FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point source discharge reduction and nonpoint source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin

planning [§ 303(e)], water quality criteria/standards review [§ 303(c)], clean lakes [§ 314(a,b)], and water quality monitoring [§ 106 and § 305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's freshwater lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENTS

The staff of the National Eutrophication Survey (Office of Research and Development, U.S. Environmental Protection Agency) expresses sincere appreciation to the Maryland Department of Natural Resources and the Maryland Department of Health and Mental Hygiene for professional involvement and to the Maryland National Guard for conducting the tributary sampling phase of the Survey.

Paul W. Slunt, Chief, Water Quality Services, James T. Allison, Natural Resources Manager, Water Quality Services, of the Maryland Department of Natural Resources, and Earl S. Quance, Chief, Division of Water and Sewerage, Maryland Department of Health and Mental Hygiene provided invaluable lake documentation and counsel during the course of the Survey.

Major General Edwin Warfield III, the Adjutant General of Maryland, and Project Officer Colonel Bernard Feingold, who directed the volunteer efforts of the Maryland National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

I. CONCLUSIONS

A. Trophic Condition\*:

Loch Raven Reservoir is classified as eutrophic based upon survey data. Chlorophyll a levels and potential for primary productivity as measured by algal assay control yields were moderate, and oxygen depletion occurred below 6.1 meters during July and October. Nutrient concentrations were low, and Secchi disc visibility ranged from a low of 0.5 meters in the spring to a high of 3.0 meters in the fall. Survey limnologists did not report any nuisance conditions; however, past studies (State of Maryland, 1970; Jansson and Rudich, 1973) have reported algal blooms, suds from dairy farm detergent usage and other problem conditions in tributaries impacting the reservoir.

B. Rate-Limiting Nutrient:

Algal assay results indicate that Loch Raven Reservoir was limited by available phosphorus levels. Spikes with phosphorus, and nitrogen and phosphorus simultaneously result in increases in assay yield. Additions of nitrogen alone did not stimulate a growth response. The ratio of available nitrogen to phosphorus in sampled waters substantiates phosphorus limitation.

\* See Appendix E

C. Nutrient Controllability:

1. Point Sources -

The mean annual phosphorus load from point sources was estimated to be 28.7% of the total load reaching Loch Raven Reservoir. The city of Manchester contributed a total of 15.1% from two wastewater treatment plants, and the city of Hampstead contributed 13.6%.

The present loading rate of  $1.45 \text{ g/m}^2/\text{yr}$  is less than that proposed by Vollenweider (in press) as "dangerous" (eutrophic) for a lake of such volume and detention time, but greater than the "permissible" (oligotrophic) rate. Total elimination of the known point sources impacting the reservoir would lower annual loading to the "permissible" rate.

2. Nonpoint Sources -

The mean annual phosphorus load from nonpoint sources was about 71.3% of the total reaching the lake. Measured tributaries accounted for 64.9% of the total impacting the lake, and ungaged tributaries accounted for 6.4%.

Numerous recommendations were made (State of Maryland, 1970) by State officials to assure the continuation of existing water quality in Loch Raven Reservoir. Included in these recommendations are a proposal for an intensive sanitary survey of all communities in the reservoir watershed which are without public sewerage facilities, and a suggestion

to amend the State Sediment Control Act to include agricultural land management practices. At this time, it is not known what action has been taken on these recommendations.

## II. LAKE AND DRAINAGE BASIN CHARACTERISTICS

Lake and drainage basin characteristics are itemized below.

Lake morphometry was provided by the State of Maryland; tributary data were provided by the Maryland District Office of the U.S. Geological Survey (USGS) (outlet drainage area includes the lake surface area). Mean hydraulic retention time was obtained by dividing the lake volume by mean flow of the outlet. The outlet data for normalized flow and daily and monthly flows for time of sampling were divided into spillage and diversion segments.

The spillage and diversions were combined to determine total outflow.

Tributary drainage areas plus the lake surface area do not equal the outlet drainage area (probably) because of differences in pool elevation used by the different sources in their calculations. Precipitation values are estimated by methods as outlined in National Eutrophication Survey (NES) Working Paper No. 175. A table of metric/English conversions is included as Appendix D.

### A. Lake Morphometry:

1. Surface area: 7.67 km<sup>2</sup>.
2. Mean depth: 15.2 meters.
3. Maximum depth: 21.3 meters.
4. Volume: 116.569 x 10<sup>6</sup> m<sup>3</sup>.
5. Mean hydraulic retention time: 146 days.

B. Tributary and Outlet:  
 (See Appendix A for flow data)

1. Tributaries -

C. Precipitation:

1. Year of sampling: 105.4 centimeters.
2. Mean annual: 139.7 centimeters.

### III. LAKE WATER QUALITY SUMMARY

Loch Raven Reservoir was sampled three times during the open-water season of 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from three stations on the lake and from a number of depths at each station (see map, page v). During each visit, depth-integrated samples were collected from each station for chlorophyll a analysis and phytoplankton identification and enumeration. During the first visit, 18.9-liter depth-integrated samples were composited for algal assays. Maximum depths sampled were 21.6 meters at Station 1, 18.0 meters at Station 2, and 14.0 meters at Station 3. For a more detailed explanation of NES methods, see NES Working Paper No. 175.

The results obtained are presented in full in Appendix B and are summarized in III A for waters at the surface and at the maximum depth for each site. Results of the phytoplankton counts and chlorophyll a determinations are included in III B. Results of the limiting study are presented in III C.

## 2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential for primary production in Loch Raven Reservoir was moderately high at the time of sampling. The increase in yield with the addition of phosphorus indicates phosphorus limitation.

Spikes of nitrogen alone produced no positive growth response. Maximum growth potential was achieved with the simultaneous addition of both phosphorus and nitrogen.

The ratio of inorganic nitrogen to dissolved phosphorus was about 207:1 in the field samples for Loch Raven Reservoir, indicating the lake was phosphorus limited at the time of assay sample collection.

IV. NUTRIENT LOADINGS  
(See Appendix C for data)

For the determination of nutrient loadings, the Maryland National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff month of March when three samples were collected. Sampling was begun in May 1973, and was completed in May 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Maryland District Office of the USGS for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were determined by using a modification of the USGS computer program for calculating stream loadings. Nutrient loads indicated for tributaries are those measured minus known point source loads, if any.

Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of USGS) were estimated by using the mean annual concentrations in Beaverdam Run, Greene Branch, Dulaney Valley Branch, Fitzhugh Run, Unnamed Stream, and Spring Branch at Station B(1), D(1), F(1), G(1), H(1), J(1), and mean annual ZZ flow.

The operators of Hampstead, Manchester, and Dutterer's wastewater treatment plants provided monthly effluent samples and corresponding flow data.

## E. Yearly Loading Rates:

In the following table, the existing phosphorus loading rates are compared to those proposed by Vollenweider (in press). Essentially, his "dangerous" rate is the rate at which the receiving waters would become eutrophic or remain eutrophic; his "permissible" rate is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphology permitted. A mesotrophic rate would be considered one between "dangerous" and "permissible".

---

| Total Yearly<br>Phosphorus Loading Rate<br><u>(grams/m<sup>2</sup>/year)</u> |
|------------------------------------------------------------------------------|
|------------------------------------------------------------------------------|

|                                                   |      |
|---------------------------------------------------|------|
| Estimated loading rate for Loch Raven Reservoir   | 1.45 |
| Vollenweider's "dangerous" or eutrophic rate      | 2.10 |
| Vollenweider's "permissible" or oligotrophic rate | 1.05 |

## **APPENDIX D**

### **CONVERSION FACTORS**

## CONVERSION FACTORS

Hectares x 2.471 = acres

Kilometers x 0.6214 = miles

Meters x 3.281 = feet

Cubic meters x  $8.107 \times 10^{-4}$  = acre/feet

Square kilometers x 0.3861 = square miles

Cubic meters/sec x 35.315 = cubic feet/sec

Centimeters x 0.3937 = inches

Kilograms x 2.205 = pounds

Kilograms/square kilometer x 5.711 = lbs/square mile

**APPENDIX E**

**PARAMETRIC RANKINGS OF LAKES**

**SAMPLED BY NES IN 1973**

**STATE OF MARYLAND**

LAKES RANKED BY INDEX NOS.

| RANK | LAKE CODE | LAKE NAME            | INDEX NO |
|------|-----------|----------------------|----------|
| 1    | 2402      | DEEP CREEK LAKE      | 550      |
| 2    | 2403      | LIBERTY RESERVOIR    | 268      |
