WORKING PAPER No. 855

WITH THE COOPERATION OF THE

UTAH STATE DIVISION OF HEALTH

AND THE

UTAH NATIONAL GUARD

SEPTEMBER, 1977

CONTENTS

FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.

b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.

c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGEMENT

The staff of the National Eutrophication Survey (Office of Research and Development, U.S. Environmental Protection Agency) expresses sincere appreciation to the Utah Department of Social Services and the Utah Department of Natural Resources for professional involvement, to the Utah National Guard for conducting the tributary sampling phase of the Survey, and to those Utah wastewater treatment plant operators who voluntarily provided effluent samples and flow data.

The staffs of the Bureau of Water Quality of the Division of Health and the Division of Wildlife Resources provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Maurice L. Watts, the Adjutant General of Utah, and Project Officer Lt. Colonel T. Ray Kingston, who directed the volunteer efforts of the Utah National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

PORCUPINE RESERVOIR

STORET NO. 4918

I. INTRODUCTION

Porcupine Reservoir was included in the National Eutrophication Survey as a water body of interest to the Utah Bureau of Environmental Health. Tributaries were not sampled, and this report relates only to lake sampling data.

II. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Porcupine Reservoir is eutrophic. It ranked seventeenth in overall trophic quality among the 27 Utah lakes and reservoirs sampled in 1975 when compared using a combination of six water quality parameters*. Eleven of the water bodies had less median total phosphorus, 21 had less median dissolved orthophosphorus, 16 had less median inorganic nitrogen, 16 had less mean chlorophyll a, and 18 had greater mean Secchi disc transparency. Depression of dissolved oxygen with depth occurred in August at stations 1 and 2 (to 2.6 mg/l at 33.8 meters).

Survey limnologists noted considerable amounts of suspended sediments in May when Secchi disc depths ranged from 0.6 to 0.8 meters.

Station 2 could not be sampled in September because the reservoir had been drawn down an estimated 12 meters.

B. Rate-Limiting Nutrient:

The algal assay results indicate Porcupine Reservoir was limited by phosphorus at the time the sample was collected (05/

* See Appendix A.

14/75). The reservoir data indicate phosphorus limitation in September as well but nitrogen limitation in August.

III. RESERVOIR AND DRAINAGE BASIN CHARACTERISTICS†

A. Morphometry††:

1. Surface area: 0.77 kilometers^2.
2. Mean depth: 20.1 meters.
3. Maximum depth: 42.4 meters.
4. Volume: 15.419 x 10^6 m^3.

B. Precipitation*:

1. Year of sampling: 49.4 centimeters.
2. Mean annual: 44.7 centimeters.

---

† Table of metric conversions--Appendix B.
†† Sudweeks, 1975; maximum depth from Ikner (1975).
* See Working Paper No. 175, "...Survey Methods 1973-1976".

IV. WATER QUALITY SUMMARY

Porcupine Reservoir was sampled three times during the open-water season of 1975 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at two stations in May and August and one station in September (see map, page v). During each visit, a single depth-integrated (4.6 m to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 39.6 meters at station 1 and 21.3 meters at station 2. Station 2 was dry in September due to reservoir drawdown.

The sampling results are presented in full in Appendix C and are summarized in the following table.

B. Biological Characteristics:

1. Phytoplankton -

Sampling Date	Dominant Genera	Algal Units per ml
05/14/75	1. Chroomonas sp.	3,196
	2. Dinobryon sp.	761
	3. Cryptomonas sp.	203
	Total	4,160
08/06/75	1. Dinobryon sp.	1,147
	2. Cyclotella sp.	688
	3. Cryptomonas sp.	191
	4. Oocystis sp.	76
	5. Peridinium sp.	38
	Other genera	40
	Total	2,180
09/23/75	1. Cyclotella sp.	887
	2. Melosira sp.	242
	3. Dinobryon sp.	202
	4. Asterionella sp.	161
	5. Cryptomonas sp.	121
	Other genera	121
	Total	1,734

2. Chlorophyll a -

Sampling Date	Station Number	Chlorophyll a (µg/l)
05/14/75	1	5.3
	2	12.2
08/06/75	1	8.5
	2	6.5
09/23/75	1	6.8
	2	-

C. Limiting Nutrient Study:

1. Autoclaved, filtered, and nutrient spiked -

Spike (mg/l)	Ortho P Conc. (mg/l)	Inorganic N Conc. (mg/l)	Maximum yield (mg/l-dry wt.)
Control	0.015	0.195	2.0
0.050 P	0.065	0.195	9.2
0.050 P + 1.0 N	0.065	1.195	23.3
1.0 N	0.015	1.195	2.8

2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Porcupine Reservoir was moderately high at the time the sample was collected (05/14/75). Also, the significant increase in yield with the addition of phosphorus alone indicates the reservoir was phosphorus limited at that time. Note that the addition of nitrogen alone resulted in a yield not significantly greater than that of the control.

The reservoir data indicate phosphorus limitation in May and September but nitrogen limitation in August. The mean inorganic nitrogen/orthophosphorus ratios were 14/1 in May, 29/1 in September, and 10/1 in August. Nitrogen limitation would be expected when N/P ratios are less than 14/1.
