F O R E W O R D

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentration (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGEMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U.S. Environmental Protection Agency) expresses sincere appreciation to the California State Water Resources Control Board and the nine Regional Water Quality Control Boards for professional involvement, to the California National Guard for conducting the tributary sampling phase of the Survey, and to those California wastewater treatment plant operators who voluntarily provided effluent samples and flow data.

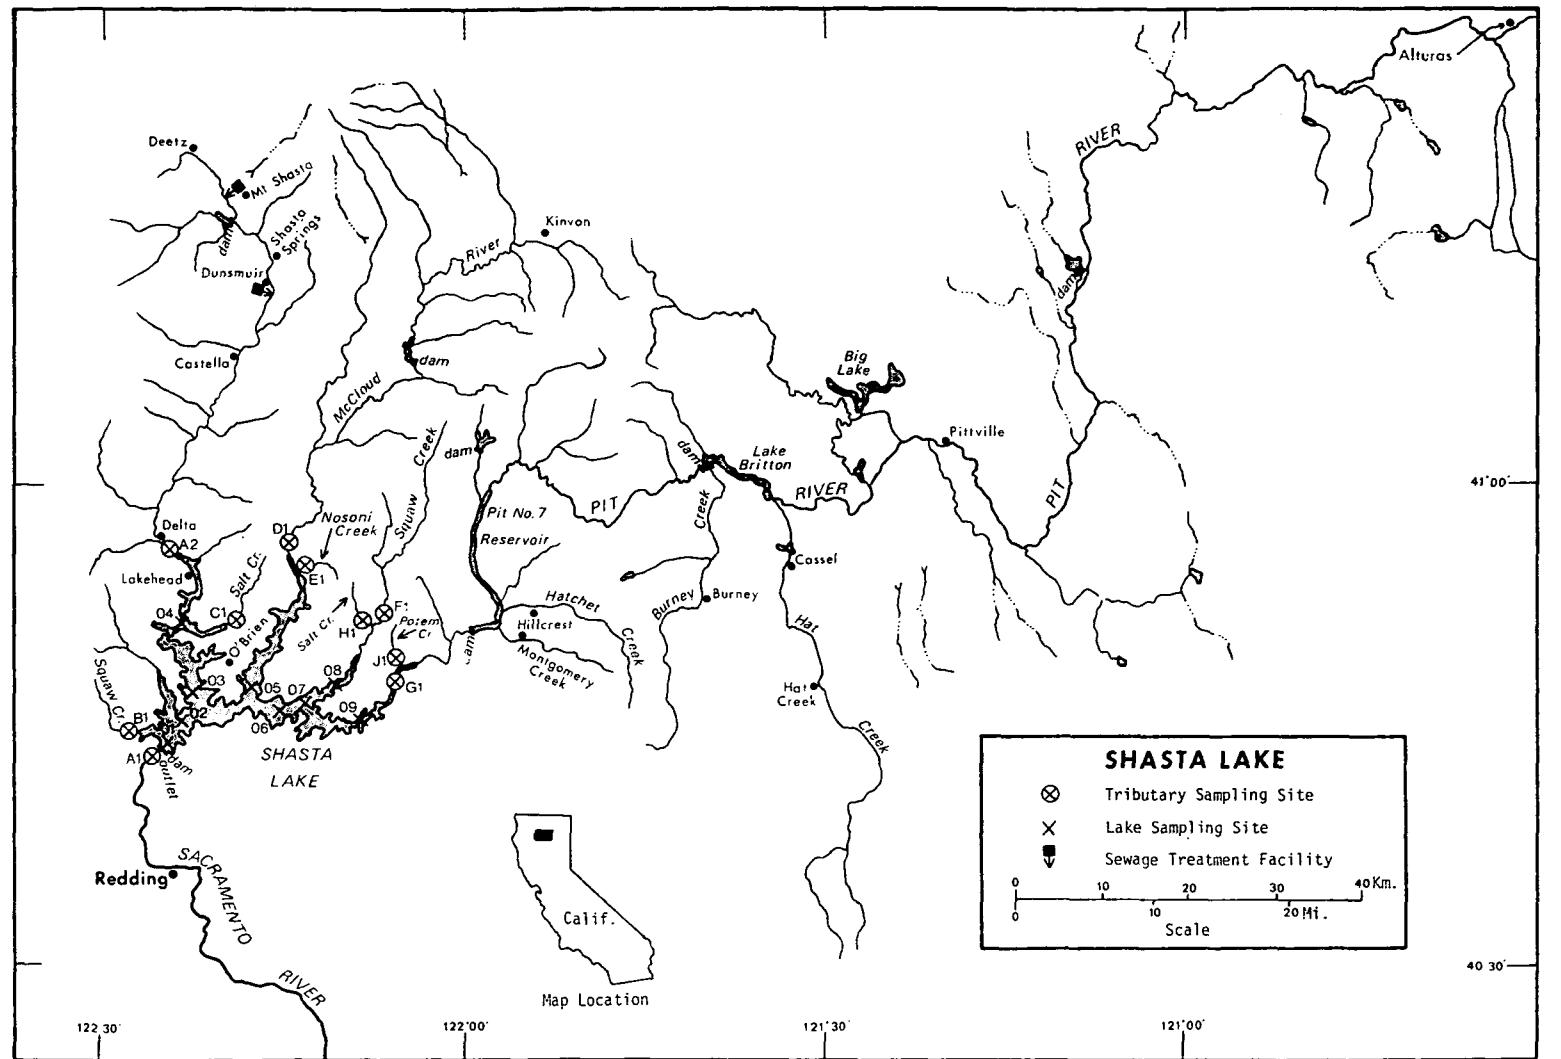

The staff of the Division of Planning and Research of the State Water Resources Control Board provided invaluable lake documentation and counsel during the Survey, coordinated the reviews of the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Glen C. Ames, the Adjutant General of California, and Project Officer Second Lieutenant Terry L. Barrie, who directed the volunteer efforts of the California National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

SHASTA LAKE

STORET NO. 0621

I. CONCLUSIONS

A. Trophic Condition*:

Survey data indicate that Shasta Lake is mesotrophic. It ranked tenth in overall trophic quality when the 24 California lakes and reservoirs sampled in 1975 were compared using a combination of six parameters**. Nine of the water bodies had less median total phosphorus, 16 had less median dissolved orthophosphorus, nine had less and five had the same median inorganic nitrogen, ten had less mean chlorophyll a, and nine had greater mean Secchi disc transparency. No significant depression of dissolved oxygen occurred at depths as great as 82 meters.

Survey limnologists did not observe macrophytes or surface concentrations of algae during sampling visits.

B. Rate-Limiting Nutrient:

The results of the algal assays are not considered representative of conditions in the reservoir because of significant changes in nutrients in the samples during shipment from the field to the laboratory.

The reservoir data indicate nitrogen limitation at all sampling stations and times.

* Trophic assessment is based on levels of nutrients, dissolved oxygen, and chlorophyll a; phytoplankton kinds and numbers; and transparency (Allum et al., 1977).

** See Appendix A.

C. Nutrient Controllability:

1. Point sources--The cities of Dunsmuir and Mt. Shasta respectively contributed 0.7% and 0.6% of the total phosphorus load to the reservoir during the sampling year. Another point source, the City of Alturas, discharges treated wastes at a rate of nearly 1,150 m³/day to the Pit River about 250 km upstream from Shasta Lake (Bailey, 1977; see map, page v). However, because of the distance and two intervening major reservoirs and several smaller hydroelectric dams it does not seem likely that Alturas contributes significant amounts of nutrients to the lake.

The present phosphorus loading of 3.05 g/m²/yr is nearly two times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 13). On the basis of Survey data, it appears the trophic quality of Shasta Lake will deteriorate unless the phosphorus inputs can be reduced.

2. Non-point sources--Non-point sources, including direct precipitation, contributed 98.7% of the total phosphorus load. The Sacramento River added 10.4%; Salt Creek, 0.1%; McCloud River, 4.9%; Squaw Creek, 0.8%; the Pit River, 74.4%; and the ungauged tributaries contributed an estimated 7.5%.

The phosphorus export rates of the Sacramento River, Salt Creek (at C-1), McCloud River, Squaw Creek (at B-1), and the Pit River were 34, 15, 11, 18, and 21 kg/km²/yr, respectively (see page 12). The somewhat higher export rate of the Sacramento River may be due to underestimation of the known point-source loads.

II. RESERVOIR AND DRAINAGE BASIN CHARACTERISTICS[†]

A. Morphometry^{††}:

1. Surface area: 119.40 kilometers².
2. Mean depth: 46.5 meters.
3. Maximum depth: 148.4 meters.
4. Volume: 5,550.705 x 10⁶ m³.
5. Mean hydraulic retention time: 217 days.

B. Tributary and Outlet:

(See Appendix C for flow data)

1. Tributaries -

<u>Name</u>	<u>Drainage area (km²)*</u>	<u>Mean flow (m³/sec)*</u>
Sacramento River	1,100.7	40.950
Salt Creek	35.0	0.854
McCloud River	1,585.1	26.750
Squaw Creek	158.0	6.310
Pit River	12,823.1	172.120
Minor tributaries & immediate drainage -	<u>809.1</u>	<u>48.396</u>
Totals	16,511.0	295.380**

2. Outlet -

Sacramento River	16,630.4**	295.380
------------------	------------	---------

C. Precipitation***:

1. Year of sampling: 94.8 centimeters.
2. Mean annual: 90.2 centimeters.

* For limits of accuracy, see Working Paper No. 175, "...Survey Methods, 1973-1976".

** Includes area of reservoir; sum of inflows adjusted to equal outflow.

*** See Working Paper No. 175.

III. WATER QUALITY SUMMARY

Shasta Lake was sampled three times in 1975 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at seven stations in March, eight stations in July, and nine stations in November (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first and last visits, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 73.2 meters at stations 1, 2, and 3; 42.7 meters at station 4; 70.1 meters at station 5; 82.3 meters at station 6; 49.1 meters at station 7; 56.7 meters at station 8; and 62.8 meters at station 9.

The sampling results are presented in full in Appendix D and are summarized in the following table.

C. Limiting Nutrient Study:

The results of the algal assay are not considered representative of conditions in the reservoir at the times of sampling (03/26/75 and 11/03/75) because of significant nutrient changes in the

in the samples during shipment from the field to the laboratory.

The reservoir data indicate nitrogen limitation at all sampling stations and times. Following is a tabulation of the mean inorganic nitrogen/orthophosphorus ratios for each of the sampling stations and times with the indicated limiting nutrient in parentheses.

<u>Station</u>	<u>03/26/75</u>	<u>07/14/75</u>	<u>11/03/75</u>

9	-	5/1 (N)	3/1 (N)

IV. NUTRIENT LOADINGS
 (See Appendix E for data)

For the determination of nutrient loadings, the California National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff month of May when two samples were collected. Sampling was begun in November, 1974, and was completed in October, 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the California District Office of the U.S. Geological Survey for the tributary sites nearest the reservoir.

In this report, nutrient loads for sampled tributaries were calculated using mean annual concentrations and mean annual flows.

Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the mean concentrations in Nosoni Creek at station E-1 and the mean annual ZZ flow.

The operators of the Dunsmuir and Mt. Shasta wastewater treatment plants provided monthly effluent samples and corresponding flow data; the City of Alturas did not participate but is not considered a significant contributor of nutrients to Lake Shasta (see page 2).

A. Waste Sources:

1. Known municipal -

Name	Pop. Served	Treatment	Mean Flow (m ³ /d)	Receiving Water
Alturas*	3,130	tr. filter	1,135.5	Pit River
Dunsmuir**	2,450	stab. pond	1,732.0	Sacramento River
Mt. Shasta**	2,515	stab. pond	1,921.8	Sacramento River

2. Known industrial - None

* Anonymous, 1971.

** Treatment plant questionnaires.

B. Annual Total Phosphorus Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg P/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Sacramento River	37,855	10.4
Salt Creek (C-1)	540	0.1
McCloud River	17,715	4.9
Squaw Creek (B-1)	2,785	0.8
Pit River	271,400	74.4
b. Minor tributaries & immediate drainage (non-point load) - 27,470		
c. Known municipal STP's -		
Alturas	?	-
Dunsmuir	2,535	0.7
Mt. Shasta	2,225	0.6
d. Septic tanks - Unknown	?	-
e. Known industrial - None	-	-
f. Direct precipitation* -	<u>2,090</u>	<u>0.6</u>
Total	364,615	100.0

2. Outputs -

Reservoir outlet - Sacramento River 316,715

3. Net annual P accumulation - 47,900 kg.

* See Working Paper No. 175.

C. Annual Total Nitrogen Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg N/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Sacramento River	2,032,775	17.8
Salt Creek (C-1)	26,445	0.2
McCloud River	687,525	6.0
Squaw Creek (B-1)	116,810	1.0
Pit River	6,323,590	55.4
b. Minor tributaries & immediate drainage (non-point load) -		
	2,083,285	18.3
c. Known municipal STP's -		
Alturas	?	-
Dunsmuir	6,705	0.1
Mt. Shasta	6,095	0.1
d. Septic tanks - Unknown		
	?	-
e. Known industrial - None		
	-	-
f. Direct precipitation* -		
	<u>128,905</u>	<u>1.1</u>
Total	11,412,135	100.0

2. Outputs -

Reservoir outlet - Sacramento River 13,283,340

3. Net annual N loss - 1,871,205 kg.

* See Working Paper No. 175.

D. Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km²/yr</u>	<u>kg N/km²/yr</u>
Sacramento River	34	1,847
Salt Creek (at C-1)	15	756
McCloud River	11	434
Squaw Creek (at B-1)	18	739
Pit River	21	493

E. Mean Nutrient Concentrations in Ungaged Streams:

<u>Tributary</u>	<u>Mean Total P Conc. (mg/l)</u>	<u>Mean Total N Conc. (mg/l)</u>
Nosoni Creek	0.018	1.365
Squaw Creek (at F-1)	0.019	0.876
Salt Creek (at H-1)	0.022	1.153
Potem Creek	0.018	0.765

F. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m ² /yr	3.05	0.40	95.6	loss*

Vollenweider phosphorus loadings
(g/m²/yr) based on mean depth and mean
hydraulic retention time of Shasta Lake:

"Dangerous" (eutrophic loading)	1.68
"Permissible" (oligotrophic loading)	0.84

* There was an apparent loss of nitrogen during the sampling year. This may have been due to nitrogen fixation in the reservoir, solubilization of previously sedimented nitrogen, recharge with nitrogen-rich ground water, unsampled point sources discharging directly to the reservoir, or insufficient outlet sampling. Whatever the cause, a similar nitrogen loss has occurred at Shagawa Lake, Minnesota, which has been intensively studied by EPA's former National Eutrophication and Lake Restoration Branch (Malueg et al., 1975).
