FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point source discharge reduction and nonpoint source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's freshwater lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by the U.S. Environmental Protection Agency and to augment plans implementation by the states.

ACKNOWLEDGMENTS

The staff of the National Eutrophication Survey (Office of Research and Development, U.S. Environmental Protection Agency) expresses sincere appreciation to the Missouri Department of Natural Resources for professional involvement, to the Missouri National Guard for conducting the tributary sampling phase of the Survey, and to those Missouri wastewater treatment plant operators who provided effluent samples and flow data.

The staff of the Missouri Department of Natural Resources, James Wilson, Director; the Division of Environmental Quality, Ken Karch, Director; and the Water Quality Program, James Odendahl, Director, provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports and provided critiques most useful in the preparation of this Working Paper series.

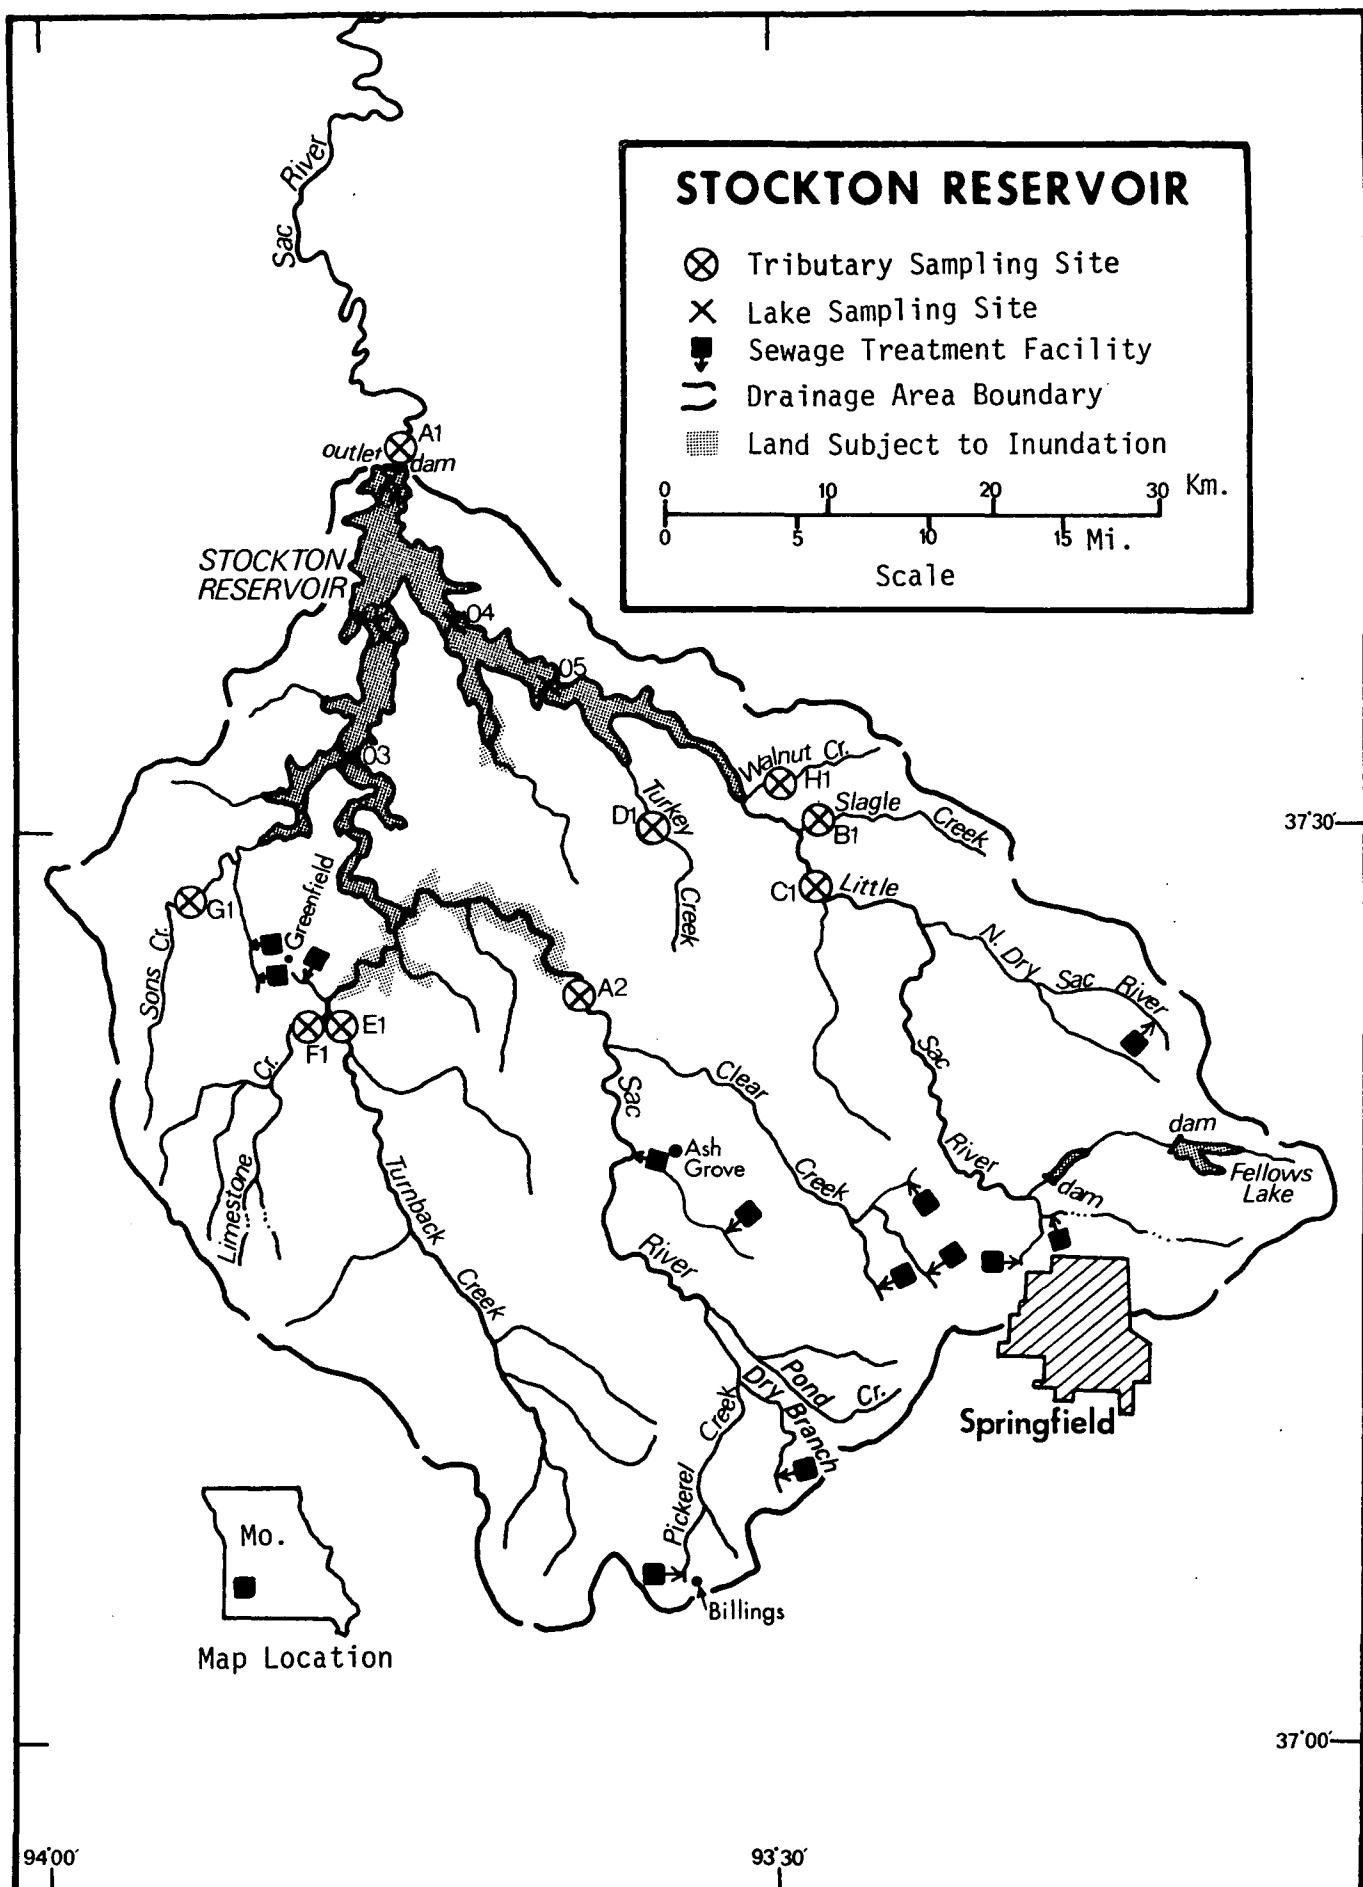

Major General Charles M. Kiefner, the Adjutant General of Missouri, and Project Officer Captain Donald L. Wollen, who directed the volunteer efforts of the Missouri National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

Lake Taneycomo	Taney
Thomas Hill Reservoir	Macon, Randolph
Lake Wappapello	Wayne, Butler

REPORT ON STOCKTON RESERVOIR, MISSOURI

STORET NO. 2903

I. CONCLUSIONS

A. Trophic Condition:*

Based upon field observations and Survey data, Stockton Reservoir is considered early eutrophic. Chlorophyll a values ranged from a low of 1.3 µg/l in the summer to a high of 29.2 µg/l in the spring with a mean of 9.0 µg/l. Low Secchi disc visibility (mean of 180 cm) and low potential for primary productivity as measured by algal assay control yield were reported. There were oxygen depletion and hydrogen sulfide production noted at Stations 03 and 04 during the summer sampling season and at Station 04 during the fall. Of the six Missouri lakes sampled in 1974, four had greater median total phosphorus levels, one had greater median inorganic nitrogen values, and three had greater median dissolved orthophosphorus levels than Stockton Reservoir. It should be noted that although phosphorus levels in the lake were similar throughout the seasons, the spring chlorophyll a values observed were an order of magnitude higher than summer values and approximately 4-5 times those observed in the fall. This same spring phenomenon can be observed in the algal counts for the similar centric diatom-based communities found in the lake all three sampling dates.

*See Appendix E.

Survey limnologists reported no problem conditions in the lake during the sampling year.

B. Rate-Limiting Nutrient:

Algal assay results indicate that Stockton Reservoir was limited by available phosphorus levels. Spikes with phosphorus or nitrogen and phosphorus simultaneously resulted in increased assay yields. Addition of nitrogen alone did not stimulate a growth response. The ratios of available nitrogen to orthophosphorus (N/P) in sampled waters substantiate phosphorus limitation.

C. Nutrient Controllability:

1. Point sources -

Point sources were estimated to contribute 42.0% of the total phosphorus load to Stockton Reservoir during the sampling year. The Springfield Northwest wastewater treatment plant contributed 25.6% of the total load and the city of Ash Grove contributed 7.7%. The remaining 12 plants were estimated to contribute 8.7% of the phosphorus load. There are a number of small private facilities and four industrial plants (Kerr-McGee Chemical Corporation; Conco Quarries, Inc.; Greismer Stone Company; Advanced Circuiting - a Division of Litton Inc.) which are not included in the nutrient budgets for Stockton Reservoir (Missouri Department of Natural Resources, manuscript). It is not known at this time how much these unmeasured sources contributed to nutrient loadings in the reservoir.

The calculated phosphorus loading of $0.49 \text{ g P/m}^2/\text{yr}$ to Stockton Reservoir is twice the loading proposed by Vollenweider (1975) for an oligotrophic lake, and less than Vollenweider's eutrophic loading figure. However, spring chlorophyll a values in the lake ($9.7 - 29.2 \mu\text{g/l}$) as well as excessively high spring algal counts indicate a much higher biological response to existing nutrient levels than would typically be expected. In light of this demonstrated increase in spring lake productivity it would be desirable to substantially reduce phosphorus contributions from known point sources in order to improve lake water quality and decrease the likelihood of problem algal blooms or macrophyte growths in the reservoir.

2. Nonpoint sources -

The total phosphorus load from nonpoint sources accounted for 58.0% of the total load reaching Stockton Reservoir. Measured tributaries contributed 23.2%, while ungaged drainage areas were estimated to have contributed 31.2%.

The phosphorus export rates of the three gaged tributaries to Stockton Reservoir (range of 2 to $13 \text{ kg P/km}^2/\text{yr}$, mean of $7 \text{ kg/km}^2/\text{yr}$) were comparable to the rates of the gaged tributaries surveyed in nearby Pomme de Terre Reservoir* (see Section IV-D).

*Working Paper No. 548

II. LAKE AND DRAINAGE BASIN CHARACTERISTICS

Lake and drainage basin characteristics are itemized below.

Lake morphometric data were provided by the Missouri Clean Water Commission. Tributary flow data were provided by the Missouri District Office of the U.S. Geological Survey (USGS). Outlet drainage area includes the lake surface area. Mean hydraulic retention time was obtained by dividing the lake volume by the mean flow of the outlet. Precipitation values are estimated by methods as outlined in National Eutrophication Survey (NES) Working Paper No. 175. A table of metric/English conversions is included as Appendix A.

A. Lake Morphometry:

1. Surface area: 100.77 km².
2. Mean depth: 7.3 meters.
3. Maximum depth: >30.5 meters.
4. Volume: 735.621×10^6 m³.
5. Mean hydraulic retention time: 386 days (1.06 yrs).

B. Tributary and Outlet:
 (See Appendix B for flow data)

1. Tributaries -

<u>Name</u>	<u>Drainage area(km²)</u>	<u>Mean flow (m³/sec)</u>
A-2 Sac River	587.9	4.39
C-1 Little Sac River	606.1	4.64
E-1 Turnback Creek	525.8	3.88
Minor tributaries and immediate drainage -	<u>1,183.8</u>	<u>9.74</u>
Totals	2,903.6	22.65
2. Outlet - A-1 Sac River	3,004.4	21.97

C. Precipitation:

1. Year of sampling: 110.8 cm.
2. Mean annual: 99.8 cm.

III. LAKE WATER QUALITY SUMMARY

Stockton Reservoir was sampled three times during the open-water season of 1974 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from five stations on the lake and from a number of depths at each station (see map, page v). During each visit, depth-integrated samples were collected from each station for chlorophyll a analysis and phytoplankton identification and enumeration. During the first and last visits, 18.9-liter depth-integrated samples were composited for algal assays. Maximum depths sampled were 30.5 meters at Station 01, 24.4 meters at Station 02, 20.7 meters at Station 03, 22.9 meters at Station 04, and 16.8 meters at Station 05. For a more detailed explanation of NES methods, see NES Working Paper No. 175.

The results obtained are presented in full in Appendix C and are summarized in III-A for waters at the surface and at the maximum depth for each site. Results of the phytoplankton counts and chlorophyll a determinations are included in III-B. Results of the limiting nutrient study are presented in III-C.

0.05 P + 1.0 N	0.055	1.395	5.2
1.00 N	0.005	1.395	0.3

2. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate that the potential for primary production in Stockton Reservoir was low at the times of sampling except at Stations 04 and 05 during the spring, when it was high. Increased growth of the test alga in response to an addition of orthophosphorus indicates that the lake was limited by phosphorus during both the spring and fall. Spikes with nitrogen and orthophosphorus simultaneously generally resulted in maximum yield. Additions of nitrogen alone did not stimulate growth significantly beyond the control yields.

The N/P ratios in the lake samples were 157/1 in the spring, 54/1 in the summer, and 75/1 in the fall, further indicating phosphorus limitation.

IV. NUTRIENT LOADINGS
(See Appendix D for data)

For the determination of nutrient loadings, the Missouri National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff months of May and June when two samples were collected. Sampling was begun in September 1974, and was completed in August 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Missouri District Office of the USGS for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were determined by using a modification of a USGS computer program for calculating stream loadings. Nutrient loads indicated for tributaries are those measured minus known point source loads, if any.

Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of USGS) were estimated by using the mean annual nutrient loads, in kg/km²/yr, in Turnback Creek, at Station E-1, and multiplying the means by the ZZ area in km².

The operators of the Ash Grove, Springfield Northwest, and Greenfield (three plants) wastewater treatment plants provided monthly effluent samples and corresponding flow data. Nutrient loads for the Ash Grove and Willard High Schools were estimated

at 0.567 kg P and 1.701 kg N/Capita/yr (180 days). Nutrient loads for the Republic, Billings, and the remaining small private wastewater treatment plants were estimated at 1.134 kg P and 3.401 kg N/Capita/yr.

A. Waste Sources:

Totals	1,791,210	100.0
2. Output - A-1 Sac River	1,106,085	
3. Net annual N accumulation -	685,125	

*Estimate based on 20 lakeside residences.

**Estimated (see NES Working Paper No. 175).

D. Mean Annual Nonpoint Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km²/yr</u>	<u>kg N/km²/yr</u>
Sac River	2	619
Little Sac River	6	567
Turnback Creek	13	537

E. Mean Nutrient Concentrations in Ungaged Streams:

<u>Tributary</u>	<u>Mean Total P (mg/l)</u>	<u>Mean Total N (mg/l)</u>
B-1 Slagle Creek	0.027	1.090
D-1 Turkey Creek	0.019	0.826
F-1 Limestone Creek	0.034	0.945
G-1 Sons Creek	0.054	1.005
H-1 Walnut Creek	0.026	0.984

Mean phosphorus values in tributary G-1, Sons Creek, are higher than those found in ungaged tributaries to Stockton Reservoir. The reason for this phosphorus inflation is not known.

F. Yearly Loadings:

In the following table, the existing phosphorus annual loading is compared to the relationship proposed by Vollenweider (1975). Essentially, his eutrophic loading is that at which the receiving waters would become eutrophic or remain eutrophic; his oligotrophic loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between eutrophic and oligotrophic.

Note that Vollenweider's model may not apply to lakes with short hydraulic retention times or in which light penetration is severely restricted by high concentrations of suspended solids in the surface waters.

Total Yearly
Phosphorus Loading
(g/m²/yr)

Estimated loading for Stockton Reservoir	0.49
Vollenweider's eutrophic loading	0.52
Vollenweider's oligotrophic loading	0.26
