It has been peer reviewed by the EPA and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation by EPA for use.

Abstract

This report presents detailed results tables from an unweighted statistical analysis of selected portions of the 1992-94 National Human Activity Pattern Survey (NHAPS) data base. This survey was designed to collect data on the potential exposure of the American people to important household pollutants. As part of the data-collection methodology, randomly selected individuals were asked to supply both minute-by-minute diaries spanning an entire day and answers to a wide range of follow-up questions focused on specific exposure types. This report provides the most comprehensive and integrated NHAPS reference to date and will be valuable to exposure assessors and a wide range of researchers in both health-related and social science disciplines. This report does not contain a complete discussion of the results tables or the quality of data collection.

Selected 24-hour diary locations and activities, selected regroupings of the 24-hour diary locations, activities, and smoker-present categories, and almost all of the follow-up question variables in the NHAPS data base were statistically analyzed across 12 subgroups (gender, age, race, Hispanic, education, employment, census region, day-of-week, season, asthma, angina, and bronchitis/emphysema). Overall statistics were also generated for the 9,386 total respondents. The follow-up questions concerned exposure to household pollutants via the air, water, and dermal pathways (e.g., "Did you smoke cigarettes yesterday," "Were you exposed to solvents-fumes," "Where do you get water for household," "How many minutes spent on sand or gravel"), whereas the 24-hour diary locations and activities were divided into categories of more general interest (e.g., "Home Kitchen," "Service Station/Gas Station," "Cleaning House," "Active Sports").

Tables show descriptive statistics (including frequency distributions) of time spent and frequency of occurrence in each of 39 locations and for 22 activities (that were experienced by more than 50 respondents) along with equivalent tables for 10 regrouped locations (Residence-Indoors, Residence-Outdoors, Inside Vehicle, Near Vehicle, Other Outdoor, Office/Factory, Mall/Store, Public Building, Bar/Restaurant, Other Indoor), seven regrouped activities (No Exposure, Food Preparation, Laundry/Dishes, Housekeeping, Bathing/Washing, Yardwork/Maintenance, Sports/Exercise, Eating/Drinking), and presence of a smoker. Tables containing frequency distributions of time spent while in exposure activities or the frequency of occurrence of exposure activities, as determined from the follow-up questions that were analyzed, are also presented. Since some of the follow-up question data were originally coded inconsistently in a "mixed-type" format, some information was lost.

The page number on which each table can be found is presented in detailed indices. The Appendix contains a condensed listing of the questionnaires (versions A and B for the adult, child-direct, and child-proxy interview types), including the question number, the NHAPS data base variable name, and the verbatim question text.

Acknowledgments

The National Human Activity Pattern Survey (NHAPS) was conducted for the U.S. Environmental Protection Agency (EPA) between October 1992 and September 1994 by the Survey Research Center at the University of Maryland, College Park. The current report was funded by the EPA Office of Research and Development, National Exposure Research Laboratory, Characterization Research Division in Las Vegas, Nevada. Timothy Triplett of the Survey Research Center assisted the authors by supplying updated versions of the NHAPS database. The NHAPS data base is available in SAS®, SPSS®, and ASCII formats. Stephen Hern, William Engelmann, Karen Hammerstrom, William Nelson, and Jackie Moya (EPA personnel) provided guidance for determining what analyses and breakdowns were to be included in the final report. Appreciation is extended to Donna Sutton for assisting in the preparation of the final electronic version of this report and to Forest Garner for his helpful comments.

Much of the impetus for creating detailed NHAPS results tables came from a need for more activity pattern data in the Exposure Factors Handbook, which is published by the Agency. Many of the tables presented in this report will also be included in the next version of the Handbook.

Section 1
Introduction

The National Human Activity Pattern Survey (NHAPS) was designed to provide estimates of potential exposure to pollutants in air, water, and soil systems with which people in the United States come into contact throughout their typical daily routine (*1,2*). Its overall design was patterned after the 1988-1990 California Activity Pattern studies carried out by the California Air Resources Board (*3,4*). Conducted between October 1992 and September 1994, the extensive NHAPS data base on the American public contains geographic (e.g., EPA region, U.S. census region, state, zip code), socioeconomic (e.g., gender, age, race, education), and temporal (e.g., quarter, month, day of week) information on 9,386 different respondents distributed over eight seasonal quarters throughout the entire nation (each respondent was interviewed only once in the study). A general discussion of the human exposure field and the role of NHAPS data in future exposure assessments is provided in another work (*5*).

The NHAPS interviews began with a random selection of a respondent from each randomly selected household. Sundays were oversampled to ensure an adequate weekend sample size. If the respondent chosen was a child less than 10 years of age, an adult (18 and older) in the household gave a proxy interview. Detailed minute-by-minute 24-hour diaries collected for each respondent contain a maximum of 82 different possible locations (e.g., Residence-Kitchen, Residence-Garage, Office, School, Bar-Restaurant, Automobile), a maximum of 91 different activities (e.g., Cleaning, Food Preparation, Bathing), and information on whether a smoker was ever present. The data from these diaries are stored in the "diary" data file (Table 1).

Additionally, respondents were asked exposure-related follow-up questions (focused mostly on air and water pathways) on specific pollutant sources (e.g., paint, glue) or prolonged background activities (e.g., gas heaters, tobacco smoke). These responses were stored in the "main" data file (Table 1). The main file also contains demographic information, household characteristics, respondent identification, and time periods (e.g., respondent identification number, interview date, time interview began, duration of interview, number of phones in household, type of interview, age, race). Specific NHAPS features are summarized in Table 2. Sample sizes and response rates for all eight quarters of the study are presented in Table 3.

The complete data-collection methodology is presented by Robinson and Blair (*2*). The study was designed for coverage of biological, status, role, geographic, and lifestyle background factors (Table 4). Version A of the questionnaire included questions concentrated on chemical storage, tobacco smoke, other exposures occurring through air, and methods of mitigating air exposures (Table 4). Version A also included some questions on bathing, washing, and ingestion of soil by children. Version B of the questionnaire included questions on chemical storage, active cigarette smoking, long-term exposures occurring through air, ingestion of soil by children, and ingestion of certain foods (Table 4). Version B also included questions on bathing, drinking, and pool swimming.

Table 1. Description of the Two NHAPS Data Files

Filename	Description
DIARY.XXX *16 variables* *157,234 records*	Diary file containing multiple-record 24-hour diaries for each of the 9,386 respondents. The set of records containing variables corresponds to all the different micro-environments each respondent visited and includes the location, activity, and smoker-present codes and the beginning and ending times for each microenvironment.
MAIN.XXX *455 variables* *9,386 records*	Main file containing household and identification information (e.g., respondent identification number, length of interview), demographic background information (e.g., region, gender, or age), temporal information (e.g., day-of-week, month, or year), responses to the exposure-related follow-up questions, and number of minutes spent in each location and activity diary category for all 9,386 respondents.

Note: Each file has a variable containing a unique identification code for each respondent that was used to link the information in the two files. The files were supplied to the authors by the Survey Research Center, U. of Maryland in SAS®, SPSS®, and ASCII formats.

Content and Purpose of this Report

This report contains detailed results tables for both the follow-up questions and many of the 24-hour diary activities and locations (including selected regroupings of the locations and activities) from the National Human Activity Pattern Survey (NHAPS) data. It is intended as a reference for use by exposure assessors and other researchers in health-related fields, but may also be of general interest to social science researchers. Some of the uses of the results tables are to:

1. obtain national distributions--means, standard deviations, frequencies, and percentiles--of time spent in a large variety of activities and locations on a single day (from the NHAPS 24-hour diary results);

2. obtain the number of respondents and percentages of respondents in a national sample who were in specific locations and activities in a single day (from the NHAPS 24-hour diary results);

3. obtain national distributions--both frequencies and percentiles--of time spent potentially being exposed and the frequency of occurrence of potential exposure to various household pollutants (from the NHAPS follow-up question results);

4. obtain the number of respondents and percentages of respondents in a nationally representative sample who were potentially exposed to various household pollutants (from the NHAPS follow-up question results);

5. conduct a missing-values analysis for each NHAPS follow-up question by selected grouping factors (e.g., age, gender, race, education); and

6. improve on the data collection methodology, coding, and study design of human activity pattern surveys.

Table 2. Summary of the National Human Activity Pattern Survey (NHAPS) Features

Dates of Data Collection	October 1992 through September 1994 (four 3-month seasonal quarters per year).
Data Collection Instrument	Telephone interviews using a Random-Digit Dial (RDD) method and Computer-Assisted Telephone Interviewing (CATI).
Data Types	(1) 24-hour diaries with beginning and ending times with one-minute resolution (0000 through 2400), (2) demographic questions, and (3) follow-up questions on medical background, housing characteristics, and exposure to chemicals.
Number of Total Respondents	9,386
Response Rate	63% (65% for last seven quarters; first quarter was 46% resulting from difficulties in procedure and training schedules).
Cooperation Rate	Over 75% excluding those respondents not contacted (or because they were not interviewed for other factors).
Geographic Variables	The 48 contiguous United States (excluding Alaska and Hawaii) by state, EPA region, U.S. census region, telephone area code, working postal zip code, and residential postal zip code (there is not complete coverage of all possible zip codes).
Socioeconomic Variables	Age (0 to 93), gender, race, education, employment status, etc.
Emphasis of Follow-up Questions	Personal exposure to contaminants in air and water from household sources.
24-Hour Diary Location Categories (WHR Variable)	82 categories arranged by Own House, Friend's/Other's House, Traveling, Other Indoor, and Other Outdoor.
24-Hour Diary Activity Categories (RACT Variable)	91 categories arranged by Non-Free Time (Paid Work, Household Work, Child Care, Obtaining Goods/Services, Personal Care) and Free Time (Educational, Organizational, Social, Recreational, Communications).
Diary Variables for each Microenvironment (Microenvironment = Location × Activity)	Date (month, day, and year), starting time, ending time, elapsed time (duration), presence of a smoker, heavy breathing activity (yes or no), location category, and activity category.
Total Diary Records (Microenvironments)	157,234
Number of Different Microenvironments Per Person	Range = 1 to 59; Mean = 17.

Table 4. Background Factors and Summary of Question Types for Questionnaires Version A and Version B

Background (Grouping) Factors	Version A (~50% of Respondents)	Version B (~50% of Respondents)
Biological (Age, Race, Gender) **Status** (Employment, Education) **Role** (Children, Other Adults, Work Hours, Work Evening, Work Outdoors) **Geographic** (Zipcodes-Home, Zipcodes-Work, Housing, Structure, Stories, Rooms, Carpet, Basement, Garage) **Life-Style** (Health)	**Air - Storage** (Gas cans, Lawnmower, Paints, Mothballs, Deodorizer, Humidifier, Windows Open, Doors Open) **Air - Yesterday** (Smoking-Home/Away, Others Smoke, Paints, Open Flame, Glues, Solvents, Pesticides, Floor Wax, Gas-Powered Equipment, Cleaning Agents, Excessive Dust, Stain Removers, Perfumes, Nail Polish, Gas-Station, Gas Stove, Microwave, Aerosol Spray, Heating, Heavy Traffic, Roadway, Parking Garage, Walk to Car) **Water** (Shower/Bath, Dishwasher, Washing Machine) **Ingestion** (Children-Soil) **24-Hour Diary** (Activities, Locations, Smoking, Hard Breathing)	**Air - Storage** (Gas, Lawnmower, Paints, Solvents) **Air - Last 6 Months** (Renovations, Paint, Floors, Addition, Carpets, Glues, Sleep Elsewhere, Pesticides, Vacuum Floors, Humifier, Gas Stove, Heat Sources) **Water** (Shower/Bath, Dishwashing, Washing Machine, Drinking Water-Bottle/Tap, Juices, Soft Drinks) **Water - Last Month** (Pool Swimming) **Ingestion** (Children-Soil, Seafood, Blackened Food) **24-Hour Diary** (Activities, Locations, Smoking, Hard Breathing)

Source: Robinson and Blair (2)

The follow-up question results tables are arranged in the order in which questions were asked on versions A and B of the NHAPS questionnaires; the condensed questionnaire text is included in Tables A1 (Version A) and A2 (Version B) in the appendix to this report. Both the 24-hour diary results tables and the follow-up question results tables are accessible through complete indices (pages 2-15 to 2-25). The follow-up question indices specify the question classification, the table number, the data base variable name, the variable label, the question number, and the page number in this report where the results table can be found. Similarly, the 24-hour-diary indices contain the table number, the location or activity variable value, the variable value label, and the page number.

The 24-Hour Diaries

Each of the 9,386 persons interviewed in the survey was asked to recall their entire daily routine (or a child's routine if it was a proxy interview) from midnight-to-midnight for the day immediately preceding the day of the interview (the diary day). The beginning and ending times of each microenvironment (i.e., each different combination of a location and an activity--including the presence of a smoker) in these diaries were recorded with a time resolution of one minute in the diary data file. Together, the set of beginning and ending times for each microenvironment spanning one day comprises a comprehensive, sequential account of a person's locations, activities, and proximity to smokers. The coding of presence-of-a-smoker was expanded in the last two quarters of the study (April 1994 to September 1994) from the simple "smoker-present" category to the fraction of time a smoker was present: "the entire time"; "more than half the time"; "half of the time"; "less than half the time"; or "hardly any of the time."

Besides tobacco smoke, the NHAPS study did not collect any minute-by-minute diary data on the respondents' proximity to specific pollutant sources. For example, there are no minute-by-minute accounts for source types such as cleaning agents, pesticides, solvents, or stoves or for their method of use. Minute-by-minute categories for housing characteristics, such as the time windows were open or the heat was on, and for types of exercise, such as running or hiking, are also missing.

The Follow-Up Questions

Each follow-up question was placed on either the A questionnaire (containing many questions specific to the air-exposure pathway), the B questionnaire (containing many questions specific to the water-exposure pathway), or both. There were three different types of both the A and B questionnaire versions for interviews with adults, children, and a proxy (for children too young to answer for themselves), resulting in a total of six different questionnaires (Table 5). Identical or nearly identical questions from these three interview types were stored in a single follow-up question variable in the final NHAPS data base. The number of responses (number of non-missing variable values equals response sample size) for questions in each interview type (Tables 6 and 7) did not always sum to the total number of respondents given each questionnaire version (4,723 for A only and 4,663 for B only). For example, the *SMOKEHO* variable, included on questionnaire version A only, contains zero adult responses, 367 direct-children responses, and 512 proxy responses (a sum total of 879 responses; maximum possible equals 4,723), and the *WKHRS* variable included on both questionnaire version A and version B, contains no proxy responses, 48 child-direct responses, and 4,848 adult responses (a sum total of 4,896 responses; maximum possible = 9,386). The missing responses arise because (1) one interview type is missing a question included on the other interview types for that questionnaire version (A or B) or (2) there was some methodology-dependent or respondent-dependent difficulty in the data collection. The exact text for each questionnaire version, including the differences between interview types, is given in the Appendix at the end of this report. Although the original questionnaires obtained from the University of Maryland Survey Research Center

did not contain explicit cross-references of question numbers (e.g., Q1, Q2, Q3) with variables (e.g., *GASCAN, LAWN, PAINT*), the questionnaires given in the Appendix--and the tables and indices for the results tables given in the next section--contain side-by-side listings of each variable and the corresponding question number specified on the original questionnaires.

Table 5. The Number of Respondents Who Were Given Each Different Questionnaire Version and Questionnaire Type

Questionnaire Type	Version A	Version B	Row Total
Adult	3,826	3,688	7,514
Child-Direct	385	452	837
Child-Proxy	512	523	1,035
Column Total	4,723	4,663	9,386

Most of the variables containing responses to follow-up questions concerning the duration of exposure activities (in minutes) were stored in a mixed format with responses less than or equal to 120 minutes, 60 minutes, or some other threshold taking on specific numeric values, and those over the threshold being grouped into arbitrary categories. This mixed coding scheme, which was inconsistently applied over all variables concerning exposure activity duration, created difficulties when statistical calculations (such as percentiles and frequency tables) were performed on certain variable values. The solution used for the analyses given in this report was to group all variable values corresponding to durations exceeding a certain threshold of minutes into one category and to treat that category separately (see statistical calculations in Section 2, Methodology).

Divisions of the Data

All of the results tables in this report contain statistics that are broken down into twelve groups plus overall (Tables 8 through 19): gender (male/female); age (1-4/5-11/12-17/18-64/> 64); race (white/black/Asian/Hispanic/other); Hispanic (yes/no); employment (full time/part time/not employed); education (< high school/high school/< college/college/graduate); census region (northeast/midwest/ southwest); day-of-week (weekday/weekend); season (winter/spring/summer/fall); asthma (yes/no); angina (yes/no); and bronchitis/emphysema (yes/no). No analyses were performed for mixed groups (e.g., males aged 12-17). Comparisons of the number of NHAPS respondents in certain demographic groups to the 1990 U.S. Census are provided in another report (*5*).

Section 2
Methodology

The tables in this report were systematically generated using SAS® statistical software (SAS Institute, Cary, NC). They provide detailed information for nearly all the follow-up questions on exposure and the exposure-related 24-hour diary categories. However, due to size and time limitations, it is impossible to produce comprehensive tables that fulfill every possible need. Thus, an attempt was made to follow a strict calculation methodology that allows readers to: (1) understand the design and scope of the NHAPS data base; (2) examine the limitations of the data with respect to specific variables of interest; and (3) quickly obtain a summary of results for each of the variables that were analyzed in the form of one or more tables containing descriptive statistics (including frequency distributions). An emphasis was placed on providing a complete description of the raw data. No attempt was made to provide explanations of the results.

Classification of Follow-Up Questions

The two tables in the Appendix provide a complete list of each follow-up question number, the corresponding variable name, and the verbatim question text. For analyses in this report, the follow-up questions are classified (Table 20) according to their relationship to other questions (i.e., they can be independent of other questions or dependent on other questions) and according to the type of variable in which the responses have been stored (yes or no responses, multiple categories of responses, or numeric responses of arbitrary value). For example, the question on questionnaire version A concerning the number of minutes spent exposed to dust (Q20a, *DUST#*) is **dependent** on a prior question asking if the respondent had been exposed to dust on the diary day (Q20, *DUST*) with the responses to Q20 falling into two **categories**: "yes" or "no." The response to question Q20a is the respondent's estimated **number** of minutes spent exposed to dust on the diary day, which can be any amount.

Each follow-up question (and corresponding variable) was assigned a single-letter code for each classification type: (1) I for Independent or D for Dependent; and (2) C for Categorical or R for Numeric/Ratio. Thus, in the above example regarding the number of minutes spent exposed to dust (Q20a, *DUST#*), the follow-up question Q20a is assigned a code of D (dependent) for the first classification type, since it is dependent on a question concerning whether or not the respondent was exposed to dust (Q20, *DUST*). It is also assigned a code of R (ratio/numeric) for the second classification type, since the estimated number of minutes spent exposed are recorded. Since responses to question Q20 are placed into one of the two categories (yes or no), it is assigned a code of C (categorical) for the second classification type.

The follow-up questions and corresponding NHAPS data base variables are listed by classification type (Tables 21 through 25). Yes/no follow-up questions are assigned an I for the first classification type, since they are independent of any other question, and a C for the second classification type, since there are two categories of responses. Follow-up questions concerning the number of minutes spent being exposed to a pollutant source are assigned an R for the second classification type, although many of the responses

Table 20. Follow-up Question Classification and Statistical Calculations Performed for NHAPS Data

Type 1 Classification	Type 2 Classification	Type 1 Code	Type 2 Code	Statistical Calculations
Independent	Categorical	I	C	Frequencies (sample sizes)
Dependent	Categorical	D	C	Frequencies (sample sizes)
Independent	Ratio/Numeric	I	R	Frequencies and percentiles
Dependent	Ratio/Numeric	D	R	Frequencies and percentiles

Note: The yes/no follow-up questions are classified as Independent-Categorical.

21	Q21a	*STAIN, STAIN#*				
22	Q37a	*WALKCAR, WALKCAR#*				
23	Q31b	*WINDY, WINDMIN*[961]				

[a] Question number and variable name are identified along with the question text in Version A and Version B of the questionnaire which are provided in the Appendix of this document.

[b] The second variable in the pair is the dependent-ratio variable, which is dependent on the first variable. The superscripted numbers after the variables designate the category into which values that were above a certain number of minutues were grouped in the analyses (see text). For example, a "61" superscript means that all values above 60 minutes were grouped into a "61" category. For the *SWTIME* variable ("181" superscript), there were three categories: "120" for 2 hours; "150" for 2.5 hours; and "181" for over 3 hours. For the *WINDMIN* variable ("961" superscript), there were five grouped categories: "180" for 2-4 hours; "360" for 4-8 hours; "600" for 8-12 hours; "840" for 6 hours; and "961" for above 16 hours. For the DROPEN# variable ("721" superscript) there were five grouped categories: "180" for 2-4 hours; "360" for 4-8 hours; "600": for 8-12 hours; and "721" for over 12 hours. For all the variables with no superscript, values above 120 minutes were grouped into a "121" category.

[c] Questions that are common to both A and B of the questionnaire are designated as Version C in this document, but these questions are found in Versions A and B included in the Appendix.

to these questions that were over a threshold number of minutes (60, 120) were placed into categories such as "2 hours," "3 hours," "4 hours," ..., "more than 12 hours." The follow-up questions on frequency of exposure (how many times...?, how often...?), which did not involve yes/no responses or responses on the number of minutes spent, were assigned a C for the second classification type, since they tend to fall into a small number of possible categories. Some of the questions that were not included in the detailed analyses presented in this report (Table 26) were used as grouping variables.

[a] Question number and variable name are identified along with the question text in Version A and Version B of the questionnaire which are provided in the Appendix of this document.

[b] Some of the questions included in this table were used as grouping variables in the detailed analyses. Data for questions that appeared on the questionnaires that had no apparent corresponding variable were also not analyzed.

Regrouping of the 24-Hour Diary Locations, Activities, and Smoker-Present Categories

Another report provides a detailed account of the NHAPS locations and activities and the regrouping methodology (*5*). The 83 original NHAPS location codes (WHR variable) were regrouped into ten locations (NEWLOC variable; Table 27): Residence (Indoors); Residence (Outdoors); Traveling Inside Vehicle; Traveling/Near Vehicle (Outdoors); Other Outdoor; Office or Factory; Mall/Grocery Store/Other Store; School/Church/Hospital/Public Building; Bar or Restaurant; and Other Indoor. Likewise, the original 91 NHAPS activity codes (RACT variable) were regrouped, by way of a transitional coding into 16 codes (NEWACT variable; Table 28), into 8 activities (REGACT variable; Table 29): Non-Exposure-Related Activity; Cooking/Food Preparation; Laundry/Dishes/Cleaning Kitchen; Housekeeping; Bathing/Showering/Washing/Using Bathroom; Yardwork/Gardening/Car or House Maintenance; Sports or Exercise; and Eating or Drinking. The FACT variable was used in this regrouping and contains verbatim text corresonding to each RACT value. The Non-Exposure category contains all the activities that do not explicitly fall into the other categories (such as sleeping and dressing). Although the activities placed in this category do not seem to relate to specific kinds of exposure, it is possible that some unspecified (and unknown) exposure could be taking place. The original location and activity categories that were not analyzed in this report are given in Table 30.

The smoking variable (SMK) was regrouped into two categories for "smoker present" and "no smoker present" (SMKB variable). When a SMK value was 0 ("no smoker present"), the SMKB was also set to 0. For the other SMK smoker-present categories (1 for "the entire time," 2 for "> half the time," 3 for "half the time," 4 for "< half the time," and 5 for "hardly any of the time"), SMKB was set to 1 ("smoker present"), since these SMK categories were only collected for the last two quarters of the study. The only other possible value for SMKB was 8 for "don't know", which is identical to the SMK value. There were 5,145 respondents who reported that they never were exposed to tobacco smoke on the diary day (SMKB = 0). There were 4,005 respondents who reported that they were exposed to tobacco smoke for at least 1 minute on the diary day (SMKB = 1), although some of the time they may have also reported "don't know" (371 out of the 4,005 respondents reported both SMKB = 1 and SMKB = 8 at different times). There were 236 respondents who reported no exposure some of the time (SMKB = 0) and "don't know" some of the time (SMKB = 8); these respondents were excluded from the statistical analyses.

Table 27. Recoded NEWLOC Locations with Overall Frequency of Occurrence*

NEWLOC	Abbreviations	Code	Original NHAPS WHRCodes	Frequency	%
Residence (Indoors)	Res. Indoors	10	100, 101-110, 113, 115-199, 201-210, 213, 215-299	97,584	62.1
Residence (Outdoors)	Res. Outdoors	20	111, 112, 114, 211, 212, 214	5,459	3.5
Traveling Inside Vehicle	In Veh.	30	300, 301-303, 305, 310-312, 320, 399	28,699	18.3
Traveling/Near Vehicle (Outdoors)	Near Veh.	40	304, 306-308, 313, 501-504	6,093	3.9
Other Outdoor	Other Outdoors	50	505-599	2,149	1.4
Office or Factory	Office/Fact.	60	401, 402	3,690	2.3
Mall/Grocery Store/Other Store	Mall/Other Store	70	403, 404	3,725	2.4
School/Church/Hospital/Pub. Bldg.	School/Pub. Bldg.	80	408, 410, 413, 415	4,804	3.1
Bar or Restaurant	Bar/Rest.	90	405, 414	2,975	1.9
Other Indoor	Other Ind.	100	314, 400, 406, 407, 409, 411, 412, 416-499	2,056	1.3
Total				157,234	100.0

* The Frequency and % columns give the number of times and the percentage of the number of times, respectively, that a microenvironment with the specified location occurred over all microenvironments for all 9,386 NHAPS respondents.

Table 28. The NEWACT Activities Regrouped From the FACT and RACT Variables for the NHAPS Data*

NEWACT	New Code	Original NHAPS Codes	Frequency	%
No Exposure Activity	0	-	114,344	72.7
Food Preparation/Cooking	10	10, 19	6,671	4.2
Eating or Drinking	15	43	18,102	11.5
Cleaning Dishes or Kitchen	20	11, 12, 16	1,527	1.0
Laundry	21	12, 14, 18	1,203	0.8
Housekeeping	22	12, 16, 19	2,362	1.5
Sweeping/Vacuuming/Dusting	23	12	90	0.1
Mowing Grass/Yardwork	25	13, 17	1,122	0.7

Continued

Table 28. ***(Continued)***

NEWACT	New Code	Original NHAPS Codes	Frequency	%
Taking/Giving a Bath/Shower	30	20, 21, 32, 40, 42	7,504	4.8
Hygiene/Using Bathroom	31	44	1,073	0.7

* Variable values were not analyzed because they were deemed to have little exposure significance or because they had a sample size less than 50. See the indices in tables 32 to 35 for the locations and activities that were analyzed.

The Statistical Calculations

All calculations were made for each category in each of the 12 groupings (gender, age, race, Hispanic, employment, education, census region, day of week, season, asthma, angina, bronchitis/ emphysema) and for all the respondents. The type of statistical calculation performed on each follow-up variable depended on the second classification of its corresponding follow-up question (C or R) (Table 20); the dependence or independence of the follow-up question on other questions did not affect the type of calculation performed, although only the doers (those respondents responding affirmatively to yes/no or other categorical questions) were analyzed for dependent-ratio type questions. For categorical classifications (C) that include all yes/no questions and questions on the number of times (frequency) an exposure activity occurred, the only calculation performed was a simple frequency table (i.e., sample sizes) containing the number of responses to the question that were placed in each specified category (percentages are also provided for yes/no questions only). For the ratio/numeric classifications (R), two different calculations were performed: (1) a frequency tablecontaining the number of responses falling into specified ranges; and (2) percentiles giving the values of the variable below which 1%, 2%, 5%, 10%, 25%, 50%, 75%, 90%, 95%, 99%, and 100% of the responses fell. Since all ratio/numeric variables were coded in a mixed

format, means and standard deviations could not be easily estimated. The frequency tables are actually "contingency" tables, since they do not contain columns for ranges where there were no responses. The ratio/numeric follow-up variables usually contain information on the number of minutes spent in an exposure activity (duration) on the diary day, although some contain the number of hours spent the previous month (e.g., *SOILHR*) or hours spent per week (e.g., *WOUT*).

The only ratio-type variables that were not recorded in a mixed type format were *SOILHR* (number of hours spent gardening or working with soil in last month) and *SMOKE1* (number of minutes spent smoking on diary day). Most of the other ratio variables have a single grouping over 120 minutes, although seven have a single grouping over 60 minutes (Q17e *BASTAY*, Q17b *BATIME*, Q16c *SHSTAY*, Q9a/A9a *CIGARMIN*, Q44/Q34 WKHRS, Q44a/Q34a WNGHT, Q44b/Q34b WOUT), and three have a single grouping or multiple groupings over 120 minutes (Q32b *DROPEN#* -- 180, 360, 600, 721; Q31b *WINDMIN* -- 180, 360, 600, 840, 961; Q17h *SWTIME* -- 120, 150, 181). For the three variables with a grouping or multiple groupings over 120, the responses in the frequency tables had to be recoded to place the range name at the midpoint of the data as follows: "180" means 2-4 hours, "360" means 4-8 hours, "600" means 8-12 hours, "721" mean over 12 hours, "840" means 12-16 hours, and "961" means over 16 hours. In this way, an attempt was made to preserve as much information as possible in spite of the inconsistent way in which the data were originally coded. In addition, occasionally the coding presented in the original NHAPS codebook (Survey Research Center, University of Maryland) did not match the codings in the actual data base. Data coded as 777, 88, or 888 (originally meaning "refused to answer") were treated as missing.

The location and activity variables (WHR, RACT) from the 24-hour-diary data take on values that correspond to each location or activity that the respondent experienced on the diary day. The doer sample size N is the number of people who experienced a given location, activity, or smoker-present category for at least one minute on the diary day. Only those locations and activities were analyzed for which there were more than 50 respondents who experienced them (doer sample size > 50). Each location, activity, regrouped location, regrouped activity, and regrouped smoker-present category was analyzed by percentiles of the cumulative number of minutes spent by each respondent on the 24-hour-diary day and the cumulative 24-hour frequency of its occurrence for the doers. Since consecutive diary records can have the same value of WHR, RACT, or SMK (e.g., a respondent remains in the Home-Kitchen location but engages in multiple different activities), frequencies of occurrence calculated over the 24-hour-diary day for locations, activities, and smoker presence may be slightly too high. The sample size (number of respondents), mean, standard deviation, standard error were also calculated. Only those time-diary records where a location, activity, or the presence of a smoker (SMKB = 1) was experienced are reflected in the statistics. A detailed description of the calculation methodology for the diary data is available in another report (*5*).

The results presented in this report are unweighted. Weighting of the NHAPS data is discussed in another report (*5*). For computations of means, it is possible to introduce corrections for the likelihood of an adult, child, or entire household being chosen and corrections with respect to the 1990 U.S. Census for disproportionate numbers of respondents by gender, age, day-of-week, season, or other factors.

Calculations of Percentages

Calculations of six different kinds of percentages from the 24-hour-diary results tables in this report are possible: (1) percentage of doers only in each group who experienced an activity, location, or smoker-present category; (2) percentage of doers plus non-doers in each group who experienced an activity, location, or smoker-present category; (3) overall percentage of total doers plus nondoers in all groups who

experienced an activity, location, or smoker-present category; (4) percentage of time spent by each group by doers only in an activity, location, or smoker-present category; (5) overall percentage of time spent by doers plus nondoers in the given group in an activity, location, or smoker-present category by each group; and (6) overall percentage of time spent by total doers plus nondoers in all groups in an activity, location, or smoker-present category. Since the 236 respondents who responded exclusively "don't know" and "no smoker" with respect to smoker presence for every minute of the day were excluded from statistical calculations, a special table is included (Table DSS-1) that presents the doer and non-doer sample sizes for smoker presence in each group. For all locations and activities, the six kinds of percentages described above can be calculated using the sample sizes in the results tables and the overall sample sizes for each group that are in Tables 8 through 19.

For example, there are 2,988 male respondents that spent at least one minute in the Home-Kitchen location out of a total of 7,063 respondents who spent time in this location (see Table DLN-101). The percentage of male doers over the total number of doers is

100 × (2,988 males in Home-Kitchen)/(7,063 total respondents in Home-Kitchen) = 42% (percentage calculation 1 above).

The percentage of male doers over all males is

100 × (2,988 males in Home-Kitchen)/(4,294 total males respondents, overall; see Table 8) = 70% (percentage calculation 2 above).

The percentage of male doers over all respondents is

100 × (2,988 males in Home-Kitchen)/(9,386 total respondents, overall) = 32% (percentage calculation 3 above).

Thus, about 42% of the respondents spending some time in the kitchen were male, about 70% of male respondents spent some time in the kitchen, and about 32% of all respondents were males who spent some time in the kitchen.

The total time spent by the male doers who completed the 24-hour (1,440-minute) diary day is the number of male doers multiplied by the average time spent in the Home-Kitchen location: 2,988 × 74.998 minutes = 224,094 minutes. Likewise, the total time spent by all doers is 7,063 × 92.646 minutes = 654,359 minutes. The total time spent by male doers plus male nondoers in all locations is 4,294 × 1,440 minutes = 6,183,360 minutes, and the total time spent by all doers plus all nondoers in all locations is 9,386 × 1,440 minutes = 13,515,840 minutes. The percentage of time male doers spent in the Home-Kitchen location over all doers is

100 × 224,094 minutes/654,359 minutes = 34% (percentage calculation 4 above).

The percentage of time male doers spent over all males in all locations is

100 × 224,094 minutes/6,183,360 minutes = 3.6% (percentage calculation 5 above).

The percentage of time male doers spent over all respondents in all locations is

100 × 224,094 minutes /13,515,840 minutes = 1.7% (percentage calculation 6 above).

Thus, for males who spend some time in the kitchen, about 34% of their time was spent there on the diary day, about 3.6% of the time spent by all males on the diary day was spent in the kitchen, and about 1.7% of the time spent by all respondents on the diary day was spent by males in the kitchen.

Indices of Results Tables

The results table numbers (e.g., QANp-25g) contain codes that convey five different pieces of information as defined in Table 31:

1. the first component indicates whether the table contains diary (D) or follow-up question (Q) results;

2. the second component indicates the table contains activity (A), location (L), or smoker- present (S) results for the diary data, or on what questionnaire version a follow-up question appeared (A, B, or A & B = C) for follow-up question data;

3. the third component indicates whether the table contains results for number of minutes or hours spent (N, for ratio/numeric follow-up variables and diary data), frequency of occurrence (F, for diary data only), or sample sizes (S, for categorical follow-up variables and diary data);

4. the fourth component indicates whether the table contains percentiles (p) or frequencies (f) for tables that present number of minutes spent (ratio/numeric follow-up variables only) or if the table contains regrouped locations and activities (r) for the diary data;

5. the fifth component indicates the follow-up question number or the diary variable value.

The leading "Q" or "A" has been removed from most of the follow-up question numbers. With this numbering scheme, it is possible to determine quickly what kind of information is contained in each results table.

Table 31. Key to the Results Table Numbers

X X X [x] - ###	
| | | | |	Variable value (diary data) or question number (follow-up question data)
| | |	p = percentiles (p), f = frequency/contingency table for QXN tables, r = regrouped locations and activities for diary data
| |	N (ratio/numeric and diary data) = number of minutes, F (diary data only) = frequencies of occurrence, or S (categorical and diary data) = sample sizes
|	A = activities, L = locations, S = smoker-present category , or A, B, or C (A and B) = questionnaire version
D = diary data or Q = folow-up question data	

The results tables for the diary data are listed in four indices (Tables 32 through 35):

1. each NHAPS location (WHR variable value),
2. each regrouped location (NEWACT variable value),
3. each original NHAPS activity and regrouped smoker-present category (RACT and SMKB variable values),
4. and each regrouped activity (REGACT variable value).

Each index lists the table number, the variable value, the variable value label, and the page number on which the actual table can be found. The sequential numbers listed at the far left of each index uniquely identify each table.

The results tables for the follow-up questions are listed in two indices (Tables 36 and 37): one for all the questions appearing on questionnaire version A (sorted by questionnaire A for adults) and one for all the questions appearing on questionnaire version B (sorted by questionnaire B for adults). Each index contains the questions that appear on both questionnaire version A **and** questionnaire version B, i.e., they are redundant with respect to questions present on both version A and version B data results. Tables 32 through 37 provide an index of all the summary results tables found in this document. Each index provides the classification of each variable (both type 1 and type 2) along with the table number, variable name, variable label, questionnaire version (A or B for adults, children, or proxy), and the page number on which the actual table can be found. For quick reference, the sequential numbers listed at the far left of each index uniquely identify each table.

Caution to Users

Users of the results tables in this report need to be aware of certain peculiarities of the NHAPS data base and of activity pattern data bases in general. Table 38 summarizes a number of points that should be considered before values are drawn from the results tables.

[a] T1 = Type 1 division of variables by "independent" or "dependent". T2 = Type 2 division of variables by "categorical" or "ratio".

[b] The table number key is given in Table 31.

* Text corresponding to the *SMOKE1* variable was not found on the questionnaires.

Table 38. Important Points for Users of the Detailed NHAPS Results Tables in this Report

Number	Description
1.	Sample Sizes. Some of the results tables presented in this report may not be meaningful across certain subgroups, since the subgroup sample sizes (number of doers) are small (e.g., <50).
2.	Weighting. Weighting is typically used for calculations of averages. The unweighted means presented in this report should not differ substantially from weighted means as long as the data is reasonably representative across subgroups. Representativeness is evidenced by a sufficiently large sample size across the joint subgroups.
3.	Documentation. The original documentation (codebooks, questionnaires, and methodology) for the NHAPS study is available from the University of Maryland Survey Research Center. The current report summarizes the original documentation through condensed questionnaires (see Appendix) and a cross-referencing of question numbers, variables, variable labels, and questionnaire text (see Appendix and indices in Tables 36 and 37).
4.	Follow-up Question Organization. The NHAPS follow-up questions were originally coded in an inconsistent and potentially confusing way. Instead of storing responses directly into data base variables, sometimes responses were coded by the interviewer (or subsequent analyst) into arbitrary categories. This lack of standardization for each variable caused substantial difficulty when attempts were made to analyze and present the data meaningfully. Users of the tables in this report should make sure they understand the limitations of the coding scheme applied for the questions of interest. Since the Appendix contains each question, its coding, and the corresponding data base variable, it can easily be used to examine each question.
5.	24-Hour-Diary Categories. The categories for the NHAPS 24-hour-diary locations and activities may not be specific enough for many potential uses of the data. The focus of the location and activity categories seems to be mostly sociological and the categories seldom reflect the many different types of possible exposure.
6.	Grouping of Results. No calculations were made across mixed groups (for example, age crossed with gender) for the results presented in this report. Mixed calculations would not only require a substantial amount of additional space (n times the current length, where n = the number of additional pages each table of results would occupy), but for many of the calculations the sample size in each mixed group would be insufficient.
7.	Independence/Dependence of Sampling. The 24-hour diary calculations in this report are made across the sample size of the number of doers (i.e., the respondents who experience a certain kind of potential exposure). While each respondent was sampled independently from the other respondents, the microenvironments (records in the diary file specifying location, activity, and smoker-present category) reported for each respondent are interdependent. Future calculations made across microenvironments (e.g., average duration of a single occurrence of a microenvironment across all occurrences of that microenvironment regardless of each respondent) instead of respondents (e.g., average 24-hour duration of a microenvironment for each person, which is then averaged over all respondents) could be biased. However, all calculations in this report consider averages of 24-hour statistics and are not biased.

Section 3
24-Hour Diary Results

Note on Missing Data: In the following tables a period (".") is used to indicate missing data. There are two different types of occurrences of the period that correspond to different varieties of missing data. First, there are missing responses in a breakdown of a certain group of the Group Name or Group Code columns (first two columns) because respondents did not report information such as their age, gender, or education. Second, periods that occur in certain cells of some tables indicate that there are no data available with which to calculate statistics. For example, there may have been only one respondent in a group that experienced a certain location and activity, and, in theory, the standard deviation must be calculated for samples sizes of at least two.

NOTE: A PERIOD (.) SIGNIFIES MISSING DATA. DK = RESPONDENT REPLIED "DON'T KNOW". REF = REFUSED DATA. N = DOER SAMPLE SIZE. MEAN = MEAN 24-HOUR CUMULATIVE FREQUENCY OF OCCURRENCE FOR DOERS. STDEV = STANDARD DEVIATION. STERR = STANDARD ERROR. MIN = MINIMUM NUMBER OF OCCURRENCES. MAX = MAXIMUM NUMBER OF OCCURRENCES. PERCENTILES ARE PERCENTAGE OF DOERS BELOW OR EQUAL TO A GIVEN NUMBER OF OCCURRENCES.

Section 4
Follow-Up Question Results

Note on Missing Data: In the following tables a period "." is used to indicate missing data. There are three different types of occurrences of the periods "." that correspond to different varieties of missing data. First, there are missing responses in a breakdown by demographic group and code, because respondents did not report their age, gender, education, etc. Second, since some respondents did not answer a question or were unable to answer a question, there is a missing data column along the top of some tables. Third, periods that occur in certain cells of some tables indicate that there were no data available with which to calculate statistics. For example, for respondents in a certain group (e.g., age, gender, education), there may have been no responses in a column corresponding to a categorized response (e.g., yes/no/don't know/".").

Note on Frequency Ranges. For frequency tables, the lower bound is exclusive and the upper bound is inclusive. Respondents who reported that they engaged in an activity, i.e., answered "yes" to a yes/no question, sometimes did not answer a dependent follow-up question (e.g., number of minutes spent in that activity), which resulted in missing responses. If the response was a value less than 1 minute, it was coded as "0" in the data base. The following heading is used above two columns in frequency tables to designate reponses that were "0" (less than one minute) and between "0" (exclusive) and some upper bound (e.g., "10"; inclusive):

0	
TO	
0	10

Additional Note: See the Methodology section (p. 2-1) for a discussion of the regrouping of follow-up question responses (e.g., into groups where the number of minutes are over one hour, "61," or two hours, "121").

NOTE: A PERIOD (.) SIGNIFIES MISSING DATA. A VALUE OF "121" FOR NUMBER OF MINUTES SIGNIFIES THAT MORE THAN 120 MINUTES WERE SPENT. DK = RESPONDENTS ANSWERED "DON'T KNOW". REF = RESPONDENTS REFUSED TO ANSWER. N = DOER SAMPLE SIZE. PERCENTILES ARE THE PERCENTAGE OF DOERS BELOW OR EQUAL TO A GIVEN NUMBER OF MINUTES.

NOTE: PERIOD (.) SIGNIFIES MISSING DATA. A VALUE OF "61" FOR NUMBER OF MINUTES SIGNIFIES THAT MORE THAN 60 MINUTES WERE SPENT. DK = RESPONDENTS ANSWERED "DON'T KNOW". REF = RESPONDENTS REFUSED TO ANSWER. N = DOER SAMPLE SIZE. PERCENTILES ARE THE PERCENTAGE OF DOERS BELOW OR EQUAL TO A GIVEN NUMBER OF MINUTES.

Appendix:
The Questionnaires

The original six questionnaires obtained from the Survey Research Center at the University of Maryland (versions A and B split by the adult, child-direct, and child-proxy interview types) did not contain explicit references to the NHAPS data base variables in which responses to each question on the questionnaires were stored. The code book, which was supplied by the Survey Research Center, did contain these variables, but did not contain the question numbers appearing beside each question on the questionnaires. Thus, we have cross-referenced the code books with the original questionnaires to obtain the revised questionnaires in this Appendix. The revised questionnaires contain the question numbers, the data base variables, and each question's verbatim text. The order of the questions has not been changed. The questionnaires have been condensed into two tables (Tables A1 and A2 for versions A and B) by including the exact wording of each question as it appeared for the adult interviews (including codes used for guiding the interviewer) and, in another column, specifying any differences (modifications) between the adult and the child-direct or child-proxy interview types.

Version A

Table A1. Condensed Questionnaire Version A for Adults With Child-Direct and Child-Proxy Modifications

Item No.	Adults: Label	Adults: Variable Name	Adults: Version A Text	Child/Proxy Modification: Label	Child/Proxy Modification: Variable Name	Child/Proxy Modification: Version A Text
1.	int2		Hello, I'm calling from the University of Maryland. My name is _____. The University of Maryland is conducting a study for the U.S. Environmental Protection Agency to help reduce the exposure of both adults and children to pollution. For this study I need to speak with the adult living in your household who is 18 or older, and will have the NEXT birthday. Who would that be? ** IF INFORMANT DOES NOT KNOW ALL THE BIRTHDAYS ASK: Of the ones you do know, who will have the NEXT birthday? 1 INFORMANT HAS NEXT BIRTHDAY (BEGIN SURVEY) 2 SOMEONE ELSE HAS NEXT BIRTHDAY 7 RESPONDENT PROBLEM (LANGUAGE, HEALTH, AGE, OTHER) 8 NON HOUSEHOLD - BUSINESS, GROUP HOME, PAY OR CAR PHONE, HOSPITAL 9 IF CALL BACK OR REFUSAL n ** NO ANSWER / TROUBLE WITH LINES h ** HOME RECORDER / ANSWERING SERVICE —	qkid		Hello, I'm calling from the University of Maryland. 40. **dint**

An important part of this study is to learn what kinds of pollutants adults and children come in contact with in their daily activities. To do this we need to find out how and where people spend their time.

I would like to ask you about the things [fill name] did yesterday -- from midnight [fill pday] night to midnight last night.

** TYPE 1 to begin diary

THE FOLLOWING INFORMATION IS ASKED EACH ACTIVITY:

1. START TIME OF ACTIVITY
2. DESCRIPTION OF ACTIVITY
3. WHERE ACTIVITY WAS DONE
4. END TIME OF ACTIVITY

AFTER EVERY 6-HOUR TIME SPAN IS REPORTED ON, THE RESPONDENT IS ASKED IF ANY OF THEIR ACTIVITIES DURING THAT PERIOD CAUSED THEM TO BREATHE HEAVILY.

NOC: Not on child questionnaire. (See similar question included at end of child's quesionnaire)
PSA: Proxy same as adult questionnaire
