

California

Gas Mileage Guide

Second Edition
January 1979

EPA Fuel Economy Estimates

How To Use This Guide

This Gas Mileage Guide gives information on the relative fuel economy performance of 1979 model year cars, station wagons, and light trucks. It provides you with estimates in terms of miles per gallon (mpg) measured on the U.S. Environmental Protection Agency's (EPA) standardized fuel economy test.

The mileage you actually get with a car depends to a large degree on how and where you drive—your personal driving habits and whether you drive in the city or country, hilly or flat areas, and in cold or mild climates. Therefore, these estimates **do not mean** that you will get the same mileage. They **do mean** that you can compare the fuel economy of each model with another to help you make your buying decision.

These 1979 models were certified by EPA as of January 22, 1979.

All new car dealers are required to prominently display and have available copies of this Guide in their showrooms.

The Gas Mileage Guide is compiled and prepared by the U.S. Environmental Protection Agency and published and distributed by the U.S. Department of Energy.

Fuel Economy and Fuel Cost Estimates

The 1979 edition of the Gas Mileage Guide no longer gives the values previously called the "highway" and "combined" mpg. The value previously named the "city" estimate is now called the "Estimated mpg." Studies have shown that, of the three previously published values, the city number was the closest to average fuel economy in real driving. It thus provides the consumer with a better single estimate of average, overall performance than either of the other values.

This change in the presentation of the fuel economy information is an interim measure until technical changes can be made to improve the accuracy of the fuel economy numbers. (If comparisons with 1978 or earlier vehicles are made, the values in the Guide should be compared to the "city" values in earlier Guides.)

"Estimated mpg" fuel economy reflects trips for local errands, driving to work, and general stop-and-go driving in urban and suburban areas but not in heavily congested traffic. The estimates reflect the performance of a well-maintained car in warm weather, driving on dry level roads after the car has been broken in.

The values in the Guide come from tests conducted or approved by the EPA. These tests are performed on vehicles submitted by the auto industry to EPA to demonstrate compliance with the requirements of the Clean Air Act and the Energy Policy and Conservation Act. Each vehicle is tested under precisely controlled conditions by professional drivers in a laboratory on a dynamometer. The

dynamometer is a machine that permits exact simulation of each vehicle's operation under various driving conditions. Temperature is controlled in the laboratory in a range of 60°–86° F. in order to provide the same temperature conditions for all vehicles.

Fuel Costs, In Dollars, Per 15,000 Miles

The fuel cost is based on what you would pay for fuel in 1 year if you drive 15,000 miles and pay 70 cents per gallon for gasoline (or 60 cents per gallon for diesel fuel).

Example: If you pay an average of 65 cents per gallon and your car gets 12 mpg, your fuel cost for 15,000 miles of driving is \$813. If you own a car that gets 20 mpg, your annual fuel cost for 15,000 miles at 70 cents per gallon is \$525.

		Cents Per Gallon						
		80	75	70	65	60	55	50
Estimated MPG	50	\$240	\$225	\$210	\$195	\$180	\$165	\$150
	48	250	234	219	203	188	172	156

Vehicle Classes

To help you compare the fuel economy of similar-sized vehicles, passenger cars and station wagons are grouped into classes according to their interior size, an important measure of vehicle utility. This means that vehicles that are approximately the same size *inside* will be in the same class. Trucks are grouped by their capacity, in terms of gross vehicle weight rating.

Car Classes

Two-Seater—Cars designed primarily to seat only two adults (pages 19–20).

Sedans

Minicompact—Less than 85 cubic feet of passenger and luggage volume (page 10).

Subcompact—Between 85 to 100 cubic feet of passenger and luggage volume (pages 10–14).

Compact—Between 100 to 110 cubic feet of passenger and luggage volume (pages 14–15).

Mid-Size—Between 110 to 120 cubic feet of passenger and luggage volume (pages 16–17).

Large—More than 120 cubic feet of passenger and luggage volume (pages 18–19).

Station Wagons

Small—Less than 130 cubic feet of passenger and cargo volume (pages 20–21).

Mid-Size—Between 130 and 160 cubic feet of passenger and cargo volume (pages 22–23).

Large—160 or more cubic feet of passenger and cargo volume (page 23).

Truck Classes

Small Pickups—Trucks having Gross Vehicle Weight Ratings (truck weight plus carrying capacity) under 4500 pounds (page 24).

Standard Pickups—Trucks having GVWR's 4500 to 6000 pounds (pages 24–25).

Vans—(page 25).

Other Special Purpose Vehicles

Special Purpose Vehicles—All other light vehicles not in another car or truck class (page 26).

In each size class, you will find the following information for every model type:

Manufacturer and Car Line Names

The manufacturers are listed alphabetically. Under each manufacturer, the car lines are listed alphabetically.

Vehicle Description

Each line in the Guide shows an engine-transmission combination available within the listed car line identified by the following designation:

Engine Size—Listed by cubic inch displacement (CID), liters (L), or cubic centimeters (CC).

Number of Cylinders or Rotors—Differentiates between 4, 5, 6, 8, and 12 cylinder engines or 1 and 2 rotors.

Engine Type—When engine size and number of cylinders are not an adequate description of an engine, the following engine type designations will also be given:

CAT, NO CAT	Used to indicate catalyst usage when both oxidation catalyst and noncatalyst versions of an engine are available
CVCC	Compound vortex control combustion engine (stratified charge)
ROTARY	Rotary engine
GM-CHEV	Engine produced by GM-Chevrolet Motor Division or GM of Canada
DIESEL	Diesel engine
GM-CAD	Engine produced by GM-Cadillac Motor Division using a short block assembly and cylinder head from Oldsmobile Division of GM
TURBO	Turbocharged engine
3WAYCAT	Three-way catalyst with feedback control
MENG, WENG	Used to identify the engine block type. The engine block type installed in your vehicle will be determined by the manufacturer
GM-BUICK	Engine produced by GM-Buick Motor Division
GM-OLDS	Engine produced by GM-Oldsmobile Division

Check with your dealer and check the fuel economy label prior to purchase for information on

the exact engine with which these vehicles will be equipped.

Transmission—

S2	Semiautomatic two speed
A3	Automatic three speed
A4	Automatic four speed
M3	Manual three speed
M3/OD	Manual three speed with separate overdrive unit
M4	Manual four speed
M4OD	Manual four speed with separate overdrive unit
M3/M4C	Manual four speed with creeper first gear or manual three speed
M5	Manual five speed
M4X2	Dual range manual four speed

Fuel System—“FI” for fuel injection or the number of barrels in the carburetor.

Interior Volume Index—The interior volume index is listed for each body style: 2-door (2-DR), 4-door (4-DR), and hatchback (HTBK). The Interior Volume Index is one way of estimating the space in a car. It is based on four measurements—head room, hip room, leg room, and shoulder room—for the front and rear seats, as well as trunk capacity. The Interior Volume Index is given as two numbers (in cubic feet). The first is an estimate of the size of the passenger compartment; the second, the size of the trunk or, in station wagons and hatchbacks, the cargo space behind the second seat.

Factors That Affect Fuel Economy

The fuel economy numbers in this Guide are based on carefully controlled tests performed on well-maintained vehicles. No standardized test of this type can ever represent each person’s individual driving. What you actually get is likely to be lower or higher.

In buying a new car, you should recognize that the EPA estimates do not predict the mileage you will obtain. Instead, these estimates provide a way to compare the relative fuel economy performance of different new models when they are driven under the same test conditions.

Such things as trip length, weather, condition of the car, number of accessories, and individual driving habits have a significant effect on mileage. The conditions under which you drive your car in many cases will not match the EPA test conditions due to the tremendous variety of in-use conditions. But even where your driving conditions are very similar to the test, technical factors and production variability would cause your mileage to be higher or lower than that measured on a standard test. The following paragraphs explain how some of these factors affect fuel economy.

Temperature

Summer temperatures (over 70° F.) are better for fuel economy than winter temperatures. At 20° F., for example, there can be an approximate 8-percent fuel economy loss compared to the estimated mpg number in this Guide. For a 20-mpg vehicle, this is about 1.5 mpg.

Wind

Wind can increase or decrease fuel economy. Examples for a car that normally gets 20 mpg are:

18 mph tailwind→about 12-percent gain in fuel economy (2.4 mpg).

18 mph crosswind→about 1-percent loss in fuel economy (0.2 mpg).

18 mph headwind→about 10-percent loss in fuel economy (2 mpg).

Precipitation

Rain or snow, and the wet roads that result, can cause an approximate 10-percent loss in fuel economy (2 mpg for a 20-mpg vehicle).

Road Condition

Rough or loose road surfaces (such as sand or gravel) can also cause a fuel economy loss ranging between 10 and 30 percent (or 2 to 6 mpg for a 20-mpg vehicle). Cars use more fuel on hilly roads than flat roads. The fuel saved in going downhill does not equal the extra fuel used going uphill.

Mountain driving causes an even greater fuel economy penalty.

How You Drive

An engine that is already warmed up (such as one that was used in the last 4 hours) requires less fuel to reach its most efficient operating condition than a “cold” engine (such as one in a car parked overnight).

Trip length also affects fuel economy. Shorter trips (under 5 miles) do not allow the engine to reach its best operating condition; longer trips allow the peak operating temperature and engine condition to be obtained. Thus, by combining numerous short trips into a single, longer trip you can save fuel both by reducing the total miles driven and by taking advantage of your vehicle’s warmed-up condition.

Smooth, even driving improves fuel economy performance; therefore, try to avoid sudden stops and starts. By anticipating stop lights and intersections, you can slow down gradually. Also, avoid rapid accelerations. On the highway, you will improve your fuel economy by driving at or below the 55-mph speed limit.

Your Vehicle’s Condition

The condition of your vehicle is important, too, for fuel economy reasons:

- Maintain your vehicle according to the manufacturer’s specifications. On the average, a tuned-up vehicle gets approximately 5 percent better fuel economy than one that has not been properly maintained.
- Keep the tires inflated to the proper pressure. Underinflated tires can cause a fuel economy loss.
