

Final Report  
To The  
Environmental Protection Agency

Title of Project: Complement Fixation, Hemagglutination-Inhibition, and Trypsin Inhibitory Capacity Testing of Human Sera.

For The Period: March 2, 1971 to March 1, 1972

Project Director: James K. Noel, Ph. D.

Name of Institution: Flow Laboratories, Inc.  
1710 Chapman Avenue  
Rockville, Maryland 20852

Contract Number: 68 - 02 - 0032

Supported By: Environmental Protection Agency  
Air Pollution Control Office  
Research Triangle Park, North Carolina 27711

February 2, 1972

## I. OVERALL OBJECTIVES

To carry out 3,000 complement fixation and hemagglutination-inhibition tests on human sera as supplied by the Environmental Protection Agency. Of these 3,000 sera, 2,000 are to be tested for trypsin inhibitory capacity.

## II. WORK COMPLETED

### A. Hemagglutination-Inhibition

#### 1. Procedures

The test was performed according to the procedure as set forth in Flow Laboratories' Proposal #30231 and dated October 26, 1970. In essence, the proper dilution (4 units) of each of four antigens (Flu A-2/Japan; Flu A-2/Hong Kong/68; Flu B/Maryland and Flu B/Massachusetts) was determined by the hemagglutination (HA) test prior to each hemagglutination-inhibition (HAI) test. The test was carried out in microtiter "V" plates (Cooke Engineering Co.) using PBS as diluent and 0.4% fresh chicken erythrocytes. Serial two-fold antigen dilutions were made in 0.025 ml amounts; the test shaken and allowed to incubate at room temperature until the cells settled. The titration end-point was considered as the last well showing complete agglutination. This dilution, which represented one unit of hemagglutination, was divided by 4 in order to obtain the dilution that would be equivalent to 4 HA units for use in the HAI test (refer to Table 1).

Prior to carrying out the HAI test, all sera were treated to remove non-specific inhibitors. The procedure employed was as follows: To each volume of serum was added four volumes of RDE (Receptor Destroying Enzyme at 128 units per ml) and incubated overnight at 37°C (waterbath). Three volumes of 2.5% sodium citrate were then added and the mixtures further incubated at 56°C for 30 minutes. Two volumes of PBS were added to yield a final 1:10 dilution of treated serum.

The HAI test was performed by preparing two-fold dilutions of each serum from 1:10 to 1:1280 in 0.025 ml amounts. To each serum dilution was added 0.025 ml of virus suspension containing 4 HA units. The test was incubated at room temperature for 30 minutes after which was added 0.05 ml of 0.4% chicken erythrocytes. The test was further incubated at room temperature until the erythrocytes settled. The antibody titer was considered as the reciprocal of the highest dilution of serum which completely inhibited agglutination.

Appropriate controls were included which are indicated in Table 2. A known positive and negative control serum was included in each HAI test series.

To determine the exact units of antigen employed in the HAI test, a back-titration of each antigen was carried out. This control was performed as an HA test employing the diluted antigen (4 units) as the initial virus dilution. The antigen was further diluted two-fold for five dilutions.

## 2. Results

A total of 3,170 serum samples were each tested with four Flu antigens. In all tests performed, exactly 4 units of each antigen were used and serum controls were satisfactory.

All HAI results are presented in the following tables. These figures represent the reciprocal of the highest serum dilution which completely inhibited agglutination.

## B. Complement Fixation

### 1. Procedure

The complement fixation (CF) test was performed according to the procedure outlined in Flow Laboratories' Proposal #30231 and dated October 26, 1970, utilizing Influenza Group A and B soluble antigens. In essence, 4 units of antigen were added to graded dilutions of serum (previously heat inactivated at 56°C for 30 minutes) and incubated at 4°C overnight with 1.8 units of complement (SV-5 free). Sensitized sheep red blood cells were added and the plates incubated at 37°C for one hour. The plates were shaken every ten minutes for the first thirty minutes of incubation. The titer was taken as the reciprocal of the highest dilution of serum giving at least a 3+ fixation on a 0-4 scale with 4+ being no hemolysis of the indicator system.

Appropriate specificity controls were included in each test. These controls included: back-titration of antigen to confirm unitage employed; serum anti-complement control; complement titration; known positive and negative serum controls; RBC control.

## 2. Results

A total of 3,063 serum specimens were tested. All CF results are presented together with the HAI results in the following tables. Those specimen numbers which have a (-) indicates insufficient material to carry out the test.

### C. Trypsin Inhibitory Capacity

#### 1. Procedure

The test was performed according to a modified procedure of Hummel (Can. J. Biochem. Physiol., 37: 1393, 1959) as stated in Flow Laboratories' Proposal #30231 and dated October 26, 1970. Basically, the reaction mixture contained 2.5 µg trypsin and 12.5 µg soybean trypsin inhibitor or 25 µl of a 1:10 dilution of serum sample to be tested to which was added 0.5 ml dermatube TAME (Worthington Biochemical Corp.) giving a final volume of 0.55 ml.

A series of 12 tubes, 2 controls and 10 serum samples were prepared as a group. Trypsin in the presence and absence of inhibitors were incubated for 10 minutes at room temperature. TAME was added, mixed and immediately transferred to a cuvette and the adsorbancy at 247 M<sub>u</sub> recorded employing an ISCO Model 610 recorder attached to a Coleman Model 46 spectrophotometer. The rate of hydrolysis of TAME was defined as 100% and the trypsin inhibitory capacity was calculated by the formula shown below.

$$\text{Trypsin Inhibitory Capacity} = \frac{\text{(Rate) Trypsin} - \text{(Rate) Inhibitor}}{\text{(Rate) Trypsin}} \times 100$$

Soybean trypsin inhibitor was included in each group of tests which served as a measure of the function of the system.

## 2. Results

All results are presented along with the HAI and CF results in the following tables. A total of 2,034 tests were carried out.
