FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGEMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Kentucky Department for Natural Resources and Environmental Protection for professional involvement, to the Kentucky National Guard for conducting the tributary sampling phase of the Survey, and to those Kentucky wastewater treatment plant operators who voluntarily provided effluent samples.

Harold Snodgrass, former Director, and Mercer M. Peters of the Division of Water Quality provided invaluable lake documentation and counsel during the Survey; and the staff of the Division reviewed the preliminary reports and provided critiques most useful in the preparation of this Working Paper series.

Major General Richard L. Frymire, the Adjutant General of Kentucky, and Project Officers Lt. Colonel Thomas Buyher, Jr., and Lt. Colonel David B. May, who directed the volunteer efforts of the Kentucky National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

CUMBERLAND LAKE

STORET NO. 2101

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Cumberland Lake is mesotrophic; i.e., moderately supplied with nutrients and moderately productive. Whether nutrient enrichment is beneficial or deleterious depends on the actual or potential effect on the uses of the lake. In this regard, personnel of the Kentucky Department for Natural Resources and Environmental Protection have indicated there is no known impairment of the beneficial uses of Cumberland Lake.

This water body ranked second in overall trophic quality when the five Kentucky reservoirs sampled in 1973 were compared using a combination of six parameters*. One of the reservoirs had less median total phosphorus, two had less median dissolved phosphorus, one had less median inorganic nitrogen, one had less mean chlorophyll a, and one had greater mean Secchi disc transparency. Marked depression of dissolved oxygen with depth occurred at six of the seven sampling stations in October.

Survey limnologists did not observe macrophytes or surface concentrations of algae during any of the sampling visits; and in a summary report (Anonymous, 1976), it is concluded that this is a mesotrophic reservoir of high water quality which provides a fine sport fishery.

* See Appendix A.

B. Rate-Limiting Nutrient:

The algal assay results indicate the lake was phosphorus limited at the time the samples were collected (05/29/73). The lake data also indicate phosphorus limitation; at all sampling times the mean inorganic nitrogen to orthophosphorus ratios were greater than 30 to 1, and phosphorus limitation would be expected.

C. Nutrient Controllability:

1. Point sources--The phosphorus contributions of the listed point sources accounted for less than 5% of the total input to Cumberland Lake. Somerset contributed 3.1%; Monticello, 1.2%; Russell Springs, 0.5%; and Williamsburg, 0.1%. However, the phosphorus export rates of the Cumberland River and Beaver Creek, were significantly higher than the rates of the other tributaries (see page 15). For the Cumberland River, it is likely that point sources beyond the 40-kilometer limit of the Survey* contributed to the phosphorus inputs to Cumberland Lake.

The phosphorus loading of 1.96 g/m² measured during the sampling year is over 1.6 times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 16). For this reason, all phosphorus inputs to the reservoir should be minimized to the greatest possible extent to slow the trend toward a eutrophic condition.

2. Non-point sources--The phosphorus load from non-point sources accounted for over 95% of the total reaching Cumberland Lake. About 50% of the phosphorus input can be attributed to the

* See Working Paper No. 175, "...Survey Methods, 1973-1976".

Cumberland River after accounting for the point-source load from the town of Williamsburg. As discussed above, part of the phosphorus load of the Cumberland River may be due to distant point sources rather than non-point source contributions.

Beaver Creek had an apparent phosphorus export rate of 71 kg/km²/yr, which is also much higher than would be expected from non-point sources and could have resulted from an underestimation of the contribution of the Monticello waste treatment facility or to unidentified point sources in that drainage basin.

Among the other tributaries, substantial phosphorus contributions came from the South Fork of the Cumberland River (12.9%) and Rockcastle Creek (10.2%). The 17 additional listed tributaries collectively contributed 15.9% of the total. The ungaged tributaries contributed an estimated 5.3% of the total phosphorus input to the lake.

II. LAKE AND DRAINAGE BASIN CHARACTERISTICS[†]

A. Morphometry^{††}:

1. Surface area: 203.36 kilometers².
2. Mean depth: 24.2 meters.
3. Maximum depth: >56.7 meters.
4. Volume: $4,927.800 \times 10^6$ m³.
5. Mean hydraulic retention time: 226 days.

B. Tributary and Outlet: (See Appendix C for flow data)

III. WATER QUALITY SUMMARY

Cumberland Lake was sampled three times in 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from seven stations on the lake and from a number of depths at each station (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first visit, two 18.9-liter depth-integrated samples were composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 56.7 meters at station 1, 44.2 meters at station 2, 30.5 meters at station 3, 39.6 meters at station 4, 40.2 meters at station 5, 36.3 meters at station 6, and 25.6 meters at station 7.

The sampling results are presented in full in Appendix D and are summarized in the following table.

0.050 P	0.074	0.296	4.4
0.050 P + 1.0 N	0.074	1.296	16.7
1.0 N	0.024	1.296	0.1

2. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate the potential primary productivity of Cumberland Reservoir was low at the time the samples were collected (05/29/73). In both assays, the significant increases in yield with the addition of phosphorus alone indicate phosphorus limitation. Note that in neither assay did the addition of nitrogen alone result in an increase in

yield.

The lake data also indicate phosphorus limitation. The mean inorganic nitrogen to orthophosphorus ratios were 32 to 1 or greater at all sampling times.

IV. NUTRIENT LOADINGS
(See Appendix E for data)

For the determination of nutrient loadings, the Kentucky National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the months of May, 1973, and January and February, 1974, when two samples were collected at most of the sites. Sampling was begun in March, 1973, and was completed in March, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Kentucky District Office of the U.S. Geological Survey for the tributary sites nearest the lake.

Except for Sinking Creek (M-1), nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings*. Nutrient loads shown are those measured minus point-source loads, if any.

The nutrient loads measured at the Somerset wastewater treatment plant exceeded the loads measured in Sinking Creek at station M-1; the nutrient loads for this stream and the unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the means of the nutrient exports, in kg/km²/year, at stations B-1, C-1, D-1, F-1, H-1, J-1, K-1, L-1, N-1, P-1, Q-1, R-1, S-1, T-1, U-1, and V-1 and multiplying the means by the M-1 and ZZ areas in km².

The operators of the Monticello, Williamsburg, and Somerset waste-

* See Working Paper No. 175.

water treatment plants provided monthly effluent samples and corresponding flow data. The operator of the Russell Springs treatment plant did not participate in the sampling program, and nutrient loads were estimated at 1.134 kg P and 3.401 kg N/capita/year.

A. Waste Sources:

South Fork, Cumberland River	18	353
Little S. Fk., Cumberland River	8	225
Sinking Creek (V-1)	8	203

E. Yearly Loadings:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m ² /yr	1.96	0.76	49.4	13.8

Vollenweider phosphorus loadings
(g/m²/yr) based on mean depth and mean
hydraulic retention time of Cumberland Reservoir:

"Dangerous" (eutrophic loading)	1.20
"Permissible" (oligotrophic loading)	0.60
