## F O R E W O R D

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's freshwater lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Iowa Department of Environmental Quality for professional involvement, to the Iowa National Guard for conducting the tributary sampling phase of the Survey, and to those wastewater treatment plant operators who voluntarily provided effluent samples and flow data.

The staff of the Water Quality Division of the Department of Environmental Quality provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

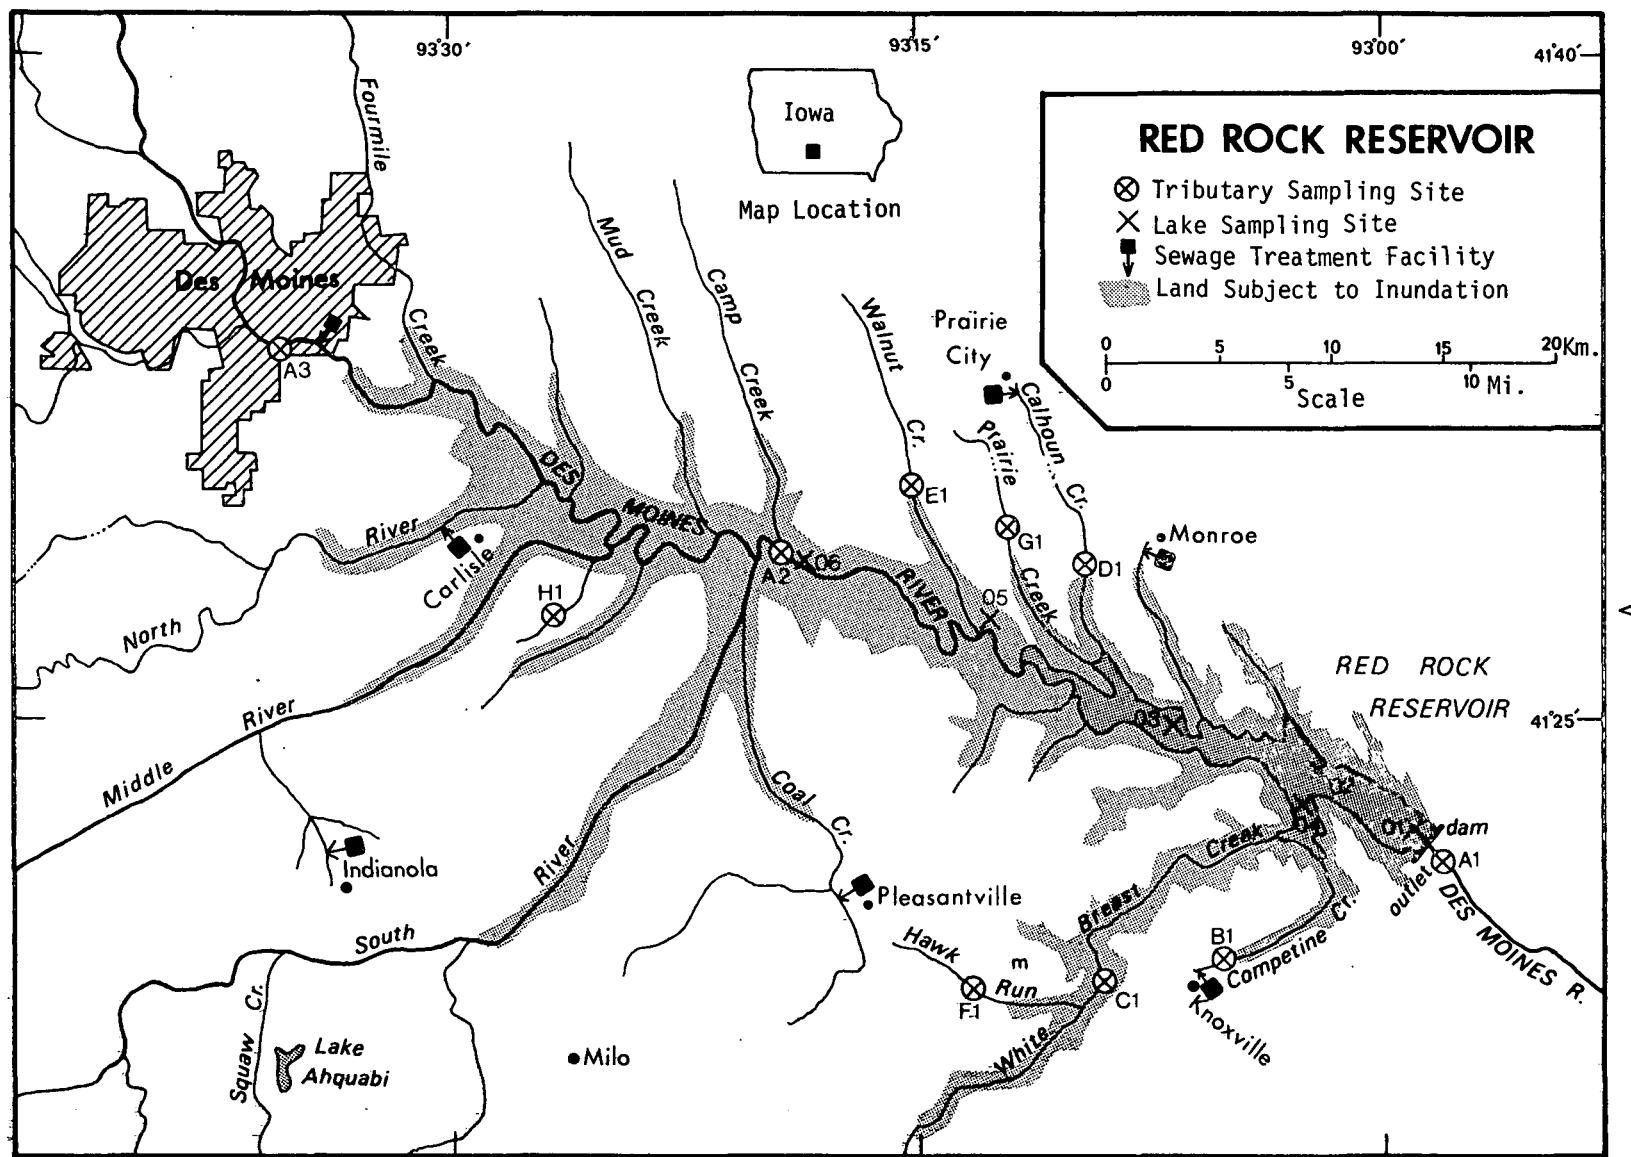

Major General Joseph G. May, the Adjutant General of Iowa, and Project Officer Colonel Cleadeth P. Woods, who directed the volunteer efforts of the Iowa National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

RED ROCK RESERVOIR

STORET NO. 1910

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Red Rock Reservoir is eutrophic. It ranked thirteenth in overall trophic quality when the 15 Iowa lakes and reservoirs sampled in 1974 were compared using a combination of six parameters\*. Twelve of the water bodies had less median total phosphorus, all of the others had less median dissolved phosphorus, 12 had less median inorganic nitrogen, five had less mean chlorophyll a, and nine had greater mean Secchi disc transparency. Marked depression of dissolved oxygen with depth occurred at stations 1, 3, and 5 in July.

B. Rate-Limiting Nutrient:

The algal assay results indicate the reservoir was phosphorus limited at the time the sample was collected (04/18/74). The reservoir data indicate phosphorus limitation in September also.

C. Nutrient Controllability:

1. Point sources--The phosphorus contribution of known point sources accounted for about 17% of the total load reaching Red Rock Reservoir during the sampling year. Almost all of the point-source load came from the Des Moines wastewater treatment plant (16.4% of the total).

---

\* See Appendix A.

The present phosphorus loading of 68.95 g/m<sup>2</sup>/yr is more than 35 times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 14). However, Vollenweider's model probably is not applicable to water bodies with short hydraulic retention times, and the mean hydraulic retention time of Red Rock Reservoir is only 10 days. Nonetheless, the existing trophic condition of the reservoir is evidence of excessive nutrient loads.

On the basis of Survey data, the trophic condition of Red Rock Reservoir will very likely continue to deteriorate if the present loading is maintained. Therefore, all phosphorus inputs should be minimized to the greatest practicable extent to reduce the rate of eutrophication.

2. Non-point sources--Non-point sources accounted for about 83% of the total phosphorus load reaching the reservoir during the sampling year. The Des Moines River contributed over 78% of the total.

The phosphorus export rate of the Des Moines River was 65 kg/km<sup>2</sup>/yr (see page 13). This rate is within the range of other tributaries studied in this area of the state and appears to be typical of a heavily-cultivated watershed.

Fluctuations in the water level of the reservoir may add to the non-point contributions. In July, 1974, the Survey limnologists reported flooded farmland in the vicinity of Red Rock Reservoir. During the April and September visits, however, lake sampling sites 4, 5, and 6 were dry (see map, page v).

The upper portion of Red Rock Reservoir is a wildlife refuge, and ducks and geese utilize the area during spring and fall migrations (Harrison, 1976). However, only a few waterfowl counts were made during the Survey sampling year (Bishop, 1976), and an assessment of the nutrient contributions of migrating ducks and geese cannot be made.

## II. LAKE AND DRAINAGE BASIN CHARACTERISTICS<sup>†</sup>

### A. Lake Morphometry<sup>††</sup>:

1. Surface area: 36.22 kilometers<sup>2</sup>.
2. Mean depth: 3.0 meters.
3. Maximum depth: 10.7 meters.
4. Volume:  $108.660 \times 10^6$  m<sup>3</sup>.
5. Mean hydraulic retention time: 10 days.

### B. Tributary and Outlet: (See Appendix C for flow data)

#### 1. Tributaries -

<u>Name</u>	<u>Drainage area (km<sup>2</sup>)*</u>	<u>Mean flow (m<sup>3</sup>/sec)*</u>
Des Moines River	30,186.4	114.46
White Breast Creek	984.2	5.51
Calhoun Creek	58.8	0.33
Minor tributaries & immediate drainage -	<u>651.0</u>	<u>3.84</u>
Totals	31,880.4	124.14

#### 2. Outlet -

Des Moines River	31,916.6**	121.04
------------------	------------	--------

### C. Precipitation\*\*\*:

1. Year of sampling: 70.7 centimeters.
2. Mean annual: 82.7 centimeters.

<sup>\*\*\*</sup> See Working Paper No. 175.

### III. LAKE WATER QUALITY SUMMARY

Red Rock Reservoir was sampled three times during the open-water season of 1974 by means of a pontoon-equipped Huey helicopter. Samples for physical and chemical parameters were collected from a number of depths at two stations on the reservoir in April, five stations in July, and three stations in September (see map, page v). During each visit, a single depth-integrated (4.6 m or near bottom to surface) sample was composited from the sampled stations for phytoplankton identification and enumeration; and during the April visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the sampled stations for chlorophyll a analysis. The maximum depths sampled were 18.9 meters at station 1, 6.4 meters at station 2, 13.7 meters at station 3, 9.8 meters at station 4, 13.1 meters at station 5, and 4.6 meters at station 6.

The sampling results are presented in full in Appendix D and are summarized in the following table (the July nutrient samples were not preserved properly and were not analyzed).

## C. Limiting Nutrient Study:

## 1. Autoclaved, filtered, and nutrient spiked -

<u>Spike (mg/l)</u>	<u>Ortho P Conc. (mg/l)</u>	<u>Inorganic N Conc. (mg/l)</u>	<u>Maximum yield (mg/l-dry wt.)</u>
Control	0.060	7.935	2.8
0.050 P	0.110	7.935	20.4
0.050 P + 1.0 N	0.110	8.935	21.9
1.0 N	0.060	8.935	2.0

## 2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Red Rock Reservoir was high at the time the sample was collected in April. The addition of phosphorus alone produced a significant increase in yield, but no such increase occurred when only nitrogen was added. This indicates limitation by phosphorus.

The reservoir data also indicate phosphorus limitation. The mean inorganic nitrogen to orthophosphorus ratios were 18 to 1 or greater in April and September.

IV. NUTRIENT LOADINGS  
(See Appendix E for data)

For the determination of nutrient loadings, the Iowa National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page vi), except for the high runoff months of April and May when two samples were collected.

Sampling was begun in August, 1974, and was completed in July, 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Iowa District Office of the U.S. Geological Survey for the tributary sites nearest the reservoir.

In this report, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings\*. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the means of the nutrient concentrations at stations E-1, F-1, G-1, and H-1 and the mean annual ZZ flow.

The operator of the Des Moines wastewater treatment plant provided monthly effluent samples and corresponding flow data. The operators of the wastewater treatment plants of Carlisle, Des Moines Highland Hills, Indianola, Knoxville, Monroe, Pleasantville, and Prairie City did not participate; nutrient loads from these sources were estimated at 1.134 kg P and 3.401 kg N/capita/year, and flows were estimated at 0.3785 m<sup>3</sup>/capita/day.

\* See Working Paper No. 175.

Competine Creek*	4.244	9.648
Walnut Creek	0.300	7.383
Hawk Run	0.173	4.193
Prairie Creek	0.391	6.889
Butcher Creek	0.185	3.625

\* Sampling site downstream from Knoxville STP.

F. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus Total	Total Phosphorus Accumulated	Total Nitrogen Total	Total Nitrogen Accumulated
grams/m <sup>2</sup> /yr	68.96	41.94	830.0	211.7

Vollenweider phosphorus loadings  
(g/m<sup>2</sup>/yr) based on mean depth and mean  
hydraulic retention time of Red Rock Reservoir:

"Dangerous" (eutrophic loading)	1.94
"Permissible" (oligotrophic loading)	0.97

## APPENDIX B

### CONVERSION FACTORS

## CONVERSION FACTORS

Hectares x 2.471 = acres

Kilometers x 0.6214 = miles

Meters x 3.281 = feet

Cubic meters x  $8.107 \times 10^{-4}$  = acre/feet

Square kilometers x 0.3861 = square miles

Cubic meters/sec x 35.315 = cubic feet/sec

Centimeters x 0.3937 = inches

Kilograms x 2.205 = pounds

Kilograms/square kilometer x 5.711 = lbs/square mile

## APPENDIX C

### TRIBUTARY FLOW DATA
