## FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's freshwater lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

#### ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Wyoming Department of Environmental Quality for professional involvement, to the Wyoming National Guard for conducting the tributary sampling phase of the Survey, and to those Wyoming wastewater treatment plant operators who voluntarily provided effluent samples.

The staff of the Water Quality Division provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

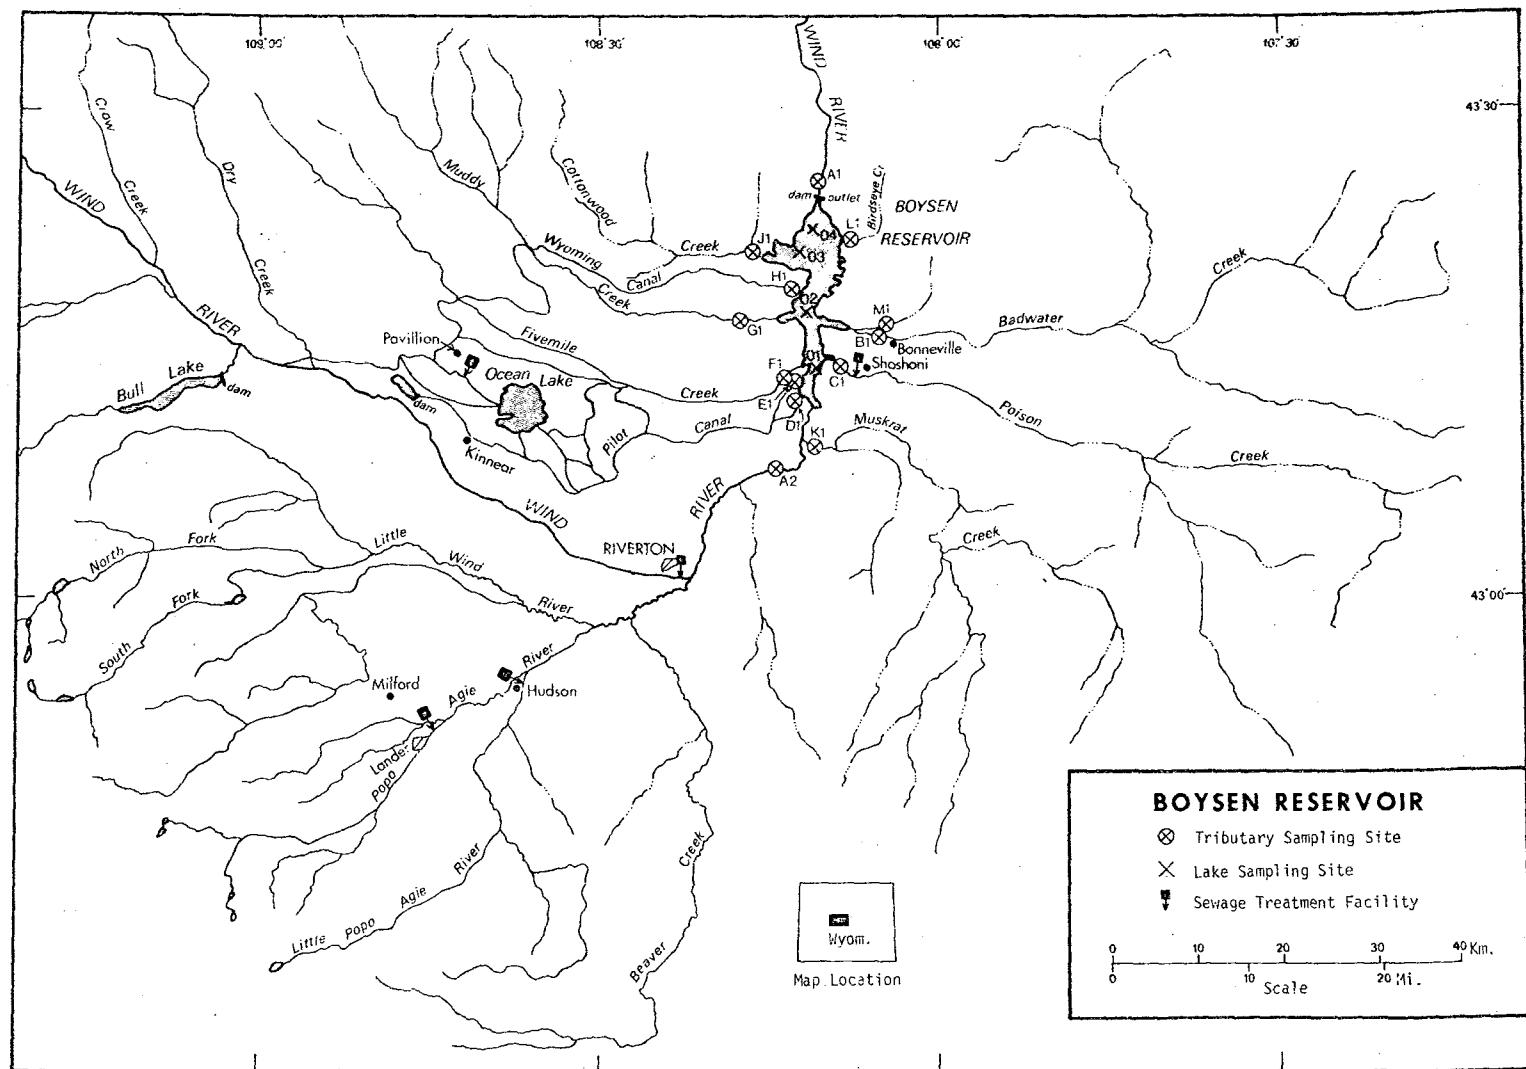

Brigadier General James L. Spence, The Adjutant General of Wyoming, and Project Officer Colonel Donald L. Boyer, who directed the volunteer efforts of the Wyoming National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

BOYSEN RESERVOIR

STORET NO. 5603

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Boysen Reservoir is eutrophic. It ranked eleventh in overall trophic quality when the 14 Wyoming lakes and reservoirs sampled in 1975 were compared using a combination of six water quality parameters\*. Seven of the water bodies had less median total phosphorus, seven had less and two had the same median dissolved orthophosphorus, ten had less median inorganic nitrogen, seven had less mean chlorophyll a, and ten had greater mean Secchi disc transparency. Marked depression of dissolved oxygen with depth occurred at station 4 in September.

Survey limnologists noted surface clumps of algae at various stations in September and October.

B. Rate-Limiting Nutrient:

The algal assay results are not considered representative of conditions in the reservoir at the time the samples were collected (05/19/75 and 10/17/75) due to significant changes in the nutrient levels in the samples during shipment from the field to the laboratory.

The reservoir data indicate nitrogen limitation at all sampling stations and times, with the exception of station 2 in May and station 4 in September.

---

\* See Appendix A.

### C. Nutrient Controllability:

1. Point sources--During the sampling year, known point sources accounted for 5.8% of the total phosphorus load to Boysen Reservoir. The wastewater treatment plant at Riverton contributed 3.0%. The facilities at Shoshoni, Hudson, and Lander were estimated to have contributed 0.2%, 0.1%, and 2.5%, respectively, but further investigation would be needed to determine the actual contribution of those sources.

The present loading of  $3.56 \text{ g/m}^2/\text{year}$  is five times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 14). It is calculated that an 80% reduction of the phosphorus load would be required to lower the loading to the eutrophic level. This would involve control of non-point as well as point-source phosphorus inputs.

2. Non-point sources--Non-point sources contributed 94.2% of the total phosphorus loading during the sampling year. The Wind River contributed 77.4%, Fivemile Creek contributed 7.7%, and six other gaged tributaries collectively contributed 4.8%. The ungaged minor tributaries and immediate drainage contributed an estimated 3.8%.

The phosphorus export rates of Fivemile Creek and the Wind River,  $23 \text{ kg}$  and  $22 \text{ kg/km}^2/\text{year}$ , were substantially greater than the rates of the other tributaries of the reservoir (mean of  $3 \text{ kg/}$

km<sup>2</sup>/year; see page 13). This may be indicative of unknown point sources, underestimation of point source loads, or substantial inputs from non-point sources. For Fivemile Creek, part of the high export rate is due to the outflow of eutrophic Ocean Lake\* and drainage from surrounding agricultural lands. Further investigation is needed to determine the controllability of nutrients from non-point sources within the Wind River and Fivemile Creek drainages.

## II. RESERVOIR AND DRAINAGE BASIN CHARACTERISTICS<sup>†</sup>

### A. Morphometry<sup>††</sup>:

1. Surface area: 89.84 kilometers<sup>2</sup>.
2. Mean depth: 10.4 meters.
3. Maximum depth: 39.6 meters.
4. Volume:  $934.336 \times 10^6 \text{ m}^3$ .
5. Mean hydraulic retention time: 270 days (based on outflow).

### B. Tributary and Outlet:

(See Appendix C for flow data)

#### 1. Tributaries -

<u>Name</u>	<u>Drainage area (km<sup>2</sup>)*</u>	<u>Mean flow (m<sup>3</sup>/sec)*</u>

### III. WATER QUALITY SUMMARY

Boysen Reservoir was sampled three times during the open-water season of 1974 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at four stations on the reservoir in May and five stations in September and October (see map, page v). During each visit, a single depth-integrated (4.6 m or near bottom to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first and last visits, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 4.6 meters at station 1, 15.8 meters at station 2, 16.8 meters at station 3, 29.9 meters at station 4, and 1.5 meters at station 5.

The sampling results are presented in full in Appendix D and are summarized in the following table.

10/17/75	1	2.6
	2	1.7
	3	2.4
	4	1.4
	5	3.8

C. Limiting Nutrient Study:

Due to significant changes in nutrient levels in the samples during shipment from the field to the laboratory, the algal assay results are not considered representative of conditions in the reservoir at the time the samples were collected (05/19/75 and 10/17/75).

Following is a tabulation of the mean inorganic nitrogen/orthophosphorus ratios at each of the sampling stations and times with the indicated limiting nutrient in parentheses.

<u>Station</u>	<u>05/12/75</u>	<u>09/02/75</u>	<u>10/17/75</u>
1	11/1 (N)	10/1 (N)	7/1 (N)
2	21/1 (P)	7/1 (N)	7/1 (N)
3	13/1 (N?)	7/1 (N)	6/1 (N)
4	8/1 (N)	19/1 (P)	5/1 (N)
5	-	9/1 (N)	13/1 (N?)

Nitrogen limitation, as indicated by the algal assay or by in-reservoir nitrogen to phosphorus ratios, does not necessarily mean that the trophic condition of the reservoir can be improved by controlling nitrogen inputs. In many cases, the apparent condition of nitrogen limitation results from excessive phosphorus input from point sources and is often accompanied by a corresponding increase in primary production. In such cases, the reversal of the enriched condition depends upon phosphorus control, not nitrogen control.

#### IV. NUTRIENT LOADINGS (See Appendix E for data)

For the determination of nutrient loadings, the Wyoming National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff months of May, June, and July when two samples were collected at most of the sites. Sampling was begun in October, 1974, and was completed in October, 1975.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Wyoming District Office of the U.S. Geological Survey for the tributary sites nearest the reservoir.

In this report, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings\*. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the means of the nutrient loads, in kg/km<sup>2</sup>/year, at stations G-1 and J-1 and multiplying the means by the ZZ area in km<sup>2</sup>.

The operator of the Riverton wastewater treatment plant provided monthly effluent samples and corresponding flow data. The operator of the Shoshoni wastewater treatment plant also provided monthly samples, but corresponding flows were not available. Therefore, nutrient loads for Shoshoni were estimated at 1.134 kg P and 3.401 kg N/capita/

\* See Working Paper No. 175.

year as were the loads for the wastewater treatment plants at Hudson and Lander which were not sampled.

A. Waste Sources:

	-	-
f. Direct precipitation* -		
	<u>96,990</u>	<u>3.7</u>
Total	2,638,495	100.0

## 2. Outputs -

Reservoir outlet - Wind River 1,277,070

3. Net annual N accumulation - 1,361,425 kg.

\* See Working Paper No. 175.

## D. Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km<sup>2</sup>/yr</u>	<u>kg N/km<sup>2</sup>/yr</u>
Wind River	22	137
Badwater Creek	3	14
Fivemile Creek	23	450
Muddy Creek	2	27
Cottonwood Creek	4	57

## E. Mean Nutrient Concentrations in Ungaged Streams:

<u>Tributary</u>	<u>Mean Total P Conc. (mg/l)</u>	<u>Mean Total N Conc. (mg/l)</u>
Poison Creek	0.617	2.251
Birdseye Creek	0.037	1.611

F. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m <sup>2</sup> /yr	3.56	3.22	29.4	15.2

Vollenweider phosphorus loadings  
(g/m<sup>2</sup>/yr) based on mean depth and mean  
hydraulic retention time of Boysen Reservoir:

"Dangerous" (eutrophic loading)	0.72
"Permissible" (oligotrophic loading)	0.36
