of off-network idle operation.

MOVES3.0.1 also provides emission factors for long-duration idle for long-haul diesel trucks. These factors are only applied for Class 8b trucks.⁶ Short-duration factors are applied for all truck class types. The idle factors used in the Tool are presented in Appendix B.

The Short Form Tool also calculates the NO_x, PM and BC emissions associated with transportation refrigeration (reefer) units. The MOVES2014b emissions model was used to develop emission rates for these units for the 2021 calendar year, following these steps:

- ☛ A national average model run was performed for the Industrial sector, including gasoline and diesel fueled equipment;
- ☛ The A/C refrigeration (reefer) unit standard classification codes (SCCs) were extracted from the output files – 2265003060 (gasoline) and 2270003060 (diesel);
- ☛ Grams per day outputs for weekdays and weekends for each of the 12 months were converted to grams per year by aggregating emissions over day types to arrive at an average day value, multiplying by the number of days in each month, and summing over month. This resulted in annual grams of emissions (of NO_x, PM₁₀, and PM_{2.5}) and grams of fuel consumed (in terms of brake specific fuel consumption or BSFC), for each fuel type;
- ☛ BSFC was converted from grams to gallons fuel using the MOVES energy density values of 2,819 g/gal and 3,167 g/gal for gasoline and diesel, respectively.
- ☛ Grams/gallon emission factors were then calculated for each pollutant by dividing the annual grams of emissions of NO_x, PM₁₀ and PM_{2.5} by the annual gallons of fuel consumed for gasoline and diesel.

³ Black carbon factors are assumed to equal the elemental carbon gram per mile factors output by the MOVES model.

⁴ All gasoline consumption in the United States and Canada is now assumed to consist of E10. References to “gasoline” in the Tool and the associated documentation refer to E10.

⁵ Emission factors for model years prior to 1992 are assumed to equal the 1992 values, since 30 year old engines are assumed to be fully deteriorated by the MOVES model.

⁶ NO_x factors for long-term extended idling are higher than short-duration factors for late model engines, since engine operation temperatures and loads at idle are generally not high enough to activate late-model emission controls such as selective catalytic reduction and exhaust gas recirculation.

Black carbon emissions associated with reefer activity were scaled from PM_{2.5} reefer emissions, applying conversion factors for nonroad equipment from the Commission for Environmental Cooperation (0.349 for diesel engines and 0.122 for gasoline engines).⁷

Table 2 provides the fuel factors used in the latest Short Form Tool.

Table 2. Weighted Average Reefer Fuel Factors (g/gallon)

Fuel	NOx	PM ₁₀	PM _{2.5}	BC
Diesel	47.562	0.965	0.936	0.327
Gasoline	17.631	0.996	0.916	0.112

The above rates are multiplied by the gallons of reefer fuel entered by the user to estimate mass emissions for the above pollutants. CO₂ emissions associated with reefer fuel use are included in the total CO₂ estimate.

The next section describes the process followed to select and adjust the running emission factors from MOVES3.0.1 for use in the Short Form Tool.

2.3 DERIVATION OF RUNNING EMISSION FACTORS BY SMARTWAY CATEGORY

The Short Form Tool requires MOVES running emission rates that are more aggregated than those used in the SmartWay Online Tool for all carriers (the “all carrier” Tool). The all-carrier Tool uses rates broken out by truck class (2b through 8b), model year, roadway type (highway, urban), hours of short-term and long-term idle (i.e., extended idle, hoteling), and mode of urban operation (deceleration, 0-25 mph, 25-50 mph, > 50 mph). The Short Form Tool does not require users to provide detail on roadway type or mode of operation, and only requires total hours of idling (not split by short or long term). For consistency with the all-carrier Tool, the MOVES-based gram per mile emission rates were generated for the Short Form Tool by aggregating the all-carrier Tool rates across roadway type⁸ and mode of operation using the equation below, which applied to all pollutants except CO₂. As shown, the resulting emissions rates are broken down by SmartWay Truck Category, truck weight class, and model year.

$$\text{Small Carrier EF}_{\text{Category, Class, MY}} = A_{\text{Category}} \times \text{EF}_{\text{Urban}<25, \text{Class, MY}} + B_{\text{Category}} \times \text{EF}_{\text{Urban 25-50, Class, MY}}$$

$$+ C_{\text{Category}} \times \text{EF}_{\text{Urban}>50, \text{Class, MY}} + D_{\text{Category}} \times \text{EF}_{\text{Highway, Class, MY}}$$

Where:

A_{Category} = weighting factor (mile fraction) for Urban operation <25 mph by SmartWay category

B_{Category} = weighting factor (mile fraction) for Urban operation 25-50 mph by SmartWay category

C_{Category} = weighting factor (mile fraction) for Urban operation >50 mph by SmartWay category

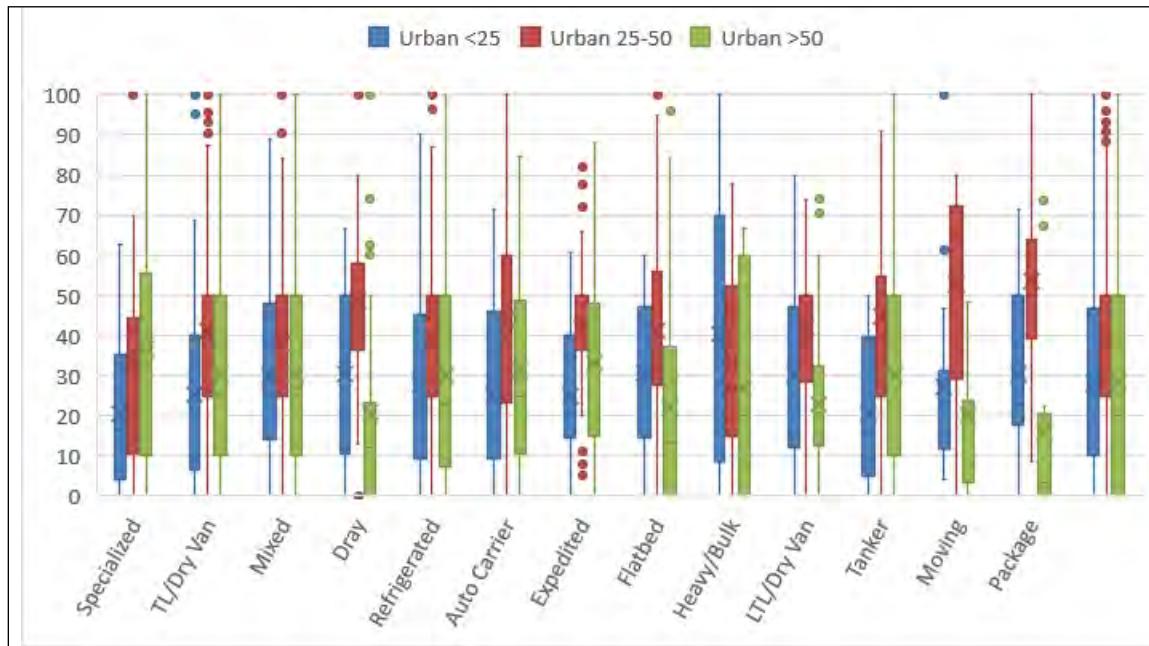

⁷ Commission for Environmental Cooperation (CEC), 2015. North American Black Carbon Emissions Estimation Guidelines: Methods for Estimating Black Carbon Emissions. Prepared for the CEC by Eastern Research Group, Inc. Final Report, May 2015.

⁸ Please refer to the Technical Documentation for the all-carrier Truck Tool for further details.

$D_{Category}$ = weighting factor (mile fraction) for Highway operation, by SmartWay category
 $EF_{Operation, Class, MY}$ = SmartWay tool emission factor for operation (urban operation <25 mph etc.)
 by weight class and model year

The weighting factors for this aggregation were developed from operational data provided by SmartWay partners from the 2018 calendar year. The partner database was queried for each SmartWay Category to extract fuel type and weight class, total annual miles and the distribution of miles by mode of operation. This resulted in 12,357 data points, nearly half of which used the SmartWay operation mode distribution defaults. Records using default mode distributions were excluded, leaving a sample of 6,858 records for analysis. A check for outliers was performed on these data by looking at the relative (normalized) distribution of miles travelled within the three urban modes of operation only. A box plot showing the distribution of normalized percent operation values in each urban operating mode, by SmartWay category, is shown below.

Figure 1. Percent Operation by Urban Mode (Normalized)

The bottom and top of the boxes are the 25th and 75th percentiles respectively, which define the inter-quartile range (IQR). The median and mean are shown within the boxes as horizontal lines and "X's", respectively. The ends of the whiskers denote the sample range without outliers, which are shown as individual points. Outliers are defined as points that fall outside the 75th percentile + (1.5 × IQR), or 25th percentile - (1.5 × IQR). These outliers were removed from the sample used to calculate operational weighting factors. Since time-in-mode is not independent, for any given outlier point the entire record was removed from the sample including other modes of operation. Though there are only a few dozen outlier points shown in the chart, each point may represent several records, as some partners entered

the same percent operation value for all weight classes in a given truck category. The total number of records removed is shown in the table below, by truck category.

Table 3. Outliers Removed by SmartWay Category

SmartWay Category	Total Records	Outliers Removed
Auto Carrier	124	0
Dray	239	56
Expedited	258	33
Flatbed	358	17
Heavy/Bulk	53	0
LTL/Dry Van	522	24
Mixed	1490	73
Moving	106	3
Package	74	2
Refrigerated	1270	95
Specialized	194	51
Tanker	172	0
TL / Dry Van	1,998	26

Weighting factors were developed by summing total VMT by SmartWay Category and mode of operation over the remaining records and dividing by total VMT for each Category. The resulting weighting factors are shown in the table below.

Table 4. Operation Mode Weighting Factors by SmartWay Category

SmartWay Category	A Urban < 25 mph	B Urban 25 - 50 mph	C Urban > 50 mph	D Highway
Auto Carrier	0.08	0.14	0.10	0.68
Dray	0.17	0.18	0.11	0.55
Expedited	0.07	0.09	0.09	0.75
Flatbed	0.07	0.09	0.09	0.75
Heavy/Bulk	0.24	0.08	0.05	0.62
LTL/Dry Van	0.14	0.15	0.08	0.63
Mixed	0.10	0.11	0.13	0.66
Moving	0.09	0.14	0.13	0.64
Package	0.69	0.13	0.05	0.14
Refrigerated	0.07	0.09	0.16	0.67
Specialized	0.51	0.03	0.05	0.41

Table 4. Operation Mode Weighting Factors by SmartWay Category

SmartWay Category	A Urban < 25 mph	B Urban 25-50 mph	C Urban > 50 mph	D Highway
Tanker	0.15	0.08	0.11	0.66
TL/Dry Van	0.09	0.10	0.10	0.71

By and large the weights for highway operation vary as expected for the truck categories. For example, package delivery trucks travel only 14 percent of total miles on highways, while expedited shippers travel 75 percent. Specialized truck weights were unusual with only 41 percent of miles on highway; an investigation revealed a small number of high mileage fleets with 25 percent of highway operation dominated this result.

The Short Form Tool multiplies the all-carrier Tool's short-term idle emission rates to the idle hours provided by carriers for truck classes 2b through 8a, since the MOVES long-duration idle rates apply only to Class 8b combination long-haul diesel trucks. For Class 8b trucks, a composite idle rate is estimated based on a weighting of short- and long-duration idle hours supplied by fleets using the all-carrier Tool. All-Carrier Tool data from Class 8b trucks indicate that 56 percent of idle hours are long-duration, and 44 percent are short-duration. This weighting was used to develop the composite idle emission factors for Class 8b diesels for use in the Short Form Tool.

3.0 Emission and Activity Estimation

The emission rates and weighting factors discussed in Section 2 are combined with activity data provided by Partners to calculate mass emissions at the fleet and/or partner level for CO₂, NOx, PM, and BC as described below.

3.1 CO₂

Mass emissions of CO₂ are calculated within the Short Form Tool utilizing emission factors expressed in *grams per gallon of fuel*, as discussed above. Reefer fuel is aggregated with vehicle fuel inputs in the Tool, with the reefer fuel type assumed to be the same as the vehicle fuel type.

3.2 NOx, PM AND BC

Unlike CO₂ emissions which only vary with fuel type, NOx, PM and BC emission rates also vary depending upon engine model year, vehicle class, and operation mode (running or idle). For this reason, EPA developed lookup tables for use in the Short Form Tool with emission factors corresponding to user-supplied inputs regarding their fleet activity. The NOx, PM and BC emission rates expressed in *grams per mile* were combined with total miles entries to estimate mass emissions. Emissions are calculated at the fuel type/truck class/model year level, following these steps:

1. Multiply total miles per truck per year by the corresponding gram per mile value. (See Appendix A for g/mile values for each SmartWay Category and fuel type (gas and diesel), by truck class group/model year group.) Then divide values by 1.10231×10^6 to obtain short tons.
2. For Class 8b trucks, split reported idle hours into short and long duration components using the average ratios discussed above (44 percent short, 56 percent long). Then multiply the short and long duration idle hours per truck per year by the corresponding short and long duration gram per hour values. Idle factors are split by fuel type, truck class and model year. Convert to short tons.
3. For non-Class 8b trucks, multiply the idle hours entered by the partner by the short duration emission factors, as there are no long duration factors for these trucks. Convert to short tons.
4. If a body type of "Reefer" has been specified for a given fuel type/truck class, calculate NOx and PM emissions for reefers by multiplying the total gallons entered for reefer fuel⁹ by the corresponding gram per gallon reefer engine emission factors (see Table 2 above). Convert to short tons.

⁹ If a partner does not have an estimate for their reefer fuel use, they may use a default value based on the average ratio of reefer to engine fuel consumption for SmartWay reefer partners (11%).

5. Add tons for steps 1 through 4 to obtain total per truck emissions. Sum across fuel types if needed for the fleet total.

Finally, note that the PM factors output by the MOVES model for use in the Short Form Tool are expressed in terms of $\text{PM}_{2.5}$. The MOVES3.0.1 model assumes a fixed ratio of $\text{PM}_{10} / \text{PM}_{2.5}$ for a given fuel type, as summarized below:

 Gasoline – 1.1304

 Diesel – 1.087

These factors are applied directly to the $\text{PM}_{2.5}$ emission factors to obtain mass emission and performance metrics for PM_{10} within the Short Form Tool.

3.3 DATA VALIDATION

The Short Form Tool has a number of standard range and value checks that must be passed before Partners can submit their data to EPA. Many of these checks simply confirm the presence of required data (e.g., total gallons for each fuel type). There is also an implicit validation check on all numeric fields because the system will not accept any non-numeric characters (including minus signs) within these fields. Partners will not be able to finalize their fleet files until all associated errors have been resolved.

Rigorous validation checks of key data inputs are needed to ensure the overall quality of the performance metrics calculated by the Short Form Tool. Validation checks serve three purposes to this end. First, unusually high or low values can be identified and flagged for the user's attention before finalizing inputs. For example, a user may misplace a decimal, inadvertently add an extra zero, or utilize the wrong units (e.g. reporting pounds instead of tons for payload) upon data entry. By comparing these data entries to reliable industry averages and distributions, these values can be flagged allowing users to quickly correct such errors.

Second, under certain circumstances Partners may operate their fleets under atypical conditions, resulting in extreme (outlier) data values. For example, permitted heavy-haul operations may routinely exceed industry-average payload values by 10 or more tons. By flagging such data entries Partners have the opportunity to provide additional information regarding their unique operating conditions through use of the Tool's comment fields.

Finally, independent criteria can be established to ensure that data inputs are never allowed to exceed certain physically constrained absolute limits. For example, a truck cannot exceed roughly 500,000 miles per year, even with dual drivers and minimal maintenance time, simply due to the available hours per year and highway speed limits. Data values above these absolute maximum levels are not allowed by the Short Form Tool, and users are required to modify the associated inputs before proceeding.

The following presents the validation ranges used in the Short Form Tool. Validation ranges are of three types:

1. "Orange" values indicating that the input or derived performance value is notably lower/higher than the expected value. Partners may enter an explanation backing up such entries, but this is not mandatory.
2. "Red" values indicating that the input or derived performance value differs greatly from the expected value. In this case the partner must enter text explaining why this value is accurate. Once entered, the value will change from "Red" to "Orange" on the data entry screen.
3. "Absolute errors" exceed values deemed physically possible and must be changed in order to be accepted by the tool.

Validation ranges for the short form Tool are based on the corresponding values in the all-carrier Tool for the following parameters.

- Distance per truck per year
- Miles per gallon
- Fraction of reefer to engine fuel use (Reefers only)
- Payload
- Idle hours per day
- Service days per year

The following table summarizes the validation range values currently used in the Short Form Tool. These values may be updated in the future to be specific to small truck fleets (based on tool inputs).

Table 5. Short Form Tool Validation Ranges by Parameter

4.0 Performance Metrics

The Short Form Tool allows the user to calculate their emissions performance using different metrics. Available performance metrics include:

- ☛ Grams per mile
- ☛ Grams per Payload Ton-Mile

The following calculations are performed for these metrics:

$$\text{g/mile: } \sum E / M$$

where

E = Emissions, M = Miles Driven

$$\text{g/avg payload ton-mile: } \sum E / (M \times AP)$$

where

E = Emissions, M = Miles Driven, AP = Average Payload

For both calculations:

- ☛ Emissions = grams of pollutant
- ☛ Miles Driven = Total Miles

Summations are performed for the different metrics. Each of the metrics is automatically aggregated across model years (for NOx, PM and BC) for reporting purposes. Additional aggregation may be reported across fuel types as specified by the user.

Appendix A: NOx, PM & BC Emission Factors (g/mi) 2021 Calendar Year - MOVES3.0.1 Basis
