TREATABILITY MANUAL

VOLUME I. Treatability Data

U.S. ENVIRONMENTAL PROTECTION AGENCY
Washington, D.C.

January 1980

PREFACE

In January, 1979, EPA's Office of Enforcement and Office of Water and Waste Management requested help from the Office of Research and Development in compiling wastwater treatment performance data into a "Treatability Manual". This Manual was to be used in developing NPDES permit limitations for facilities which, at the time of permit issuance, were not fully covered by promulgated, industry-specific effluent guidelines authorized under Sections 301, 304, 306, 307, and 501 of the CWA.

A planning group was set up to manage the treatability program under the chairmanship of William Cawley, Deputy Director, Industrial Environmental Research Laboratory - Cincinnati. The group includes participants from: 1) the Industrial Environmental Research Laboratory - Cincinnati, 2) Effluent Guidelines Division, Office of Water and Waste Management; 3) Permits Division, Office of Enforcement; 4) Municipal Environmental Research Laboratory - Cincinnati; 5) R. S. Kerr, Environmental Research Laboratory - Ada; 6) Industrial Environmental Research Laboratory - Research Triangle Park; 7) Monsanto Research Corporation; and 8) Aerospace Corporation.

The objectives of the treatability program are:

- To provide readily accessible data and information on treatability of industrial and municipal waste streams for use by NPDES permit writers, enforcement personnel, and by industrial or municipal permit holders;
- To provide a basis for research planning by identifying gaps in knowledge of the treatability of certain pollutants and wastestreams;
- To set up a system allowing rapid response to program office requirements for generation of treatability data.

The primary output from this program is a five-volume Treatability Manual. The individual volumes are named as follows:

Volume I - Treatability Data
Volume II - Industrial Descriptions
Volume III - Technologies
Volume IV - Cost Estimating
Volume V - Summary

* To provide readily accessible data and information on treatability of industrial and municipal waste streams for use by NPDES permit writers, enforcement personnel, and laboratory researchers; and

* To provide a basis for research planning by identifying gaps in treatability knowledge and state-of-the-art.

A primary output from the treatability program is a five volume treatability manual. The treatability manual comprises five volumes, as follows:

VOLUME I	Treatability Data
VOLUME II	Industrial Descriptions
VOLUME III	Technologies
VOLUME IV	Cost Estimating
VOLUME V	Summary

ACKNOWLEDGMENT

The sheer size and comprehensiveness of this document should make it obvious that this had to be the effort of a large number of people. It is the collection of contributions from throughout the Environmental Protection Agency, particularly from the Office of Enforcement, Office of Water and Hazardous Materials and the Office of Research and Development. Equally important to its success were the efforts of the employees of the Aerospace Corporation and the Monsanto Research Corporation who participated in this operation.

No list of the names of everyone who took part in the effort would in any way adequately acknowledge the effort which those involved in preparing this Manual made toward its development. Equally difficult would be an attempt to name the people who have made the most significant contributions both because there have been too many and because it would be impossible to adequately define the term "significant." This document exists because of major contributions by the contractor's staff and by members of the following:

Effluent Guidelines Division
Office of Water and Waste Management

Permits Division
Office of Water Enforcement

National Enforcement Investigation Center
Office of Enforcement

Center for Environmental Research Information

Municipal Environmental Research Laboratory

Robert S. Kerr Environmental Research Laboratory

Industrial Environmental Research Laboratory
Research Triangle Park, NC

Industrial Environmental Research Laboratory
Cincinnati, OH
Office of Research and Development

The purpose of this acknowledgement is to express my thanks as Committee Chairman and the thanks of the Agency to the Committee Members and others who contributed to the success of this effort.

William A. Cawley, Deputy Director, IERL-Ci
Chairman, Treatability Coordination Committee

CONTENTS

CONTENTS (continued)

CONTENTS (continued)

CONTENTS (continued)

CONTENTS (continued)

GLOSSARY

AAP: Army Ammunitions Plant.

AN: Ammonium Nitrate.

ANFO: Ammonium Nitrate/Fuel Oil.

BATEA: Best Available Technology Economically Achievable.

BAT: Best Applicable Technology.

BEJ: Best Engineering Judgement.

BOD: Biochemical Oxygen Demand.

clarification: Process by which a suspension is clarified to give a "clear" supernatant.

cryolite: A mineral consisting of sodium-aluminum fluoride.

CWA: Clean Water Act.

cyanidation process: Gold and/or silver are extracted from finely crushed ores, concentrates, tailings, and low-grade mine-run rock in dilute, weakly alkaline solutions of potassium or sodium cyanide.

comminutor: Mechanical devices that cut up material normally removed in the screening process.

effluent: A waste product discharged from a process.

EGD: Effluent Guidelines Division.

elutriation: The process of washing and separating suspended particles by decantation.

extraction: The process of separating the active constituents of drugs by suitable methods.

fermentation: A chemical change of organic matter brought about by the action of an enzyme or ferment.

flocculation: The coagulation or coalescence of a finely-divided precipitate.

fumigant: A gaseous or readily volatilizable chemical used as a disinfectant or pesticide.

GAC: Granular Activated Carbon.

gravity concentration: A process which uses the differences in density to separate valuable ore minerals from gangue.

gravity separation/settling: A process which removes suspended solids by natural gravitational forces.

grit removal: Preliminary treatment that removes large objects, in order to prevent damage to subsequent treatment and process equipment.

influent: A process stream entering the treatment system.

intake: Water, such as tap or well water, that is used as makeup water in the process.

lagoon: A shallow artifical pond for the natural oxidation of sewage and ultimate drying of the sludge.

LAP: Loading Assembly and Packing operations.

MHF: Multiple Hearth Furnace.

neutralization: The process of adjusting either an acidic or a basic wastestream to a pH in the range of seven.

NPNES. National Pollutant Discharge Elimination System.

NRDC: Natural Resources Defense Council.

NSPS: New Source Performance Standards.

photolysis: Chemical decomposition or dissociation by the action of radient energy.

PCB: PolyChlorinated Biphenyl.

POTW: Public Owned Treatment Works.

PSES: Pretreatment Standards for Existing Sources.

purged: Removed by a process of cleaning; take off or out.

screening process: A process used to remove coarse and/or gross solids from untreated wastewater before subsequent treatment.

SIC: Standard Industrial Classification.

SS: Suspended Solids.

SRT: Solids Retention Time.

starved air combustion: Used for the volumetric and organic reduction of sludge solids.

terpene: Any of a class of isomeric hydrocarbons.

thermal drying: Process in which the moisture in sludge is reduced by evaporation using hot air, without the solids being combusted.

TKN: Total Kjeldahl Nitrogen.

TOC: Total Organic Carbon.

trickling filter: Process in which wastes are sprayed through the air to absorb oxygen and allowed to trickle through a bed of rock or synthetic media coated with a slime of micro-

bial growth to remove dissolved and collodial biodegradable organics.

TSS: Total Suspended Solids.

vacuum filtration: Process employed to dewater sludges so that a coke is produced having the physical handling characteristics and contents required for processing.

VSS: Volatile Suspended Solids.

WQC: Water Quality Criterion.

I.1 INTRODUCTION

Volume I is a compendium of treatability data for specific compounds. It is the first of a five volume set on industrial wastewater treatability. Volume II is a collection of industrial wastewater discharge information and includes data for both raw and treated wastewaters. Volume III is a compilation of available performance data for existing wastewater treatment technologies. Volume IV is a collection of capital and operating cost data for the treatment technologies described in Volume III. Volume V is an executive summary and describes the use of information contained in Volumes I - IV. The information contained in this manual was obtained from the open literature, government publications, on-going Office of Research and Development (ORD) treatability studies, equipment vendors, and regional and state EPA offices.

I.1.1 VOLUME 1 ORGANIZATION AND CONTENTS

Volume I of the Treatability Manual supplies data on specific compounds. It is intended to provide facile reference to physical data on the pollutants, their occurrence patterns, and methods of treatment and/or removal. Pollutants are grouped according to the following chemical categories:

- Metals and Inorganics
- Ethers
- Phthalates
- Nitrogen Compounds
- Phenols
- Aromatics
- Polynuclear Aromatic Hydrocarbons
- PCB's and Related Compounds
- Halogenated Hydrocarbons
- Pesticides
- Oxygenated Compounds
- Miscellaneous

The three-part entry for each pollutant includes the items discussed below:

- Description of the Pure Species

This section includes information such as name, formula, alternate names, Chemical Abstracts Registry Number, molecular or atomic weight, melting and boiling points, water solubility and vapor pressure. For organic compounds Henry's law constants, log octanol/water partition coefficients, biodegradability information, and carbon adsorption data are also presented; for metals common oxidation states and precipitation/coagulation properties are given.

A separate entry in this section summarizes current knowledge on probable fates in an aqueous medium. Processes considered in this last category are photolysis, oxidation, hydrolysis, volatilization, sorption, biological processes, and other significant reactions and interactions. When literature fate data for a specific compound are inadequate or nonexistent, the fate of closely related compounds are discussed, and the data is identified as pertaining to the general class of compounds.

- Industrial Occurrence Data

Wastewater pollutant concentrations are presented in tabular form for each industry in which the chemical substance has been detected. The minimum, maximum and average concentrations are reported for both untreated and treated wastewater. This information is derived from that presented in Volume II of the wastewater treatability manual. Consult Volume II for additional information regarding wastestreams in each industry.

Industrial wastewater discharge data presented in Section I.3 is then used in conjunction with the observed pollutant concentrations to estimate pollutant loadings for the industry. Pollutant loadings reported in kg/d form a basis for comparing relative impacts of the discharge from various industries.

- Pollutant Treatability/Removability

For each alternative standard treatment process, removal ranges and achieveable concentrations for the compound of interest are presented for both synthetic and actual wastewater samples, where appropriate data are available. Cross references to Volume III are given.

I.1.2 PHYSICAL AND CHEMICAL PROPERTIES DATA

Physical/chemical data presented in this volume are useful in predicting environmental fate or probable effectiveness of alternative treatment approaches. A brief description of the presentation and utility of individual parameters follows.

I.1.2.1 Henry's Law Constant

Henry's law constant is the equilibrium partial pressure of a compound divided by the concentration of the compound in water at 25°C and is defined by the following equation:

$$K = \frac{P}{S}$$

where

K = Henry's law constant, m^3 atm $gmol^{-1}$

P = partial pressure of compound in gas phase, atm

S = concentration of compound in liquid phase, $gmol/m^3$

It is an expression of the equilibrium distribution of a compound between air and water. The constant indicates qualitatively the volatility of a compound and is frequently used in equations which attempt to predict "stripping" of compound from aqueous solution. Increasing values of the constant favor volatilization as a fate mechanism and indicate amenability to steam or air stripping.

I.1.2.2 Log Octanol/Water Partition Coefficient

The log octanol/water partition coefficient or log P is the equilibrium distribution of a compound between two immiscible solvents, n-octanol and water. It is defined by the following equation:

$$\text{Log } P = \text{Log } \frac{C_{A,O}}{C_{A,H_2O}}$$

where

$C_{A,O}$ = concentration of compound in oil phase

C_{A,H_2O} = concentration of compound in water phase

Log P varies with temperature and solute concentration. The temperature of determination is assumed to be 25°C, although in many cases the temperature and method of determination is not known.

Log P measures the affinity of a compound for oil and water phases, as such it is a useful parameter for predicting the bioconcentration potential of compounds and sorption of compounds by organic soils where experimental values are not available. It is also used to determine the applicability of solvent extraction as a treatment alternative. Increasing values favoring strong bioaccumulation, adsorption and solvent extraction potentials.

I.1.2.3 Carbon Adsorption Data

Batch equilibrium carbon adsorption isotherm data were used to determine the effectiveness of carbon in adsorbing organic compounds. The adsorption isotherm is the relationship, at a given temperature and other conditions, between the amount of a substance adsorbed and its equilibrium concentration in the surrounding solution.

The carbon adsorption data were plotted according to the Freundlich equation. While this equation is empirical it is none-the-less widely used and has been found to describe adequately the adsorption process in dilute solution. The Freundlich equation has the form:

$$\frac{X}{M} = KC_f^{1/n}$$

The data were fitted to the logarithmic form of the above equation, which has the form:

$$\log \frac{X}{M} = \log K + 1/n \log C_f$$

where

$X = C_o - C_f$ = initial concentration of solute in mg/L minus final concentration in solution at equilibrium

M = weight in grams of adsorbent (carbon)

C_f = final concentration of solute in mg/L at equilibrium

K = intercept at $C_f = 1$ ($\log C_f = 0$)

$1/n$ = slope of the line

For the dilute solutions in this study, this equation yields a straight line with a slope of $1/n$ and an intercept equal to the value of K when $C_f = 1$ ($\log C_f = 0$). The intercept is roughly an indicator of adsorption capacity and the slope, $1/n$, of adsorption intensity. The concentration of compound on the carbon in equilibrium with a concentration C_f is given by the $\frac{X}{M}$ value, expressed as mg compound/gram of carbon.

Figures 1 and 2 are presented to illustrate the interpretation of adsorption isotherms. In Figure 1, the isotherm for Carbon A is at a high level and has only a slight slope. This means that adsorption is large over the entire range of concentrations studied. The fact that the isotherm for Carbon B in Figure 1 is

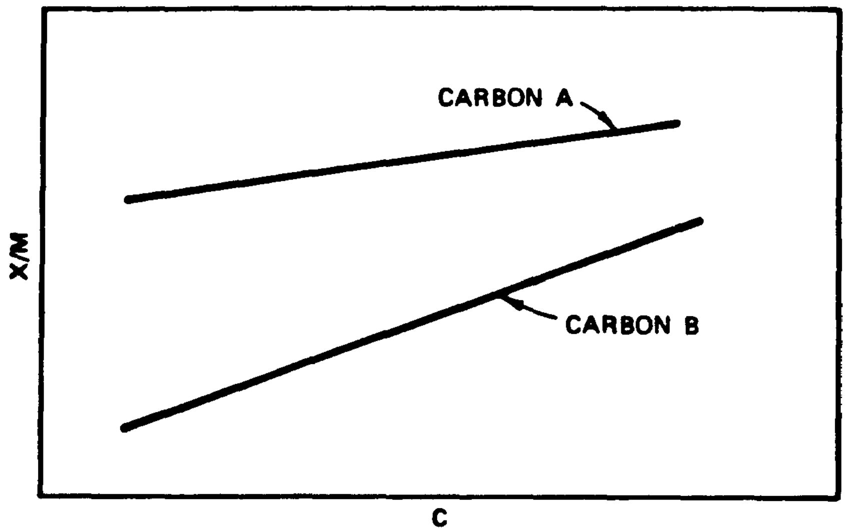

Figure 1. Adsorption isotherm, Carbon A and B.

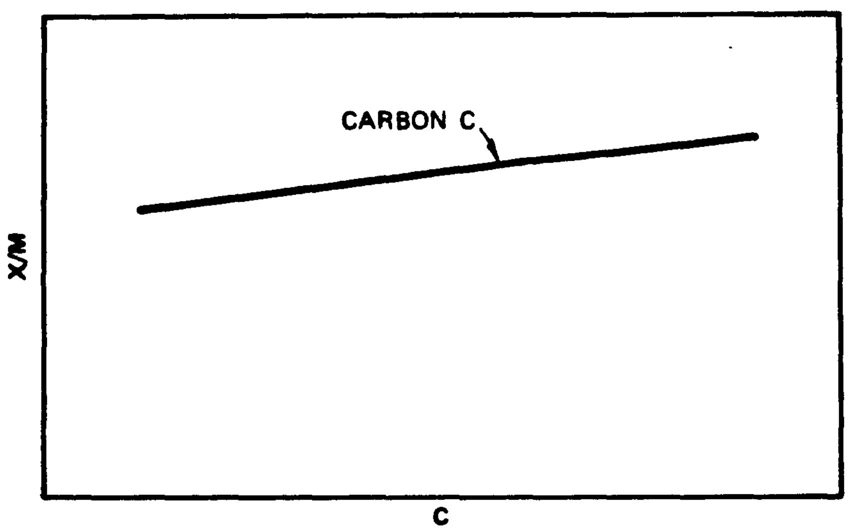

Figure 2. Adsorption isotherm, Carbon C.

at a lower level indicates proportionally less adsorption, although adsorption improves at higher concentrations over that at low concentrations. An isotherm having a steep slope, Carbon D, indicates that adsorption is good at high concentrations, but much less at low concentration.

For most compounds, the isotherm test was conducted at neutral pH. For those compounds that were expected to show an effect of pH the test was conducted at acid and/or basic pH as well as at neutral. The actual pH's are shown on the data sheets along with type of carbon used.

The adsorbability, defined as the carbon dose required to reduce a pollutant concentration from 10 mg/L to 1 mg/L at neutral pH, is also reported and serves as a basis for comparing individual compounds.

I.1.2.4 Biodegradability

The entry for biodegradability includes descriptive information on biological system utilized, measurement method, removals achieved and rate of removal. Biodegradability data are presented where available so as to give a qualitative indication as to whether or not a compound is amenable to biological oxidation. Test procedures varied as to length of time, degree of acclimation of seed organisms, and system utilized. In addition, other removal mechanisms such as vaporization and adsorption into sludge may have interfered with test results. These effects can not be clearly differentiated for the references used and their influence was not determined.

I.1.2.5 Metal Precipitation/Coagulation Properties

Solubility curves are given to illustrate the effect of lime softening and chemical coagulation on metals removal. Percent removal of metal is plotted as a function of coagulant dose, initial metal concentration and pH of the treated water.

I.2 POLLUTANT SELECTION

Pollutants selected for study in Volume I of the wastewater treatability manual were taken from the list of 299 compounds considered in Section 311 of the Water Pollution Control Act. Selection was based on a consideration of pollutant toxicity and stability in an aqueous environment. Of the 299 compounds initially considered, 129 had been previously designated as Toxic (Priority) Pollutants by the EPA and were included for study. Ninety-six of the remaining pollutants were found to readily dissociate, volatilize or otherwise degrade in an aqueous environment and were not considered. This left 74 pollutants that did not readily degrade or disappear from an aqueous environment. These were added to the list of 129 toxic pollutants to make a total of 203 and included for study in Volume I. Other pollutants will be added for study as time and data availability permits.

In addition, a number of conventional or classical water pollutants not addressed in Volume I are covered in Volumes II and III. These are listed below.

- Total Suspended Solids
- Total Kjeldahl Nitrogen
- Chemical Oxygen Demand
- Biochemical Oxygen Demand
- Oil and Grease
- Total Phenols
- Total Phosphous
- Total Organic Chlorine
- Total Organic Carbon

Compound: Antimony   Formula: Sb

Alternate Names [1] Antimony black, Antimony regulas

CAS #: 7440-36-0

Physical, Chemical, and Biological Properties [2-4]

at. wt.: 121.8   m.p., °C: 630   b.p. (760 torr), °C: 1,380
vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: Antimonic acid and antimony oxides are very slightly soluble
common oxidation states: +5, +3, -3

Probable Fate [2]

photolysis: Not important under natural conditions (<100°C)
oxidation: Present as soluble oxide or antimonite salts under natural redox conditions
hydrolysis: Oxide or antimonic acid formed by hydrolysis
volatilization: Not important under natural redox conditions
sorption: Adsorbed to clays; coprecipitates with iron and aluminum compounds
biological processes: Slight bioaccumulation and probable biomethylation
other reactions/interactions: Not important

Precipitation/Coagulation Properties: Not available

Compound: Arsenic   Formula: As

Alternate Names [1]: Arsen (German, Polish)

CAS #: 7440-38-2

Physical, Chemical, and Biological Properties [2, 3]

at. wt.: 74.9   m.p., °C: 817   b.p. (760 torr), °C: Sublimes at 613

vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: As_2O_5, 1.05 x 10^6 at 16°C; As_2O_3, 3.7 x 10^4 at 20°C
common oxidation states: +5, +3, 0, -3

Probable Fate [2]

photolysis: Not important
oxidation: Under reducing condition, As is a stable solid; dissolved arsenic acid is present in oxygenated water
hydrolysis: Hydrolyzed to arsenious and arsenic acid forms (soluble)
volatilization: Not important under natural redox conditions
sorption: As is removed by clays, iron and manganese oxides, and aluminum
biological processes: Bioaccumulated, but not biomagnified; biotransformed to organic arsenicals
other reactions/interactions: Not important

Precipitation/Coagulation Properties [4]

Compound: Asbestos

Formula:
Chrysotile - $3MgO \bullet 2SiO_2 \bullet 2H_2O$
Tremolite - $CaMg_3(SiO_3)_4$
Crocidolite - $NO_2O \bullet Fe_2O_3 \bullet 2FeO \bullet 6SiO$

Alternate Names [1]: Chrysotile, Amosite, Amphibole, Crocidolite, Tremolite, Anthophylite

CAS #: 1332-21-4

Physical, Chemical, and Biological Properties

mol. wt.: Varies m.p., °C: Varies b.p. (760 torr), °C: Unknown
vapor pressure (25°C), torr: Negligible
solubility in water (25°C), mg/L: Not applicable

Probable Fate [2]

photolysis: Asbestos is not photolyzed under environmental conditions
oxidation: Asbestos is resistant to oxidation
hydrolysis: Asbestos is not hydrolyzed under environmental conditions
volatilization: Negligible from aqueous solutions, may be aerosol under windy conditions
sorption: Does not have an adsorptive affinity for solids normally found in natural water systems
biological processes: No evidence was found regarding bioaccumulation
other reactions/interactions: Asbestos is refractory in the aquatic environment

Precipitation/Coagulation Properties: Not available

Compound: Cadmium   Formula: Cd

Alternate Names [1]: Kadmium (German)

CAS #: 7440-43-9

Physical, Chemical, and Biological Properties [2-4]

at. wt.: 112.4   m.p., °C: 321   b.p. (760 torr), °C: 765
vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: $CdCl_2$, 1.40 x 10^6 at 20°C; CdS, 1.3 at 18°C; $Cd(OH)_2$, 26 at 25°C
common oxidation states: +2 (always +2 in water)

Probable Fate [2]

photolysis: It is not an important mechanism in determining fate of cadmium compounds
oxidation: In reducing condition, Cd may precipitate with reduced sulfur to form CdS
hydrolysis: Aqueous solutions of cadmium salts are hydrolyzed to form hydroxide compounds
volatilization: It is not known to form volatile compounds
sorption: Sorption processes are important in determining cadmium transport, partitioning, and potential for remobilization
biological processes: Accumulates in the tissues of aquatic and marine organisms at higher concentration
other reactions/interactions: Organic ligands of biological origin may affect solubility and adsorption

Compound: Chromium   Formula: Cr

Alternate Names [1]: Chrome (French)

CAS #: 7440-47-3

Physical, Chemical, and Biological Properties [2]

at. wt.: 52.00   m.p., °C: 1,860   b.p. (760 torr), °C: 2,670
vapor pressure (25°C), torr: Negligible
solubility in water (0°C), mg/L: CrO_3, 6.17×10^5
common oxidation states: +3, +6

Probable Fate [2]

photolysis: Not important
oxidation: Cr(VI) slowly transformed to more stable Cr(III)
hydrolysis: Cr(III) transformed to $Cr(OH)_3$ or Cr_2O_3 (both insoluble at neutral or alkaline pH)
volatilization: Not important
sorption: Cr(VI) adsorbed by organic materials; sorption of Cr(III) ancillary to precipitation of $Cr(OH)_3$
biological processes: Bioaccumulated by many aquatic organisms and passed on through the food chain; biotransformation is not important
other reactions/interactions: Not important

Precipitation/Coagulation Properties [3]

Compound: Copper   Formula: Cu

Alternate Names [1]: Allbri natural copper, Bronze powder, Copper bronze, C.I. pigment metal 2

CAS #: 7440-50-8

Physical, Chemical, and Biological Properties [2-4]

at. wt.: 63.55   m.p., °C: 1,080   b.p. (760 torr), °C: 2,600
vapor pressure (25°C), torr: Negligible
solubility in water (0°C), mg/L: $CuCl_2$, 7.06 x 10^5
common oxidation states: +1, +2

Probable Fate [2]

photolysis: Not important
oxidation: Cu(I) quickly oxidized in water; transformation Cu(II) to CuO and $Cu_2(OH)_2CO_3$ very pH-dependent
hydrolysis: CuO and $Cu_2(OH)_2CO_3$ formed, but less effective than sorption
volatilization: Not important
sorption: Sorbed by hydrous iron and manganese oxides, enhanced by complexing with ligands
biological processes: Bioaccumulated by all organisms, but not biomagnified; biotransformation not important
other reactions/interactions: Not important

Precipitation/Coagulation Properties: Not available

CAS #: 57-12-5 for cyanide ion/74-90-8 for HCN

Physical, Chemical, and Biological Properties for HCN [1]

mol. wt.: 27.03 m.p., °C: -13.3 b.p. (760 torr), °C: 25.6
vapor pressure (20°C), torr: 620
solubility in water (25°C), mg/L: soluble in all proportions

Probable Fate [2]

photolysis: Presence of titanium dioxide causes rapid photooxidation of cyanide ion; otherwise, only some metallocyanides are photodecomposed
oxidation: Strong oxidizing agents are required to oxidize cyanides
hydrolysis: Too slow to compete with other fate mechanisms
volatilization: HCN, which composes almost all the total cyanides under natural conditions, is very rapidly volatilized
sorption: Cyanides are sorbed by most materials, but highly solublity precludes strong adsorption
biological processes: Toxicity precludes bioaccumulation; almost all organisms biodegrade cyanides, but not as rapidly as volitalization
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Lead   Formula: Pb

Alternate Names [1]: Pigment metal 4, Lead flake, Olow (Polish)

CAS #: 7439-92-1

Physical, Chemical, and Biological Properties [2, 3]

at. wt.: 207.2   m.p., °C: 328   b.p. (760 torr), °C: 1,740
vapor pressure (25°C), torr: Negligible
solubility in water (20°C), mg/L: PbO, 17; $PbCl_2$, 9.9 x 10^3
common oxidation states: o, +2, +4

Probable Fate [2]

photolysis: Not important
oxidation/reduction: Pb(IV) readily reduces to Pb(II); solubility control by $PbSO_4$ at low pH and by $PbCO_3$ at high pH
hydrolysis: Not important at pH <11.5
volatilization: Importance of volatilization of $(CH_3)_4Pb$ unknown in natural condition
sorption: Pb removed to sediments effectively by inorganic solids, hydrous iron oxides and crystalline structures
biological processes: Bioaccumulation by aquatic organisms and biomethylation by microbes
other reactions/interactions: Not important

Precipitation/Coagulation Properties [4]

Compound: Mercury   Formula: Hg

Alternate Names [1]: Quick silver; Liquid silver

CAS #: 7439-97-6

Physical, Chemical, and Biological Properties [2-4]

at. wt.: 200.6   m.p., °C: 38.9   b.p. (760 torr), °C: 357
vapor pressure (25°C), torr: 0.0012
solubility in water, mg/L: HgO, 53 at 25°C; HgS (α), 0.01 at 18°C; HgS (β), insoluble; $HgCl_2$, 6.9×10^4 at 20°C
common oxidation states: +1, +2

Probable Fate [2]

photolysis: Breakdown of atmospheric dimethyl mercury to methyl mercury of slight importance
oxidation/reduction: Oxidation of metallic mercury forms ionic mercury (later adsorbed); reduction forms HgS precipitate
hydrolysis: Not important
volatilization: Metallic Hg, methylated Hg, and adsorbed Hg all volatilizable
sorption: Hg is adsorbed by most particles, buried in sediment, and reduced to HgS
biological processes: Bioaccumulated by all organisms and readily methylated metabolically
other reactions/interactions: Not important

Compound: Nickel　　　　Formula: Ni

Alternate Names [1]: Nickel sponge, Pulverized nickel, Raney nickel, Carbonyl nickel powder

CAS #: 7440-02-0

Physical, Chemical, and Biological Properties [2, 3]

at. wt.: 58.71　　m.p., °C: 1,450　　b.p. (760 torr), °C: 2,730
vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: NiS, 3.6 at 18°C; $NiCl_2$, 6.42×10^5 at 20°C
common oxidation states: +2

Probable Fate [2]

photolysis: Not important
oxidation: Under reducing conditions with sulfur, NiS is formed; otherwise unimportant
hydrolysis: Hydrolysis under natural conditions removes no nickel from solution
volatilization: Not important
sorption: Ni coprecipitates with hydrous metal oxides, and to a lesser degree is adsorbed by organic matter and incorporated in crystalline minerals
biological processes: Slightly bioaccumulated; no biotransformation noted
other reactions/interactions: Not important

Precipitation/Coagulation Properties: Not available

Compound: Selenium   Formula: Se

Alternate Names [1]: Selenium dust

CAS #: 7782-49-2

Physical, Chemical, and Biological Properties [2, 3]

at. wt.: 78.96   m.p., °C: 217   b.p. (760 torr), °C: 685
vapor pressure (25°C), torr: Negligible
solubility in water (14°C), mg/L: SeO_2, 3.84×10^5; SeO_3 decomposes, very soluble
common oxidation states: 2, 0, +4, +6

Probable Fate [2]

photolysis: Not important
oxidation: In aerobic waters, soluble anions are formed; under reducing conditions, selenium or metal selenides (insoluble) go into sediment, possibly forming volatile H_2Se
hydrolysis: SeO_4^{-2}, SeO_4^{-2}, and $HSeO_3^-$ (all soluble) are formed
volatilization: H_2Se can be formed; volatilization can also follow biomethylation
sorption: Adsorbed by hydrous metal oxides (strongly), clays, and organic chemicals, but only a small percentage of total Se is sorbed
biological processes: Bioaccumulation by many species; possible biological redox reactions, and some biomethylation
other reactions/interactions: Not important

Compound: Silver Formula: Ag

Alternate Names [1]: Argentium, Shell silver

CAS #: 7440-22-4

Physical, Chemical, and Biological Properties [2, 3]

at. wt.: 107.9 m.p., °C: 962 b.p. (760 torr), °C: 2,210
vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: Ag_2O, 13 at 20°C; AgCl, 0.89 at 10°C
common oxidation states: +1 (principal state), +2, +3

Probable Fate [2]

photolysis: Not important in aquatic environment
oxidation: Ag and Ag+ compounds (most insoluble) only forms usually present (both precipitate)
hydrolysis: Important only at high pH, where Ag_2O may precipitate
volatilization: Not important
sorption: Strongly sorbed by MnO_2, then released in saline water; some sorption by clays and organic materials
biological processes: Bioaccumulated by many aquatic organisms
other reactions/interactions: Not important

Compound: Thallium   Formula: Tl

Alternate Names [1]: Thallium salt

CAS #: 7440-28-0

Physical, Chemical, and Biological Properties [2,3]

mol. wt.: 204.4   m.p., °C: 304   b.p. (760 torr), °C: 1,460
vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: Tl_2S, 2.0×10^2 at 20°C; TlCl, 2.9×10^3 at 16°C
common oxidation states: +1, +3

Probable Fate [2]

photolysis: Not important
oxidation: Tl(III) present only in very oxidizing water; in reducing conditions, metallic Tl or sulfide may precipitate
hydrolysis: Hydrolysis of Tl^{3+} to insoluble $Tl(OH)_3$ unimportant because of low Tl^{3+} content of natural water
sorption: Tl^+ adsorbed strongly by clay minerals and to a lesser degree by hydrous metal oxides
biological processes: Quickly bioaccumulated by aquatic organisms
other reactions/interactions: Not important

Precipitation/Coagulation Properties: Not available

Compound: Zinc   Formula: Zn

Alternate Names [1]: Blue powder, C.I. Pigment-black 16

CAS #: 7440-66-6

Physical, Chemical, and Biological Properties [2, 3]

mol. wt.: 65.38   m.p., °C: 420   b.p. (760 torr), °C: 907
vapor pressure (25°C), torr: Negligible
solubility in water, mg/L: ZnO, 1.6 at 29°C; $ZnCl_2$, 4.32×10^6 at 25°C
common oxidation states: Always +2 in aqueous solution

Probable Fate

photolysis: Not important
oxidation: ZnS precipitates under reducing conditions; most redox conditions do not affect Zn directly, but affect materials which sorb Zn
hydrolysis: $Zn(OH)_2$ and ZnO precipitate after formation by hydrolysis
volatilization: Not important
sorption: Dominant fate of Zn is sorption by hydrous metal oxides, clay minerals, and organic materials
biological processes: Strongly bioaccumulated in all organisms and biotransformed to many zinc-containing enzymes
other reactions/interactions: Not important

Precipitation/Coagulation Properties: Not available

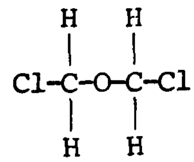
Compound: Bis(chloromethyl) ether

Formula:



Alternate Names: BCME, Bis-CME, sym-Dichloromethyl ether

CAS #: 542-88-1

Physical, Chemical, and Biological Properties [1]

mol. wt.: 115 m.p., °C: -41.5 b.p. (760 torr), °C: 104
vapor pressure (22°C), torr: 30
solubility in water (temp. unknown), mg/L: 22,000
log octanol/water partition coefficients: -0.38
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Does not occur
oxidation: Oxidation by hydroxyl radical can compete with hydrolysis in air but not in water
hydrolysis: Very rapidly hydrolyzed, independent of pH
volatilization: Cannot compete with hydrolysis
sorption: Not important
biological processes: Not important
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

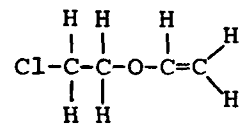
Compound: 2-Chloroethyl vinyl ether

Formula:



Alternate Names: (2-Chloroethoxy) ethene,
Vinyl 2-chloroethyl ether

CAS #: 110-75-8

Physical, Chemical, and Biological Properties [1]

mol. wt.: 106.6 m.p., °C: Not available b.p. (760 torr), °C: 108
vapor pressure (20°C), torr: 26.75
solubility in water (temp. unknown), mg/L: 15,000
log octanol/water partition coefficients: 1.28
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Does not occur
oxidation: Atmospheric photooxidation after volatilization principal fate of $ClCH_2CH_2OCHCH_2$
hydrolysis: Of minor importance if compound is adsorbed by clays or fulvic acids
volatilization: High vapor pressure indicates strong volatilization
sorption: Probably adsorbed by clays and humic materials
biological processes: Insufficient data to reach conclusion
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF 2-CHLOROETHYL VINYL ETHER[a,b]

Industry	Raw wastewater					
	Concentration, µg/L			Loading,[c] kg/d		
	Minimum	Maximum	Mean	Minimum	Maximum	Mean

[a]Information contained in this table was obtained from Volume II of the Treatability Manual.

[b]NA - not available; ND - not detected; BDL - below detection limit.

[c]Pollutant loadings determined by multiplying mean pollutant concentration by industry wastewater discharges as reported in Section I.3; where mean is not available, one-half the reported maximum was utilized.

INDUSTRIAL OCCURRENCE OF 2-CHLOROETHYL VINYL ETHER[a,b]

	Treated wastewater					
	Concentration, µg/L			Loading,[c] kg/d		
Industry	Minimum	Maximum	Mean	Minimum	Maximum	Mean

[a]Information contained in this table was obtained from Volume II of the Treatability Manual.

[b]NA - not available; ND - not detected; BDL - below detection limit.

[c]Pollutant loadings determined by multiplying mean pollutant concentration by industry wastewater discharges as reported in Section I.3; where mean is not available, one-half the reported maximum was utilized.

POLLUTANT REMOVABILITY/TREATABILITY WASTEWATER TREATMENT ALTERNATIVE FOR 2-CHLOROETHYL VINYL ETHER[a,b]

Treatment process[a]	Synthetic wastewater		Actual wastewater		Volume III references, Section numbers
	Removal range,[c] %	Average achievable conc., µg/L	Removal range,[c] %	Average achievable conc., µg/L	

[a]See Volume III for detailed information.

[b]NA - Not available, ND - not detected, BDL - below detection limit.

[c]Average and maximum removals reported.

Compound: 4-Chlorophenyl phenyl ether   Formula: 
Alternate Names: 1-Chloro-4-phenoxybenzene,
p-Chlorophenyl phenyl ether,
4-Chlorodiphenyl ether,
4-Chlorophenyl ether

CAS #: 7005-72-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 203.7   m.p., °C: Not available   b.p. (760 torr), °C: 284
vapor pressure (20°C), torr: 0.001
solubility in water (20°C), mg/L: 59
log octanol/water partition coefficients: 5.00
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Could be important if compound is adsorbed by humus containing sensitizers (polyfunctional aromatics)
oxidation: Not important
hydrolysis: Not important
volatilization: Although no data available, believed to be unimportant
sorption: Adsorption by humus certain; by clays probable
biological processes: Possible bioaccumulation; gradual biodegradation (t 1/2 ∿250 days)
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF 4-CHLOROPHENYL PHENYL ETHER[a,b]

	Raw wastewater					
	Concentration, μg/L			Loading,[c] kg/d

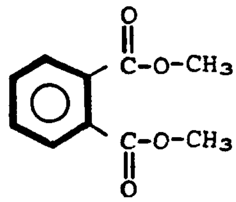
Compound: Dimethyl phthalate

Formula:



Alternate Names: DMP, 1,2-Benzenedicarboxylic acid, Dimethyl ester, Phthalic acid dimethyl ester, Methyl phthalate

CAS #: 131-11-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 194.2 m.p., °C: 0 b.p. (760 torr), °C: 282
vapor pressure (20°C), torr: <0.01
solubility in water (32°C), mg/L: 4,000
log octanol/water partition coefficients: 3.42
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: No direct photolysis; indirect photolysis too slow to be important
oxidation: Not important
hydrolysis*: Too slow to be important under natural conditions
volatilization: Possible, but not important
sorption*: Sorption onto particles and Biota and complexation with humic substances principal transport mechanism
biological processes*: Bioaccumulation, biodegradation, and biotransformation by many organisms (including humans) are very important fates
other reactions/interactions: Not important

*Inferred from data on phthalate esters as a group.

Carbon Adsorption Data [2]

pH: 3.0, 7.0, 9.0
type of carbon: Not available
adsorbability: 93 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

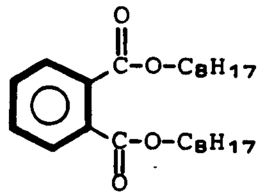
Compound: Di-n-octyl phthalate

Formula:



Alternate Names: DOP, *o*-Benzenedicarboxylic acid, Dioctyl ester, n-Dioctyl phthalate, Octyl phthalate, Dioctyl-*o*-benzenedicarboxylate

CAS #: 117-84-0

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 391.0 m.p., °C: -25 b.p. (760 torr), °C: 220
vapor pressure (150°C), torr: <0.2
solubility in water (25°C), mg/L: Insoluble
log octanol/water partition coefficients: >4.42 (exact value unknown because of molecular folding)
Henry's law constant: Not available
biodegradability: Aerobic degradation in fresh water hydrosoil; 50% after 14 days incubation

Probable Fate [1]

photolysis: No direct photolysis; indirect photolysis too slow to be important
oxidation: Not important
hydrolysis*: Hydrolysis only in surface waters but too slow to be important
volatilization: Not likely to be an important transport process
sorption*: Adsorption onto solids and particles and complexation with organics are important transport processes
biological processes*: Bioaccumulation by many organisms, biodegradation, and metabolization are all important fates
other reactions/interactions: Not important

---

*Inferred from data on phthalate esters as a group.

Carbon Adsorption Data: Not available

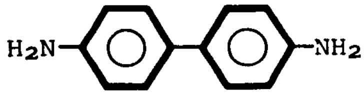
Compound: Benzidine

Formula:



Alternate Names: 4,4'-Diaminobiphenyl,
4,4'-Biphenyldiamine,
(1,1'-Biphenyl)-4,4'-diamine

CAS #: 92-87-5

Physical, Chemical, and Biological Properties [1]

mol. wt.: 184.2 m.p., °C: 129 b.p. (760 torr), °C: 402
vapor pressure (25°C), torr: Not available
solubility in water (12°C), mg/L: 400
log octanol/water partition coefficients: 1.81
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Possible but actual significance uncertain
oxidation: Oxidation by metal cations very fast; also, reactions with oxygen and/or hyperoxy radical are very important
hydrolysis: Not important
volatilization: Not important
sorption: Very rapid adsorption by clay minerals
biological processes: No bioaccumulation; only slight biodegradation
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

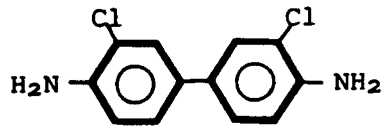
Compound: 3,3'-Dichlorobenzidine

Formula:



Alternate Names: 3,3'-Dichloro-4,4'-diamino-(1,1'-biphenyl)

CAS #: 91-94-1

Physical, Chemical, and Biological Properties [1]

mol. wt.: 253.1   m.p., °C: 132   b.p. (760 torr), °C: Not available
vapor pressure (25°C), torr: Not available
solubility in water (25°C), mg/L: Not available
log octanol/water partition coefficients: 3.02
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis*: Probable, but exact importance unknown
oxidation*: Oxidized (especially by metal cations) like benzidine but not quite as easily
hydrolysis: Probably not important
volatilization*: Not important
sorption*: Adsorption by clay minerals, possibly most important transport process
biological processes: No data available
other reactions/interactions: Not important

---

*Based on data for unsubstituted benzidine.

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF 3,3'-DICHLOROBENZIDINE[a,b]

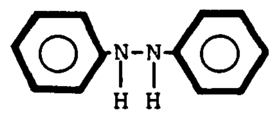
Compound: 1,2-Diphenylhydrazine

Formula:



Alternate Names: Hydrazobenzene, N,N'-bianiline

CAS #: 122-66-7

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 184.2 m.p., °C: 131 b.p. (760 torr), °C: Not available
vapor pressure (25°C), torr: Not available
solubility in water (25°C), mg/L: Not available
log octanol/water partition coefficients: 3.03
Henry's law constant: Not available
biodegradability: No information for 1,2-Diphenylhydrazine; 1,1-Diphenylhydrazine reduced from 2 ppm to nondetectable levels during 7-day static biological test using activated sludge

Probable Fate [1]

photolysis: Slow photoreduction to aniline possibly leads to destruction of compound
oxidation: Reversible oxidation to azobenzene occurs; further oxidation unknown if any
hydrolysis: Only possible in bisulfite wastes of a paper mill or coal mine
volatilization: Not important
sorption: Sorption onto particulates is the main transport process for the compound
biological processes: No data, but bioaccumulation possible
other reactions/interactions: Intramolecular rearrangement to form benzidine occurs in acidic solution

Carbon Adsorption Data: Not available

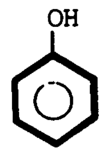
Compound: Phenol

Formula:



Alternate Names: Carbolic acid, Hydroxybenzene, Phenyl hydroxide, Phenic acid, Phenyl hydrate

CAS #: 108-95-2

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 94.11 m.p., °C: 40.9 b.p. (760 torr), °C: 182
vapor pressure (20°C), torr: 0.529*
solubility in water (25°C), mg/L: 93,000
log octanol/water partition coefficient: 1.46
Henry's law constant: Not available
biodegradability: 98% phenol removal (measured as COD removal) obtained at 20°C in activated sludge at a rate of 80 mg COD/g dry innoculum/hr

---

*Vapor pressure of phenol as a supercooled liquid.

Probable Fate [1]

photolysis: Photooxidation of votalized phenol and photolysis of phenolic anion may both take place at moderate rates
oxidation: Metal-catalyzed oxidation may take place in highly aerated waters
hydrolysis: Not important
volatilization: Very little, if any, volatilization of phenol occurs
sorption: Not important
biological processes: No bioaccumulation, but very extensive biodegradation in natural waters
other reactions/interactions: Chlorination of water may produce chlorophenols

Carbon Adsorption Data [3]

pH: 3.0, 7.0, 9.0
type of carbon: Not available
adsorbability: 430 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

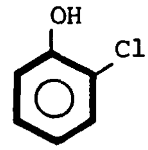
Compound: 2-Chlorophenol

Formula:



Alternate Names: *o*-Chlorophenol

CAS #: 95-57-8

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 128.6 m.p., °C: 8.4 b.p. (760 torr), °C: 176
vapor pressure (20°C), torr: 2.2 (calculated)
solubility in water (20°C), mg/L: 28,500
log octanol/water partition coefficient: 2.17
Henry's law constant: Not available
biodegradability: 96% 2-chlorophenol removal (measured as COD removal) obtained at 20°C in activated sludge at a rate of 25 mg COD/g dry innoculum/hr

Probable Fate [1]

photolysis: Photolysis occurs in aqueous alkali, but environmental importance is unknown
oxidation: Insufficient data
hydrolysis: Not important
volatilization: Probably occurs, but not fast enough to be important
sorption: Slight potential for adsorption by lipophilic materials
biological processes: No bioaccumulation; much more resistant to biodegradation than phenol
other reactions/interactions: Chlorination of water could further chlorinate 2-chlorophenol

Carbon Adsorption Data [3]

pH: 5.5
type of carbon: Filtrasorb-300
adsorbability: Not available

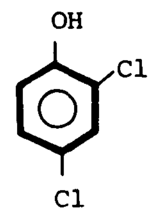
Compound: 2,4-Dichlorophenol   Formula:



Alternate Names: 2,4-DCP

CAS #: 120-83-2

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 163.0   m.p., °C: 45   b.p. (760 torr), °C: 210
vapor pressure (20°C), torr: 0.12 (calculated)
solubility in water (20°C), mg/L: 4,500
log octanol/water partition coefficient: 2.75
Henry's law constant: Not available
biodegradability: 98% 2,4-dichlorophenol removal (measured as COD removal) obtained at 20°C in activated sludge at a rate of 10 mg COD/g dry innoculum/hr

Probable Fate [1]

photolysis: Photolysis possible, but cannot compete with microbial biodegradation
oxidation: Any oxidation which occurs is too slow to be important
hydrolysis: Not important
volatilization: No data, but not expected to be important
sorption: Sorption will not remove significant amounts of 2,4-Dichlorophenol
biological processes: Rapid microbial degradation is the principal fate of 2,4-DCP
other reactions/interactions: Chlorination of water may produce further chlorination of 2,4-DCP

Carbon Adsorption Data [3]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

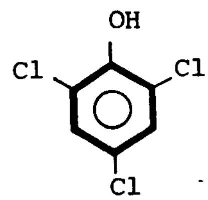
Compound: 2,4,6-Trichlorophenol   Formula:



Alternate Names: None

CAS #: 88-06-2

Physical, Chemical, and Biological Properties [1, 2]

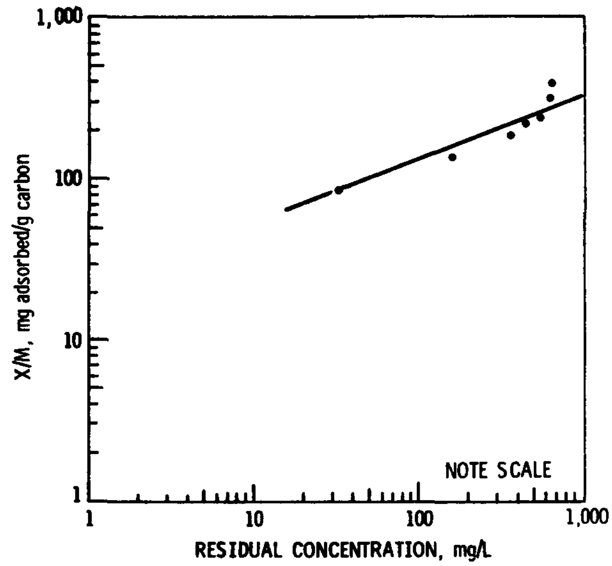
mol. wt.: 197.4   m.p., °C: 68   b.p. (760 torr), °C: 244
vapor pressure (76.5°C), torr: 1.0
solubility in water (25°C), mg/L: 800
log octanol/water partition coefficient: 3.38
Henry's law constant: Not available
biodegradability: 100% degradation of 200 mg/L solution by Pseudomonas at 30°C in 120 hr

Probable Fate [1]

photolysis: Reported in experiments, but environmental significance unknown
oxidation: Too slow to be important
hydrolysis: Not important
volatilization: Not important
sorption: High potential for sorption by organic materials; rate unknown
biological processes: Biodegradation very important, but exact rate uncertain due to variations between data
other reactions/interactions: Not important

Carbon Adsorption Data [3]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available



Date: 8/13/79   I.8.4-1

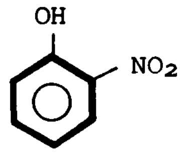
Compound: 2-Nitrophenol

Formula:



Alternate Names: *o*-Nitrophenol, 2-Hydroxynitrobenzene

CAS #: 88-75-5

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 139.11 m.p., °C: 45.3 b.p. (760 torr), °C: 216
vapor pressure (49.3°C), torr: 1.0
solubility in water (20°C), mg/L: 2,100
log octanol/water partition coefficient: 1.76
Henry's law constant: Not available
biodegradability: 97% 2-nitrophenol removal (measured as COD removal) obtained at 20% C in activated sludge at a rate of 14 mg COD/g dry innoculum/hr

Probable Fate [1]

photolysis: Slow photolysis is very probable fate
oxidation: Oxidation by hydroxy radical attack; no rate available
hydrolysis: Slight potential for hydrolysis after adsorption by clay materials
volatilization: Volatilization occurs, but is not important
sorption: Adsorbed to a moderate degree by clay minerals
biological processes: No bioaccumulation; very resistant to biodegradation under natural conditions
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

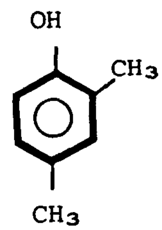
Compound: 2,4-Dimethylphenol

Formula:



Alternate Names: 2,4-Xylenol,
1-Hydroxy-2,4-dimethylbenzene

CAS #: 105-67-9

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 122.2 m.p., °C: 24.5 b.p. (760 torr), °C: 211
vapor pressure (20°C), torr: 0.0621*
solubility in water (160°C), mg/L: 17,000
log octanol/water partition coefficient: 2.50
Henry's law constant: Not available
biodegradability: 95% 2,4-dimethylphenol removed (measured as COD removal) obtained at 20°C in activated sludge at a rate of 28 mg COD/g dry innoculum/hr

*Vapor pressure as a supercooled liquid.

Probable Fate [1]

photolysis: Photooxidation definitely occurs, but rate and importance are unknown
oxidation: Metal-catalyzed oxidation may occur in aerated surface waters
hydrolysis: Not important
volatilization: Not important
sorption: Slight potential for adsorption onto organic materials
biological processes: Available data are conflicting and inconclusive, but biodegradation can occur
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

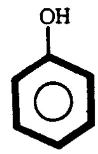
Compound: Total phenols

Formula: Derivatives of phenol



Alternate Names: Hydroxybenzenes,
Phenoyl hydroxides

CAS #: See sections on individual phenols

Physical, Chemical, and Biological Properties

See sections on individual phenols.

Probable Fate [1]

photolysis: Photooxidation is important only for phenol, pentachlorophenol, nitrophenols, and possibly alkyl phenols
oxidation: Probably not important for any phenols
hydrolysis: Probably not important for any phenols
volatilization: Phenols are volatilized very little
sorption: Important for highly chlorinated phenols and possibly for nitrophenols
biological processes: Biodegradation is very important for chlorophenols, but not for nitrophenols
other reactions/interactions: Not important

Carbon Adsorption Data: See sections on individual phenols

Compound: Benzene

Formula: 

Alternate Names: Benzol, Cyclohexatriene

CAS #: 71-43-2

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 78.12 m.p., °C: 5.5 b.p. (760 torr), °C: 80.1
vapor pressure (25°C), torr: 95.2
solubility in water (25°C), mg/L: 1,780-1,800
log octanol/water partition coefficient: Conflicting data reported
Henry's law constant: Not available
biodegradability: 33% theoretical oxidation of 500 ppm benzene by phenol-acclimated sludge after 12 hr aeration

Probable Fate [1]

photolysis: Photooxidation of volatilized benzene is the only form of photolysis which occurs
oxidation: No aqueous oxidation occurs, but volatilized benzene is photooxidized at a rapid rate
hydrolysis: Not important
volatilization: Rapid volatilization (half-life = 4.81 hr) is the primary transport process for benzene
sorption: Benzene should be adsorbed by organic material
biological processes: Low potential for bioaccumulation; metabolized to catechols by many organisms; biodegraded at a slow rate
other reactions/interactions: Not important

Carbon Adsorption Data [3]

pH: 4.8-5.0
type of carbon: Not available
adsorbability: >10,000 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

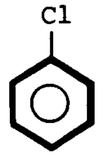
Compound: Chlorobenzene

Formula:



Alternate Names: Monochlorobenzene, Benzene chloride

CAS #: 108-90-7

Physical, Chemical, and Biological Properties [1]

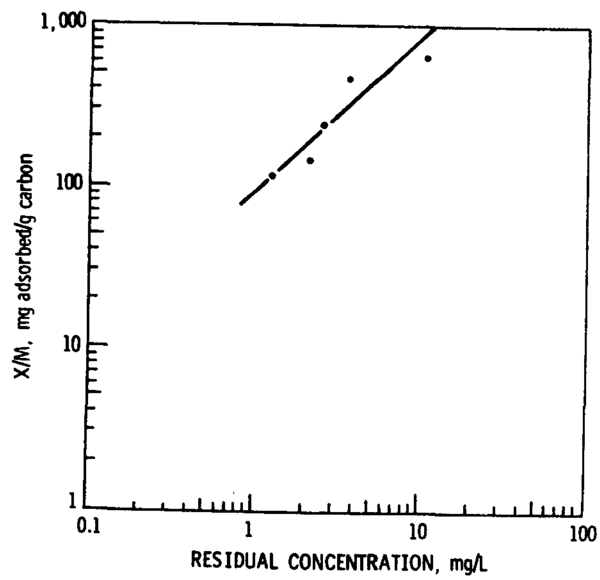
mol. wt.: 112.6 m.p., °C: -45 b.p. (760 torr), °C: 132
vapor pressure (25°C), torr: Conflicting data reported
solubility in water (25°C), mg/L: 488
log octanol/water partition coefficient: 2.84
Henry's law constant: 3.56×10^{-3} atmos. m^3/mole
biodegradability: Not available

Probable Fate [1]

photolysis: Lack of data probably indicates relative unimportance
oxidation: No data on aqueous oxidation; photooxidation of volatilized chlorobenzene is slower than photooxidation of benzene
hydrolysis: Not important
volatilization: Very rapid volatilization is the main transport process
sorption: Chlorobenzene is presumably sorbed by organic materials
biological processes: High potential for bioaccumulation and magnification; biodegradation very slow
other reactions/interactions: There is a low probability of further chlorinating chlorobenzene by reaction with chlorine-containing water

Carbon Adsorption Data [2]

pH: 7.4
type of carbon: Not available
adsorbability: 97 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH



INDUSTRIAL OCCURRENCE OF CHLOROBENZENE[a,b]

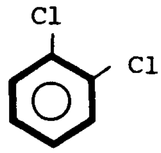
2. Dobbs, R. A., R. J. Middendorf, and J. M. Cohen. Carbon Adsorption Isotherms for Toxic Organics. U.S. Environmental Protection Agency, Cincinnati, Ohio, 1978.

Compound: 1,2-Dichlorobenzene

Formula:



Alternate Names: *o*-Dichlorobenzene, Orthodichlorobenzene, Dowtherm E

CAS #: 95-50-1

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 147.0 m.p., °C: -17.0 b.p. (760 torr), °C: 180
vapor pressure (25°C), torr: 1.5
solubility in water (25°C), mg/L: 145
log octanol/water partition coefficient: 3.38
Henry's law constant: 1.99×10^{-3} atmos. m^3/mole
biodegradability: 100% decomposition by ring disruption by Pseudomonas of 200 mg/L solution in 72 hr

Probable Fate [1]

photolysis: Lack of data probably indicates relative unimportance
oxidation: Resistant to autooxidation by peroxy radical in water; oxidation by hydroxy radicals occurs in atmosphere
hydrolysis: Not important
volatilization: Relatively rapid volatilization occurs; half-life is less than nine hours
sorption: Significant amount of adsorption by organic materials should occur in environment
biological processes: Bioaccumulated more than chlorobenzene; sufficiently resistant to biodegradation to make volatilization more important
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF 1,2-DICHLOROBENZENE[a,b]

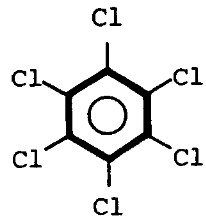
Compound: Hexachlorobenzene

Formula:



Alternate Names: Perchlorobenzene, HCB

CAS #: 118-74-1

Physical, Chemical, and Biological Properties [1]

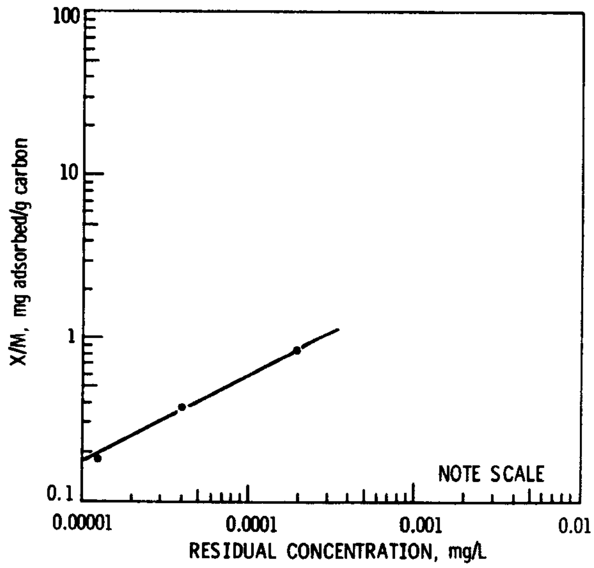
mol. wt.: 284.8 m.p., °C: 230 b.p. (760 torr), °C: 322
vapor pressure (20°C), torr: 1.09×10^{-5}
solubility in water (25°C), µg/L: 6
log octanol/water partition coefficient: 6.18
Henry's law constant: Not available
biodegradability: No degradation by Pseudomonas at 30°C in 120 hr

Probable Fate [1]

photolysis: Extremely slow under environmental conditions
oxidation: Not important
hydrolysis: Not important
volatilization: Data inconclusive
sorption: Strongly sorbed by particulate matter
biological processes: Strongly bioaccumulated by many organisms; extremely slow biodegradation
other reactions/interactions: Not important

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available



INDUSTRIAL OCCURRENCE OF HEXACHLOROBENZENE[a,b]

Industry	Raw wastewater					
	Concentration, µg/L			Loading,[c] kg/d		
	Minimum	Maximum	Mean	Minimum	Maximum	Mean
Textile mills	NA	2	1.3[d]	5.5×10^{-6}	0.037	0.0023
Nonferrous metals manufacturing	ND	5,000	220	0	NA	12

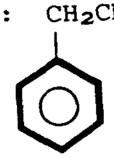
Compound: Ethylbenzene

Formula: CH_2CH_3



Alternate Names: Phenylethane, Ethylbenzol

CAS #: 100-41-4

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 106.2 m.p., °C: -94.9 b.p. (760 torr), °C: 136
vapor pressure (20°C), torr: 7
solubility in water (20°C), mg/L: 152
log octanol/water partition coefficient: 3.15
Henry's law constant: 6.44 atmos. m^3/mole
biodegradability: 27% theoretical oxidation of 500 ppm solution by phenol-acclimated activated sludge after 12 hr aeration

Probable Fate [1]

photolysis: Photooxidation after volatilization is the principal fate of ethylbenzene
oxidation: Not important other than in the case of photooxidation
hydrolysis: Not important
volatilization: Principal transport process for ethylbenzene
sorption: Probably adsorbed by organic materials
biological processes: Very little potential for bioaccumulation; can be used as sole carbon source by some microbes
other reactions/interactions: Not important

Carbon Adsorption Data [3]

pH: 7.3
type of carbon: Not available
adsorbability: 170 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

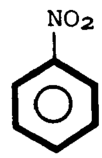
Compound: Nitrobenzene

Formula:



Alternate Names: Nitrobenzol

CAS #: 98-95-3

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 123.1 m.p., °C: 5.6 b.p. (760 torr), °C: 211
vapor pressure (20°C), torr: 0.15
solubility in water (20°C), mg/L: 1,900
log octanol/water partition coefficient: 1.85
Henry's law constant: 1.53×10^{-5} atmos. m^3/mole
biodegradability: 98% nitrobenzene removal (measured as COD removal) obtained at 20°C in activated sludge at a rate of 14 mg COD/g dry innoculum/hr

Probable Fate [1]

photolysis: Photoreduction could occur if nitrobenzene is adsorbed onto humus particles
oxidation: Only important as method of destroying photoreduction products
hydrolysis: Not important
volatilization: Not fast enough to be important
sorption: Adsorbed by humus and probably by clay
biological processes: No bioaccumulation of any significance; biodegradation is relatively slow
other reactions/interactions: Not important

Carbon Adsorption Data [3]

pH: 7.5
type of carbon: Not available
adsorbability: 130 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

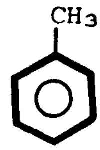
Compound: Toluene

Formula:



Alternate Names: Toluol, Phenylmethane, Methylbenzene, Methylbenzol, Methacide

CAS #: 108-88-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 92.13 m.p., °C: -95 b.p. (760 torr), °C: 111
vapor pressure (25°C), torr: 28.7
solubility in water (25°C), mg/L: 535
log octanol/water partition coefficient: 2.69
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Amount of dissociation to benzyl alcohol and benzaldehyde unknown; atmospheric photooxidation to benzaldehyde follows volatilization
oxidation: Only important as photooxidation
hydrolysis: Not important
volatilization: Volatilization occurs with a half-life of about five hours
sorption: Presumably adsorbed by organic materials
biological processes: Bioaccumulation not important; metabolization produces acids (acetic, pyruvic, and hippuric)
other reactions/interactions: Not important

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

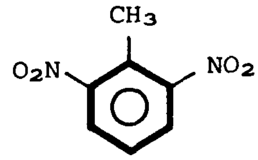
Compound: 2,6-Dinitrotoluene

Formula:



Alternate Names: Dinitrotoluol

CAS #: 606-20-2

Physical, Chemical, and Biological Properties [1]

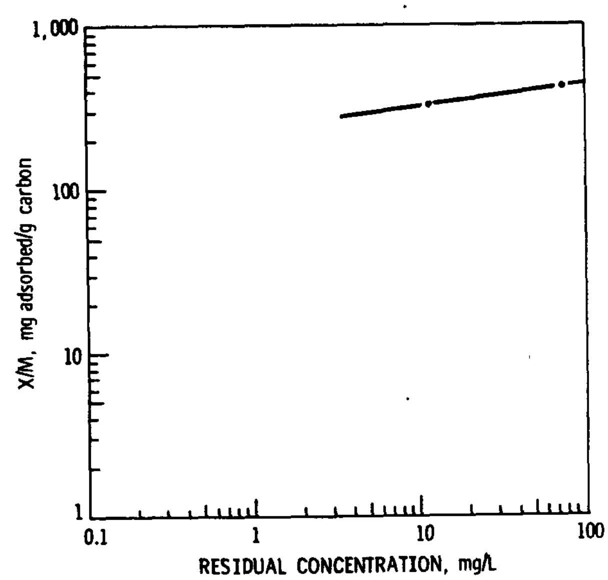
mol. wt.: 182.1 m.p., °C: 65 b.p. (760 torr), °C: 285
vapor pressure (25°C), torr: Not available
solubility in water (25°C), mg/L: Not available
log octanol/water partition coefficient: 2.05
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Intramolecular photolysis could be very important
oxidation: Not important
hydrolysis: Not important
volatilization: Probably not an important transport process
sorption: 2,6-Dinitrotoluene should be strongly sorbed by humus and clay
biological processes: No data on bioaccumulation; biodegradation very slow
other reactions/interactions: Not important

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available



INDUSTRIAL OCCURRENCE OF 2,6-DINITROTOLUENE[a,b]

	Raw wastewater					
	Concentration, μg/L			Loading,[c] kg/d		
Industry	Minimum	Maximum	Mean	Minimum	Maximum	Mean
Textile mills	NA	54[d]	54[d]	0.00023	1.6	0.097

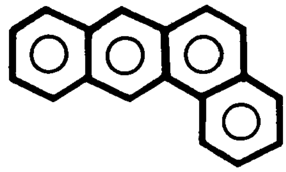
Compound: Benz(a)anthracene

Formula:



Alternate Names: 1,2-Benzanthracene, Tetraphene, Naphthanthracene, 2,3-Benzophenanthrene

CAS #: 56-55-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 228.3   m.p., °C: 155-157   b.p. (760 torr), °C: Not available
vapor pressure (20°C), torr: 5×10^{-9}
solubility in water (25°C), mg/L: 0.014
log octanol/water partition coefficient: 5.61
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Photolysis to quinones is rapid, but is greatly hindered by adsorption
oxidation: Oxidation by alkyl peroxy radicals could compete with photolysis dissolved benz(a)anthracene
hydrolysis: Not important
volatilization: Too slow to compete with sorption as a transport process
sorption: Very strong adsorption by suspended solids is the principal transport process
biological processes: Short-term bioaccumulation is accompanied by metabolization; biodegradation is the principal fate
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

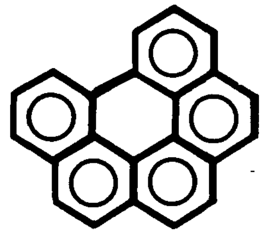
Compound: Benzo(ghi)perylene

Formula:



Alternate Names: 1,12-Benzoperylene

CAS #: 191-24-2

Physical, Chemical, and Biological Properties [1]

mol. wt.: 276   m.p., °C: 222   b.p. (760 torr), °C: Not available
vapor pressure (20°C), torr: 10^{-10} (calculated)
solubility in water (25°C), mg/L: 0.00026
log octanol/water partition coefficient: 7.23
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: The dissolved portion could undergo rapid photolysis, but very little of the compound is present in dissolved form
oxidation: Oxidation by chlorine and/or ozone could occur if enough chlorine or ozone is present; relatively unimportant
hydrolysis: Not important
volatilization: Probably too slow to compete with adsorption as a transport process; rate uncertain
sorption: Very strong adsorption onto suspended solids, especially organic matter, should be the dominant transport process
biological processes: Bioaccumulation is short-term; metabolization and microbial biodegradation are the principal fates
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Anthracene

Formula: 
Alternate Names: Paranaphthalene, Green oil, Tetra Olive NZG

CAS #: 120-12-7

Physical, Chemical, and Biological Properties [1]

mol. wt.: 178.2   m.p., °C: 216   b.p. (760 torr), °C: Not available
vapor pressure (20°C), torr: 1.95×10^{-4}
solubility in water (25°C), mg/L: 0.073
log octanol/water partition coefficient: 4.45
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Rapid photolysis occurs only for dissolved portion; thus, increased adsorption greatly decreases photolysis
oxidation: Ozone and chlorine in sufficient quantities can oxidize dissolved anthracene
hydrolysis: Not important
volatilization: Volatilization is hindered by adsorption and is significant only in shallow, clear, well mixed streams
sorption: Adsorption by suspended solids and sediments is the primary transport process
biological processes: Short-term bioaccumulation; metabolization and biodegradation are the ultimate fates
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Fluorene

Formula: 
Alternate Names: 2,3-Benzidene,
Diphenylenemethane

CAS #: 86-73-7

Physical, Chemical, and Biological Properties [1]

mol. wt.: 116.2 m.p., °C: 116-117 b.p. (760 torr), °C: Not available
vapor pressure (20°C), torr: 1.3×10^{-2} (calculated)
solubility in water (25°C), mg/L: 1.98
log octanol/water partition coefficient: 4.18
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Inconclusive data; photolysis may be important, but is probably impeded by adsorption
oxidation: Chlorine and/or ozone in sufficient quantities may oxidize fluorene
hydrolysis: Not important
volatilization: Probably not an important transport process
sorption: Adsorption onto particles, biota, and sediments is probably the dominant transport process
biological processes: Bioaccumulation is short-term; metabolization and biodegradation are very important fates
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

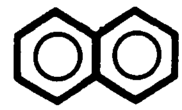
Compound: Naphthalene

Formula:



Alternate Names: Moth balls, Tar Camphor, Naphthene

CAS #: 91-20-3

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 128.2 m.p., °C: 80.6 b.p. (760 torr), °C: Not available
vapor pressure (20°C), torr: 0.0492
solubility in water (25°C), mg/L: 34.4
log octanol/water partition coefficient: 3.37
Henry's law constant: Not available
biodegradability: Readily degraded in static biological test using acclimated seed from an activated sludge plant; reduced from 2 ppm to nondetectable during 7-day test

Probable Fate [1]

photolysis: Relatively high solubility could make photolysis an important fate; data inconclusive
oxidation: Chlorine and/or ozone in sufficient quantities may oxidize naphthalene
hydrolysis: Not important
volatilization: Rate uncertain; could be very important
sorption: Relatively low partition coefficient makes adsorption less dominant but sorption is still a competitive transport process
biological processes: Short-term bioaccumulation; biodegradation and metabolization are the ultimate fates
other reactions/interactions: Not important

Carbon Adsorption Data [3]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

Compound: Aroclor 1016

Formula: A mixture of mono, di, and trichloro isomers of the polychlorinated biphenyls (PCB's)

Alternate Names: None

CAS #: Not assigned

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 257.9* m.p., °C: Not available b.p. (760 torr), °C: 325-356
vapor pressure (25°C), torr: 4×10^{-4} (estimated)
solubility in water (temp. unknown), mg/L: 0.34 (estimated)
log octanol/water partition coefficient: 3.48 (estimated)
Henry's law constant: Not available
biodegradability: Aerobic degradation in semicontinuous activated sludge process; 30% degradation of <1 mg/L concentration after 48 hours incubation

---

*Average.

Probable Fate [1]

photolysis: Not important
oxidation: Not important
hydrolysis: Not important
volatilization: Slow volatilization is the cause of global distribution of PCB's, but is inhibited by adsorption
sorption: PCB's are rapidly adsorbed onto solids especially organic matter, and are often immobilized in sediments, but may reenter solution
biological processes: Strong bioaccumulation; mono-, di- and tri-chlorinated biphenyls are gradually biodegraded
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Aroclor 1221

Formula: A mixture of polychlorinated biphenyls which is approximately 21% chlorine by weight

Alternate Names: None

CAS #: 111-042-82

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 200.7* m.p., °C: Not available b.p. (760 torr), °C: 275-320
vapor pressure (25°C), torr: 6.7×10^{-3} (estimated)
solubility in water (25°C), mg/L: 15 (estimated)
log octanol/water partition coefficient: 2.81 (estimated)
Henry's law constant: Not available
biodegradability: Aerobic degradation in semicontinuous activated sludge process; 80% degradation of <5 mg/L concentration after 48 hour incubation

*Average.

Probable Fate [1]

photolysis: Not important
oxidation: Not important
hydrolysis: Not important
volatilization: Slow volatilization distributes PCB's globally, but is inhibited by adsorption
sorption: PCB's are rapidly adsorbed onto solids, especially organic matter, and are often immobilized in sediment, but may reenter solution
biological processes: Strong bioaccumulation; mono-, di-, and tri-chlorinated biphenyls are gradually biodegraded
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Methyl chloride

Formula:

```
    H
    |
 Cl-C-H
    |
    H
```

Alternate Names: Chloromethane, Monochloromethane

CAS #: 74-87-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 50.59 m.p., °C: -97.7 b.p. (760 torr), °C: -24.2
vapor pressure (20°C), torr: 3,760
solubility in water (20°C), mg/L: 6,450-7,250
log octanol/water partition coefficient: 0.91
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Information lacking, probably unimportant; appreciable photodissociation may occur in stratosphere
oxidation: Information lacking, probably unimportant; in troposphere oxidation by hydroxyl radicals for formyl chloride and other products important fate
hydrolysis: Slow hydrolysis, unimportant in comparison to volatilization
volatilization: Volatilization to the atmosphere is rapid and is a major transport process for removal of methyl chloride
sorption: No data available, sorption onto sediments and suspended particulates probably unimportant
biological processes: Data lacking, biodegradation and bioaccumulation are not expected to be important fates
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF METHYL CHLORIDE[a,b]

	Raw wastewater

Compound: Methylene chloride

Formula: 
Alternate Names: Dichloromethane, Methylene dichloride, Methane dichloride, Methylene bichloride

CAS #: 74-09-2

Physical, Chemical, and Biological Properties [1]

mol. wt.: 84.94 m.p., °C: -95 b.p. (760 torr), °C: 39.8
vapor pressure (20°C), torr: 362
solubility in water (25°C), mg/L: 13,200-20,000
log octanol/water partition coefficient: 1.25
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Photochemical reactions in aqueous media are probably unimportant slow photodecomposition in troposphere in the presence of nitrogen oxides is possible, appreciable photodissociation may occur in stratosphere
oxidation: Information lacking, probably unimportant; in troposphere oxidation by hydroxyl radicals to carbon dioxide, carbon monoxide, and phosgene is important fate mechanism
hydrolysis: Not important fate process
volatilization: Due to high vapor pressure, volatilization to the atmosphere is rapid and is a major transport process
sorption: Data lacking, sorption by inorganic and organic materials not expected to be important fate mechanism
biological processes: Data lacking, bioaccumulation not expected, biodegradation may be possible
other reactions/interactions: Not important

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

   Cl
   |
Cl-C-Cl
   |
   Cl
```

Alternate Names: Tetrachloromethane, Methane tetrachloride, Perchloromethane, Benzinoform

CAS #: 56-23-5

Physical, Chemical, and Biological Properties [1]

mol. wt.: 153.8   m.p., °C: -22.9   b.p. (760 torr), °C: 76.5
vapor pressure (20°C), torr: 90
solubility in water (20°C), mg/L: 785
log octanol/water partition coefficient: 2.64
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: No information available pertaining to the rate of photolysis in aqueous environment; in the stratsophere photodissociation occurs to eventually form phosgene as the principal product
oxidation: No information available; in troposphere it exhibits an extremely slow rate of reaction with hydroxyl radicals
hydrolysis: Data unavailable
volatilization: Volatilization is rapid and is an important transport process for the removal of tetrachloromethane from aquatic systems
sorption: Little data available, but adsorption onto sediments rich in organic material possible
biological processes: Little data available, some bioaccumulation and biodegradation possible
other reactions/interactions: Unknown

Carbon Adsorption Data [2]

pH: 7.3
type of carbon: Not available
adsorbability: 225 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

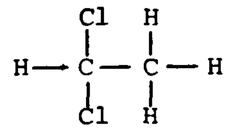
Compound: 1,1-Dichloroethane

Formula:



Alternate Names: Ethylidene chloride, Ethylidene dichloride

CAS #: 75-34-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 98.96 m.p., °C: -97.0 b.p. (760 torr), °C: 57.3
vapor pressure (25°C), torr: 234
solubility in water (20°C), mg/L: 5,500
log octanol/water partition coefficient: 1.79
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Information lacking; photodissociation to chloroacetyl chloride in stratosphere is predicted
oxidation: Information lacking; indirect evidence from similar compounds suggests little potential for oxidation in aquatic systems, in troposphere 1,1-dichloroethane is probably oxidized at a slow rate in a similar fashion to 1,2-dichloroethane
hydrolysis: No information available
volatilization: Due to high vapor pressure, volatilization to the atmosphere should be major transport process
sorption: No data available
biological processes: Data lacking; bioaccumulation not expected, biodegradation may be possible
other reactions/interactions: Unknown

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF 1,1-DICHLOROETHANE[a,b]

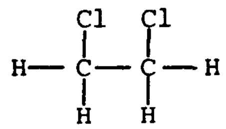
Compound: 1,2-Dichloroethane

Formula:



Alternate Names: Ethylene dichloride, Glycol dichloride

CAS #: 107-06-2

Physical, Chemical, and Biological Properties [1]

mol. wt.: 98.98 m.p., °C: -35.4 b.p. (760 torr), °C: 83.5
vapor pressure (20°C), torr: 61
solubility in water (20°C), mg/L: 8,690
log octanol/water partition coefficient: 1.48
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Information not available; photodissociation in stratosphere to chloroacetyl chloride is expected
oxidation: Information not available pertaining to oxidation in aqueous environment; in troposphere oxidation by hydroxyl radicals to chloroacetyl chloride is expected
hydrolysis: Hydrolysis is probably too slow to be an important process for removal of 1,2-dichloroethane
volatilization: Due to high vapor pressure, volatilization to the atmosphere is rapid and is major transport process
sorption: Information not available
biological processes: Information not available
other reactions/interactions: Unknown

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

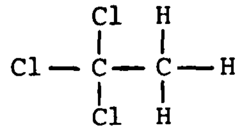
Compound: 1,1,1-Trichloroethane

Formula:



Alternate Names: Methyl chloroform, Chlorotene, Genklene, Baltana

CAS #: 71-55-6

Physical, Chemical, and Biological Properties [1]

mol. wt.: 133.4 m.p., °C: -30.4 b.p. (760 torr), °C: 74.1
vapor pressure (20°C), torr: 96.0
solubility in water (20°C), mg/L: 480-4,400
log octanol/water partition coefficient: 2.17
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Information lacking, does not appear to be a major aquatic fate; photodissociation to chlorine atoms and chlorine oxides in stratosphere is predicted
oxidation: Information lacking, probably not important aquatic fate; slow photooxidation in troposphere to trichloroacetaldehyde and subsequently trichloroacetic acid reported
hydrolysis: Slow hydrolysis to acetic and hydrochloric acids and vinylidene chloride suggested
volatilization: Volatilization to the atmosphere is rapid and is a major transport process
sorption: Information lacking, may be important fate mechanism
biological processes: Information lacking, some bioaccumulation and biodegradation indicated
other reactions/interactions: Unknown

Carbon Adsorption Data: Not available

Compound: Vinyl chloride

Formula: 
Alternate Names: Chloroethene, Monochloroethylene, Monovinylchloride, MVC, Chloroethylene

CAS #: 75-01-4

Physical, Chemical, and Biological Properties [1]

mol. wt.: 62.50 m.p., °C: -154 b.p. (760 torr), °C: -13.4
vapor pressure (25°C), torr: 2,660
solubility in water (25°C), mg/L: 1.1
log octanol/water partition coefficient: 0.60
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Light-induced transformations of vinyl chloride can occur through indirect photolysis in water containing photosensitizers, direct photolysis insignificant

oxidation: Experiments indicate that vinyl chloride is decomposed in water by reactive radicals, when present in sufficient concentration; in the troposphere rapid oxidation by hydroxyl radicals occurs yielding as end-products hydrogen chloride and carbon monoxide

hydrolysis: Due to rapid volatilization, hydrolysis should not be a significant aquatic fate

volatilization: Volatilization to the atmosphere is rapid and is a major transport process

sorption: Sorption by inorganic and organic materials not expected to be important fate mechanism

biological processes: Biodegradation and bioaccumulation are not believed to be important fate processes

other reactions/interactions: Vinyl chloride could be converted to more highly chlorinated compounds in aqueous environment where high concentrations of chlorine/chloride exist

Carbon Adsorption Data: Not available

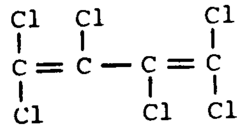
Compound: Hexachlorobutadiene

Formula:



Alternate Names: HCBD, Hexachloro-1,3-butadiene

CAS #: 87-68-3

Physical, Chemical, and Biological Properties [1]

mol. wt.: 260.8   m.p., °C: -21   b.p. (760 torr), °C: 215
vapor pressure (20°C), torr: 0.15
solubility in water (20°C), mg/L: 2
log octanol/water partition coefficient: 3.74
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Absorption of sunlight too weak to make photolysis important
oxidation: Lack of information probably indicates unimportance
hydrolysis: Lack of information probably indicates unimportance
volatilization: Low vapor pressure precludes volatilization as an important transport process
sorption: Adsorbed by organic materials very strongly
biological processes: Bioaccumulation occurs in some aquatic organisms; no information on biodegradation
other reactions/interactions: Unknown

Carbon Adsorption Data [2]

pH: 7.3
type of carbon: Not available
adsorbability: 25 mg/L carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

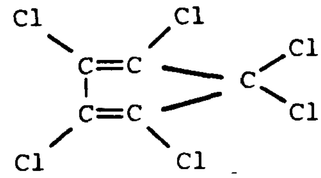
Compound: Hexachlorocyclopentadiene

Formula:



Alternate Names: HCCPD, Perchlorocyclopentadiene

CAS #: 77-47-4

Physical, Chemical, and Biological Properties [1]

mol. wt.: 272.8 m.p., °C: -9.9 b.p. (760 torr), °C: 239
vapor pressure (25°C), torr: 0.081
solubility in water (temp. unknown), mg/L: 0.805
log octanol/water partition coefficient: Not available
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: No data, but dimerization and addition of HCCPD to aromatic groups of humus could be photolytically catalyzed
oxidation: Lack of data probably indicates unimportance
hydrolysis: Acid-catalyzed hydrolysis to tetrachlorocyclopentadienone could occur only if HCCPD is adsorbed onto clay surface
volatilization: Extremely low vapor pressure precludes volatilization
sorption: Based on data for hexachlorobutadiene, adsorption onto organic matter may be important
biological processes: Bioaccumulated in many organisms/Weak biodegradation to tetrachlorocyclopentadienone hydrate
other reactions/interactions: Not important

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

Compound: Methyl bromide

Formula:

```
  H
  |
H-C-Br
  |
  H
```

Alternate Names: Bromomethane, Terabol, Monobromomethane, Embafume

CAS #: 74-83-9

Physical, Chemical, and Biological Properties [1]

mol. wt.: 94.94 m.p., °C: -93.6 b.p. (760 torr), °C: 4.6
vapor pressure (20°C), torr: 1,420
solubility in water (20°C), mg/L: 900
log octanol/water partition coefficient: 1.1
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Volatilized methyl bromide should photodissociation above the ozone layer
oxidation: Atmospheric photooxidation by hydroxyl radicals releases inorganic bromide which is carried down by rain
hydrolysis: Unvolatilized methyl bromide should undergo hydrolysis with a half-life of less than 20 days
volatilization: Rapid volatilization is the dominant transport process
sorption: Too slow to compete with volatilization
biological processes: Not expected to be important/very little data
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF METHYL BROMIDE[a,b]

Compound: Bromoform

Formula: 
Alternate Names: Tribromomethane, Methenyl tribromide

CAS #: 75-25-2

Physical, Chemical, and Biological Properties [1]

mol. wt.: 252.8 m.p., °C: 8.3 b.p. (760 torr), °C: 150
vapor pressure (34°C), torr: 10
solubility in water, mg/L: 3,010 at 15°C; 3,190 at 30°C
log octanol/water partition coefficient: 2.30
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: No information
oxidation: Atmospheric photooxidation by hydroxyl radicals to $COBr_2$ is relatively rapid
hydrolysis: Too slow to be important
volatilization: Volatilization has been demonstrated, but the rate is unknown
sorption: No information
biological processes: Slight potential for bioaccumulation/Metabolization is known to occur in some organisms
other reactions/interactions: Possibly produced by haloform reaction

Carbon Adsorption Data [2]

pH: 7.3
type of carbon: Not available
adsorbability: 45 mg/L; carbon dose required to reduce pollutant concentration from 10 mg/L to 1 mg/L at neutral pH

Compound: Dichlorodifluoromethane

Formula: 
Alternate Names: Fluorocarbon-12, Freon-12

CAS #: 75-71-8

Physical, Chemical, and Biological Properties [1]

mol. wt.: 129.9 m.p., °C: -158 b.p. (760 torr), °C: -29.8
vapor pressure (20°C), torr: 4,310
solubility in water (25°C), mg/L: 280
log octanol/water partition coefficient: 2.16
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Volatilized dichlorodifluoromethane is photodissociated to CF_2O and Cl_2 in the stratosphere
oxidation: No information; probably unimportant
hydrolysis: Not important under environmental conditions
volatilization: Very rapid volatilization removes most of the compound from water
sorption: Some potential for adsorption exists, but is greatly inhibited by volatilization
biological processes: Potential for bioaccumulation and transformation is offset by volatilization
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Trichlorofluoromethane

Formula:

```
   Cl
   |
Cl-C-Cl
   |
   F
```

Alternate Names: Fluorocarbon-11, Freon-11

CAS #: 75-69-4

Physical, Chemical, and Biological Properties [1]

mol. wt.: 137.4 m.p., °C: -111 b.p. (760 torr), °C: 23.8
vapor pressure (20°C), torr: 667
solubility in water (temp. unknown), mg/L: 1,100
log octanol/water partition coefficient: 2.53
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Volatilized trichlorofluoromethane is eventually photodissociated to CFClO and Cl_2 in the stratosphere
oxidation: No information; not expected to be important
hydrolysis: Not important under environmental conditions
volatilization: Rapid volatilization is the major transport process
sorption: Potential for adsorption is greatly hindered by volatilization
biological processes: Rapid volatilization precludes bioaccumulation or degradation
other reactions/interactions: Not important

Carbon Adsorption Data: Not available

Compound: Tetrachloroethylene

Formula: 
Alternate Names: Tetrachloroethene, Ethylene tetrachloride, Perchloroethylene

CAS #: 127-18-4

Physical, Chemical, and Biological Properties [1]

mol. wt.: 165.8 m.p., °C: -22.7 b.p. (760 torr), °C: 121
vapor pressure (20°C), torr: 14
solubility in water (20°C), mg/L: 150-200
log octanol/water partition coefficient: 2.88
Henry's law constant: Not available
biodegradability: Not available

Probable Fate [1]

photolysis: Not important except as photooxidation (below)
oxidation: Tropospheric photooxidation by hydroxyl radicals yields Trichloroacetyl chloride and phosgene
hydrolysis: Probably too slow to be important
volatilization: Rapid volatilization is the primary transport process
sorption: Too slow to compete with volatilization
biological processes: Moderate potential for bioaccumulation; possible biodegradation by higher organisms
other reactions/interactions: Not important

Carbon Adsorption Data [2]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

Carbon Adsorption Data [3]

pH: Not available
type of carbon: Filtrasorb-300
adsorbability: Not available

INDUSTRIAL OCCURRENCE OF METHYL PARATHION[a,b]

	Raw wastewater					
	Concentration, μg/L			Loading,[c] kg/d		
Industry	Minimum	Maximum	Mean	Minimum	Maximum	Mean

[a]Information contained in this table was obtained from Volume II of the Treatability Manual.

[b]NA - not available; ND - not detected; BDL - below detection limit.

[c]Pollutant loadings determined by multiplying mean pollutant concentration by industry wastewater discharges as reported in Section I.3; where mean is not available, one-half the reported maximum was utilized.

INDUSTRIAL OCCURRENCE OF METHYL PARATHION[a,b]

Industry	Treated wastewater					
	Concentration, µg/L			Loading,[c] kg/d		
	Minimum	Maximum	Mean	Minimum	Maximum	Mean

[a]Information contained in this table was obtained from Volume II of the Treatability Manual.

[b]NA - not available; ND - not detected; BDL - below detection limit.

[c]Pollutant loadings determined by multiplying mean pollutant concentration by industry wastewater discharges as reported in Section I.3; where mean is not available, one-half the reported maximum was utilized.

POLLUTANT REMOVABILITY/TREATABILITY WASTEWATER TREATMENT ALTERNATIVE FOR METHYL PARATHION[a,b]

Treatment process[a]	Synthetic wastewater: Removal range,[c] %	Synthetic wastewater: Average achievable conc., µg/L	Actual wastewater: Removal range,[c] %	Actual wastewater: Average achievable conc., µg/L	Volume III references, Section numbers

[a]See Volume III for detailed information.

[b]NA - Not available, ND - not detected, BDL - below detection limit.

[c]Average and maximum removals reported.

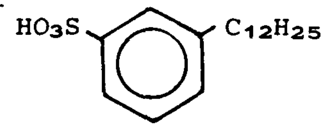
Compound: Dodecyl benzenesulfonic acid Formula:



Alternate Names: Benzenesulfonic acid, dodecyl ester; Dodecylbenzenesulfonate

CAS #: 1886-81-3

Physical, Chemical, and Biological Properties [1, 2]

mol. wt.: 326.5 m.p., °C: Not available b.p. (760 torr), °C: Not available
vapor pressure (25°C), torr: Not available
solubility in water (25°C), mg/L: Not available
log octanol/water partition coefficient: Not available
Henry's law constant: Not available
biodegradability: 99% removal (measured as COD removal) obtained at 20°C in activated sludge as a rate of 11 mg COD/g dry innoculum/hr

Probable Fate: Not available

photolysis:
oxidation:
hydrolysis:
volatilization:
sorption:
biological processes:
other reactions/interactions:

Carbon Adsorption Data: Not available

INDUSTRIAL OCCURRENCE OF DODECYL BENZENE SULFONIC ACID[a,b]

	Raw wastewater					
	Concentration, µg/L			Loading,[c] kg/d		
Industry	Minimum	Maximum	Mean	Minimum	Maximum	Mean

[a]Information contained in this table was obtained from Volume II of the Treatability Manual.

[b]NA - not available; ND - not detected; BDL - below detection limit.

[c]Pollutant loadings determined by multiplying mean pollutant concentration by industry wastewater discharges as reported in Section I.3; where mean is not available, one-half the reported maximum was utilized.

INDUSTRIAL OCCURRENCE OF DODECYL BENZENE SULFONIC ACID[a,b]

	Treated wastewater					
	Concentration, µg/L			Loading,[c] kg/d		
Industry	Minimum	Maximum	Mean	Minimum	Maximum	Mean

[a]Information contained in this table was obtained from Volume II of the Treatability Manual.

[b]NA - not available; ND - not detected; BDL - below detection limit.

[c]Pollutant loadings determined by multiplying mean pollutant concentration by industry wastewater discharges as reported in Section I.3; where mean is not available, one-half the reported maximum was utilized.

POLLUTANT REMOVABILITY/TREATABILITY WASTEWATER TREATMENT ALTERNATIVE FOR DODECYLBENZENE SULFONIC ACID[a,b]

Treatment process[a]	Synthetic wastewater: Removal range,[c] %	Synthetic wastewater: Average achievable conc., μg/L	Actual wastewater: Removal range,[c] %	Actual wastewater: Average achievable conc., μg/L	Volume III references, Section numbers

[a]See Volume III for detailed information.

[b]NA - Not available, ND - not detected, BDL - below detection limit.

[c]Average and maximum removals reported.
