FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's freshwater lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Kansas State Department of Health and Environment for professional involvement, to the Kansas National Guard for conducting the tributary sampling phase of the Survey, and to those Kansas wastewater treatment plant operators who voluntarily provided effluent samples and flow data.

The staff of the Kansas Division of Environmental Health provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Edward R. Fry, the Adjutant General of Kansas, and Project Officer Colonel Albin L. Lundquist, who directed the volunteer efforts of the Kansas National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

WILSON RESERVOIR

STORET NO. 2015

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Wilson Reservoir is mesotrophic. It ranked second in overall trophic quality among the 15 Kansas reservoirs sampled in 1974 when compared using a combination of six water quality parameters*. One of the reservoirs had less median total phosphorus, one had less and one had the same median dissolved orthophosphorus, two had less and one had the same median inorganic nitrogen, six had less mean chlorophyll a, and none of the other reservoirs had greater mean Secchi disc transparency. Depression of dissolved oxygen with depth occurred at sampling stations 2 and 3 in June.

Survey limnologists did not observe macrophytes or surface concentrations of algae during sampling visits.

B. Rate-Limiting Nutrient:

The algal assay results indicate that Wilson Reservoir was phosphorus limited at the time the sample was collected (04/12/74). The reservoir data indicate phosphorus limitation at all sampling stations and times.

* See Appendix A.

C. Nutrient Controllability:

1. Point Sources--During the sampling year, the listed point sources accounted for an estimated 22.1% of the total phosphorus input to Wilson Reservoir. The wastewater treatment plant at Plainville contributed 16.7%, the plant at Natomas contributed 3.9%, and the plant at Bunker Hill contributed 1.6% of the total.

The present phosphorus loading of 0.47 g/m²/year is nearly 1.4 times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 13). Continuation of this loading may increase primary productivity and eventually cause the reservoir to become eutrophic. Because the water-body is phosphorus limited, point-source phosphorus should be reduced to the greatest practicable extent to at least slow the present rate of enrichment.

2. Non-point sources--Non-point sources contributed 77.8% of the total phosphorus load during the sampling year. The Saline River contributed 62.7%, Cedar Creek contributed 0.7%, and Paradise Creek contributed 0.3%. The ungaged minor tributaries and immediate drainage contributed an estimated 10.4%.

The phosphorus export rates of the three tributaries were quite low (3 kg/km²/yr and less; see page 12).

II. RESERVOIR AND DRAINAGE BASIN CHARACTERISTICS[†]

A. Morphometry^{††}:

1. Surface area: 36.42 kilometers².
2. Mean depth: 8.4 meters.
3. Maximum depth: >16.8 meters.
4. Volume: $305.908 \times 10^6 \text{ m}^3$.
5. Mean hydraulic retention time: 2.8 years (based on outflow).

B. Tributary and Outlet:

(See Appendix C for flow data)

1. Tributaries -

<u>Name</u>	<u>Drainage area (km²)*</u>	<u>Mean flow (m³/sec)*</u>
Saline River	3,890.2	3.440
Cedar Creek	71.0	0.074
Paradise Creek	595.7	0.600
Minor tributaries & immediate drainage -	<u>371.7</u>	<u>1.030</u>
Totals	4,928.6	5.144

2. Outlet -

Saline River	4,965.0**	3.490
--------------	-----------	-------

C. Precipitation***:

1. Year of sampling: 40.7 centimeters.
2. Mean annual: 68.0 centimeters.

III. WATER QUALITY SUMMARY

Wilson Reservoir was sampled three times during the open-water season of 1974 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at three stations on the reservoir (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 16.8 meters at station 1, 15.2 meters at station 2, and 12.2 meters at station 3.

The sampling results are presented in full in Appendix D and are summarized in the following table (the June nutrient samples were not preserved properly and were not analyzed).

	3	17.5

C. Limiting Nutrient Study:

1. Autoclaved, filtered, and nutrient spiked -

<u>Spike (mg/l)</u>	<u>Ortho P Conc. (mg/l)</u>	<u>Inorganic N Conc. (mg/l)</u>	<u>Maximum yield (mg/l-dry wt.)</u>
Control	<0.005	0.285	0.1
0.050 P	<0.055	0.285	6.8
0.050 P + 1.0 N	<0.055	1.285	14.1
1.0 N	<0.005	1.285	0.1

2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Wilson Reservoir was low at the time the sample was collected (04/12/74). Also, the increase in yield with the addition of phosphorus alone indicates that the reservoir was phosphorus limited at that time. Note that the addition

of nitrogen alone resulted in a yield no greater than that of the control.

The reservoir data indicate phosphorus limitation as well. The mean inorganic nitrogen/orthophosphorus ratios were 30/1 or greater at all sampling stations and times, and phosphorus limitation would be expected.

IV. NUTRIENT LOADINGS
(See Appendix E for data)

For the determination of nutrient loadings, the Kansas National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the months of May, June, and July when two samples were collected. Sampling was begun in October, 1974, and was completed in September, 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Kansas District Office of the U.S. Geological Survey for the tributary sites nearest the reservoir.

In this report, nutrient loads for sampled tributaries were calculated using mean annual concentrations and mean annual flows. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the mean concentrations in Cedar Creek at station B-1 and the mean annual ZZ flow.

The operator of the Plainville wastewater treatment plant provided monthly effluent samples; however, flows appear to be estimates. The operator of the Natona wastewater treatment plant also provided monthly samples but flows were not available. Therefore, nutrient loads from these sources and those from the wastewater treatment plant

at Bunker Hill, which was not sampled, were estimated at 1.134 kg P and 3.401 kg N/capita/year; and flows were estimated at 0.3785 m³/capita/day.

A. Waste Sources:

1. Known municipal* -

<u>Name</u>	<u>Pop. Served</u>	<u>Treatment</u>	<u>Mean Flow (m³/d)</u>	<u>Receiving Water</u>
Plainville	2,518	tr. filter	953.1	Trib. of Para-dise Creek
Natoma	590	tr. filter	223.3	Paradise Creek
Bunker Hill	240	stab. pond	90.8	Unnamed Trib./Wilson Reservoir

2. Known industrial - None

* Treatment plant questionnaires; Anonymous, 1971.

B. Annual Total Phosphorus Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg P/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Saline River	10,740	62.7
Cedar Creek	130	0.7
Paradise Creek	50	0.3

f. Direct precipitation* -	<u>635</u>	<u>3.7</u>
Total	17,135	100.0

2. Outputs -

Lake outlet - Saline River 5,065

3. Net annual P accumulation - 12,070 kg.

* See Working Paper No. 175.

C. Annual Total Nitrogen Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg N/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Saline River	134,305	46.3
Cedar Creek	4,950	1.7
Paradise Creek	31,190	10.7
b. Minor tributaries & immediate drainage (non-point load) -	68,895	23.7
c. Known municipal STP's -		
Bunker Hill	815	0.3
Natomas	2,005	0.7
Plainville	8,565	3.0
d. Septic tanks - Unknown	?	-
e. Known industrial - None	-	-
f. Direct precipitation* -	<u>39,320</u>	<u>13.6</u>
Total	290,045	100.0

2. Outputs -

Lake outlet - Saline River 160,140

3. Net annual N accumulation - 129,905 kg.

D. Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km²/yr</u>	<u>kg N/km²/yr</u>
Saline River	3	35
Cedar Creek	2	70
Paradise Creek	<1	52

* See Working Paper No. 175.

E. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus Total	Total Phosphorus Accumulated	Total Nitrogen Total	Total Nitrogen Accumulated
grams/m ² /yr	0.47	0.33	8.0	3.6

Vollenweider phosphorus loadings
(g/m²/yr) based on mean depth and mean
hydraulic retention time of Wilson Reservoir:

"Dangerous" (eutrophic loading)	0.34
"Permissible" (oligotrophic loading)	0.17
