

Project Summary

Recommended Operating Procedure No. 51: Glass Source Assessment Sampling System (Glass SASS)

Raymond A. Grote

This recommended operating procedure (ROP) has been prepared for use in research activities conducted by EPA's Air and Energy Engineering Research Laboratory (AEERL). The method described in this document is applicable to the stack sampling of flue gas from the rotary kiln and to associated equipment of the Combustion Research Branch of AEERL. It has been the standard method of sampling kiln flue gas due to the transient nature of the puff development and its capability to sample the maximum volume over the shortest period of time.

ROPs describe non-routine or experimental research operations where some

judgment in application may be warranted. ROPs may not be applicable to activities conducted by other research groups, and should *not* be used in place of standard operating procedures. Use of ROPs must be accompanied by an understanding of their purpose and scope. Questions should be directed to the author.

This Project Summary was developed by EPA's Air and Energy Engineering Research Laboratory, Research Triangle Park, NC, to announce key findings of the research project that is fully documented in a separate report of the same title (see Project Report ordering information at back).

The EPA author, **R. Grote** is with Air and Energy Engineering Research Laboratory,
Research Triangle Park, NC 27711.

Judith S. Ford is the EPA Project Officer (see below).
