Environmental Services/Sciences Divisions Unique Functional Capabilities

The Environmental Services Divisions (ESD) were originally established to provide the regions with the technical expertise necessary to carry out the environmental programs mandated by Federal legislation. This legislation presently includes the Clean Air Act (CAA), the Clean Water Act (CWA), the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), the Resource Conservation and Recovery Act (RCRA), the Toxic Substances Control Act (TSCA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and the Safe Drinking Water Act (SDWA). This technical support consisted of serving as the division responsible for providing the environmental quality and pollutant measurements as required by the various operating programs of the region and concurrently providing advice and assistance to state and local agencies when requested.

Through the years the role that has evolved for the ESD is two-faceted: continuation of technical support to the media programs, primarily field investigations, laboratory analyses, data analysis, Quality Assurance/Quality Control oversight, and Geographical Information Systems; and the development of the key "programs" that provide needed data and information to other programs within the region. Certainly, timely provision of technical support is mandated. However, the "programs" that ESD operates are equally as important, albeit in a less direct manner, to the operating programs. These activities include: monitoring the quality of the ambient environment: compliance monitoring; ensuring the quality of environmental data; responding to environmental emergencies; sample collection, transport, laboratory analysis, data analysis and evaluation; and policy guidance and technical assistance to other federal, state, and local agencies regarding these activities. These activities involve all media for which the Environmental Protection Agency is responsible; namely, air, water, solid wastes, hazardous wastes, radiation, and toxics. Considering all media included, we have begun to implement multimedia evaluations for all environmental areas. The ESDs are working with the Office of Research and Development to implement R-EMAP, a program in which the regions address their highest risk-based priorities by using the Environmental Monitoring and Assessment Program (EMAP) design. They are also working with the Office of Enforcement to provide technical support for the criminal enforcement program.

The ESDs' main emphasis is on the collection, analysis, and distribution of highly accurate environmental quality data. As a general rule, quality of data is more important than quantity of data. To accomplish this, a strong quality assurance effort is maintained and built on data generated by the agency programs and data provided by the states, other federal agencies, contractors, local communities, and industries.
