FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Georgia Department of Natural Resources for professional involvement and to the Georgia National Guard for conducting the tributary sampling phase of the Survey.

Joe D. Tanner, Commissioner of the Department of Natural Resources; J. Leonard Ledbetter, Director of the Environmental Protection Division; Ralph S. Howard, Jr., Environmental Affairs Coordinator; Gene B. Welsh, Chief of the Water Protection Branch; Edward T. Hall, Jr., Unit Coordinator; and Broughton A. Caldwell, R. Marshall Gaddis, William D. Kennedy, and Kenneth W. Martin, Environmental Specialists, provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary lake reports, and provided critiques most useful in the preparation of this Working Paper series.

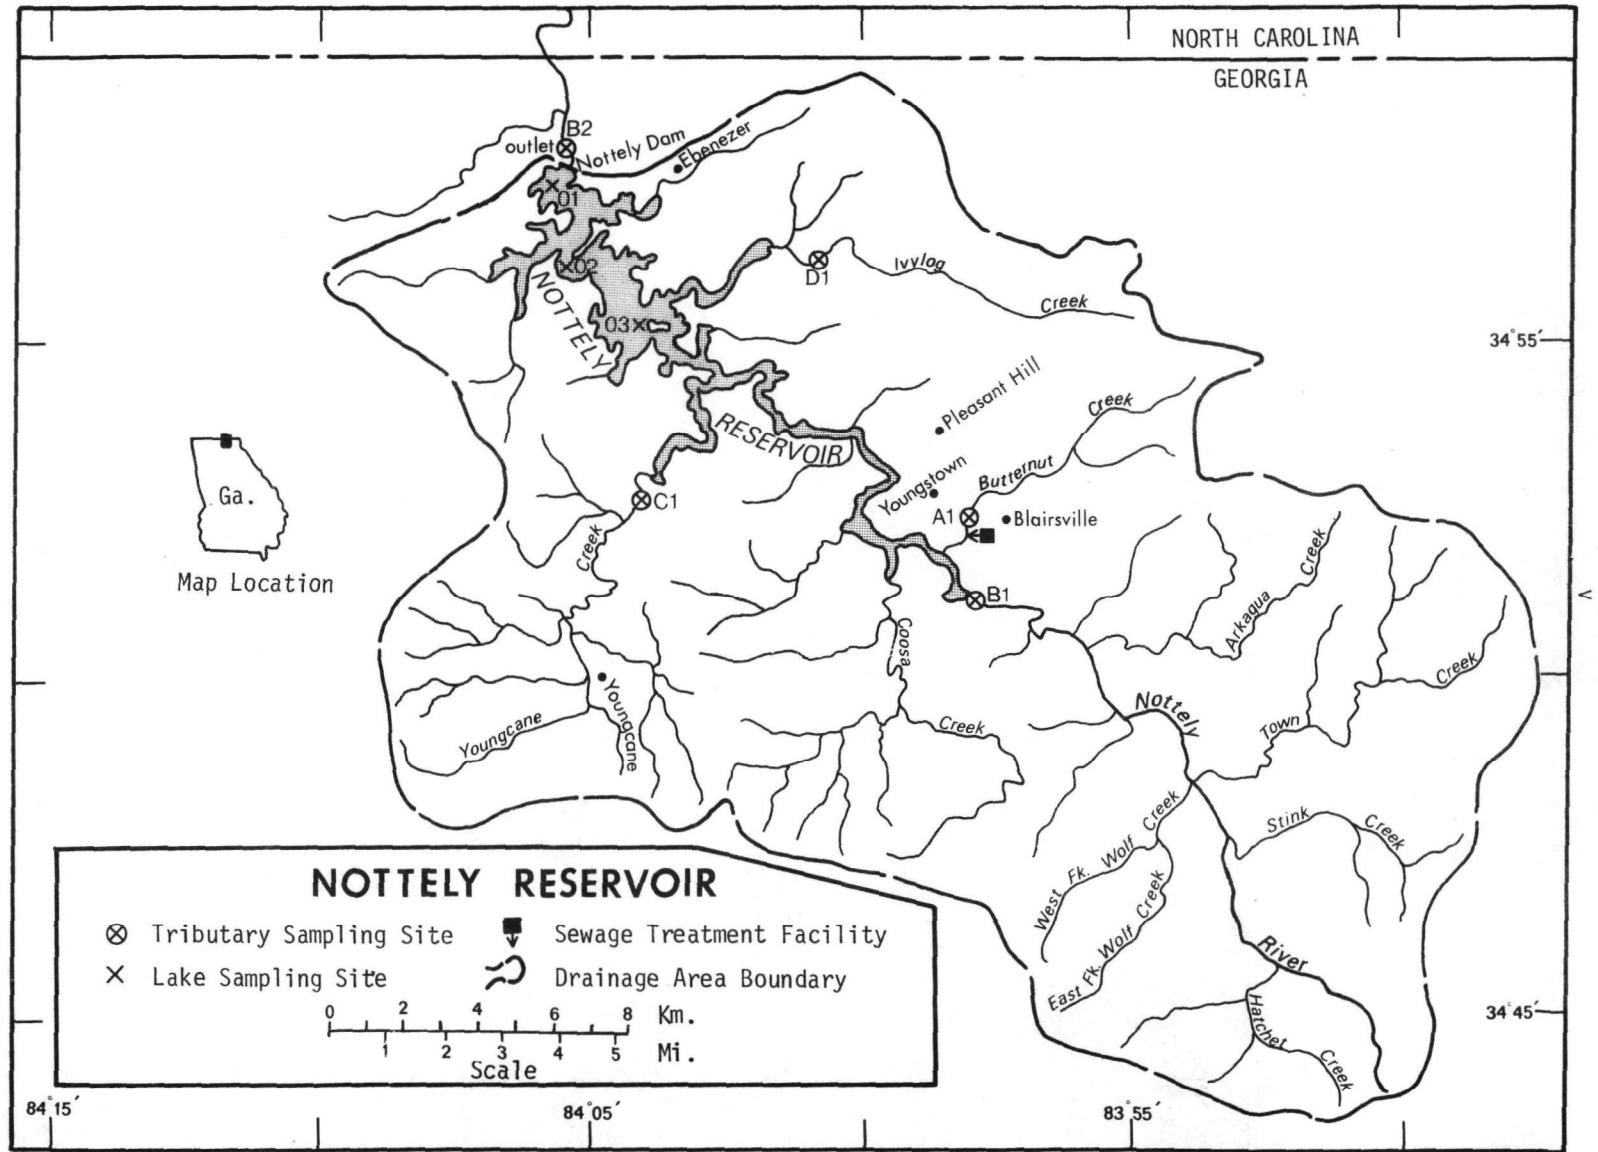

Major General Joel B. Paris, III, then the Adjutant General of Georgia, and Project Officer Lt. Colonel John R. Ranier, who directed the volunteer efforts of the Georgia National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

NOTTELY RESERVOIR*

STORET NO. 1311

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Nottely Reservoir is mesotrophic. It ranked fourth in overall trophic quality when all 14 Georgia lakes sampled in 1973 were compared using a combination of six parameters**. Three of the lakes had less median total phosphorus, one had less and two had the same median dissolved phosphorus, four had less median inorganic nitrogen, five had less mean chlorophyll a, and four had greater mean Secchi disc transparency.

Depression of dissolved oxygen occurred in the thermocline and hypolimnion at all sampling stations in June, and oxygen depletion occurred in the hypolimnion at all stations in September.

No algal blooms or aquatic vegetation were observed by, Survey limnologists, and personnel of the Georgia Department of Natural Resources know of no problems in the reservoir (Hall, 1975).

B. Rate-Limiting Nutrient:

The algal assay results indicate that Nottely Reservoir was limited by phosphorus at the time the assay sample was

* Table of metric conversions--Appendix A.

** See Appendix B.

collected. These results are substantiated by the reservoir data; i.e., the mean N/P ratios were 16/1 or greater at all sampling times.

C. Nutrient Controllability:

1. Point sources--During the sampling year, the estimated phosphorus contribution from point sources, including septic tanks, amounted to 4.5% of the total load. The Blairsville wastewater treatment plant is estimated to have contributed 4.2% of this total.

The present total phosphorus loading rate of $0.75 \text{ g/m}^2/\text{yr}$ is below the rate proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic rate but greater than his proposed oligotrophic rate; i.e., a mesotrophic rate (see page 14). Complete removal of point-source phosphorus loads would reduce the loading rate to $0.72 \text{ g/m}^2/\text{yr}$ but probably would not result in a significant change in the trophic condition of this reservoir.

2. Non-point sources--The phosphorus contribution from non-point sources, including precipitation, amounted to 95.5% of the total load during the sampling year. Nottely Creek contributed 44.6%, Youngcane Creek contributed 11.9%, and the remaining two tributaries contributed 9.0%, collectively. The ungauged tributaries were estimated to have contributed 27.7%.

The phosphorus export rates of the Nottely Reservoir tributaries ranged from 12 to 27 kg/km²/yr with a mean of 20 kg/km²/yr (see page 14). These rates compare well with the export rates of tributaries to nearby Blue Ridge Lake* (range of 9 to 27 kg/km²/yr; mean of 18 kg/km²/yr) and Chatuge Lake** (range of 14 to 24 kg/km²/yr; mean of 21 kg/km²/yr).

II. LAKE AND DRAINAGE BASIN CHARACTERISTICS

A. Lake Morphometry[†]:

1. Surface area: 17.36 kilometers².
2. Mean depth: 13.1 meters.
3. Maximum depth: >36.6 meters.
4. Volume: $227.416 \times 10^6 \text{ m}^3$.
5. Mean hydraulic retention time: 231 days.

B. Tributary and Outlet:

(See Appendix C for flow data)

1. Tributaries -

<u>Name</u>	<u>Drainage area (km²)*</u>	<u>Mean flow (m³/sec)*</u>
Butternut Creek	31.1	0.5
Nottely River	217.3	5.6
Youngcane Creek	71.5	1.4
Ivylog Creek	43.3	0.8
Minor tributaries & immediate drainage -	<u>176.4</u>	<u>3.1</u>
Totals	539.6	11.4

2. Outlet -

Nottley River	557.0**	11.4
---------------	---------	------

C. Precipitation***:

1. Year of sampling: 194.4 centimeters.
2. Mean annual: 125.4 centimeters.

* For limits of accuracy, see Working Paper No. 175, "...Survey Methods, 1973-1976".

** Includes area of reservoir.

*** See Working Paper No. 175.

III. LAKE WATER QUALITY SUMMARY

Nottely Reservoir was sampled three times during the open-water season of 1972 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from three stations on the lake and from a number of depths at each station (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the three stations for phytoplankton identification and enumeration; and during the first visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 36.6 meters at station 1, 36.0 meters at station 2, and 22.9 meters at station 3.

The results are summarized in the following table and are presented in full in Appendix D.

0.050 P + 1.0 N	0.052	1.129	14.8
1.0 N	0.002	1.129	0.1

3. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate that the potential primary productivity of Nottely Reservoir was low at the time the sample was taken. Also, increasing yields with increasing concentrations of orthophosphorus indicate that the lake was phosphorus limited at that time. Note that the addition of only nitrogen did not alter the yield as compared to that of the control.

The reservoir data also indicate phosphorus limitation. On all sampling occasions, the mean ratios of inorganic nitrogen to orthophosphorus were 16 to 1 or greater.

IV. NUTRIENT LOADINGS
(See Appendix E for data)

For the determination of nutrient loadings, the Georgia National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff month of February when two samples were collected. Sampling was begun in March, 1973, and was completed in February, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Georgia District Office of the U.S. Geological Survey for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings*. Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated by using the means of the nutrient loads, in kg/km²/year, at stations C-1 and D-1 and multiplying the means by the ZZ area in km².

The City of Blairsville did not participate in the Survey, and nutrient loads were estimated at 1.134 kg P and 3.401 kg N/capita/year. Also, the Vogel State Park wastewater treatment facility, which discharges to the East Fork of Wolf Creek, was not sampled. However, in

* See Working Paper No. 175.

a recent Georgia Department of Natural Resources report (Anonymous, 1973), the stream was classified as "healthy" at a sampling station less than two miles downstream from the park, so it is not likely that this point source contributes significant amounts of nutrients to Nottely Reservoir.

The only industrial waste source in the drainage, the Joseph Campbell Company, only discharges brine (Anonymous, 1972) and is not believed to be of nutrient significance.

A. Waste Sources[†]:

1. Known domestic -

<u>Name</u>	<u>Pop. Served</u>	<u>Treatment</u>	<u>Mean Flow (m³/d)</u>	<u>Receiving Water</u>
Blairsville Vogel State Park**	491* ?	stab. pond ?	170.3* ?	Butternut Creek E. Fk., Wolf Creek

2. Known industrial -

<u>Name</u>	<u>Type</u>	<u>Waste and Treatment</u>	<u>Design Flow (m³/d)</u>	<u>Receiving Water</u>
Joseph Campbell Co., Blairsville	food process- ing	brine; storage pond	5.3	Butternut Creek

* Population served is 1970 Census; flow estimated at 0.3785 m³/capita/day.

** Anonymous, 1973.

B. Annual Total Phosphorus Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg P/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Butternut Creek	365	2.8
Nottely River	5,820	44.6
Youngcane Creek	1,550	11.9
Ivylog Creek	815	6.2
b. Minor tributaries & immediate drainage (non-point load) -		27.7
c. Known domestic STP's -		
Blairsville	555	4.2
Vogel State Park	insignificant	
d. Septic tanks* -	35	0.3
e. Known industrial -		
J. Campbell Co.	insignificant	
f. Direct precipitation** -	<u>305</u>	<u>2.3</u>
Total	13,060	100.0

2. Outputs -

Lake outlet - Nottely River 8,000

3. Net annual P accumulation - 5,060 kg.

* Estimate based on 121 lakeshore dwellings; see Working Paper No. 175.

** Estimated; see Working Paper No. 175.

C. Annual Total Nitrogen Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg N/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Butternut Creek	15,200	5.1
Nottely River	151,170	50.8
Youngcane Creek	25,620	8.6
Ivylog Creek	17,300	5.8
b. Minor tributaries & immediate drainage (non-point load) -		66,855
		22.4
c. Known domestic STP's -		
Blairsville	1,670	0.6
Vogel State Park		insignificant
d. Septic tanks* -		1,290
		0.4
e. Known industrial -		
J. Campbell Co.		insignificant
f. Direct precipitation** -		<u>18,740</u>
		<u>6.3</u>
Total	297,845	100.0

2. Outputs -

Lake outlet - Nottely River 297,710

3. Net annual N accumulation - 135 kg.

* Estimate based on 121 lakeshore dwellings; see Working Paper No. 175.

** Estimated; see Working Paper No. 175.

D. Mean Annual Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km²/yr</u>	<u>kg N/km²/yr</u>
Butternut Creek	12	489
Nottely River	27	696
Youngcane Creek	22	358
Ivylog Creek	19	400

E. Yearly Loading Rates:

In the following table, the existing phosphorus loading rates are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" rate is the rate at which the receiving water would become eutrophic or remain eutrophic; his "permissible" rate is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic rate would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m ² /yr	0.75	0.29	17.2	0.3

Vollenweider loading rates for phosphorus (g/m²/yr) based on mean depth and mean hydraulic retention time of Nottely Reservoir:

"Dangerous" (eutrophic rate)	0.88
"Permissible" (oligotrophic rate)	0.44
