FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGEMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Texas Water Quality Board for professional involvement, to the Texas National Guard for conducting the tributary sampling phase of the Survey, and to those Texas wastewater treatment plant operators who voluntarily provided effluent samples.

Hugh C. Yantis, Jr., Executive Director of the Texas Water Quality Board, and John B. Latchford, Jr., Director, and the staff of the Field Operations Division provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Thomas Bishop, the Adjutant General of Texas, and Project Officer Colonel William L. Seals, who directed the volunteer efforts of the Texas National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

LAKE MEREDITH
STORET NO. 4823

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Lake Meredith is mesotrophic; i.e., moderately supplied with nutrients and moderately productive.

Whether nutrient enrichment is beneficial or deleterious depends on the actual or potential effect on the uses of the reservoir.

In this regard, no nuisance conditions are known to personnel of the Texas Water Quality Board and there is little or no impairment of the designated beneficial uses of this water body.

Lake Meredith ranked second in overall trophic quality when the 39 Texas reservoirs sampled in 1974 were compared using a combination of six water quality parameters*. Seven of the water bodies had less median total phosphorus, eleven had less and six had the same median dissolved orthophosphorus, two had less and three had the same median inorganic nitrogen, two had less mean chlorophyll a, and 11 had greater mean Secchi disc transparency. Marked depression of metalimnetic dissolved oxygen occurred at stations 1 and 2 during the August sampling.

Survey limnologists did not observe macrophytes or surface algal concentrations during sampling visits. In a report on a previous study on Lake Meredith, it is noted that aquatic vegetation is not a problem (Kraai, 1974).

* See Appendix A.

B. Rate-Limiting Nutrient:

The algal assay results are not considered representative of conditions in the lake at the times the samples were taken. The lake data indicate nitrogen limitation at all sampling stations in March and October, at station 4 in May, and at stations 1 and 2 in August.

C. Nutrient Controllability:

1. Point sources--The only known point source impacting Lake Meredith during the sampling year was the wastewater treatment plant at Amarillo which accounted for an estimated 28.9% of the total phosphorus load.

The present phosphorus loading of 6.41 g/m²/year is nearly 23 times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 14). However, the lake primarily is nitrogen limited, and this may account for the rather low chlorophyll a levels and the absence of aquatic vegetation problems.

The median inorganic nitrogen concentration in the lake was only 70 µg/l, and it is questionable whether point-source phosphorus control would result in a shift to persistent phosphorus limitation.

2. Non-point sources--During the sampling year, non-point sources contributed 71.1% of the total phosphorus load. The Canadian River contributed 70.8% and three other gaged tributaries collectively contributed less than 1%. The ungaged minor tributaries and immediate drainage were estimated to have contributed less than 1%.

The phosphorus export rate of the Canadian River was much higher than the other tributaries in this drainage basin (see page 12). This may be the result of underestimation of the point-source load contributed by the Amarillo wastewater treatment plant.

II. LAKE AND DRAINAGE BASIN CHARACTERISTICS[†]

A. Lake Morphometry^{††}:

1. Surface area: 66.77 kilometers².
2. Mean depth: 16.0 meters.
3. Maximum depth: >26.2 meters.
4. Volume: 1,066.229 x 10⁶ m³.
5. Mean hydraulic retention time: 8.6 years.

B. Tributary and Outlet: (See Appendix C for flow data)

1. Tributaries -

<u>Name</u>	<u>Drainage area (km²)^{†††}</u>	<u>Mean flow (m³/sec)^{†††}</u>
Canadian River	39,823.8	6.290
Bonita Creek	166.8	0.057
Big Blue Creek	665.6	0.253
Bugbee Creek	19.7	0.005
Minor tributaries & immediate drainage -	<u>821.6</u>	<u>0.279</u>
Totals	41,497.5	6.884

2. Outlet -

Aqueduct	-	2.778*
Canadian River	<u>41,564.3</u>	<u>1.170</u>
Total	41,564.3**	3.948

C. Precipitation***:

1. Year of sampling: 58.6 centimeters.
2. Mean annual: 51.5 centimeters.

III. LAKE WATER QUALITY SUMMARY

Lake Meredith was sampled four times in 1974 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at four stations on the lake (see map, page vi). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first and last visits, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 26.2 meters at station 1, 21.9 meters at station 2, 14.0 meters at station 3, and 9.1 meters at station 4.

The sampling results are presented in full in Appendix D and are summarized in the following table.

C. Limiting Nutrient Study:

The algal assay results are not considered representative of conditions in the lake at the times the samples were collected (03/05/74 and 10/28/74) due to significant changes in nitrogen and phosphorus in the samples during shipment from the field to the laboratory.

The lake data indicate nitrogen was limiting in March and October. However, at the other two sampling times, a combination of limiting nutrients is indicated. Following is a tabulation of

the mean inorganic nitrogen/orthophosphorus ratios for each of the sampling stations and times with the indicated limiting nutrient in parentheses.

<u>Station</u>	<u>03/05/74</u>	<u>05/04/74</u>	<u>08/07/74</u>	<u>10/28/74</u>
1	8/1 (N)	20/1 (P)	9/1 (N)	4/1 (N)
2	8/1 (N)	16/1 (P)	8/1 (N)	4/1 (N)
3	7/1 (N)	18/1 (P)	26/1 (P)	3/1 (N)
4	5/1 (N)	12/1 (N)	32/1 (P)	5/1 (N)

IV. NUTRIENT LOADINGS
(See Appendix E for data)

For the determination of nutrient loadings, the Texas National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page vi), except for the high runoff month of May when two samples were collected. Sampling was begun in September, 1974, and was completed in August, 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Texas District Office of the U.S. Geological Survey for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries, including the aqueduct, were calculated using mean annual concentrations and mean annual flows. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the mean concentrations in Big Blue Creek at station F-1 and the mean annual ZZ flow.

The operator of the Amarillo wastewater treatment plant did not participate. Therefore, nutrient loads were estimated at 1.134 kg P and 3.401 kg N/capita/year, and flows were estimated at 0.3785 m³/capita/day.

A. Waste Sources:

Total	1,629,070	100.0

2. Outputs -

Lake outlet - Aqueduct	56,070
Canadian River	<u>19,115</u>
Total	75,185

3. Net annual N accumulation - 1,553,885 kg.

D. Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km²/yr</u>	<u>kg N/km²/yr</u>
Canadian River	8	30
Bonita Creek	<1	6
Big Blue Creek	<1	7
Bugbee Creek	<1	6

* See Working Paper No. 175.

E. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus	Total Nitrogen		
	Total	Accumulated	Total	Accumulated
grams/m ² /yr	6.41	6.38	24.4	23.3

Vollenweider phosphorus loadings
(g/m²/yr) based on mean depth and mean
hydraulic retention time of Lake Meredith:

"Dangerous" (eutrophic loading)	0.28
"Permissible" (oligotrophic loading)	0.14
