## FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning {§303(c)}, water quality criteria/standards review {§303(c)}, clean lakes {§314(a,b)}, and water quality monitoring {§106 and §305(b)} activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

#### ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Indiana State Board of Health for professional involvement, to the Indiana National Guard for conducting the tributary sampling phase of the Survey, and to those Indiana wastewater treatment plant operators who provided effluent samples and flow data.

The staff of the Division of Water Pollution Control, Indiana State Board of Health, provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

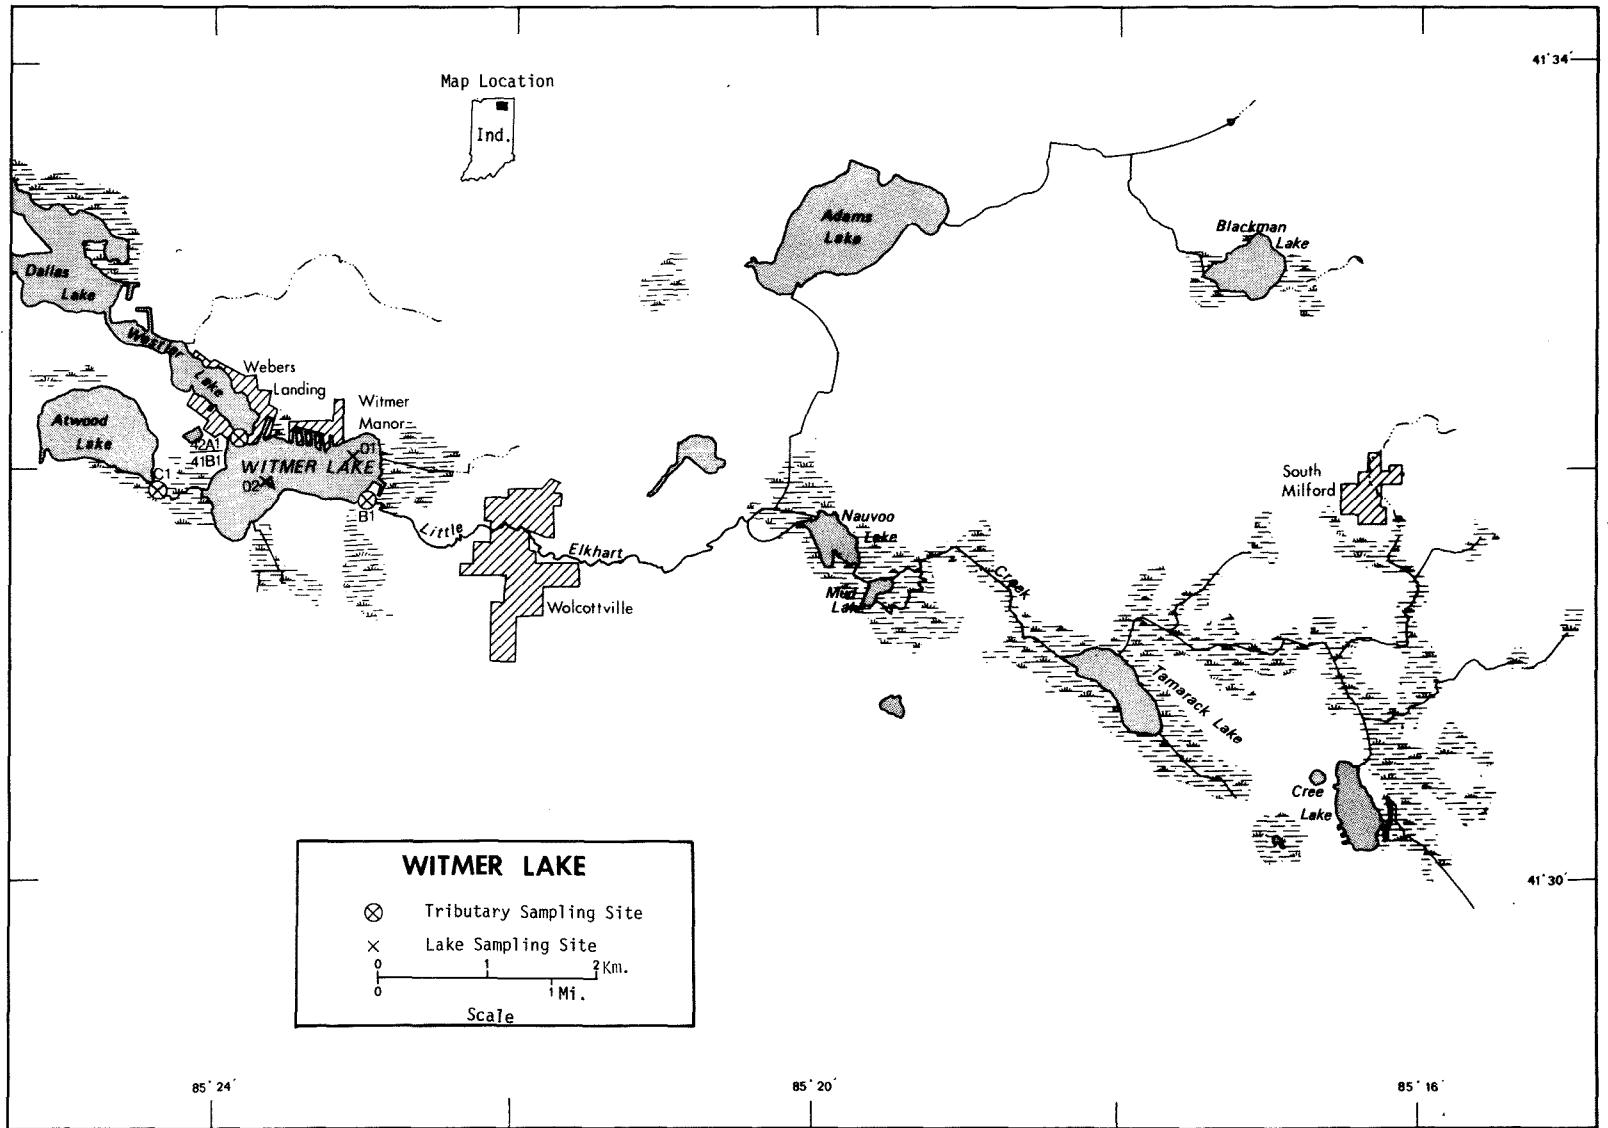

Major General Alfred F. Ahner, Adjutant General of Indiana, and Project Officers Lt. Colonel Charles B. Roberts (Retired) and Colonel Robert L. Sharp, who directed the volunteer efforts of the Indiana National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

WITMER LAKE

STORET NO. 1842

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Witmer Lake is eutrophic. Of the 27 Indiana lakes sampled in 1973, Witmer Lake ranked fifteenth in overall trophic quality using a combination of six parameters\*. Twelve lakes had less and two had the same median total phosphorus, 12 had less and one had the same median dissolved phosphorus, 13 had less median inorganic nitrogen, 15 had less mean chlorophyll a, and 13 had greater mean Secchi disc transparency.

Survey limnologists noted algal blooms at both stations in August and October, and dissolved oxygen was depleted in the hypolimnion at both stations at those times.

B. Rate-Limiting Nutrient:

The algal assay results indicate that Witmer Lake was phosphorus limited at the time the assay sample was collected (05/03/73). However, the lake data indicate nitrogen limitation in August and October.

C. Nutrient Controllability:

1. Point sources--During the sampling year, Witmer Lake received a total phosphorus loading nearly 2½ times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic

---

\* See Appendix A.

loading (see page 11). The only known point source, Wolcottville, contributed just over 8% of the total phosphorus load.

While even complete removal of phosphorus at the Wolcottville wastewater treatment plant would still leave a loading about twice the eutrophic loading, it is possible that a high degree of phosphorus removal at this source would result in persistent phosphorus limitation (see page 7) and a reduction in the incidence and severity of nuisance algal blooms. Also, phosphorus control might benefit downstream Westler Lake (see map, page v). Note that 67% of the phosphorus load to Witmer Lake was not retained and moved on into Westler Lake. Dallas Lake, just downstream from Westler Lake, probably would benefit also.

2. Non-point sources--During the sampling year, the non-point phosphorus contributions of the Witmer Lake tributaries and immediate drainage accounted for just over 90% of the total phosphorus load to the lake. However, the phosphorus exports of the gaged tributaries do not appear to be excessive (see page 10).

## II. LAKE AND DRAINAGE BASIN CHARACTERISTICS<sup>†</sup>

### A. Lake Morphometry<sup>††</sup>:

1. Surface area: 0.83 kilometers<sup>2</sup>.
2. Mean depth: 10.4 meters.
3. Maximum depth: 16.5 meters.
4. Volume:  $8.632 \times 10^6$  m<sup>3</sup>.
5. Mean hydraulic retention time: 115 days.

### B. Tributary and Outlet: (See Appendix C for flow data)

#### 1. Tributaries -

<u>Name</u>	<u>Drainage area (km<sup>2</sup>)*</u>	<u>Mean flow (m<sup>3</sup>/sec)*</u>
Little Elkhart Creek	82.1	0.78
Unnamed Stream C-1	3.4	0.03
Minor tributaries & immediate drainage -	<u>7.2</u>	<u>0.06</u>
Totals	92.7	0.87

#### 2. Outlet -

Westler Lake inlet	93.5**	0.87**
--------------------	--------	--------

### C. Precipitation\*\*\*:

1. Year of sampling: 111.6 centimeters.
2. Mean annual: 91.3 centimeters.

<sup>†</sup> Table of metric conversions--Appendix B.

<sup>††</sup> Winters, 1975.

\*\* Includes area of lake; outflow adjusted to equal sum of inflows.

\*\*\* See Working Paper No. 175.

### III. LAKE WATER QUALITY SUMMARY

Witmer Lake was sampled three times during the open-water season of 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at two stations on the lake (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 11.6 meters at station 1 and 14.9 meters at station 2.

The sampling results are presented in full in Appendix D and are summarized in the following table.

A. SUMMARY OF PHYSICAL AND CHEMICAL CHARACTERISTICS FOR WITMER LAKE

## 1. Autoclaved, filtered, and nutrient spiked -

<u>Spike (<math>\text{mg/l}</math>)</u>	<u>Ortho P Conc. (<math>\text{mg/l}</math>)</u>	<u>Inorganic N Conc. (<math>\text{mg/l}</math>)</u>	<u>Maximum yield (<math>\text{mg/l-dry wt.}</math>)</u>
Control	0.015	0.554	5.2
0.050 P	0.065	0.554	11.5
0.050 P + 1.0 N	0.065	1.554	17.9
1.0 N	0.015	1.554	5.0

\* The May phytoplankton sample was lost in shipment.

## 2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Witmer Lake was high at the time the assay sample was collected (05/03/73). The results also indicate that the lake was phosphorus limited. Note the lack of increase in the yield when only nitrogen was added; but, when orthophosphorus alone was added, the yield was doubled.

The lake data also indicate phosphorus limitation in May (the mean inorganic nitrogen/orthophosphorus ratio was 120/1) but nitrogen limitation in August and October (the mean N/P ratios were 9/1 and 10/1, respectively).

IV. NUTRIENT LOADINGS  
(See Appendix E for data)

For the determination of nutrient loadings, the Indiana National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff months of February and March when two samples were collected. Sampling was begun in June, 1973, and was completed in May, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Indiana District Office of the U.S. Geological Survey for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings\*. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the nutrient loads, in kg/km<sup>2</sup>/year, at station C-1 and multiplying by the ZZ area in km<sup>2</sup>.

The operator of the Wolcottville wastewater treatment plant provided monthly effluent samples and corresponding flow data.

Note that the estimated septic tank phosphorus loading was reduced by 50% to adjust for the Indiana phosphate detergent ban instituted in January, 1972.

## 2. Outputs -

Lake outlet - Westler Lake inlet 53,730

## 3. Net annual N accumulation - 12,380 kg.

## D. Mean Annual Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km<sup>2</sup>/yr</u>	<u>kg N/km<sup>2</sup>/yr</u>
Little Elkhart Creek	24	722
Unnamed Stream C-1	6	381

\* Estimate based on 110 lakeshore dwellings; see Working Paper No. 175.

\*\* See Working Paper No. 175.

E. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m <sup>2</sup> /yr	2.73	0.89	79.7	14.9

Vollenweider phosphorus loadings  
(g/m<sup>2</sup>/yr) based on mean depth and mean  
hydraulic retention time of Witmer Lake:

"Dangerous" (eutrophic loading)	1.12
"Permissible" (oligotrophic loading)	0.56

## **APPENDIX B**

### **CONVERSION FACTORS**

## CONVERSION FACTORS

Hectares x 2.471 = acres

Kilometers x 0.6214 = miles

Meters x 3.281 = feet

Cubic meters x  $8.107 \times 10^{-4}$  = acre/feet

Square kilometers x 0.3861 = square miles

Cubic meters/sec x 35.315 = cubic feet/sec

Centimeters x 0.3937 = inches

Kilograms x 2.205 = pounds

Kilograms/square kilometer x 5.711 = lbs/square mile

**APPENDIX C**

**TRIBUTARY FLOW DATA**

## TRIBUTARY FLOW INFORMATION FOR INDIANA
