RESEARCH REPORTING SERIES

Research reports of the Office of Research and Development, U.S. Environmental Protection Agency, have been grouped into series. These broad categories were established to facilitate further development and application of environmental technology. Elimination of traditional grouping was consciously planned to foster technology transfer and a maximum interface in related fields. These series are:

1. Environmental Health Effects Research
2. Environmental Protection Technology
3. Ecological Research
4. Environmental Monitoring
5. Socioeconomic Environmental Studies
6. Scientific and Technical Assessment Reports (STAR)
9. Miscellaneous Reports

Since it does not present research information oriented to the programs of ORD, this document has been assigned to the MISCELLANEOUS REPORTS series. Prepared in conjunction with the Office of Research and Development's activities as an International Reference Center for Air Pollution Control of the WHO, it provides an assembly of data on air quality management standards which were compiled in part for the information and support of other EPA offices.

EPA REVIEW NOTICE

This report has been reviewed by the Office of Research and Development, EPA, and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

DISTRIBUTION STATEMENT

This report is available to the public through the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161.

ABSTRACT

This is as complete as possible an assembly of the numerical air quality management standards of the world, including the United States. The kinds of standards included are those for: air quality, concentration at point of impingement at ground level, deposited particulate matter, emergency procedure concentrations, emissions, fluorides in forage, fuel, measurement method, protection zone, soiling index, stack height and sulfation. It excludes air quality management regulations that do not have numerical limits; and, conversely, numerical limits that do not directly relate to air quality management. In the former category are open burning and fugitive dust regulations, that, almost without exception, do not include numerical limits. In the latter category are numerical design standards for fuel burning equipment which relate only indirectly to air quality management.

The standards are presented in tabular form, supported, where necessary, with figures.

This report was submitted in fulfillment of Contract Number 68-02-0556 by the Department of Environmental Sciences and Engineering, School of Public Health, University of North Carolina at Chapel Hill, under the sponsorship of the Environmental Protection Agency. Work was completed as of September, 1974.

This report is in two volumes: Volume I, The Air Quality Management Standards of the World, Including United States Federal Standards; and Volume II, The Air Quality Management Standards of the United States.

ACKNOWLEDGMENTS

The work of this project was directed by a steering committee consisting of:

Rudolph P. V. Boksleitner, (EPA) Project Officer
Peter Halpin (EPA)
Donald Walters (EPA)
Werner Martin (UNC-CH)
Arthur C. Stern (UNC-CH)

We were greatly assisted in the assembly for Volume I of some of the material from outside the United States by the Division of Environmental Health of the World Health Organization, Geneva, Switzerland, which sent us material collected in behalf of the project by its representatives around the world. Also the Centre Interprofessionnel Technique d'Etudes de la Pollution Atmospherique (CITEPA) in Paris, France sent us continuously information on material included in Volume I.

The arduous task of typing the tables was performed by

Mrs. Ernestine McIver
Mrs. Lou Sawyer
Ms. Deborah Ginder

Dr. Yuji Horie of the University of North Carolina at Chapel Hill (UNC-CH) assisted in the preparation of some of the tables in Volume II involving United States Particulate Matter Emission Standards.

SECTION I

CONCLUSIONS

There is a need for tabulations of air quality management standards but no known effort, other than this project, to meet this need. Several national and international organizations have indicated their intention of developing and maintaining in current status a file of the world's environmental laws, regulations, standards, etc. However, as far as is known to the authors, none of these projects are operational, one reason being the enormity of the task of covering all aspects of the environment and all facets of legislation and regulation. To insure that the task gets done, it would be better to break it down into smaller and more manageable sub-tasks, such as the development and maintenance in current status of a file of the world's air quality management standards. This report forms a 1974 base which can be kept in current status with much less effort than would be required to redo the task from scratch if it is allowed to become obsolete.

SECTION II
RECOMMENDATIONS

It is recommended that the tables in this report be stored in a computer and that a computer program be developed to allow the file to be kept current by the addition of new standards and the up-dating and correction of those in the file. The program should allow the computer to respond to interrogation concerning individual file entries and classes of file entries, as well as to generate up-dated tables similar to those in this report and an up-dated version of this entire report. Thereafter the file and the program should be maintained on current status and its availability publicized among potential users.

Failing such computerization, it is recommended that this report be kept up to date by manual methods.

SECTION III

INTRODUCTION

This report is as complete as possible an assembly of the numerical air quality management standards of the world, including the United States. The kinds of standards included are those for: air quality, concentration at point of impingement at ground level, deposited particulate matter, emergency procedure concentrations, emissions, fluorides in forage, fuel, measurement method, protection zone, soiling index, stack height and sulfation. It excludes air quality management regulations that do not have numerical limits; and, conversely, numerical limits that do not directly relate to air quality management. In the former category are open burning and fugitive dust regulations that, almost without exception, do not include numerical limits. In the latter category are numerical design standards for fuel burning equipment which relate only indirectly to air quality management.

The standards are presented in tabular form, supported, where necessary, with figures.

This report is in two volumes: Volume I, The Air Quality Management Standards of the World, Including United States Federal Standards; and Volume II, The Air Quality Management Standards of the United States.

Although the table and figure entries include no information on methods of sampling and analysis, the promulgating documents frequently cover these matters in considerable detail. The value of an air quality management standard is closely related to its method of sampling and analysis, and, in many cases would have been different had a different method of sampling and analysis been specified in the promulgating document.

In the tables, indented entries are subcategories of the last preceding non-indented entry. In many cases, entries have been abbreviated to make them fit on one line. Such abbreviation forces the exclusion from the entry of qualifying phrases, sentences and paragraphs which appear in the promulgating document. For this reason, the user of an entry should verify that entry with the promulgating document, if decisions of importance depend upon the accuracy of the value and the applicability of the standard. Most common among the materials excluded from entries are: statements of standard temperature, pressure and dilution to which gas quantities are to be reduced and of the methods of sampling and analysis. Although in some cases a footnote has been added with respect to reduction of gases to a standard temperature, pressure or dilution or

use of a standard method of sampling and analysis, the absence of such a footnote does not imply that no such reduction or method is required. The absence of such a footnote usually means that such reduction or method does not appear as an explicit part of the statement of the standard, even though it may appear elsewhere in the promulgating document.

SECTION IV

The Air Quality Management Standards of the United States

In this volume of the report, the standards of the District of Columbia and Puerto Rico are included among the standards of the United States. The information incorporated herein on Federal Standards was obtained from the Federal Register; on State standards from the state regulations as compiled by the Environmental Reporter*; and on cities, counties, regions and air pollution control districts from the regulations of the jurisdictions received by mail in response to requests for same, also by mail. Such requests were sent to all United States governmental air pollution agencies listed in the 1973-1974 Directory of Governmental Air Pollution Agencies as of October 31, 1973[†]. Those agencies that did not respond were sent two routine follow-up requests. Where a jurisdiction that had not responded after these follow-up requests was considered important, i.e. likely to have standards different from that of its state, it was sent a third special follow-up request. As a result of this effort, regulations were received from 285 United States jurisdictions below the state level, and were incorporated in this report.

The United States tables in this report were compiled during the summer of 1974 and incorporated the current Federal and State standards at the time of compilation. However the possibility exists, that some of the standards from jurisdictions below the State level may have changed between the time of the receipt of regulations from them and this compilation.

A. The Air Quality Standards of the United States

The air quality standards of the United States are presented in eight principal tables (Tables 17 through 24). The principal table (Table 17) covers the limits on specific pollutants in the ambient air. Another table (Table 18) is a table of quasi-emission standards i.e. the limits on specific pollutants in the ambient air at ground level required by state or local regulation to be used in diffusion computations to determine limits of emission from specific sources. In this report, standards of this type are called Point of Impingement at Ground Level Standards. Standards for fluorides which are based upon the fluoride content of vegetation, especially forage, are in Table 19. Table 20 covers standards for particulate matter deposited by sedimentation, rainout or

*Published by Bureau of National Affairs, 1231, 25th Street, N.W., Washington, D. C. 20037

+Published by the Air Pollution Control Association, 4400 Fifth Avenue, Pittsburgh, Pennsylvania, 15213, in cooperation with USEPA

washout as fallout, dustfall or sootfall onto or into exposed receptables. Table 21 covers standards for the reflectance or transmittance of light by filters through which ambient air has been drawn for a prescribed period of time, i.e. soiling index; and for the rate of conversion of lead oxide to lead sulfate by exposure of candles or plates covered with a paste of this material to the ambient air for a prescribed period of time, i.e. sulfation. The alert, warning and emergency levels promulgated in the United States are in Table 22; and those for odor and visibility are in Tables 23 and 24, respectively.

B. The Emission Standards of the United States

The emission standards of the United States are presented in five principal tables (Table 25 through 30) and several subsidiary tables and figures. One principal table (Table 25) covers limits on the emission of specific substances other than total particulate matter. This table includes some of the standards for these same specific substances in fuels. Another principal table (Table 26) covers limits on the emission of total particulate matter. The remaining tables for emission standards of the United States are those for stack height (Table 27); Visible emissions (Table 28); Mobile sources (Table 29) and Measurement methods (Table 30). In these tables, when the same limit has been promulgated by not more than two equivalent jurisdictions, each is given a separate listing, but when the same limit has been promulgated by more than two equivalent jurisdictions, only the number of such jurisdiction are listed in the main body of the table and the names of the jurisdictions are listed in a footnote. In listing equivalent jurisdictions, the District of Columbia and Puerto Rico are counted as states.

The subsidiary tables and figures, e.g. Table 25-1, are not intended to be independent. They are extensions of the main tables, e.g. Table 25, and are accessed through the footnotes to the main tables.

The only entries available to the compilers of these tables which have not been included in the tables are limits promulgated by lesser jurisdictions that are in contravention of limits promulgated by higher jurisdictions. Thus state emission limits which are higher than federal emission limits, and city or county limits which are higher than those of their state have not been included in the tables even though they may still appear in the promulgating documents of those jurisdictions. In those cases where it is not readily apparent that such contravention has occurred, the limits of the lower jurisdiction have been included in the tables. This situation occurs when the limits of the several jurisdictions are expressed

in different terms that are not readily comparable without detailed computation.

In many cases the relationship between the size or capacity of a process and its emission limit can be expressed by an equation, a table or a figure. Where all three give the same information only the equation has been included, and essentially all such equations have been consolidated into Tables 25-7 or 26-7. Where no equation is included in the promulgating document but one can be readily derived from the table or figure given, such equation has been derived and presented. Where no equation is given, or can be readily computed, but where both a table and figure are given, in general the table has been reproduced rather than the figure. Where the information is obtainable only from a figure, the figure has been reproduced.

In these tables, M means 1000, MM means 1,000,000 and MMM means 1,000,000,000. Pounds have, in some cases, been converted to tons at 2000 pounds per ton. Units of emission limits are as they appear in the promulgating document. No attempt has been made to convert them to common units or to SI units, since very few United States emission standards are currently expressed as SI units. The official restatement of Federal standards in SI units occurred after these tables were completed so that federal standards are expressed in the units that were used prior to their recent restatement in SI units.

It should be noted that Table 18, listed under the Air Quality Standards of the United States, is a quasi-emission standard in that it sets forth limits on specific pollutants in the ambient air at ground level required by state or local regulation to be used in diffusion computations to determine limits of emission from specific sources. In this report, standards of this type are called Point of Impingement at Ground Level Standards.

SECTION V

ANALYSIS

AIR QUALITY STANDARDS (TABLES 17 THROUGH 24)

Table 17 lists ambient air quality standards from 38 states for 20 substances. The frequency of their listing varies from 5 substances listed in only one state, county or city to sulfur dioxide and suspended particulate matter listed by governmental units in 37 and 33 states, respectively. Since about six of each of the latter governmental units are at lower than the state level, this means that about half of the states (including District of Columbia and Puerto Rico) have promulgated state air quality standards for sulfur dioxide and suspended particulate matter and about half have not done so, thereby adhering to the Federal air quality standards for these substances. With respect to the other substances for which there are Federal air quality standards, the number of states which have adopted state air quality standards are: for Carbon Monoxide - 9; for Hydrocarbons - 8; for Nitrogen Dioxide - 7; and for Photochemical Oxidants - 14; the remaining states adhering to the Federal air quality standards. The comparable table for the World's air quality standards is Table 2 in Volume I, which lists 142 substances in contrast to the 20 substances in Table 17 for the United States. Table 17 should also be compared to Table 25 for United States emission standards for Specific Substances which lists 75 substances. This points up the relatively greater emphasis in the United States on emission standards than on air quality standards.

Point of Impingement at Ground Level Standards (Table 18) are used in 21 states for 13 substances. The frequency of use for different substances vary from 4 substances listed by only one state each to sulfur dioxide which is listed by governmental agencies in 15 states. As has been noted before, Point of Impingement at Ground Level Standards are quasi-emission standards and involve diffusion computation from sources. The equivalent table in Volume I is Table 3.

Fluorides in Forage Standards (Table 19) are in use in 5 states- Idaho, Kentucky, Montana, Texas and Washington. Outside the United States they are used only in Canada (Table 4, Volume I).

Governmental units in thirteen states employ Deposited Particulate Matter Standards (Table 20) and governmental units in 14 states use Soiling Index and Sulfation Standards. The corresponding tables in Volume I are Tables 5 and 6.

Emergency Procedure Concentrations have been adopted by all 50 states, the District of Columbia and Puerto Rico. They cover in almost all states: Sulfur Dioxide, Suspended Particulate Matter,

Carbon Monoxide, Nitrogen Oxides and Oxidants. For no other substances have emergency procedure concentrations been promulgated. The corresponding table in Volume I is Table 7.

Numerical Odor Standards (Table 23) and numerical Visibility Standards (Table 24) are unique to the United States. They were not found in the regulations of any other country. In the United States, 8 states and the District of Columbia have adopted odor standards, and two states, California and Texas have visibility standards.

EMISSION STANDARDS (TABLES 25 THROUGH 30)

Table 25 lists emission standards for 75 substances from all states except Arkansas and Hawaii. The frequency of listing varies from 49 substances listed in only one state and 10 substances listed in only two states, to various gaseous sulfur oxides and acids (sulfur, sulfur compounds, sulfur dioxide, sulfur oxides, sulfur trioxide, sulfuric acid and total reduced sulfur) that run for 48 pages in the table. The other substances that require more than one page for their listing are Carbon Monoxide, (3 pages) Fluorine (3 pages); Hydrogen Sulfide (2 pages), Nitrogen Oxides (12 pages), and Organic Material (4 pages). This table includes the limits for ash, lead, sulfur and volatile matter in fuels which in Volume I appears as a separate table (Table 9). In comparison with the equivalent Tables in Volume I (Tables 8 and 9), it is apparent that the United States makes greater use of emission and fuel standards for specific substances than do foreign countries.

There are Emission Standards for Particulate Matter (Table 26) for all states except Hawaii. They cover Processes in General, Agricultural, Chemical, Metallurgical, Mineral and Combustion processes, the latter including the burning of both wood, fossil fuels and refuse. In comparison with the equivalent table in Volume I (Table 10), it appears that essentially the same processes are regulated by emission standards for Particulate Matter in the United States as in the other industrialized nations of the world.

Only a relatively few states, counties or cities in the United States have promulgated Stack Height Requirements (Table 27) viz: Georgia, Indiana; St. Louis County and City, Missouri; New Jersey; Akron, Barberton and Summit Counties, Ohio; Tennessee and Texas. In comparison with the equivalent table in Volume I (Table 11), specific requirements for stack height are much less common in the United States regulations than abroad.

Table 28 gives Visible Emission Standards for 49 states, the District of Columbia and Puerto Rico expressed in terms of emission opacity in percent. They cover smoke emission from mobile sources,

aircraft, automobiles, trucks and buses, locomotives and marine vessels, as well as from a wide variety of stationary sources and the combustion of wood, fossil fuels and refuse. This table is equivalent to Table 12 in Volume I. There is no United States equivalent to Table 13 in Volume I for Emission Standards for Soot, based mainly on Bacharach Shade Number. This type of standard is not used in the United States as an air quality management standard promulgated by an air pollution control regulatory agency, even though the procedure may be widely used by oil burner installers and service men for the adjustment of oil burners.

Also there are no United States Sanitary Protection Zone Standards, equivalent to those in Table 14 of Volume I, which are incorporated in air pollution control agency regulations for air quality management purposes. In the United States, equivalent standards are to be found in zoning regulations administered by local planning and zoning boards and commissions.

The exhaust gases for which Emission Standards for Mobile Sources (Table 29) have been promulgated are Carbon Monoxide, Hydrocarbons and Nitrogen Oxides. For new cars they have been promulgated only by the Federal government and the state of California; for used cars they have been promulgated by four states: Arizona, California, New Jersey and New York. The equivalent table in Volume I is Table 15, which covers the same exhaust gases. Table 15 covers smoke emission from mobile sources whereas, in this volume, such standards are in Table 28.

The final table in Volume II is that for Recommended Measurement Methods (Table 30). Methods from all states for 19 substances are listed. Methods listed in county and city regulations have not been included in this table. The equivalent Volume I table is Table 16.

			0.012						

Table 17 (continued). AMBIENT AIR QUALITY STANDARDS OF THE
UNITED STATES

FOOTNOTES

1. 2⁴ hrs. average not to be exceeded more than once a year.
2. Not to be exceeded more than once in 2⁴ hrs.
3. Residential & commercial area, as suspended particulate.
4. If not otherwise indicated, all standards are primary standards.
5. Long term has no other meaning than "long averaging time" (>3 hrs.). Short term <3 hrs.
AAM = annual arithmetic mean, AGM = annual geometric mean
6. As hydrogen fluoride.
7. Total fluorides.
8. During growing season.
9. For whole year.
10. For two consecutive months.
11. For six consecutive months.
12. Not to be exceeded more than twice in two consecutive days.
13. Not to be exceeded more than twice a year.
14. Secondary standard.
15. Not to be exceeded more than twice in any five consecutive days.

Table 17 (continued). AMBIENT AIR QUALITY STANDARDS OF THE
UNITED STATES⁴

FOOTNOTES (continued)

16. Only H_2S .
17. Total reduced sulfur.
18. Not to be exceeded more than once in any five consecutive days.
19. Residential & recreational area.
20. Industrial area.
21. $2\frac{1}{4}$ hr. average not to be exceeded more than 1% of the time during three months.
22. Including O_3
23. Total Oxidants.
24. During any daylight hour.
25. Not to be exceeded more than once in any three consecutive days.
26. On and before 1976.
27. On and before 1980.
28. Value of 99th percentile of concentrations.
29. Upper limit.
30. Lower limit.
31. Not to be exceeded more than once in any month.
32. Not to be exceeded more than twice in any week.

Table 17 (continued). AMBIENT AIR QUALITY STANDARDS OF THE
UNITED STATES⁴⁴

FOOTNOTES (continued)

33. Not to be exceeded if more than once in any four days.
34. Not to be exceeded more than 10% of the time during a 30 day period.
35. Not to be exceeded more than once in any 90 day period.
36. Not to be exceeded more than once in any one week period.
37. As an arithmetic mean of all stations.
38. For light industry areas.
39. Annual average shall be arithmetic average of four consecutive seasonal geometric mean values.
40. 50 percentile value per year.
41. 84 percentile value per year.
42. 24 hr. average shall not be exceeded for more than 15% of the time in a calendar month.
43. Commercial & business area.
44. Rural area.
45. 24 hr. average not to be exceeded more than 1% of the time during April 1 - Oct. 31. Not more than 5% of the time during Nov. 1 - March 31.
46. If background location $> 30 \text{ mg/m}^3$ of individual sample class and east of Cascade Mountain.
47. Any seven consecutive days.
48. AQCR = Air Quality Control Region

Table 18 (continued). POINT OF IMPINGEMENT AT GROUND LEVEL STANDARDS
OF THE UNITED STATES

FOOTNOTES

1. Point of Impingement Standard, which affects only the area beyond the property line.
2. Not to be exceeded more than twice in five consecutive days.
3. Not to be exceeded more than twice a year.
4. Not to be exceeded more than once in five days.
5. Not to be exceeded more than once a year.
6. As contribution above background level.
7. Not to be exceeded more than once in any eight consecutive hours.
8. Not to be exceeded more than once in any four days.
9. Not to be exceeded more than once in any 90 days.
10. Applicable for sulfite pulp mills.
11. Land use area A = residential & recreational, B= commercial & business & D= rural
12. Land use area C = industrial
13. Not to be exceeded more than once in any 12 hours.
14. Only 70% of state limits are permitted.
15. Only 80% of state limits are permitted.
16. Not to be exceeded more than once in any 48 hours.

Table 18 (continued). POINT OF IMPINGEMENT AT GROUND LEVEL STANDARDS
OF THE UNITED STATES

FOOTNOTES (continued)

17. Land use area A, B, C, & D. Definitions see Footnotes 11 and 12.
18. Not to be exceeded more than once in any 24 hours.
19. Not to be exceeded more than once in one week.
20. Geometric mean.
21. Basis for stack height calculations.
22. APCD = Air Pollution Control District
23. As H₂S.
24. New sulfuric acid plant.
25. Not to be exceeded more than once in any six hours.
26. Not to be exceeded more than once in any hour.
27. Concentration may exceed 0.1 for not more than 30 min/60 min, but not more than twice in any 8 hours.
28. For fugitive dust.
29. Same standard as for sulfuric acid mist, for each separate and combined.
30. Non-methane.
31. Carbonyls, aldehydes, ketones calculated as formaldehydes.
32. Total hydrocarbons.
33. As HF.

Table 18 (continued). POINT OF IMPINGEMENT AT GROUND LEVEL STANDARDS

TABLE 22 (CONTINUED). EMERGENCY PROCEDURE CONCENTRATION LEVELS OF THE UNITED STATES

FOOTNOTES

- 1 - SO_2 (ppm) x COH first line. (eg. 0.2)
- 2 - SO_2 $\mu\text{g}/\text{m}^3$ x part. $\mu\text{g}/\text{m}^3$ second line. (eg. 300,000)
- 3 - If one of the listed concentrations is reached control procedure goes into effect.
- 4 - Watch level
- 5 - Yellow Alert
- 6 - Product of SO_2 in ppm and part. in $\mu\text{g}/\text{m}^3$.
- 7 - For any 8 hrs period in the preceding 16 hrs for NO_x & Oxidants for any 4 hr period in the preceding 8 hrs.
- 8 - Emergency level is reached if "Warning Level" concentrations exceeded, and continue to increase.
- 9 - 1st stage: "Conditions of air pollution"
2nd stage: "Conditions of episodic air pollution."
- 10 - Total hydrocarbons 18.0 ppm (1 hr); 12.0 ppm (24 hrs).
- 11 - Total hydrocarbons 15.0 ppm (1 hr); 10.0 ppm (24 hrs).
- 12 - Total hydrocarbons 20.0 ppm (1 hr); 13.0 ppm (24 hrs).
- 13 - Oxidants level for Metropolitan Charlotte
Air Quality Control Region only
- 14 - Los Angeles, (Plus most of the other counties)
- 15 - Bay Area Air Pollution Control District
- 16 - There are no uniform emergency episode levels set in California

FOOTNOTES

1. On thymol blue/ammonia water/gelatine plates.
2. Burn at 1300°F for 0.3 sec.
3. Baltimore City and Anne Arundel, Baltimore, Carroll, Hartford and Howard Counties.
4. Ground level concentrations not to exceed 15 $\mu\text{g}/\text{m}^3$ (24 hr average), 50 $\mu\text{g}/\text{m}^3$ (1 hr. average) not more than once per 24 hr. or 100 $\mu\text{g}/\text{m}^3$ maximum (125 $\mu\text{g}/\text{m}^3$ during shut-down or start up).
5. Ground level concentration not to exceed 0.08 ppm (30 min. average) for residential, business or commercial property, or 0.12 ppm (30 min.average) for other property (0.3 ppm during shut-down or start-up)
6. Shall not cause air quality or forage standards to be exceeded.
7. Exposure of calcium formate paper.
8. Method for computing stack emission limit from diffusion equation given in regulation.
9. Unless reduced by at least 85%.
10. After 1/1/75.
11. Direct-flame afterburner or boiler required.
12. Except during abnormal movement of furnace burden requiring pressure relief.
13. Except existing units < 2000 lb. refuse/hr.
14. Carbon Monoxide boiler or after-burner required.
15. Smokeless flares required.
16. Ground level concentration shall not exceed 20% of one hour ambient air quality value for CO.
17. Unless burned by smokeless flare.

Footnotes (continued)

18. 90% efficient incineration, carbon adsorption, or equivalent, required.
19. 93% removal by secondary combustion required.
20. Burn at 1300°F quantities in excess of this amount.
21. Burn at 1300°F for 0.25 sec.
22. Except by flaring for pressure relief.
23. Average over 24 consecutive hours and having aggregate partial pressure less than 44 psia.
24. Or combination with other listed carbon compounds or classes.
25. Apply effects factor from Table 25-1 to particulate matter emission limit.
26. Also compounds of the element.
27. Corrected to 7% oxygen for combustion sources.
28. Control by intermittent production curtailment and proportional model reduction to meet ambient air quality standard for SO₂.
29. Does not apply to emissions of less than 150 ppm.
30. Table 25-2.
31. Also shut-down.
32. Excluding methane.
33. Whichever is more restrictive.
34. Whichever is more restrictive.
35. By 7/1/75.
36. Eq. 1 - Table 25-7.
37. Eq. 2 - Table 25-7.

Footnotes (continued).

38. Montgomery and Prince George's Counties
39. Mobile-Pensacola-Panama City-Southern Mississippi; and Tennessee River Valley -Cumberland Mountains Interstate Air Quality Control Regions.
40. All regions other than those in footnote 39.
41. Whichever is more restrictive.
42. By 7/75, whichever is more restrictive
43. Chicago, East St. Louis, and Peoria areas.
44. Eq. 3 - Table 25-7.
45. Eq. 4 - Table 25-7.
46. AQCR - Air Quality Control Region - in which Priority area has been designated by the United States Environmental Protection Agency.
47. Eq. 5 & 6 - Table 25-7.
48. Eq. 7 & 8 - Table 25-7.
49. Allegheny, Calvert, Caroline, Cecil, Charles, Dorchester, Frederick, Garrett, Kent, Queen Anne's, St. Mary's, Somerset, Talbot, Washington, Wicomico and Worcester Counties.
50. Table 25-3.
51. N.F. - Non-ferrous.
52. Emission of two or more sources within circle 10 miles in diameter.
53. Whichever is more restrictive.
54. Georgia, New York and Oklahoma.
55. Approximately 1300 ppm.

Footnotes (continued)

56. Unless reduced to emission equivalent by sulfur collecting device.
57. Central Maine, Downeast, Aroostook County and Northwest Maine Air Quality Control Regions.
58. Arlington, Belmont, Boston, Brookline, Cambridge, Chelsea, Everett, Malden, Medford, Newton, Somerville, Waltham, and Waterville.
59. Residual oil not allowed in facilities < 6 MMBTU/hr.
60. Other than listed in footnote 58.
61. Residual oil not allowed in facilities < 3 MMBTU/hr.
62. Allen, Ashtabula, Columbiana, Cuyahoga, Jefferson, Lucas, Summit and Trumbull Counties.
63. Unless SO_x emission < 1.75 lb/MMBTU.
64. From units modified to increase emission rate over that in 1970.
65. Or incinerate at 1600°F for 0.5 sec.
66. Whichever is more restrictive.
67. Baltimore City and Ann Arundel, Baltimore, Carroll, Harford, Howard, Montgomery and Prince George's Counties.
68. Burning prohibited.
69. Table 25-4.
70. Whichever is more restrictive.
71. Not greater than emissions in 1971.
72. Eqs. 9 & 10 - Table 25-7.
73. By 10/1/74.

Footnotes (continued)

- 74. Does not apply when discharge <3000 ton and SO₂ discharged in 60 min <50 lb and at rate of <100 lb/hr.
- 75. Figure 25-2 and Tables 25-5 and 25-6.
- 76. Unless controlled to SO₂ emission of 0.3 lb/MMBTU.
- 77. Corrected to 12% CO₂.
- 78. Does not apply to marine vessels, internal combustion engines or to commercial fuel used in Atlantic, Cape May, Cumberland, Hunterdon, Ocean, Sussex and Warren Counties.
- 79. Use may be authorized after appropriate demonstration.
- 80. Exceptions allowed in Suffolk and Rockland Counties.
- 81. Exception when Eq. 11 - Table 25-7 is satisfied.
- 82. Franklin, Hancock, Hocking, Holmes, Knox, Licking, Morgan, Ross, Seneca and Shelby Counties.
- 83. Exemptions for mills of <110 ton/day ADP (See footnote 109).
- 84. Provide alternate means of incinerating non-condensibles at 1200°F for 0.3 sec. when lime kiln is out of service.
- 85. Eq. 12 - Table 25-7.
- 86. Allegheny County, Beaver Valley, Monongehela Valley and Southeast Pennsylvania air basins.
- 87. Eq. 15 - Table 25-7.
- 88. Eq. 14 - Table 25-7.
- 89. San Juan, Catano, Guayabo and Bayamon.
- 90. Except ocean going vessels in use or four family or smaller dwellings.
- 91. Eq. 15 - Table 25-7.

Footnotes (continued)

92. Ground level concentration not to exceed 0.4 ppm (30 min. average).
93. Athens, Auglaize, Carroll, Clinton, Defiance, Fairfield, Fayette, Greene, Hardin, Harrison, Highland, Huron, Jackson, Marion, Mercer, Miami, Muskingum, Paulding, Sandusky, Union, Vinton, Williams and Wood Counties.
94. Adams, Ashland, Brown, Champaign, Clark, Clermont, Crawford, Darke, Delaware, Fulton, Gallia, Geauga, Guernsey, Logan, Madison, Medina, Meigs, Morrow, Noble, Ottawa, Perry, Pike, Portage, Preble, Putnam, Scioto, Stark, Van Wert, Warren and Wyandot Counties.
95. Calculate h_e (effective stack height) by Eq. 16 - Table 25-7. Calculate H_e (standard effective stack height) by appropriate Eq. 37-42-Table 25-7; Calculate F by Eq. 17 - Table 25-7; Calculate E by appropriate Equation 33-36 - Table 25-7 or from given value; Multiply E by F to obtain allowable emission.
96. Ground level concentration not to exceed 0.28 ppm (30 min. average).
97. Ground level concentration not to exceed 0.32 ppm (30 min. average).
98. Eq. 30 - Table 25-7.
99. Except during start-up.
100. Also Table 25-2.
101. Eq. 31 - Table 25-7.
102. Whichever is more restrictive.
103. Whichever is more restrictive. Also non-condensibles must be burned in lime kiln.
104. Also investment casting.
105. Combinations of CS_2 , H_2S and carbon oxy sulfide.
106. Fabric filter or other 99.9% efficiency collector required.
107. Kent and Surrey Counties.

Footnotes (continued)

108. Table 25-8.
109. ADP - Air Dried Pulp.
110. Also reconstruction of existing plants.
111. Areas where air quality standard is exceeded.
112. Eq. 15 - Table 25-7.
113. Connecticut, Mississippi, New Hampshire, Ohio, Oklahoma, Virginia and West Virginia.
114. Eq. 19 - Table 25-7.
115. Eq. 20 - Table 25-7.
116. Eq. 21 - Table 25-7.
117. Connecticut, Mississippi, New Hampshire, Ohio, Oklahoma, Puerto Rico, Virginia and West Virginia.
118. Eq. 22 - Table 25-7.
119. Eq. 23 - Table 25-7.
120. Eq. 24 - Table 25-7.
121. Eq. 25 - Table 25-7.
122. Colorado, New York, Oklahoma and Wisconsin.
123. Alabama, Arizona, Connecticut, Illinois, Iowa, Maryland, Minnesota, Nebraska, Ohio, Pennsylvania, South Dakota, Virginia and Wyoming.
124. Arizona, Colorado, Florida, Georgia, Iowa, Oklahoma and South Dakota.
125. District of Columbia, Nebraska and Rhode Island.
126. Alabama, Connecticut, Indiana, New York, Ohio and Wisconsin.
127. Chicago and East St. Louis areas.

Footnotes (continued)

128. 0.2 or 0.3 lb/MMBTU may be required to attain ambient air quality standard.
129. Dallas, Ft. Worth, Houston and Galveston.
130. Corrected to 15% excess air.
131. 0.3 or 0.5 lb/MMBTU may be required to attain ambient air quality standard.
132. Arizona, Colorado, Florida, Georgia and Oklahoma.
133. Alabama, Connecticut, Indiana, New York and Wisconsin.
134. Ohio, Virginia and Wisconsin.
135. Kansas, Kentucky, Ohio, Virginia and Wisconsin.
136. Alabama, Connecticut, Louisiana and Ohio.
137. Pennsylvania, Kentucky and Oklahoma.
138. Idaho, New Hampshire and Washington.
139. Alabama, Minnesota, Ohio and Puerto Rico.
140. Arizona, New York and Wisconsin.
141. Iowa, Mississippi, North Carolina, Ohio and Pennsylvania.
142. Eq. 26 - Table 25-7.
143. APA - Air Pollution Authority.
144. Burn at 1200°F for 0.3 sec.
145. Figure 25-1.
146. Worker exposure.
147. APCD - Air Pollution Control District.

Footnotes (continued)

148. Corrected to 6% O₂.
149. After 12/31/74.
150. Also burn at 1300°F for 0.3 sec.
151. Other than grey iron cupolas, blast furnaces, basic oxygen furnaces, catalyst regeneration and fluid cokers.
152. Burn at 1400°F for 0.5 sec.
153. Orange, Riverside and Ventura Counties.
154. Grey iron cupolas, blast furnaces and basic oxygen furnaces.
155. Huntsville and Jefferson and Mobile Counties.
156. Burn at 1200°F for 0.3 sec.
157. Los Angeles, Orange, Riverside, San Bernardino and Santa Barbara Counties.
158. Corrected to 3% O₂.
159. Calaveras, Fresno, Kern (Valley Basin), Kings, Los Angeles, Merced, Orange, Riverside (West Central Area), San Joaquin, Santa Barbara, Stanislaus, Sutter and Ventura Counties.
160. Monterey, San Bernardino and Santa Cruz Counties.
161. Kings, Los Angeles, Riverside, San Bernardino, San Diego, and Tulare Counties.
162. Los Angeles, Monterey, Orange, San Bernardino, San Diego, Santa Cruz and Ventura Counties.
163. Los Angeles, Monterey, Orange, Sacramento, Sacramento, San Bernardino, San Diego, Santa Cruz and Ventura Counties.
164. Calaveras, Fresno, Kern, Kings, Los Angeles, Merced, Monterey, Orange, Plumas, Riverside, Sacramento, San Bernardino, San Diego, San Joaquin, Santa Barbara, Santa Cruz, Shasta, Stanislaus, Sutter, Tulare and Ventura Counties.

Footnotes (continued)

165. Federal New Source performance standard.
166. Unless 90% reduction is achieved.
167. Without combustion controls.
168. ARMD - Air Resources Management District.
169. Calaveras, Fresno, Inyo, Kern, Los Angeles, Merced, Monterey, Placer, Sacramento, San Joaquin, San Luis Obispo, Santa Barbara, Santa Cruz, Stanislaus, Sutter and Tulare Counties.
170. Calaveras, Fresno, Kern (Valley Basin), Kings, Los Angeles, Merced, Orange, Riverside (West Central Area), San Joaquin, San Luis Obispo, Santa Barbara, Stanislaus, Sutter and Ventura Counties.
171. Corrected to 5% excess air.
172. 33% of 1969 emissions.
173. Including portion of district within Northeast Plateau Air Basin.
174. Oct. 1 to April 30.
175. April 30 to Oct. 1, until 4/31/76.
176. Alabama, Kentucky and Ohio.
177. Alabama, Kentucky, North Carolina, Ohio, Oklahoma and Virginia.
178. Eq. 27 & 28 - Table 25-7.
179. No greater emission than in 1970.
180. Humboldt, Placer and Trinity Counties.
181. Akron, Cleveland and Portsmouth.
182. Eq. 32 - Table 25-7.
183. Eq. 29 - Table 25-7.
184. Also in combination with H_2SO_4 .

Footnotes (continued)

185. Also in combination with SO_3 .
186. Including SO_3 .
187. Alabama, Kentucky, Ohio, Oklahoma and Virginia
188. Or $0.012 (H_s)^2 \text{ lb/day}$, where H_s is stack height in feet.
189. $0.013 (H_s)^2 \text{ lb/day}$, where H_s is stack height in feet.
190. Idaho, Maryland, Oregon and Utah.
191. Los Angeles, Orange, Riverside, San Bernardino, San Benito, San Diego and Santa Barbara Counties.
192. Kent, New Castle and Sussex Counties.
193. Los Angeles, Orange, Riverside, San Bernardino, San Benito, San Diego, San Luis Obispo and Santa Barbara Counties.
194. AQCR - Air Quality Control Region.
195. Los Angeles, Monterey, San Benito, San Luis Obispo and Santa Cruz Counties.
196. Missoula City and Cascade, Missoula and Yellowstone Counties.
197. Eq. 33 - Table 25-7.
198. Eq. 34 - Table 25-7.
199. Eq. 35 - Table 25-7.
200. Eq. 36 - Table 25-7.
201. Eq. 37 - Table 25-7.
202. Eq. 38 - Table 25-7.
203. Eq. 39 - Table 25-7.
204. Eq. 40 - Table 25-7.

Footnotes (continued)

- 205. Eq. 41 - Table 25-7.
- 206. Eq. 42 - Table 25-7.
- 207. Belmont, Butler, Coshocton, Erie, Hamilton, Henry, Lake, Lawrence, Mahoning, Monroe, Montgomery, Pickaway, Richland, Tuscarawas, Washington and Wayne Counties.
- 208. Cedar Rapids and Des Moines; and Linn and Polk Counties.
- 209. For two minutes.
- 210. As Hexane.
- 211. As total carbon.
- 212. Methane equivalent.
- 213. Per ton of product.
- 214. For 30 minutes.
- 215. Piqua, Springfield, and Montgomery County.
- 216. Introduced into plant as feed.
- 217. Columbia-Willamette, Lane Regional and Mid-Willamette Valley APA (see footnote 143).
- 218. Other than Chicago, East St. Louis and Peoria Areas.
- 219. Digester charge.
- 220. Built before fuel restrictions.
- 221. Eq. 18 - Table 25-7.
- 222. Louisville and Cincinnati Air Quality Control Regions

Footnotes (continued)

- 223. Minneapolis-St. Paul Metropolitan Area - Anoka, Carver, Dakota, Hennepin, Ramsey, Scott and Washington Counties.
- 224. **Metropolitan Area.**
- 225. Cincinnati, Paducah-Cairo and Evansville-Henderson Air Quality Control Regions.
- 226. Huntington-Ashland, Bluegrass, Appalachian, North Central and South Central Air Quality Control Regions.
- 227. Table 25-9.
- 228. Subject to relaxation pursuant to emergency energy conservation legislation or regulations.
- 229. All regions in state except Northeast Indiana Intrastate Air Quality Control Region.
- 230. Greater Metropolitan Cleveland, Northwest Ohio Zanesville-Cambridge Intrastate; and Metropolitan Toledo and Steubenville-Meirton-Wheeling Interstate Air Quality Control Regions.
- 231. Mansfield-Marion and Metropolitan Dayton Intrastate; and Metropolitan Cincinnati, Northwest Pennsylvania-Youngstown and Parkersburg-Marietta Interstate Air Quality Control Regions.
- 232. Metropolitan Columbus, Sandusky and Wilmington-Chillicothe-Logan Intrastate; and Huntington-Ashland-Portsmouth-Ironton Interstate Air Quality Control Regions.
- 233. Allegheny County, Beaver Valley, Monongehela Valley and Southeast Pennsylvania air basins^c.
- 235. No areas have been yet designated Priority I Air Quality Control Regions with respect to NO₂.
- 236. Corrected to 10% excess air.

Table 25-1 - Particulate Matter from Non-Ferrous Foundries;
Smelters or Investment Casting Facilities

New Hampshire

Multiply particulate matter emission computed from applicable process weight equation (or table) by the following factor to get allowable emission.

EFFECTS FACTOR FOR PARTICULATE MATTER

MATERIAL

A. All material not specifically listed here 1.0

B. Elements and their compounds of the basic elements

Antimony	0.9
Arsenic	0.9
Barium	0.9
Beryllium	0.003
Cadmium	0.2
Chromium	0.2
Cobalt	0.9
Copper	0.2
Hafnium	0.9
Lead - Lead arsenate	0.3
Lithium hydride	0.04
Phosphorus	0.2
Selenium	0.2
Silver	0.1
Tellurium	0.2
Thallium	0.2
Uranium (soluble)	0.1
Uranium (insoluable)	0.4
Vanadium	0.2
Zinc Oxide	0.8

C. Mineral material and miscellaneous substances

Asbestos	0.4
Silica (Crystalline)	0.4

Table 25-7

Equations

Nomenclature

a - Plume rise factor - <0.67 for 1000MMBTU/hr.
 > 0.8 for 1000MMBTU/hr.

A - Maximum allowable emissions of sulfur oxides - lb/lb S in feed gases.

B - Allowable sulfur content of oil - lb/MMBTU

C_{max.} - Hourly maximum ground level concentration - $\mu\text{g}/\text{m}^3$

D_e - Stack exit inside diameter - ft.

E, E_p - Maximum allowable sulfur dioxide emission - lb/hr.

E_m - Maximum allowable sulfur dioxide emission - lb/MMBTU.

E_n - Maximum allowable nitrogen oxides emission - lb/hr.

F - = 0.8 when in urban area burning fuel >1% S: 2 or more sources of over 500 MMBTU/hr
 = 1.0 other sources in urban area
 = 2.0 when in rural area: fuel burning: <10,000 MMBTU/hr
 = 3.0 when in rural area: fuel burning: >10,000 MMBTU/hr

F_r - Reduction factor - dimensionless.

G - Percent of total heat input from gaseous fossil fuel - %.

h_e - Effective stack height - ft.

H_e - Standard effective stack height - ft.

h, h_s, H_n, H_s - Physical stack height above grade - ft.

I - Allowable sulfur content of coal - lb/MMBTU.

J - Recovery plant rating - long tons S/day.

K - Heat input - MMBTU/hr.

L - Percent of total heat input from liquid fossil fuel - %.

n - Number of stacks.

Table 25-7 (Continued)

N - Normal capacity of acid plant - tons/day.

P - Process weight - tons/hr.

P_d - Unit production rate of acid plant - tons/day.

P_i, P_n - Percent of total emission (E) from source - %.

Q_d - Heat input from distillate fuel oil - MMBTU/hr.

Q_m - Plant generating capacity - MMBTU/hr.

Q_r - Heat input from residual fuel oil - MMBTU/hr.

Q_s - Heat input from solid fuel - MMBTU/hr.

q - Stack exit flow rate - ft^3/m (STP).

R - Percent of total heat input from solid fossil fuel - %.

S - Maximum allowable emission concentration - ppm.

S_f - Maximum allowable sulfur dioxide emission - lb/MMBTU.

S_p - Maximum allowable sulfur dioxide emission - lb/ton process weight.

S_r - Maximum allowable sulfur dioxide emission from residual fuel oil - lb/MMBTU.

S_s - Maximum allowable sulfur dioxide emission from solid fuel - lb/MMBTU.

T_e - Stack exit temperature - $^{\circ}\text{R}$.

V_e - Stack exit velocity - ft/sec.

Y - Maximum allowable sulfur emission - lb/hr.

X - Maximum heat input - MMBTU/hr.

X_s - Sulfur input in feed - lb/hr.

Y_s - Maximum allowable sulfur emission - lb/hr.

Equations

$$1. \quad E = 4000 F(h_s/300)^3.$$

$$2. \quad E = 4000 F(h_s/300)^2.$$

$$3. \quad E = S_s Q_s + 0.3 Q_d + S_r Q_r.$$

Table 25-7 (Continued)

4. $E = 20,000 (H_s/300)^2$

Where $H_s = \frac{P_1 H_1 + P_2 H_2 + \dots + P_n H_n}{100}$: (Note: $P_1 + P_2 + \dots + P_n = 100$)

5. $C_{max} = \frac{90 S_f Q_m^{0.75} 0.25}{a h_s^n}$ for combustion operations.

6. $E_m = 17.0 Q_m^{-0.33}$ for combustion operations: (Not to exceed 6 lb/MMBTU Input).

7. $C_{max} = \frac{40 S_p P^{0.75} 0.25}{a h_s^n}$ for process operation.

8. $E = 19.5 P^{0.67}$ for process operations.

9. $Y = 0.7X$ < 250MMBTU/hr.

10. $Y = 0.105X$ > 250MMBTU/hr.

11. $E_m = \frac{2 LB + 2 RI}{L + R}$: (Note: $L + R = 100$).

12. $E_m = 5.1 K^{-0.14}$

13. $E_m = 1.7 K^{-0.14}$

14. $A = 0.32 J^{-0.5}$

15. $E_m = \frac{L(0.8) + R(1.2)}{G + L + R}$: (Note: $G + L + R = 100$).

16. $h_s = H + 0.083 V_e D_e (1.5 + 0.82 \frac{T_e - 550}{T_e} D_e)$

17. $F_r = \frac{\text{Effective Stack Height (he)}}{\text{Standard Effective Stack Height (He)}}$

18. $E_m = \frac{G (0.2) + L (0.30) + R (0.7)}{G + L + R}$: (Note: $G + L + R = 100$)

19. $Y_s = 0.2 X_s$

20. $Y_s = 0.1 X_s$

Table 25-7 (Continued)

21. $Y_s = 0.4X_s$
22. $Y_s = 0.98X_s^{0.77}$
23. $Y_s = 0.49X_s^{0.77}$
24. $Y_s = 0.564X_s^{0.85}$
25. $Y_s = 0.282X^{0.85}$
26. $E_n = \frac{0.3(G + L) + 0.9R}{R + L + G}$: (Note: $R + L + G = 100$)
Except cyclone furnaces and, horizontally opposed solid fired.
27. $E = 1.06 Q_m$.
28. $E = 0.55 Q_m$ - May be required if needed to meet ambient air quality standards.
29. $S = 1/3 (-1690 + 20.75N + P_d (68.5 - .2375))$.
30. $E = 2.64 Q_m$.
 $E = 1.58 Q_m$ or) May be required by state air pollution control board
 $E = 1.06 Q_m$) to attain ambient air quality standards.
31. $E = 2.64 Q_m$.
32. $E = 2.72 Q_m^{-0.1328}$
33. $E = 0.0198q$
34. $E = 0.0347q$
35. $E = 123.4 + 0.091q$
36. $E = 0.614q^{0.8042}$
37. $He = 0.885q^{0.5}$
38. $He = 1.17q^{0.5}$
39. $He = 7.4(123.4 + 0.091q)^{0.5}$
40. $He = 5.8q^{0.402}$
41. $He = 1.8q^{0.5}$
42. $He = 0.49q^{0.5}$

22. Linear interpolation between the two process rates.
23. Table 26-3. Stack height at least 80 ft. above foundation grade and 10 ft. above top structure.
24. Breaker stack emission - Eq. 16 - Table 26-7. Main wind box not to exceed 1.2 times Eq. 16 - Table 26-7.
25. And/or is equipped with 90% efficiency fugitive dust control facilities.
26. Eq. 10 - Table 26-7.
27. Equip with 95% efficiency dust control device.
28. Eq. 5 - Table 26-7.
29. ADP - Air dried pulp.
30. Alabama, Idaho, Louisiana, Maine, Mississippi, New Hampshire, New Mexico, Oregon, South Carolina, Tennessee, Virginia, Washington.
31. Alabama, Georgia, Illinois, Indiana, Iowa, Missouri, New York, North Carolina, Oklahoma, Tennessee - Table 26-5.
32. Or not more than 2 residences within 1 mile radius of plant.
33. Or 99% efficient collector, whichever is more restrictive.
34. Breaker stack emission - Eq. 6 - Table 26-7. - Main wind box emission not to exceed 1.2 times Eq. 6 - Table 26-7.
35. Eq. 7 - Table 26-7.
36. Per ton produced on daily basis.
37. Average (quarterly geometric mean).
38. Average.

Footnotes (continued)

39. Monthly average.
40. Total organic and inorganic particulate matter.
41. Annual average.
42. Or 85% control, whichever is more restrictive.
43. Alabama, Idaho, Louisiana, Maine, Mississippi, New Hampshire, New Mexico, Oregon, Washington.
44. North Carolina, Oklahoma, Virginia.
45. Alabama, Idaho, Louisiana, Maine, Mississippi, New Hampshire, New Mexico, Oregon, Tennessee, Washington.
46. At 50% excess air or 12% CO₂.
47. Table 26-6.
48. Based on weight of material charged.
49. Eq. 8 - Table 26-7.
50. Colorado, Georgia, Kentucky.
51. Must have 99.5% control.
52. Also 99.7% collection efficiency required.
53. Plants over 15000 bbl/day apply for special limit.
54. 99.7% dust removal required.
55. Connecticut, Michigan, Wisconsin.
56. Eq. 9 - Table 26-7.
57. 80% collection efficiency required.
58. Idaho, Indiana, Kansas, Mississippi, North Carolina, Oklahoma.

Footnotes (continued)

59. APA - Air Pollution Authority.
60. Eqs. 11 & 12 - Table 26-7.
61. 200,000 lb process weight - use general process weight table.
62. Delaware, New Mexico, Virginia, West Virginia.
63. Also 85% collection efficiency.
64. Montgomery and Prince Georges Counties.
65. Allegheny, Calvert, Caroline, Cecil, Charles, Dorchester, Frederick, Garrett, Kent, Queen Anne's, St. Mary's, Somerset, Talbot, Washington, Wicomico and Worcester Counties.
66. Missouri, Montana, North Dakota, New Hampshire, Tennessee.
67. Baltimore City and Ann Arundel, Baltimore, Carroll, Hartford, Howard, Montgomery and Prince George's Counties.
68. APCD - Air Pollution Control District.
69. Calaveras, Fresno, Kern(Valley Basin), Kings, Los Angeles, Merced, Orange, Riverside (West Central Area), San Joaquin, San-Luis Obispo, Santa Barbara, Stanislaus, Sutter, and Ventura Counties.
70. Inyo, Placer, Sacramento, Santa Barbara (other than South Coast Air Basin) and Sutter Counties.
71. Calaveras, Fresno, Kings, Merced, San Diego (except incinerators), San Joaquin, Santa Barbara (South Coast Air Basin), Stanislaus, Tulare and Ventura Counties.
72. Fresno, Kern (Desert Basin), Kings, Merced, San Diego, San Joaquin, Stanislaus and Tulare Counties.
73. Inyo, Placer, Sacramento, San Bernardino, San Benito, San Luis Obispo and Santa Barbara Counties.
74. Including the portion of the district within the Northeast Plateau Air Basin.
75. Sliding scale from 0 to 3600.

Footnotes (continued)

76. 50% efficiency dust collection required.
77. 60% efficiency dust collection required.
78. 70% efficiency dust collection required.
79. 99% efficiency dust collection required.
80. 90% efficiency dust collection required.
81. Idaho, Indiana, Kansas, Maine, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, North Carolina, Oklahoma, Tennessee.
82. Colorado, Georgia, Vermont.
83. Must be multi-chambered.

192. M-1 Zone heavy manufacturing.

Table 26-1 - Particulate Emission
Pennsylvania

$$A = 0.76E^{0.42}$$

where:

A = Allowable emissions in pounds per hour^a.

E = Emission index = $F \times W$ pounds per hour.

F = Process factor in pounds per unit, and

W = Production or charging rate in units per hour.

<u>Process</u>	<u>Process Factor, F(in pounds per ton)</u>
Carbon Black manufacturing	500 (product)
Charcoal manufacturing	400 (product)
Crushers, grinders, or screens	20 (feed)
Paint manufacturing	0.05 (pigment handled)
Phosphoric acid manufacturing	6.0 (phosphorous burned)
Detergent drying	30 (product)
Alfalfa dehydration	30 (product)
Grain elevators (loading and unloading)	90 (grain)
Grain screening and cleaning	300 (grain)
Grain drying	200 (product)
Meat smoking	0.01 (meat)
Ammonium nitrate manufacturing (granulator)	0.1 (product)
Ferroalloy production furnace	0.3 (product)
Primary iron and/or steel making:	
Iron production	100 (product)
Sintering - windbox	20 (dry solids feed)
Steel production	40 (product)
Scarfing	20 (product)
Primary lead production:	
Roasting	0.004 (ore feed)
Sintering - Windbox	0.2 (sinter)
Lead reduction	0.5 (product)
Primary zinc production:	
Roasting	3 (ore feed)
Sintering - windbox	2 (product)
Zinc reduction	10 (product)

^a = Or 0.02 grain/ft³, whichever is greater

Table 26-1 - (continued) Particulate Emission
Pennsylvania

Secondary aluminum production:		
Sweating	50	(aluminum product)
Melting and refining	10	(aluminum feed)
Brass and bronze production (melting and refining)	20	(product)
Iron foundry:		
Melting:		
Five tons per hour and less	150	(iron)
More than five tons per hour	50	(iron)
Sand handling	20	(sand)
Shake-out	20	(sand)
Secondary lead smelting	0.5	(product)
Secondary magnesium smelting	0.2	(product)
Secondary zinc smelting:		
Sweating	0.01	(product)
Refining	0.3	(product)
Asphaltic concrete production	6	(aggregate feed)
Asphalt roofing manufacturing: (felt saturation)	0.6	(asphalt used)
Portland cement manufacturing:		
Clinker production	150	(dry solids feed)
Clinker cooling	50	(product)
Coal drying	2	(product)
Coal dry-cleaning	2	(product)
Lime calcining	200	(product)
Petroleum refining (catalytic cracking)	40	(liquid feed)

a - Coke Burn - off rate

b - If national secondary air quality standards for particulates are exceeded in the county between 7/1/73 and 10/1/74

Table 26-7

Equations

Nomenclature

B - Burning rate - 1000 lb/hr.

C - Charging rate - lb/hr.

C_e - Maximum permissible emission - grains/ ft^3

E - Maximum permissible emission - lb/hr.

E_c - Maximum permissible emission for coal burning - lb/MMBTU.

E_d - Maximum permissible dry emission - lb/hr.

E_f - Maximum permissible fine particulate matter emission - lb/unit time.

E_g - Maximum permissible emission for gas burning - lb/MMBTU.

E_o - Maximum permissible emission for oil burning - lb/MMBTU.

E_t - Maximum permissible total emission - lb/hr.

E_T - Maximum permissible emission - lb/unit time.

H_l - Heat input from liquid fuel - MMBTU/hr.

H_s - Heat input from solid fuel - MMBTU/hr.

N - Number of 500 lb bales per hour - No/hr.

P - Process weight rate - tons/hr.

q - Stack effluent flow rate - ft^3/min (STP).

Q_c - Heat energy supplied by coal - BTU/unit time.

Q_g - Heat energy supplied by gas - BTU/unit time.

Q_o - Heat energy supplied by oil - BTU/unit time.

R - Charging rate - lb/hr.

S - Emission rate of flue gas - ft^3/min (STP).

S_s - Applicable particulate matter emission standard for solid fuel - lb/MMBTU.

* Interpolation of the data in this table for process weight rates up to 60,000 lb/hr shall be accomplished by use of the equation $E = 4.10 P^{0.67}$, and interpolation and extrapolation of the data for process weight rates in excess of 60,000 lb/hr shall be accomplished by use of the equation:

$$E = 55.0 P^{0.11} - 40, \text{ where } E = \text{rate of emission in lb/hr and } P = \text{process weight rate in tons/hr.}$$

- 9. See Table 27-8
- 10. See Table 27-5
- 11. Effective stack height shall be calculated by the following equation:

$$h_e = h + 0.083v_e D_e \left[1.5 + 0.82 \left(\frac{T_e - 550}{T_e} \right)^2 \right]$$

Where:

h_e = Effective stack height in feet (ft)
 h = Physical stack height above ground level in feet
 v_e = Stack exit velocity in feet per second (ft/sec)
 D_e = Stack exit inside diameter in feet (ft)
 T_e = Stack exit temperature in degrees Rankin ($\circ R$)

TABLE 27-1
STACK HEIGHTS AND EMISSIONS, GEORGIA

$$\text{FOR } \text{SO}_2: \quad S_{\text{stack}} < 300 \text{ ft} \quad S = 10,000 F \left(\frac{h_s}{300} \right)^3 (\text{lbs/hr})$$

$$S_{\text{stack}} > 300 \text{ ft} \quad S = 10,000 F \left(\frac{h_s}{300} \right)^2 (\text{lbs/hr})$$

$F = 0.8$, when 2 or more fuel-burning sources each having a heat input of more than 500 million BTU's per hour and burning fuel containing more than 1 percent sulfur by weight are located in an urban area;
 $F = 1$, for other fuel-burning sources located in an

urban area, and for all other kinds of sources emitting sulfur dioxide regardless of location;
 $F = 2$, for fuel-burning sources having a heat input less than 10,000 million BTU's per hour, and located in a rural area;

For the purposes of this section, the term "urban" shall mean any site located within or 5 miles from the limits of a city having a population of 50,000 or more; the term "rural" will apply to all other site locations.

h_s is the stack height in feet. If several stacks are located at a given site, then the stack height to be used above will be the weighted average stack height given by

$$h_s = \frac{h_1 S_1 + h_2 S_2 + \dots + h_n S_n}{S_{\text{total}}}$$

height of the first stack, S_1 is the sulfur dioxide emitted from the first stack, h_2 is the height of the second stack, and so forth. S_{total} is the total sulfur dioxide emission at the site. S is expressed in pounds per hour sulfur dioxide from a stack. No single stack may exceed the above allowed emission calculated using its own actual height.

TABLE 27-2
STACK HEIGHTS AND EMISSIONS, GEORGIA

For suspended particulates:

- Maximum Allowable Particulate Emissions:**
1. At any site from either fuel burning or manufacturing process emission sources, located within or one mile from the limits of a city having a population of 50,000 or more, with the exception of asphaltic concrete, hot mix plants, cupola furnaces for metallurgical melting, and kaolin and fuller's earth processes, no person shall cause, let, permit, suffer or allow the emission of fly ash and/or other particulate matter equal to or exceeding:

(i) for stack heights below 120 feet $- P = 0.48h_s$ pounds per hour;

(ii) for stack heights below 300 feet but equal to or greater than 120 feet $- P = 900 \frac{h_s}{3}$ pounds per hour;

(iii) for stack heights equal to or greater than 300 feet $- P = 900 \frac{h_s}{2}$ pounds per hour;

300

(iv) P = the maximum allowable fly ash and/or other particulate emissions in pounds per hour;

(v) h_s = the stack height in feet.

2. If several stacks are located at a given site, then the stack height to be used in the above equations will be the weighted average stack height given by

$$h_s = \frac{h_1 A_1 + h_2 A_2 + \dots + h_n A_n}{A_{total}}$$

A_{total}

where h_1 is the height of the first stack, A_1 is the fly ash and/or particulate matter emission from the first stack, h_2 is the height of the second stack, and so forth. A_{total} is the total ash and particulate matter emission at the site, in pounds per hour. No single stack may equal or exceed the above allowed emissions calculated using its own stack height.

Table 27-4
Stack Height and Emissions Standards for SO₂, Indiana

$$\frac{C_{\max} = 40 S_p P^{0.75} n^{0.25}}{a h_s}$$

Process operations

$$\frac{C_{\max} = 90 S_f Q_m^{0.75} n^{0.25}}{a h_s}$$

Fuel combustion

Factors in these formulas are defined as follows:

C_{\max} = maximum ground level concentration with respect to distance and at the "critical" wind speed for level terrain, in micrograms per cubic meter, resulting from the point source. This value shall not exceed 200. Lower values may be selected where terrain and other conditions dictate.

S_f = pounds of sulfur dioxide emitted per million Btu of heat input value of the fuel.

S_p = pounds of sulfur dioxide emitted per ton of process weight input.

Q_m = total equipment capacity rating, fuel heat input in millions of Btu per hour.

p = total equipment capacity process weight input, tons per hour.

n = number of stacks or chimneys in fuel burning or process operations

a = plume rise factor. The value 0.67 shall be used for all process equipment ratings and fuel-burning equipment capacity ratings of less than 1,000 million Btu heat input. No value greater than 0.8 for larger fuel-burning equipment capacities shall be used.

h_s = stack height in feet. If a number of stacks with varying heights for different equipment capacity ratings exist, an average stack height to represent " n " stacks shall be calculated by dividing the sum of the height of each stack multiplied by its equipment capacity rating by the total plant capacity rating.

Page 27-5
**Stack Heights and Emission Standards
 for Suspended Particulates, Tennessee**

1. Stack gas exit temperature less than 100 degrees F
 (See Note)

$$Q = 3.02 \times 10^{-4} V_s h_s^2 \left[\frac{d}{h_s} \right]^{0.71}$$

2. Stack gas exit temperature of 125 degrees F or greater (See Note)
- Stacks less than 500 feet

$$Q = 0.2h_s [Q_T \times 0.02 \times (T_s - 60)]^{0.25}$$

- b. Stacks 500 feet and greater

$$Q = 0.3h_s [Q_T \times 0.02 \times (T_s - 60)]^{0.25}$$

3. For stack gas exit temperatures from 100 degrees F to 124 degrees F calculate allowable emission as in 1 and either 2a or 2b depending upon stack height (using T_s of 125 degrees F) and make linear interpolation based upon actual stack gas exit temperature. The terms of the preceding equations shall have the following meaning and units:

d_s - inside diameter or equivalent diameter of stack tip in feet

h_s - stack height in feet (vertical distance above grade directly below tip of stack)

Q - maximum allowable emission rate in pounds per hour

Q_T - volume rate of stack gas flow in cubic feet per second calculated to 60° F

T_s - temperature of stack gases at stack tip in °F

V_s - velocity of stack gases at stack tip in $\frac{\text{feet}}{\text{second}}$

NOTE: In determining applicability of equations in this subsection based upon exit gas temperature the actual exit gas temperature must equal or exceed the stated temperature during ninety (90) percent or more of the operating time.

Table 2
Stack Heights and Emissions of
Particulate Matter, St. Louis Co. Missouri

When a plant or premise has more than one stack and the stack heights are unequal, a weighted average stack height shall be used for purposes of determining maximum allowable emissions. This weighted average stack height shall be calculated in the following manner:

- (1) Determine the heat input of each fuel burning unit (expressed in B.T.U. per hour). Add together the heat inputs of the units venting to each stack. If a single unit vents to more than one stack, prorate the B.T.U. input to each stack in proportion to exhaust gas flows.
- (2) Determine the height of each stack, measured in feet.
- (3) Multiply the total heat input of units vented through each stack as determined in (1) by the height of the stack to which discharged.
- (4) Add together the values obtained from (3).
- (5) Add together the heat input for all of the units of the plant or premise.
- (6) Divide the sum obtained in step (4) by the sum obtained in step (5). The quotient (result) is the weighted average stack height expressed in feet.

Table 27-7
 Stack Height and Emissions of
 Particulate Matter, St. Louis City, Missouri

$D = \frac{50 \cdot A \cdot H_s \cdot 10^3}{2.22 \cdot Q_h^{0.75}}$	No. of Stacks	Reduction factor for dividing
	1	1.0

80,000	138		
100,000	155		

Interpolation and extrapolation of the data in this Table shall be accomplished by the use of the equation $H_e = 0.49 q^{0.50}$, where H_e is the standard effective stack height in feet and q is the stack effluent flow rate in scfm.

TABLE 28. VISIBLE EMISSION STANDARD OF THE UNITED STATES

59. Stack diameter > 60".
60. Plants not meeting weight emission regulations.
61. Stack diameter < 60".
62. Plants meeting weight emission regulations.
63. Lincoln and Omaha, Nebraska; Puget Sound, Spokane and Yakima Air Pollution Authorities, Washington.
64. New or modified sources thru out the state plus existing sources in subregion 1 of the Lake Michigan Interstate, all of the ~~Southeast~~ Wisconsin Interstate Air Quality Control Regions.
65. Table 28-1.
66. 60% opacity for 8 min/hr, 3 lines/24 hr permitted.

TABLE 28-1. VISIBLE EMISSION STANDARDS-POUGHKEEPSIE, NEW YORK

TYPE OF INSTALLATION	LIMITING DENSITY, SHADE OR APPEARANCE OF SMOKE
A. Domestic installations, primarily for heating and hot water, in one and two family dwellings.	Not darker than Shade #1.
B. Installations, primarily for heating and hot water in apartment houses, office buildings, hospitals and other installations of similar character.	Not darker than Shade #1 <u>except</u> that smoke not darker than Shade #3 is permitted for not more than a total of 4 minutes in any period of 30 minutes.
C. All other stationary installations except those included in Paragraph F hereof.	Not darker than Shade #2 <u>except</u> that smoke not darker than Shade #3 is permitted for not more than a total of 4 minutes in any period of 30 minutes.
D. Railroad Locomotives	Not darker than Shade #2 <u>except</u> that smoke not darker than Shade #3 is permitted for not more than a total of 1 minute in any period of 6 minutes for a locomotive in motion, or for not more than a total of 4 minutes in any period of 30 minutes for a locomotive not in motion.
E. For building a wholly fresh fire in a cold fire box.	In railroad locomotives, not darker than Shade #3 is permitted for not more than 12 consecutive minutes in any period of 24 hours; in other installations, not darker than Shade #3 is permitted for not more than 20 consecutive minutes while such fire is being built.
F. For installations using a fuel input in excess of 25,000,000 BTU per hour, the primary purpose of which is to provide standby and emergency facilities for maintaining essential public utility services.	Not darker than Shade #2 <u>except</u> that smoke not darker than Shade #3 is permitted for not more than a total of 10 minutes in any period of 30 minutes.

TABLE 29 (CONTINUED). EMISSION STANDARDS FOR MOBILE SOURCES OF THE UNITED STATES

FOOTNOTES

1. Light duty gasoline vehicles (< 6000 lb: > 50 in³ displacement).
2. Federal regulations.
3. Light duty gasoline vehicles.
4. Gasoline and Diesel (> 6000 lb): includes buses.
5. In addition, diesel vehicles must meet an exhaust smoke standard of not more than 20% opacity during acceleration and 15% during lugging, with peak opacity in either mode not to exceed 50%.
6. Not idle emission with transmission set in neutral; Test made with portable equipment on highway.
7. Test made at safety lane inspection station.
8. American manufacturers only.
9. Also foreign manufacturers of > 140 in³ displacement vehicles.
10. Uses new automobile test procedures.
11. Sum of Hydrocarbons plus Nitrogen Oxides (as NO₂).

Table 30. RECOMMENDED MEASUREMENT METHODS OF THE UNITED STATES¹

Pollutant	State	Principal Method ¹⁷	Specific Method	Footnote
Smoke	Federal	opacity	Ringelman	10, 16
Smoke	Louisiana	opacity	Ringelman	10, 16

Table 30 (continued). RECOMMENDED MEASUREMENT METHODS OF THE UNITED STATES¹

FOOTNOTES

1. All methods, if not otherwise indicated, are for ambient air measurements.
2. For emission measurements, method No. 10, 39 FR 13776, April 17, 1974.
3. Light transmittance, Tape Sampler Method ASTM D 1704-61.
4. ASTM D1739-62.
5. 38 FR 25678, Sept. 14, 1973.
6. For ambient air and emission measurement.
7. Used for performance testing of new stationary sources.
8. Alaska, Colorado, D.C., Minnesota, Missouri, New Mexico, North Dakota, Virginia, and Wisconsin refer to ASME Power Test Code 27-1957.
9. Arizona, Connecticut, D.C., and Virginia refer to ASME Power Test Code 21-1941.
10. For emission measurements.
11. Method 6 or 8 of 39 FR 13776, April 17, 1974.
12. Method 104, 39 FR 15396, May 3, 1974.
13. Method 101 for measurements in air stream, 39 FR 15396, May 3, 1974.
14. Method 102 for measurements in hydrogen stream, 39 FR 15396, May 3, 1974.

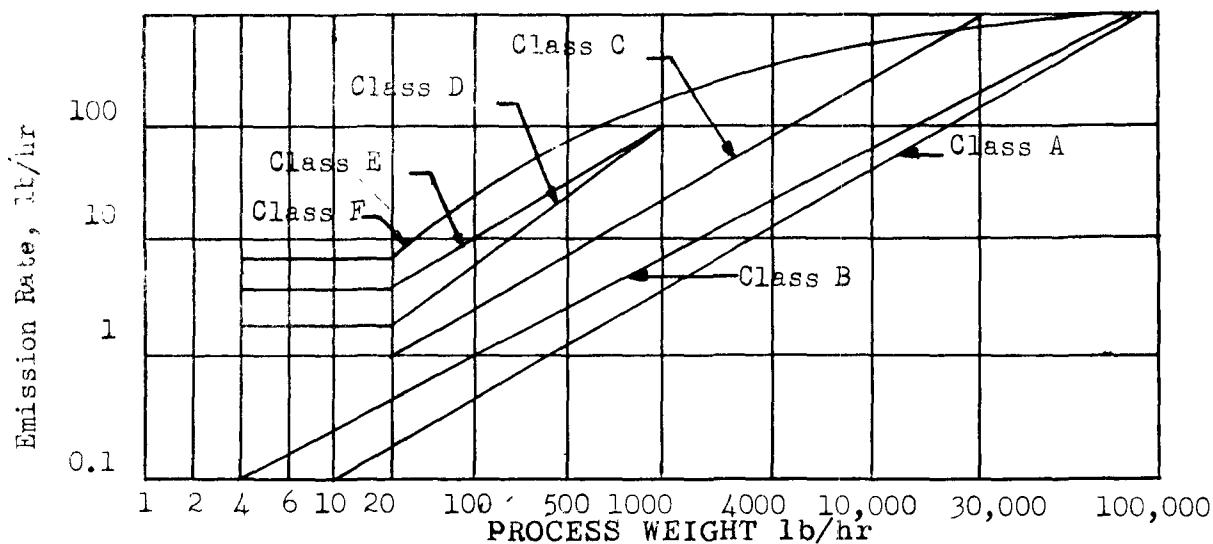

Table 30 (continued). RECOMMENDED MEASUREMENT METHODS OF THE UNITED STATES¹

FOOTNOTES

5. Revised 8 39 FR 13776, April 17, 1974.
15. Rev'd 9 39-FR 13776, April 17, 1974.
17. All states use as Standard Condition of the Atmosphere 68 - F and 14.7 lbs/in² or 20-25 C and 760 mm Hg except Colorado, 0 C and 760 mm Hg for ambient air sampling.
18. Winter-Willard distillation, SPADNS - color: Tentative Method of Analysis for Fluoride Content of the Atmosphere and Plant Tissues, Methods of Air Sampling and Analysis, Inter-society Committee, American Public Health Association, 1972.
19. FID = Flame ionization detector.

For gases, the following standards shall apply. The Director of Health shall determine the class of any particular gas.

AVERAGE EMISSION - RATE POTENTIAL lb/hr.

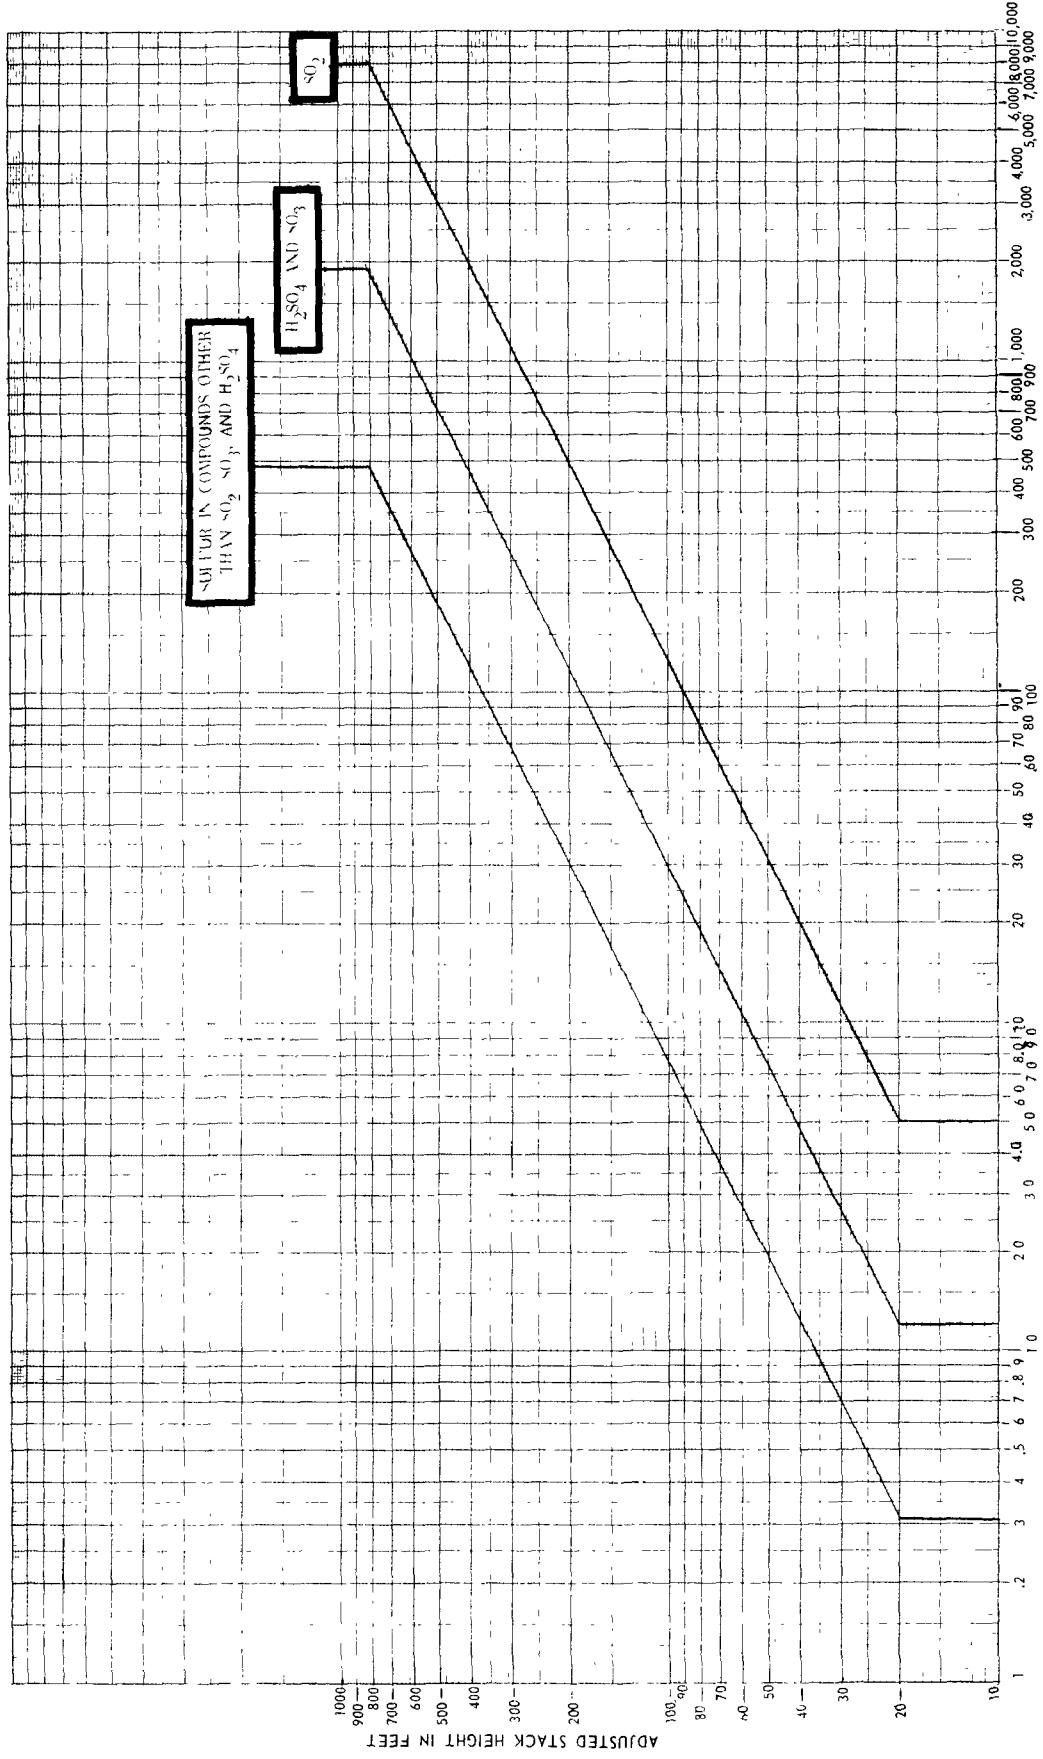

Class	Gases*
A	Nickel carbonyl
B	Phosphine
C	Acrolein, bromine, fluorine
D	Chlorine, HCHO, HCl, SO ₂
E	Alkyl alcohol, HB, HCN, NO ₂ , H ₂ S
F	Acetic acid, NH ₃ , methyl acrylate

*Examples only. Not all inclusive

Each curve gives the allowable emission rates for each class of gases in terms of the rate at which the gases would be emitted (potential rate of pollutant emission) in the absence of gas cleaning devices.

COLLECTION EFFICIENCY BASED ON PARTICLE SIZE

UTILIZATION OF THIS FIGURE IS ACCOMPLISHED BY DETERMINING THE PARTICLE SIZE AND THEN READING VERTICALLY TO THE CURVE AND THEN HORIZONTALLY TO DETERMINE THE COLLECTION EFFICIENCY. THIS CHART IMPLIES THAT AS THE PARTICLE SIZE DECREASES THE COLLECTION EFFICIENCY IS DECREASED.

		14. SPONSORING AGENCY CODE
15. SUPPLEMENTARY NOTES Volume II of 2 Volumes		
16. ABSTRACT This is as complete as possible an assembly of the numerical air quality management standards of the world, including the United States. The kinds of standards included are those for: air quality, concentration at point of impingement at ground level, deposited particulate matter, emergency procedure concentrations, emissions, fluorides in forage, fuel, measurement method, protection zone, soiling index, stack height and sulfation. It excludes air quality management regulations that do not have numerical limits; and, conversely, numerical limits that do not directly relate to air quality management. In the former category are open burning and fugitive dust regulations, that, almost without exception, do not include numerical limits. In the latter category are numerical design standards for fuel burning equipment which relate only indirectly to air quality management. The standards are presented in tabular form, supported, where necessary, with figures.
