PART A. SUMMARY OF AIR POLLUTANT EMISSIONS IN THE UNITED STATES 1

PART B. SUMMARY OF AIR POLLUTANT EMISSION IN STATES, IN INTRASTATE AQCRs AND IN RESPECTIVE STATE PORTIONS OF INTERSTATE AQCRs 2

PART C. SUMMARY OF AIR POLLUTANT EMISSIONS IN INTERSTATE AQCRs 370

ABSTRACT

This report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended in 1977, and of EPA Regulations, Title 40, Code of Federal Regulations, Part 51.7. Summary data are presented for the nation as a whole, for individual states, for intrastate and individual interstate portions of Air Quality Control Regions, and for total interstate Air Quality Control Regions.

The data compilations presented result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system, the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina.

ACKNOWLEDGMENT

The National Emission Report series is the result of the generous cooperation and diligent efforts of personnel in many areas of government and private industry. Their contributions are gratefully acknowledged.

1974 NATIONAL EMISSIONS REPORT

Introduction

This report summarizes, by source category, estimates of emissions in 1974 of those air pollutants for which national standards have been promulgated. These pollutants, called criteria pollutants, are particulates, sulfur oxides (SO_x), nitrogen oxides (NO_x), hydrocarbons (HC), and carbon monoxide (CO). National Emission Reports, a series of annual reports, are compiled from information contained in the National Emissions Data System (NEDS) on emisson sources. Compilations of emissions data are presented for the nation as a whole, for individual states, for intrastate Air Quality Control Regions (AQCRs), for respective state portions of interstate AQCRs, and for interstate AQCRs. Figure 1 is a map illustrating AQCR boundaries.

This report represents the best available indicators of national emissions for the calendar year 1974. Table 1 shows EPA calculated national emissions estimates that are independent of NEDS data for 1974. Readers interested only in national emissions estimates should refer to this table for total national emissions and national emissions for major source category groupings. More detailed emissions summary reports for the nation, each state, and AQCR, based on NEDS data, are given in Parts A, B, and C, the body of the report, pages 1-422. The estimates reported are based on emission-source records contained in NEDS as of August 14, 1976. State-submitted Semiannual Reports that were successfully updated in accordance with NEDS files prior to this date also are included. Thus, the data are generally comparable to data collected for the development of State Implementation Plans (SIPs), but include revisions and updating information where they are available. The following text sections provide a detailed technical description of the procedures that were used to develop the emissions data.

Emissions Inventory

Much detailed information concerning sources and their operations is needed for the development of the emissions inventory by which the impact of source emissions on an area's air quality can be assessed at the state or local level. The NEDS, operating through the EPA Office of Air Quality Planning and Standards (OAQPS), processes source and emissions information for the whole nation. Since NEDS operations were initiated in 1971, the National Air Data Branch (NADB) of OAQPS and EPA Regional Offices have been engaged actively in the collection and analysis of air pollutant emissions. A detailed description of the NEDS and of its methodology for compiling an emissions inventory is available in *OAQPS Guideline AEROS Manual Series, Volume II: AEROS User's Manual* (EPA-450/2-76-029). Brief discussions of the NEDS basic elements, used for the preparation of the National Emissions Reports, are given below.

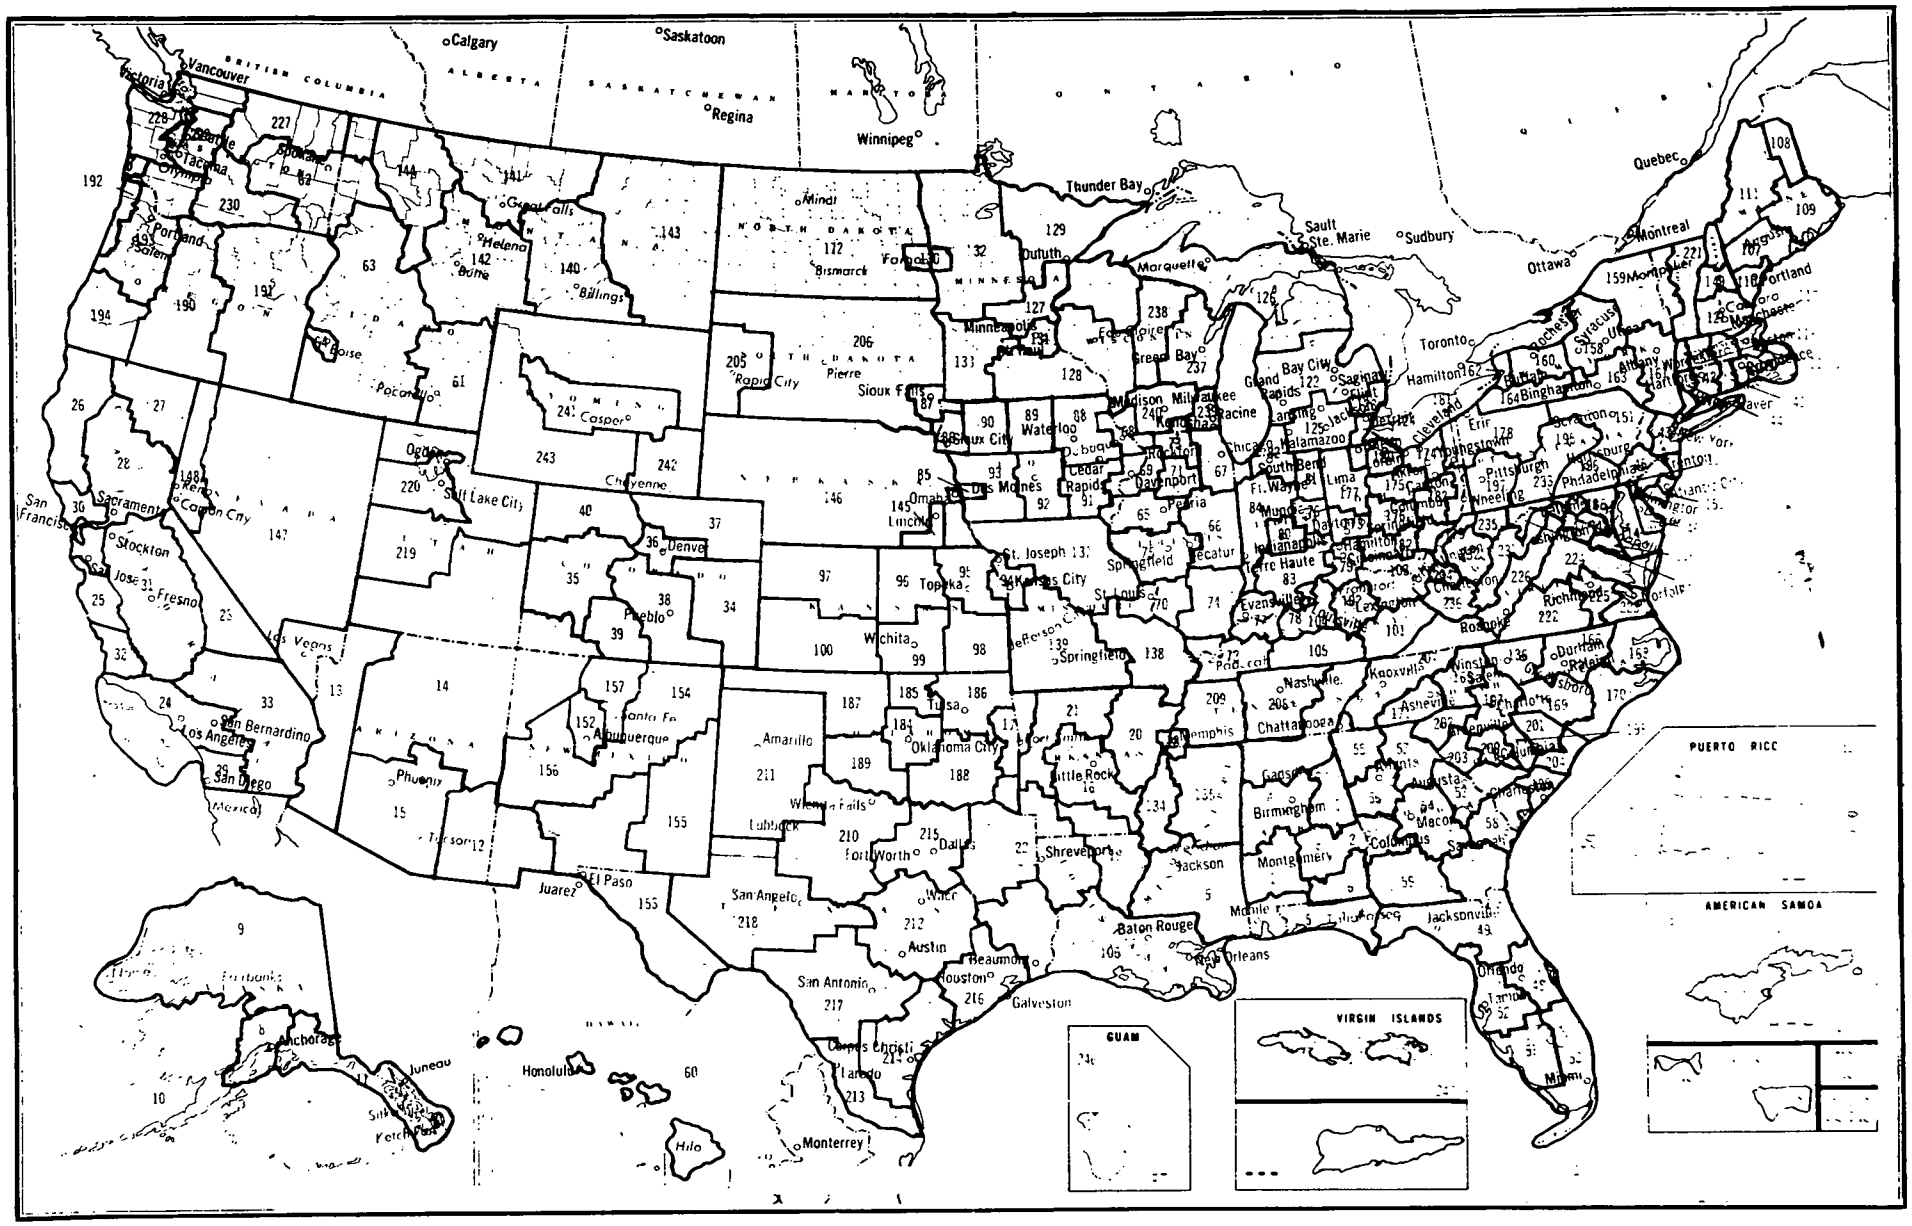

Figure 1. Air Quality Control Regions.

TABLE 1. EPA-CALCULATED NATIONAL EMISSIONS ESTIMATES FOR 1974

Source category	Emissions Estimates 10^3 tons/yr				
	Particulates	Sulfur oxides	Nitrogen oxides	Hydro carbons	Carbon monoxide
Fuel combustion (point and area)	6,200	24,100	13,100	1,600	1,400
Residential	200	500	400	100	300
Electric generation	4,200	18,700	6,900	100	300
Industrial	1,600	3,600	5,500	1,400	600
Commercial-institutional	200	1,300	300	40	200
Industrial processes (point)	10,400	5,900	800	10,300	9,100
Chemical manufacturing	300	500	300	1,800	2,800
Food/agriculture	1,500	0	0	0	0
Primary metals	1,900	3,700	0	200	1,300
Secondary metals	200	0	0	0	1,400
Mineral products	6,000	700	100	0	0
Petroleum industry	100	800	400	900	2,500
Wood Products	400	100	0	0	1,100
Evaporation	0	0	0	6,600	0
Other Processes	0	100	0	800	0
Solid waste disposal (point and area)	600	50	200	1,000	3,600
Municipal incineration	100	10	20	10	300
Residential	200	20	100	500	1,300
Commercial-institutional	200	10	50	300	900
Industrial	100	10	20	200	1,100
Transportation (area)	1,300	800	10,600	13,600	82,300
Gasoline vehicles					
Light vehicles	700	200	5,700	9,300	60,700
Heavy vehicles	100	20	800	1,400	11,400
Off highway	20	10	200	500	6,500
Diesel vehicles					
Heavy vehicles	100	200	1,600	200	800
Off highway	100	100	1,300	100	400
Rail	100	100	800	200	300
Aircraft	100	30	100	400	700
Vessels	100	200	100	500	1,500
Gasoline handling evaporation loss	0	0	0	1,000	0
Miscellaneous (area)	700	0	100	4,600	4,400
Forest fires	500	0	100	500	3,800
Structural fires	100	0	10	10	100
Slash burning	100	0	20	100	500
Frost control	0	0	0	0	0
Solvent evaporation loss	0	0	0	4,000	0
Grand total (point and area)	19,200	30,900	24,800	31,100	100,800

NEDS Point-Source File

The NEDS point-source file contains data concerning stationary facilities that are individual emitters of relatively large quantities of one or more air contaminants. A point source is defined for state reporting purposes as a facility at which the annual emissions of any one criteria pollutant equal or exceed 100 tons (90.7 metric tons) per year. Nearly all point-source data originate at state air pollution control agencies. In general, individual emission points are defined within such a facility to represent the emissions from individual stacks and processes. There may be emitting points at a facility that individually have emissions of fewer than 100 tons per year, but emissions from such points are included in NEDS if the criterion of emissions of 100 tons per year for the entire facility is met. Data for other facilities, regardless of emissions, may also be included if the data are reported from state files.

At the time of this report, NEDS contains data from approximately 130,000 emitting points at 43,000 facilities in all states, the District of Columbia, and three territories. Considerable information is stored for each point source. For example, NEDS stores data on annual operating rates, or activity levels, of a process. More specifically, these rates may relate to the amount of fuel consumed by a boiler, quantity of product manufactured in an industrial process, or some comparable measure. Information identifying existing air-pollution control devices and their efficiencies is also recorded. These and similar data are used to determine source emissions according to the procedures outlined in the following discussion of the NEDS emission factor file.

NEDS point-source data are reviewed continually through extensive and cooperative efforts by the National Air Data Branch, the EPA Regional Offices, and the state and local air-pollution control agencies. Data were originally acquired from state records and converted to the NEDS format primarily through EPA internal and contractual efforts. Under provisions of the Clean Air Act and SIP requirements, state agencies must submit revised source data in NEDS format to EPA semiannually for (1) each source achieving final compliance with an SIP emission-limitation regulation or strategy, (2) each new or modified source receiving approval to begin construction or operation, and (3) each source that terminated operations during a reporting period. Thus, the basic data of the NEDS are revised and updated periodically and reflect progress under the SIPs.

The point-source file contains the data reported to NEDS by the state air-pollution control agencies. Some states still rely on manual procedures for maintenance of their own source/emissions files. The majority of states have, however, installed, or are in the process of installing, automated data systems and EPA has assisted many of the states in these efforts. The most common system in use is one designed and maintained by EPA: the Emission Inventory/Permits and Registration Subsystem (EIS/P&R) of the Comprehensive Data Handling System (CDHS). EIS/P&R has the capability to output data in NEDS format for reporting to EPA. A number of systems designed and maintained by the states also have a similar capability. Data can be easily reported to NEDS by means of data format conversion programs.

NEDS Area-Source File

In NEDS, area sources are all emissions sources not identified as point sources. For example, the NEDS area-source file contains data on all mobile sources such as motor vehicles, aircraft, and railroads; small stationary sources; and miscellaneous sources such as forest fires, agricultural burning, and retail gasoline marketing operations. Unlike data for point sources, however, data for each of these small individual sources are not stored in NEDS. Rather, estimates of total emission levels for specific categories of area sources are stored for individual geographic areas. Generally, data relevant to area-source emissions (for example, total amount of gasoline consumed by all motor vehicles) are grouped for each of the approximately 3100 counties or county equivalents in the United States. Area-source data are developed primarily from reports published by other Federal agencies and, when possible, from valid data collected by state air-pollution control agencies. Detailed procedures for the determination of levels of area source activity are discussed in *Aeros User's Manual, Volume II* (OAQPS No. 1.2-039), EPA-450/2-76-029. Under current SIP requirements, states are not required to submit area-source data to EPA. Therefore, area-source data are updated annually by NADB; states are given the opportunity, however, to review the EPA-generated area-source data for accuracy and completeness. In addition, a number of state

agencies have voluntarily submitted their own area-source data for inclusion in NEDS. These data are reviewed for consistency with the NEDS point-source data and are added to the NEDS file if they are acceptable for inclusion.

NEDS Emission-Factor File

In normal NEDS operations, source emissions are calculated automatically via computer program, based on the data stored in point and area source files. The principal vehicle for these calculations is the NEDS emission-factor file. An emission factor is a statistical average--a quantitative estimate--of the rate at which a pollutant is released to the atmosphere (as a result of an activity such as combustion or industrial production) divided by the level of that activity. Thus, an emission factor relates the quantity of pollutants to an indicator of activity such as production capacity or quantity of fuel burned. Because emission factors are statistical averages, they are not necessarily precise indicators of emissions from an individual source. When they are applied to a large number of sources, however, a reasonable estimate of total emissions can be obtained. In general, the larger the sample, the lower the percentage of error. Therefore, for the entire nation, an emission estimate based on emission factors may be quite precise, but for smaller geographic areas the percentage of error increases. Emission factors are usually determined from results of source tests in which quantities of air pollutants are measured from specific processes. Emission factors may also be determined from process material balances and engineering appraisals of particular processes. A collection of derived emission factors is given in *Compilation of Air Pollutant Emission Factors* (U.S. Environmental Protection Agency, Research Triangle Park, N.C., Publication No. AP-42, March 1975) and its supplements.

The emission factors in AP-42 and associated data maintained by NADB are related to the activity levels for sources covered by NEDS. Area-source emission factors are designated for each area-source category represented in NEDS. The emissions are determined by multiplying the appropriate emission factor by the activity level recorded.

Similarly, point-source emission factors are related to point-source activity levels through the NEDS Source Classification Code (SCC), determined and recorded for each point source. These codes give specific identification of the source (e.g., industrial coal-fired boiler, solid-waste incinerator, gray-iron cupola) and define the units of the activity level recorded in the point-source file. Appropriate emission factors are designated for each SCC and are multiplied by the activity level to calculate the emissions. Where a control device is indicated in the point-source file, the given control-device efficiency is included in the emission calculation so that estimated actual emissions are computed for all sources. Additionally, provision is made for the direct recording of emissions determined by stack tests or engineering material balances for specific sources. It is assumed that the determination of emissions by these latter methods provides a more precise estimate than the calculation of emissions by the application of an emission factor. Further, when the point-source file indicates that the recorded emissions estimates were determined by a source test or material balance, the computer program that calculates emissions will substitute these data for emissions estimates that were calculated through the use of factors.

Some SCCs do not have corresponding emission factors in the NEDS emission-factor file. These SCCs are general in nature (i.e., termed miscellaneous or unspecified) and are used for the categorization of point sources that are otherwise not classifiable. A source will fall in these categories when (1) no emission information is available, (2) the source is inadequately identified, or (3) the source is unique, or very unusual, and therefore cannot be assigned a specific SCC.

For some of the sources in such miscellaneous categories, emissions estimates may be derived by engineering analysis or judgment. The resulting emissions estimates are incorporated into the point-source file and carry the same weight as calculated emissions estimates. The National Emissions Reports are based on all emissions estimates in the NEDS point-source file, however derived.

The error caused by having no estimates for some point sources and "guess" estimates for a few others is insignificant when emissions are summarized for the nation as a whole; but that error may be fairly sizable for

local areas in which a number of point sources could not be assigned a specific SCC. The evidence suggests that the problem of missing emissions estimates for a few point sources is not major when considered in relation to (1) the potential imprecision introduced through an application of emission factors to specific point sources, or (2) the imprecision introduced through the calculation of area-source activity levels for small geographic areas.

Reliability of Reported Emissions

Because an emissions inventory such as NEDS is often used as a basis for making important management decisions, it is imperative that the data therein be as accurate and precise as possible. Hence, when an inventory is developed, the question of reliability must be considered if the resulting emissions estimates are to be applied with any confidence.

Imprecision of emissions data is an inevitable result of the estimation techniques used to develop the data base, though these techniques are, for practical considerations, the best that are available. As noted previously, the use of emission factors and calculation of area-source activity levels for NEDS cause inherent variations, or random errors, in the calculated emissions. Generally, as the number of observations on which emissions estimates are based is increased, the impact of imprecision of the data decreases. Thus, for the NEDS national emissions summary tabulation, which is based on a very large number of observations, imprecision is a relatively minor factor. For emissions summaries for smaller geographic areas (such as states and AQCRs), which are based on a smaller number of observations, the error potential increases.

Other factors that influence emissions inventory reliability are mistakes and biases in the reported data. Major mistakes input to NEDS are prevented by edit programs used to process input data or by review of NEDS output reports prior to publication of the National Emissions Report. Such data errors have been corrected for this report. It is likely that there are a number of other, relatively minor mistakes that remain that should have an insignificant impact on the reliability of reported emissions. Biases in the NEDS data are introduced as a result of inaccuracies, or deficiencies, in the techniques used to compile the data. In comparison with mistakes, biases usually represent a more subtle type of error because it is rarely apparent with biases that the resulting emissions estimates deviate from what the "true" values should be (as is often the case with many mistakes). As an example, the emissions from a source may be measured by a sampling technique that yields biased results. Another example is the use of a biased (i.e., nonrepresentative) emission factor to estimate the emissions from a number of sources.

For NEDS, biases are introduced principally through inaccuracies in the procedures used to compile NEDS area-source data and lack of complete and timely reporting of point-source data by state agencies. In addition to regulation prescribing reporting of point-source data (40CFR 51.7) includes an inherent bias since it requires reporting only from facilities identified as emitting over 100 tons per year. Emissions from fuel combustion not accounted for by reporting of point sources are generally included, instead, as area-source fuel use, but with less precision that if all fuel use were accounted for by individual point sources. Emissions from industrial process sources not reported as point sources are not accounted for, however. Thus, NEDS data may be biased low for industrial process emissions in cases where state agencies fail to report all major industrial process sources adequately as point sources or where emissions from facilities individually emitting less that 100 tons per year are collectively significant.

As a possible means of checking the reliability of NEDS emissions data, Table 1 shows EPA-calculated national emissions estimates for each of the five criteria pollutants according to the same major source categories as defined in the NEDS emissions summaries. These data are obtained from the data prepared for the *National Air Quality and Emissions Trends Report, 1976* (EPA-450/1-77-002). The methodology used to derive these data relies upon essentially the same sources of information for emission factors and area-source calculation algorithms as used with NEDS. Differences between NEDS area-source data and totals reported in Table 1 are due primarily to the differences in the precision of the methods of calculation used. For NEDS, national emissions totals are obtained by summarizing individual county totals. National Trends Report emissions totals are obtained from one calculation performed at the national level by use of total national activity levels and national average emission factors for each source category. For source categories reported in NEDS as point sources,

national emissions totals reported below are also based on one calculation, performed at the national level; in this calculation, use is made of available data on national industrial production and fuel consumption, other appropriate data, and national average emission factors. Where necessary, average level of pollution control is considered to estimate actual emissions. The methodology for EPA calculation of national emissions estimates is inherently less precise than that used to produce NEDS summaries and does not allow inclusion of emissions measured by calculation procedures for individual sources that may give more accurate emissions estimates than a standard emission factor calculation. The national calculation does not suffer from biases and omissions of sources to the same extent as NEDS point-source data, however. As a result, the national emissions totals presented below are judged to be the most reliable estimates of national emissions available at this writing. EPA national emissions estimates are periodically revised as better emission inventory techniques and emission factors are developed. Updated national emissions estimates for 1975 will be presented in future editions of the *National Air Quality and Emissions Trends Report.*

Comparison of the national NEDS emissions totals with EPA-calculated national emissions estimates indicates reasonable agreement for most source categories. Notable discrepancies do exist in some cases, however. Some of these can be clearly traced to specific deficiencies in the NEDS data. Others involve more complex problems concerning differences in techniques used to produce the data. It is difficult to resolve these problems without an exhaustive review of NEDS data.

For stationary fuel-combustion sources, discrepancies exist for particulate and SO_2 emissions from power plants and for emissions of all pollutants from industrial fuel combustion. The low emissions of NO_x and hydrocarbons in NEDS are due clearly to missing point sources. Natural gas-fired turbines and reciprocating engines are not well represented in the NEDS point-source file. These sources, operated largely by natural gas pipeline and gas-processing companies, account for a large portion of NO_x and hydrocarbon emissions from industrial fuel combustion. Discrepancies in particulate and SO_2 emissions are not readily explained. Calculating emissions of these pollutants involves the use of many variables, including fuel amounts, sulfur and ash contents, degree of control employed, and either emission factors or state-supplied emissions estimates for sources. Fuel amounts in NEDS are slightly higher than fuel amounts used to calculate EPA national emissions estimates, but not sufficient so to account entirely for the difference in emissions. Fuel use data for the nation and each state are given in the *1974 National Emissions Data System (NEDS) Fuel Use Report* (EPA-450/2-78-031). **No specific factor can be identified to explain these discrepancies. It is likely that some combination of factors is responsible for the observed differences in emissions estimates.**

Industrial process emissions of particulates and hydrocarbons are lower in NEDS than in EPA national emissions estimates. Particulate emissions are lower either because (1) some industrial process sources are missing or not properly coded in the NEDS point source files or (2) the degree of control for point sources exceeds the national average degree of control assumed for calculation of national emissions estimates. Hydrocarbon emissions estimates are lower because many petroleum storage facilities at refineries, gasoline bulk terminals, and gasoline bulk plants are not included in the NEDS point-source file. In addition, the portion of industrial organic solvent use accounted for by point sources is relatively small. Missing solvent use is approximately accounted for as area-source solvent use, instead. As a result, the NEDS emissions shown for miscellaneous area-source solvent evaporation loss are substantially higher than EPA national emissions estimates, but the total emissions from solvent use are approximately the same. This relationship is not readily apparent since, in the NEDS emissions summary report, all point-source evaporative emissions from petroleum storage and transportation and organic solvent use are combined. NEDS SO_x emissions from industrial processes are higher than in the EPA national emissions estimates. This difference is due to failure to account adequately for SO_2 control practices at primary nonferrous smelters in the NEDS point-source file and inclusion in NEDS of miscellaneous SO_2 emissions sources (such as waste-gas flares and incinerators) that are not accounted for in the EPA national emissions estimates because no adequate emissions inventory methodology is available.

For solid waste disposal, NEDS CO emissions estimates are somewhat low because some municipal incinerators are not recorded as point sources and emissions from open burning and industrial incinerators are also lower than EPA national emissions estimates. Because of the scarcity of information on solid waste disposal, it is not clear whether the NEDS data are really too low or the EPA national emissions estimates are too high.

Calculation of highway vehicle emissions in NEDS is a complex procedure involving estimated gasoline and diesel fuel-use data, vehicle miles traveled (VMT), average route speed, and average emission factors. Currently, NEDS defines only two categories of gasoline-powered highway vehicles: light vehicles (under 6000 pounds gross vehicle weight) and heavy vehicles (over 6000 pounds gross vehicle weight). EPA national emissions estimates include calculated emissions for three categories: light-duty vehicles, light-duty trucks and heavy-duty vehicles. Emission factors for each of these categories are readily available from AP-42. For NEDS, an approximation must be made to develop emission factors that match the NEDS vehicle categories. This approximation introduces an error into the NEDS emissions calculations. As a result, NEDS emissions totals for light vehicles are very close to the sum of EPA-calculated national emissions estimates for light-duty vehicles and light-duty trucks, but NEDS emissions data for heavy vehicles are somewhat lower than EPA-calculated emissions estimates for heavy-duty gasoline-powered vehicles.

Tabulated Data From Neds

Nationwide emissions of the five criteria pollutants in 1974 are summarized by emission source category in the first table (page 1) of this report. The second group of tables presents a summary of air pollutant emissions for that year in individual states, in intrastate AQCRs, and in the portions of interstate AQCRs within each state. Air pollutant emissions data for each interstate AQCR are presented in the third group of tables.

Each table has the same format, with emissions shown for each defined NEDS source category. Area-source categories are identical to those defined in the NEDS area-source file. The *AEROS User's Manual* (EPA-450/2 76-029) gives a detailed definition of each area-source category. The following brief descriptions of selected area-source categories are presented as additional clarifying information.

Area-Source Category	Description
Gasoline-Light Vehicles Gasoline-Heavy Vehicles	Light vehicles in NEDS summaries refers to vehicles with a gross weight of less than 6000 pounds (2722kg). Heavy vehicles are those with gross weight over this amount.
Off Highway	Off-Highway vehicles include farm, construction, and industrial machinery, lawn and garden tractors, snowmobiles, and off-road motorcycles.
Gasoline Handling Evaporation Loss	This category represents evaporative emissions occurring at retail gasoline service stations from filling of underground storage tanks and vehicle tanks.
Slash Burning	This category represents emissions from deliberate prescribed burning of forest and agricultural wastes as a standard management practice.
Frost Control	This category represents emissions from the use of orchard heaters.
Solvent Evaporation Loss	This category represents an estimate of evaporative emissions from organic solvent use, not accounted for by point sources in NEDS.

Point-Source data in the emissions summaries are grouped according to NEDS Source Classification Code (SCC) definitions. A complete SCC listing is given in *Compilation of Air Pollutant Emission Factors,* AP-42 and the *AEROS Manual of Codes* (EPA-450/2-76-005). A brief summary of the relationships between NEDS SCC categories and the emissions summary categories is given in the table below.

Point-Source Category	SCC	Description
External Combustion-Electric Generation	101	Power-plant boiler fuel use
External Combustion-Industrial	102	Industrial boiler fuel use
External Combustion-Commercial-Institutional	103	Commercial-institutional boiler fuel use
Internal Combustion-Electric Generation	201	Power-plant fuel use in turbines and reciprocating engines
Internal Combustion-Industrial	202	Industrial turbines and IC engines
Internal Combustion-Commercial-Institutional	203	Commercial-institutional turbines and IC engines
Internal Combustion-Engine Testing	204	Testing of aircraft and rocket engines
Industrial Process-Chemical Mfg.	301	Chemical production
Industrial Process-Food/Agriculture	302	Food and grain processing
Industrial Process-Primary Metal	303	Primary iron/steel, aluminum, copper, etc.
Industrial Process-Secondary Metal	304	Foundries, secondary metal smelting
Industrial Process-Mineral Products	305	Stone, clay and glass
Industrial Process-Petroleum Industry	306	Petroleum refining
Industrial Process-Wood Products	307	Pulp and paper, plywood, sawmills
Industrial Process-Evaporation	4	Dry cleaning (401001), degreasing (401002), surface coating (402), petroleum product storage (403,404) and transfer (406) (except retail service stations) and printing (405).
Industrial Process-Metal Fabrication	309	Hardware, machinery manufacturing
Industrial Process-Leather Products	320	Leather goods
Industrial process-Textile Mfg.	330	Fabrics and carpet operations
Industrial Process-Inprocess Fuel	390	Fuel used by all industries in dryers, furnaces, kilns, etc.
Industrial Process-Other/Not Classified	399	Industrial processes not identified above
Solid Waste Disposal	5	Municipal incinerators and open burning dumps (501), commercial incinerators and open burning (502) and industrial incinerators and open burning (503)

SUMMARY OF AIR POLLUTANT EMISSIONS IN THE UNITED STATES

UNITED STATES

Emission categories	Pollutant, tons per year				
	Particulates	Sulfur oxides	Nitrogen oxides	Hydro-carbons	Carbon monoxide
GRAND TOTAL	**16,322,898**	**33,050,968**	**22,403,768**	**31,943,322**	**103,320,494**

15. SUPPLEMENTARY NOTES

16. ABSTRACT

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended 1977, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.7. Summary data are presented for the nation as a whole, for individual states, and for Air Quality Control Regions and individual interstate portions, thereof.

The data compilations result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, at Research Triangle Park, North Carolina 27711.
