## Technical Report

Inspection and Maintenance of New Technology Vehicles in Washington, D.C.

Jonathan Adler

July 1985

#### NOTICE

Technical Reports do not necessarily represent final EPA decisions or positions. They are intended to present technical analysis of issues using data which are currently available. The purpose in the release of such reports is to facilitate the exchange of technical information and to inform the public of technical developments which may form the basis for a final EPA decision, position or regulatory action.

## INSPECTION AND MAINTENANCE ON NEW TECHNOLOGY VEHICLES IN WASHINGTON, D.C.

# 1.0 Introduction

In 1978 and 1979, EPA conducted an emissions test program in Portland, Oregon. The Portland Study provided data which have been useful in the development of mobile source models and public policy regarding inspection and maintenance (I/M) programs. Among these data is information about the emissions behavior of a fleet influenced by I/M, the costs and effectiveness of emission-related repairs, and how well I/M short tests can identify excess emissions. Since the completion of the Portland Study, many changes have occurred in the emission control technology of cars. The new technology alters the way cars perform on the short tests of I/M programs, respond to repairs, and behave in a fleet. Since the changes have included the addition of complex electronic controls, questions have arisen about whether most mechanics can conduct effective repairs on these vehicles.

EPA desired to have information about new technology cars which would be comparable to the information gained in the Portland Study, subject to more restricted resources. EPA initiated a test program in Washington, D.C. to analyze how new technology vehicles respond to I/M. Washington was chosen as the sample site because testing facilities were already available, because the I/M program there does not allow cost waivers (which would introduce recruiting and data analysis complications), and because its centralized format made recruiting easier. The program was conducted by the testing firm of EG&G Automotive Research (EG&G) under EPA contract number 68-03-3202 during the spring and summer of 1984. The contractor completed testing on seventy-eight light-duty vehicles. Twenty-four vehicles were of the 1980 model year, and fifty-four were of the 1981 model year.

In this program, new technology vehicles which failed the I/M test in D.C. were given two or three series of emissions tests, each including a Federal Test Procedure (FTP), a Highway Fuel Economy Test, and the following short tests: 50 mph cruise, four-mode idle, engine restart idle, and loaded two-mode idle. Each test series also included an examination and diagnosis by an in-house mechanic. The seventy-eight cars were recruited for EG&G testing after they failed the initial I/M test at a District-operated test lane. The first series of EG&G tests provided information about the condition of the vehicles as they failed. After the first test, the vehicles were returned to their owners, who then completed the I/M

process. The cars were brought back to the test facility after they had been repaired and passed District or District-licensed reinspection. Each received a second test series. difference between the emission results in the first and second series shows the amount of emission reduction achieved for these vehicles by the repairs. As part of his second examination, the contractor's mechanic described the repairs which appeared to have been done, and those which were reported by the owner. Most of the vehicles were then released from the program, but twenty-two were retained for further repairs, which were conducted by the contractor's mechanic. Originally, the contractor was to have chosen vehicles which had high emissions (at least twice the FTP standard for one or more pollutant) during the second test to receive these repairs. retrospect, it appears that this criterion was not followed in all cases. All of the cars chosen for contractor repairs had emission-related malfunctions during the second test sequence, but not all had high FTP emissions. After the contractor's repairs, these vehicles were tested a third time.

In June, 1984, EPA became aware of some quality control problems being experienced at the D.C. inspection stations. Because of these problems, EPA became concerned that some of the vehicles being tested by the contractor may have been inappropriately failed at their initial D.C. inspection and others may have been inappropriately passed upon reinspection. In order to allow the results of this study to be applicable to I/M programs without these problems, some vehicles should be removed from the analysis. Data analysis techniques which accomplish this removal are discussed in the next section.

# 2.0 Data Preparation

The results of this project will show approximately the emission reductions that were achieved from these vehicles by the I/M program in Washington, D.C. during the spring and summer of 1984. At that time, the program was experiencing some quality assurance (QA) problems. Because of these problems, some decisions which were made by the inspection stations during the inspections and reinspections may have been incorrect. Such decisions affect the emissions reductions achieved by the I/M program; they also affect the results of this study. In order to estimate the results of an I/M program without these QA problems, cases in which these decisions were incorrect should be removed from the analysis. While this study cannot compensate for cases in which vehicles incorrectly passed the initial inspection (they are not part of the study), cases in which vehicles incorrectly fail the inspection or pass the reinspection may be evaluated. It would be impossible to re-create the condition of each car at the inspection station

at either the initial or the post-repair I/M test, but the car's actual performance there may be inferred from the results of the four idle-neutral segments among the short tests which were conducted by the contractor. Emission readings of the D.C. inspection are taken during the idle-neutral mode.

During the second (post-repair) test sequence, sixteen vehicles failed at least one of the contractor's idle tests at the 1.5% CO and 300 ppm HC cutpoints used in D.C. They and their scores are listed in Appendix E. Eight of the sixteen failed decisively in all four segments, with all CO readings over 3.0% or all HC readings over 350 ppm. These vehicles (numbers 002, 004, 042, 049, 126, 127, 133, and 231) probably should not have passed the reinspection, based on their consistently high idle scores. Vehicle 231 received subsequent repairs by the contractor which reduced its idle emissions below the cutpoints, so it receives special note in the results The results section of this report includes analyses section. of the data both with these vehicles included and with them removed. The other eight may have legitimately passed the reinspection, because each came close to passing at least one the contractor's idle tests. They are not treated separately from the rest of the data.

There were also several cars which probably should not have failed their initial inspections. Vehicle 24, for example, had FTP scores of 0.11 g/mi of HC and 1.09 g/mi of CO and idle test scores of 0.2% CO and 20 ppm HC during the first contractor test sequence. However, there is no clear distinction in the data between cars that should not have failed the D.C. test and cars that could have properly failed.

This lack of a distinctly clean group of cars dictates that one can only arbitrarily define a criterion for whether a vehicle correctly failed the initial D.C. inspection. "Screening" based on the contractor's idle test results is an attempt to apply such a criterion. It assumes that a car which has consistently low idle scores at the laboratory probably should have had low scores at the D.C. lanes. By applying conservative cutpoints to all four idle segments it may be possible to identify and remove falsely failed cars. Screening extrapolates a low idle score from four other low idle scores. There are several cases in the data where three of the four known idle scores are low (much less than the I/M cutpoints) and the fourth is high (exceeding the cutpoints). It is also possible that all four idle tests at the lab could be low and the D.C. inspection score legitimately high due to intermittent problem. Despite this shortcoming, screening is the best available method to identify cases of vehicles which should not have failed the initial inspection or participated in this testing program.

The data from this project were analyzed with combinations of the following conditions applied:

- The eight vehicles which clearly should not have passed reinspection are excluded. This determination is based on idle scores above 3.0% CO or 350 ppm HC in all four idle-neutral segments of the second test sequence. By comparing results with and without this condition, the importance of proper reinspection becomes clear.
- Vehicles are excluded which have low emissions in all four idle segments of the initial test sequence. Conservative screening cutpoints of 0.3% CO and 60 ppm HC were chosen because higher cutpoints further reduce the sample size, and lower readings approach the tolerance limits of the measurement system.

These conditions are intended to remove from analysis vehicles which appear to have received incorrect inspections or reinspections. However, they may, when applied, introduce sampling bias to the results. It is not possible to determine the exact effects of this bias.

The results include average emissions for the first and second tests, and average emissions of the vehicles as they left the program (the third test, when performed, otherwise the second.)

#### 3.0 Results

Commercial maintenance reduced avarage emissions of HC and CO and raised emissions of NOx from the test fleet. Maintenance by the contractor further reduced emissions of HC and CO. The contractor was also able to reduce NOx to a level below that of the as-received fleet. Fuel economy improved slightly on average with maintenance, but there was considerable variation among vehicles.

Tables 1 through 6 summarize the average FTP scores of groups of vehicles in this program. Results are separated by model year. Within the 1980 model year, the results of General Motors (GM) vehicles and non-GM vehicles are separated because of the sealed carburetor technology which only GM applied in that year. This separation is not useful among vehicles which received repairs at the laboratory (Table 2), as only three 1980 cars received such repairs. When reviewing the tables, the reader should consider the following notes.

The values listed depend heavily on the performance of a small group of the vehicles in the sample. The results are

average values, and a single vehicle which has very high emissions will influence them considerably. A few of the cars have emissions which are high enough to classify them in EPA terms as "super emitters" (at least 12 g/mi HC or 180 g/mi CO). In some of the smaller samples, large changes in the average emissions could be caused by the influence of one such vehicle. Note the difference between Tables 5 and 6 in the "changes 1-2" result for the 1981 vehicles. The difference between the samples represented in these tables is attributable to one vehicle, #231.

The additional reductions which were achieved by the contractor's repairs were affected by the following factors:

- The mechanic is competent and especially well-versed in emission control. He also had the use of the vehicles' FTP scores as a diagnostic indicator.
- Vehicles were often chosen for this maintenance because they had problems, evident from the mechanic's observations, for which the repairs would reduce emissions.
- The goal of the mechanic was to reduce the vehicles' emissions during the FTP.
- The reductions may have been limited by the fact that the test contract did not allow the contractor to repair all of the cars, and that some repairs were omitted in order to isolate the effects of others.

Table 1 lists the average emissions for all vehicles in each category of the sample. The values listed for "test 1" and "test 2" are the average emissions during the initial ("as received") test and the second (after commercial repair) test. The "final" values are the average emissions of the vehicles as they left this testing program; i.e., the results of the third (after contractor maintenance) test in cases where such tests were done, and the results of the second test in the other cases. The values listed for "change 1-2" are the percentages by which emissions changed as a result of commercial maintenance (i.e., the change from test 1 to test 2). The net change values show the percentage difference between the emissions of the vehicles as received and those of the vehicles as they left the program.

Table 1
Average FTP Scores, All Vehicles

Model Year	<u>N</u>		HC (g/mi)	CO (g/mi)	NOx (g/mi)	Fuel Economy (mi/qal)

\* Average fuel economy represents the harmonic mean of individual fuel economies; the inverse of the mean of the inverses of the individual values.

The scores listed in Table 1 for the first and second tests should approximate those of same model year vehicles which failed the inspection and were repaired in the Washington, D.C. I/M program during the spring and summer of 1984. The emission reductions shown between the two tests are probably close to the actual reductions which the program achieved at that time.

Table 2 shows the average emissions of the vehicles which received contractor repairs. The contractor was more successful at reducing emissions than the commercial repair facilities. It should be noted that the contractor tended to repair those vehicles which had evident problems even after the commercial repairs.

Table 2
Average FTP Scores of Vehicles
Receiving Contractor Maintenance

Model <u>Year</u>	Ñ		HC (g/mi)	CO (g/mi)	NOx (g/mi)	Fuel Economy (mi/gal)
81	19	Test 1 Test 2 Change 1-2 Final Net Change	2.01 1.86 - 7% 1.26 -37%	36.02 36.74 + 2% 21.98 -39%	1.43 1.55 + 8% 1.19 -17%	17.74 17.55 - 1% 18.16 + 2%
80	3	Test 1 Test 2 Change 1-2 Final Net Change	2.39 1.52 -36% 1.06 -56%	51.64 26.25 -49% 20.77 -60%	2.64 3.71 +41% 2.11 -20%	18.78 19.49 + 4% 19.42 + 3%

Table 3 shows the emission values and reductions for the vehicles which were correctly failed in the initial inspection of the I/M program (as predicted by the screening technique described earlier). A comparison of these results with those in Table 1 shows the importance of quality assurance during the initial inspection. The increased reduction figures from the correctly failed vehicles are a result of their higher average emissions during the initial test. The total reduction from this group is roughly the same as that of the whole sample, because these are the vehicles from which the reductions may be obtained. Repairs of the falsely failed vehicles which are excluded from this group yield little benefit, as their already low emissions are difficult to reduce further.

Table 3
Average FTP Scores, Correct Failures

Model Year	<u>N</u>		HC (g/mi)	CO (g/mi)	NOx (g/mi)	Fuel Economy (mi/gal)
81	40	Test 1 Test 2 Change 1-2 Final Net Change	2.10 1.24 -41% 1.16 -45%	38.82 21.20 -45% 18.91 -51%	1.15 1.29 +12% 1.10 - 4%	18.67 19.28 + 3% 19.48 + 4%
80	21	Test 1 Test 2 Change 1-2 Final Net Change	1.69 1.26 -25% 1.20 -29%	30.17 20.47 -32% 19.69 -35%	1.88 2.03 + 8% 1.80 - 4%	19.34 19.38 0% 19.37 0%

Vehicle #231 correctly failed the initial test, but should not have passed the reinspection. It is the only such car which received contractor maintenance. The contractor was able to reduce its idle emissions so that it would have passed. Table 6 shows the average emissions for the group described in Table 5 with vehicle #231 included.

#### 4.0 Repair Comments

The comments of the contractor's mechanic (Appendix B) list the results of his examinations of the cars for each test sequence. The examinations provide information about the condition of the cars at the time of each test. In the first examination, the mechanic described the vehicle as received, in the condition in which it failed the I/M test. The examination about why it failed. In his examination clues accompanying the second test, the mechanic described the condition of the car as it passed the reinspection. assessed any new or continuing problems which were present. The comments on the second test sequence also list what repairs were done, as reported by the vehicle owner, and attempt to include their cost. The comments accompanying the third test sequence list repairs done by the contractor and any problems which were not repaired. This section summarizes the comments, discussing the common emission-related malfunctions and the effectiveness of commercial repairs. The complete sample of twenty-four 1980 model year vehicles and fifty-four 1981 model year vehicles is discussed.

Of particular interest in this study are design features which distinguish the 1980 and later model year vehicles from older models such as closed loop control systems and limited adiustment carburetors. There were three cases malfunctioning closed loop systems among the forty-one vehicles which have such systems. Two of these caused extremely high FTP emissions, and were successfully repaired by replacement of Both vehicles had been super emitters, the oxygen sensors. among the worst in the whole group, and were brought close to the FTP standards by the repairs. They also showed roughly 40% improvements in fuel economy after the repairs. It must be noted that one of these vehicles did not have high emissions as received; it became a super-emitter after the commercial (See comments on vehicle #231 in Appendix B for more repairs. details.) The third case of a closed-loop system problem caused higher than average emissions, and was successfully repaired through replacement of an unspecified "three-way" part.

Sealed parameter carburetors were used in 1980 model year GM cars and are used on all later model year cars. These carburetors have plugs which discourage the novice mechanic from adjusting the air-fuel mixture. Mechanics are able to permanently remove the plugs. A carburetor missing these plugs has probably been adjusted. Four of the ten 1980 GM cars entered this study with missing mixture plugs. A fifth had its plugs removed during the commercial repairs. Of the fifty-four 1981 cars, ten (18.5%) entered the study without the plugs, and two more had them removed by commercial repair facilities. The

FTP emissions of this group were not significantly higher than the average for the whole sample. The proportion of the group within the sample, roughly 20% for 1981 cars, agrees with that found in recent EPA tampering surveys.

Though not a new technology, air injection became common in the late seventies. Problems with air injection systems are a known cause of I/M failures. Twenty-two (92%) of the 1980 vehicles and forty-seven (87%) of the 1981 vehicles were equipped with these systems. The mechanic noted that these systems were malfunctioning in four (18%) of the 1980 cars and sixteen (34%) of the 1981 cars. The FTP emissions of this group were not significantly different from the sample average. Most of these malfunctions were associated with diverter valves, which tended to stick or were not properly actuated.

The mechanic reported that thirty-seven (47%) of the vehicles had timing misadjustments of at least two degrees. The range of misadjustment was  $+8^{\circ}$  to  $-14^{\circ}$ . More vehicles had retarded timing than advanced. Twenty-five vehicles had misadjusted timing after the commercial repairs.

Eight vehicles (10%) arrived with excessively dirty air ers. Some of these were replaced during commercial Other less dirty air filters were also replaced. maintenance. Thirteen (17%) cars had dirty or worn spark plugs. Commercial repair facilities usually did not specify that they replaced the plugs, beyond stating that major or minor tune-ups were done. As with the air filters, spark plugs were replaced that perhaps did not need to be. Twelve cars (15%) entered the program with damaged, leaking, or misrouted hoses. Some of these cases were repaired, but five new cases were noted after the commercial repairs. Ten cars (13%) had malfunctioning Some were repaired, but two more were heated air systems. noted after commercial repairs. There were nine cases (12%) of choke problems. Again, some were repaired and two more Seventeen cars (22%) arrived with faulty EGR Twelve cars (15%) showed evidence of misfueling systems. (damaged inlet restrictor, fuel lead above unleaded standard, or lead deposits detected in the tailpipe -- these indications were usually not recorded in the comments, as they were coded into the computerized dataset). None of these problems can be singled out as causing emissions to be higher than others, because the sample sizes are so small.

The average repair bill was about \$95 for both model years. This figure is approximate, as the comments do not include cost data for all cars, and some of the bills included costs for non-I/M repairs. Major carburetor repairs were among

the most expensive, often costing over \$200. Commercial repair facilities conducted twelve of these repairs. One of these caused a large decrease in FTP emissions, and one caused a large increase. The rest had mixed small changes. Four of the cars which received major carburetor work scored close to or below the standards on the first FTP, and another has been classified as a false I/M failure, indicating that these expensive repairs were unnecessary in some cases.

Twenty-five cars (32%) received tune-ups, which cost roughly \$50 - \$100. Tune-ups were often done after carburetor repair work, further boosting repair costs. Some vehicles received more than one tune-up before passing the reinspection. It is not evident how a second tune-up would differ from the first.

Maintenance by the contractor was more successful in reducing FTP emissions than that of commercial facilities. Again, it should be noted that the goal of the contractor's mechanic was to reduce FTP emissions of HC, CO, and NOx rather than to pass the I/M test. There were not enough of these repairs to allow statements about the success of particular types of repairs. The mechanic avoided tune-ups in favor of specific adjustments. In some cases he did not perform all possible repairs, in an attempt to isolate the effects of individual repairs, so even more reductions than he achieved were available. Some cars left the program with unexplained high emissions.

The following general conclusions can be drawn from the mechanic's comments:

- 1. The problems addressed by both the commercial mechanic and the contractor's mechanic tended to be related to traditional I/M problems (e.g., ignition timing, air filters, tune-ups, etc.) rather than to new technology components. This is despite the fact that malfunctioning closed-loop systems caused very high emissions in some cases.
- 2. Many cars had their air/fuel mixture plugs removed. However, it is not clear whether the removals caused lower emissions by allowing proper adjustment of the mixture or whether they caused higher emissions by allowing improper adjustments.
- 3. The contractor's mechanic noted some problems during the second test sequence which were not present during the first, indicating poor work during the commercial repairs.

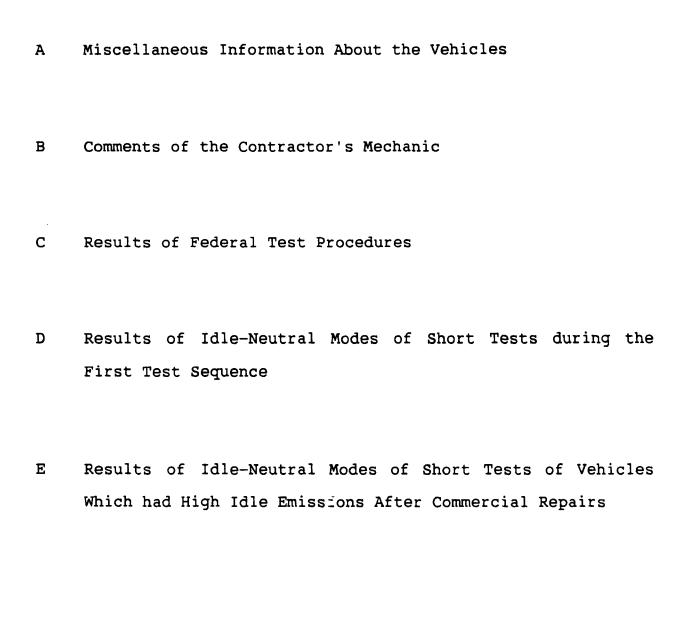

- 4. In some cases emissions increased after commercial repairs.
- 5. Some vehicles received expensive repairs which probably were not necessary. Other less expensive repairs were also unnecessarily conducted.
- 6. Some vehicles had to undergo repairs more than once in order to pass reinspection.

This evidence indicates that some commercial repair facilities may not be competent, equipped, or motivated to perform correct diagnosis and repair.

#### 5.0 Conclusions

This study showed that average emissions from new technology vehicles were reduced by the I/M program in Washington, D.C. during the spring and summer of 1984. It also showed that this benefit would be increased with improved quality assurance. Individual vehicles within the study had increased idle and FTP emissions after I/M, indicating that they received possibly inappropriate repairs. Many of the vehicles in the program seemed to have problems with conventional emission-related components. The few which had malfunctions in new technology components were among the highest of emitters. They showed large reductions when properly repaired. This study also indicates that the air quality benefit and the cost-effectiveness of I/M for new technology vehicles, like old technology vehicles, could be improved by efforts being directed at improving the diagnosis and repair of vehicles which fail I/M tests.

Appendix B: Comments of the Contractor's Mechanic

VEH#	TEST SEQ.*		RESULTS CO	(g/m1) NOX	COMMENTS	PAGE B-1
2	A B	4.03	55.76 45.82		HEATED AIR DOOR ASSY MSG. IDLE MIXT LIM DEVICE MSG. CHOKE LEAN. TIMING 4 DEG LOW. SPARK WIRES SHORTING. AIR BYPASS VALVE DISC. DIVERTOR VALVE STUCK. HEAD GASKET LEAKING. NO D.C. FAILURE RESULTS GIVEN. NO LABEL. TEMP SENSOR IN AIR CLEANER IS CONNECTED TO DIVERTOR VALVE. OIL 2 QTS LOW. REBUILT CARB AND TUNE TO PASS INSP FOR \$220.37.	
4	A B	2.04 2.74	44.61 69.38		IDLE MIXTURE LIMITER MISSING. FAILED HC-315 AND CO-8.75% AT LANE. IDLE CO STILL RICH. SERVICE STN IN D.C. PUT IN A NEW BATTERY AND SPARK PLUGS AND GAVE IT A REINSP TO PASS. REPAIRS COST \$128.05 INCLUDING THE NEW BATTERY AT \$73.09 INCL TAX. UNCLEAR WHETHER OWNER REQUESTED NEW BATTERY ASIDE FROM I/M REPAIR. IF SO, I/M REPAIR COST \$54.96, INCL REINSP FEE.	•
5	A B	1.51	23.63 9.37		IDLE AND FAST IDLE SPEEDS HIGH. FAILED CO AT LANE - 4.5%. IDLE SPEED STILL A LITTLE HIGH. TIMING -5 DEG FROM SPEC, WAS +2 DEG FROM SPEC. NEW AIR FILTER IS NOT THE CORRECT SIZE. SERVICE STN GAVE ADJ FOR \$15.90.	
8	A B	1.36	23.10 13.13		EGR VALVE APPEARS TO BE STUCK. VALVES OUT OF ADJ. FAILED CO AT LANE - 5.27%, SPEC 1.5%. OWNER GOT CARB OVERHAUL IN VIRGINIA FOR \$223.98.	
14	Α	3.07	62.33	1.07	AIR PUMP SYSTEM DISABLED. BYPASS HOSE PLUGGED IN 2 PLACES. TIMING 4 DEGREES LOW, IDLE SPEED 350 HIGH. FAST IDLE SPEED LOW. FAILED AT LANE HC-448 (SPEC	
	В	2.29	50.21	1.61	300) AND CO-8.05%, (SPEC 1.5%). AIR SYSTEM STILL DISABLED. TIMING 4 DEGREES LOW. IDLE SPEED 90 RPM HIGH. MIXTURE CAP MSG. FAST IDLE SPEED LOW. EGR LINE DISCON. CAR GIVEN MINOR TUNE-UP TO PASS TEST. COST \$45.95.	;
17	A	2.24	23.49	2.54	NO STICKER FOR ENGINE FAMILY. HEATED AIR DOOR STUCK. IDLE SPEED +300 CHOKE RICH. CHOKE LIMITER ALTERED. TIMING +8 DEG OVER SPEC. PCV HOSE COLLAPSED. FAILED AT LANE HC-393.	
	В	3.07	34.20	2.28	NO SIGNIF CHANGES. OWNER SAID HE PUT IN NEW AIR FILTER, CLEANED UP HIS CAR, AND PASSED REINSP.	
19	A B	. 43 . 44	4.39 4.87		OK. CAR FAILED CO AT LANE ~ 2.76%. OWNER SPENT \$152.12 FOR TUNE-UP, BUT STILL FAILED CO AT LANE. OWNER REPORTED TRYING 3 TIMES AT THE LANE BEFORE HE PASSED.	
20	A	.57	8.80	.77	CO IS IN SPEC 2.0 + OR - 1.0 AT LAB. IDLE RPM 600 HIGH. CARB & FILTERS VERY	
	В	. 42	4.31	1.02	DIRTY, OIL LEAKAGE. FAILED CO AT LANE. OIL IS VERY DIRTY. ENGINE HAS MINOR OIL LEAKAGE. CARBURETOR IS SLIGHTLY DIRTY. FAST IDLE SPEED SPECIFICATIONS NOT AVAILABLE. IDLE SPEED 350 RPM HIGH. PAID ABOUT \$20, NOT INCLUDING A LOT OF MUFFLER WORK, FOR A RE-INSP AT A DC AMOCO STN. UNCLEAR IF ANY ADJ MADE.	
21	Α	1.41	9.71	2.31	BROKEN VAC LINE TO HAI SYSTEM. TIMING +4 DEG FROM SPEC. AIR FILTER VERY DIRTY. AIR PUMP DUMPS VERY SOON AT IDLE. FAILED AT LANE, HC-371 AND CO-1.9%.	
	В	1.53	9.50	1.81	AIR PUMP DUMPS VERY SOON AT IDLE. FAILED AT LANE, HC-3/T AND CO-1.9%.  AIR PUMP DUMPS CONTIN. EMISSIONS CLEAN WITH VACUUM APPLIED TO DIVERTOR. CAR  MAY HAVE IDLED TOO LONG. DELAY VALVE IN DIVERTOR BLEEDS DOWN. SERVICE STN  GAVE MINOR MAINT WITH NO APPARENT ADJUSTMENTS FOR \$31.90.	•

<sup>\*</sup> TEST SEQUENCE A IS OF THE VEHICLE IN THE CONDITION RECIEVED; SEQUENCE B IS OF THE VEHICLE AFTER COMMERCIAL REPAIR; SEQUENCE C IS OF THE VEHICLE AFTER REPAIRS DONE BY THE CONTRACTOR (IF ANY).

VEH#	TEST SEQ.	FTP HC	RESULTS CO	(g/mi) NOX	COMMENTS
22	A	1.38	15.79	1.81	ENGINE DOES NOT IDLE WHEN COLD. CHOKE NOT WORKING, NO FAST IDLE. IDLE CO HIGH ONCE, BUT LOW DURING SHORT TESTS. FAILED HC-582 AND CO-3.9% AT LANE. VEHICLE AT ONE TIME DID NOT HAVE A CATALYST IN IT AND OWNER USED LEADED FUEL, HAS CATALYST NOW.
	В	2.51	27.82	1.82	OWNER DID MINOR MAINT, BUT STILL FAILED INSP FOR 2 TRIES. THEN WENT TO AN AUTHORIZED REINSP GAS STATION AND WAS PASSED FOR \$30.18, BUT NO REPAIRS MADE.
24	A	.11	1.09	2.13	SEEMS OK. IDLE CO GENERALLY ONLY .02% ON SHORT TESTS. BUT SHOWED 1.3% AT LAB INSP. FAILED CO AT LANE-2.99%, LIMIT 1.5%. OWNER HAS HAD CATALYST REPLACED BY DEALER.
	В	. 10	. 99	2.04	OWNER SAID HE GOT AN ADJUSTMENT "SET TO SPEC" TO PASS - NO RECEIPT.
26	A	. 15	9.99	1.52	RPM 100 LOW. CO ON SHORT TESTS LOW, BUT ON UNDERHOOD INSP WAS 1.35%. FAILED CO AT LANE-1.8%.
	В	. 17	5.52	1.58	IDLE RPM VARIES FROM -50 TO +200 FROM SPEC. A DC AMOCO STN GAVE "ADJ CARB" & RE-INSP FOR \$29.10.
28	Α	.30	3.71	1.47	TIMING +4 DEG. IDLE EMISSIONS ALL LOW, EXCEPT DURING ECOMP INSP IN WHICH CO WAS 5%, APPARENTLY DUE TO LONG IDLE. FAILED AT LANE, CO-4.72%.
	В	.33	3.70	1.66	OWNER PAID \$16.00 FOR AN ADJUSTMENT, BUT NO ADJ APPEARS TO HAVE BEEN MADE. NOR WAS ONE NECESSARY.
29	A	. 65	12.17	1.82	IDLE MIXTURE IS TOO RICH. RPM +230. FAILED AT LANE HC-578 & CO-15%, LIMITS 300 & 1.5%.
	В	. 28	2.50	1.96	RPM +300, TIMING -2 DEG. TUNE-UP FOR \$112.27 BY GARAGE IN DC (INCLUDES ABOUT \$25 OF OTHER).
39	A B	.74	2.64		IDLE SPEED +100. EGR VALVE STUCK. FAILED AT LANE, HC - 448 PPM.
	В	. 63	3.76	3.26	CAR IS CLEAN. OLDS DLR SET ENG TO SPEC & ADJ CARB, LUBED EGR VALVE WHICH WAS STICKING. NO COST INFO.
40	A	1.12	9.34	1.26	NO BUILD DATE AVAILABLE. TIMING 9 DEG LOW, ONE VAC LINE DAMAGED, CARB AND PCV SYSTEM VERY DIRTY. FAILED HC AT LANE-495.
	В	1.26	12.02	1.81	CARB TOO LEAN OR VACUUM LEAK SOMEPLACE. OWNER PAID \$185.82 TO OVERHAUL CARB AND ADJ.
41	A	1.69	34.82	1.41	NO BUILD DATE AVAILABLE. SPARK PLUGS INCORRECTLY GAPPED AND WORN. MIXTURE PLUGS ARE PUNCHED OUT. AIR CONDITIONER COMPRESSOR DRIVE BELT BROKE. RPM +160. ALL IDLE EMISSIONS HIGH, OFF-IDLE LOW. SEC VAC BREAK RICH. FAILED AT LANE CO-5.75%, LIMIT 1.5%.
	8	.91	6.23	1.67	NO BUILD DATE AVAILABLE. NO LEAD SAMPLE FOR FUEL. RPM +300. OWNER PAID \$87.00 FOR UNKNOWN REPAIRS.
42	A	2.19	36.13	3.17	TIMING 4 DEG LOW, PRIMARY VAC BREAK RICH, CHOKE VAC DIAPHRAGM LEAKS. FAILED AT LANE HC-687 AND CO-15%, NO RECEIPT.
	В	3.06	51.31	3.04	PCV CRACKED. EGR APPEARS STUCK. OWNER WENT TO 2 STNS FOR TUNE-UP. REPAIRS WERE PAID ABOUT \$100. WAS PASSED BY A THIRD STATION.

3

VEH#	TEST SEQ.	FTP HC	RESULTS CO	(g/mi) NOX	COMMENTS
43	Α	2.41	57.89	1.43	EVAP VENT LINE DAMAGED. PCV AND OTHER HOSES OIL SOAKED OR HEAT HARDENED. ONE SIDE OF AIR SYSTEM DISABLED. ENGINE IDLE SPEED IS ERRATIC, TIMING +5 DEG. FAILED AT LANE CO-5.92%.
	8	1.32	11.55	4.97	AIR FILT ELEM DIRTY. IDLE MIXT PLUGS PUNCHED OUT. SPARK PLUGS WORN. DIVERTER VALVE IS LEAKING VAC CHECK VLV MISSING. TMG ERRATIC (POSSIBLE). TMG CHAIN PROB. IDLE SPD +500. CHEVY DLR REPL CANNISTER & MISC FOR \$93.65 AND SERV STN
	С	.52	3.05	1.85	GAVE REINSP & CARB ADJ (?) TIMING IS TOO ERRATIC TO MEASURE. DLR REPL AIR PIPE & CHK VALVE FOR \$58.69. AT LAB DIRECTION & LAB RECONN AN EGR HOSE.
46	A	1.39	22.03	3.28	FUEL ANALYSIS NOT AVAILABLE. TIMING 2 DEG LOW, FAST IDLE HIGH. FAILED CO AT LANE 1.62%.
	В	1.30	16.87	3.11	PCV VALVE DIRTY. PCV HOSES ARE OIL SOAKED AND HARD. EVAP CANISTER FILTER IS DIRTY. CARB FLOAT BOWL HOSE TO CANISTER IS OFF. COOLANT LEVEL LOW. EGR VALVE AND INTERNAL BACK PRESSURE TRANSDUCER NOT WORKING. INIT TIMING IS 2 DEG RETARDED. GULF STN DID UNKNOWN REPS FOR \$123.
	С	1.09	7.38	2.11	CATALYST LKS ON BOTTOM. EXCESSIVE EXTERNAL OIL LEAKAGE. REPL PCV VALVE. REPLACED PCV HOSES. REPLACED EVAPORATIVE CANISTER FILTER. REPLA EGR VALVE. RECONNECTED CANISTER FLT BOWL HOSE. FILLED COOLANT TO PROPER LEVEL. ADJ INITIAL TIMING TO 8 DEG BTDC.
47	A	3.23	82.40	1.13	IDLE MIXTURE TOO RICH. FUEL ANALYSIS NOT AVAILABLE. TIMING 4 DEG LOW. MIXTURE LIMITER MISSING. FAILED CO AT LANE -4.9%, PASSED HC AT 262 PPM.
	В	.55	9.09	1.56	IDLE MIXTURE PLUGS BROKEN OUT. CARBURETOR FLOAT BOWL VENT HOSE IS DETERIORATED FAST IDLE SPEED GREATER THAN SPEC. IDLE CO LEAN. IDLE SPEED +100. CAD DLR ADJ CARB, TIMING, CHOKE FOR \$120.75.
48	A	.94	2.29	2.70	DISTRIBUTOR BOLT LOOSE. PCV HOSE HEAT HARDENED. IGNITION TIMING VARIABLE DUE TO DISTRIBUTOR BOLT LOOSE, CHOKE DIAPHRAGM LEAKS. FAILED HC - 1739 AT LANE.
	В	. 64	2.69	1.60	HEATED AIR DUCT DAMAGED. CARB EXCEPTIONALLY DIRTY. IDLE MIX PLUGS PUNCHED OUT. EFE VLV IS FROZEN. PCV VLV EXCEPTIONALLY DIRTY. OIL LEAKAGE UNDER CAR. INIT TMG IS 14 DEG RETARD. DIST HOLD DOWN BOLT IS LOOSE. FAST IDLE SPEED IS GRTR THAN SPEC. PLUMBTESMO POSITIVE. DEALER DID REPS FOR \$38.
49	Α	2.03	33.30	1.92	ALL IDLE CONDITIONS SHOW HIGH HC & CO, OFF IDLE OK. IDLE MIXTURE LIMITER MISSING. FAILED HC & CO AT LANE.
	В	1.57	22.68	1.80	CARB IS SLIGHTLY GUMMED UP. IDLE MIXTURE SCREWS ARE UNCAPPED. SECOUNDARY VACUUM BREAK DIAPHRAGM IS LEAKING. FAST IDLE SPEED LOWER THAN SPECIFIED. EXXON STN GAVE TUNE-UP FOR \$47.70.
51	A	3.38	75.00	3.22	CARBURETOR ASSEMBLY IS LEAKING FUEL. VACUUM ADVANCE DIAPHRAGM LEAKS. PCV FILTER MISSING. OIL IS EXCEPTIONALLY DIRTY. COOLANT LEVEL EXCEPTIONALLY LOW. FAST IDLE SPEED LOW. IDLE SPEED -160. TIMING +3 DEG. FAILED HC:900 & CO:15% AT LANE.
	B C	1.93 1.57	50.33 51.88	3.04 2.38	OWNER PAID \$36.99 FOR CARB ADJ & RE-INSP AT TIRE DLR. INSTALLED NEW CARB AND AIR FILTER.
52	Α	1.06	23.16	2.70	AIR CLEANER TEMP SENSOR DEFECTIVE. IDLE MIXTURE LIMITING DEVICE IS MISSING. SPARK PLUGS ARE WORN. OIL LEVEL EXCESSIVELY LOW. ENGINE COOLANT RUSTY. FAST IDLE SPEED GREATER THAN SPEC. IDLE SPEED IS +120 RPM. FAILED CO AT LANE:7.08%.
	В	1.20	28.75	2.69	HOSE OFF EGR TVS. TIMING -3 DEG, IDLE RPM +100, CARB RICH. FORD DLR GAVE CARB OVERHAUL. TUNE-UP AND RE-INSP FOR \$333.05.

PAGE 8-3

VEH#	TEST SEQ.	FTP HC	RESULTS CO	(g/mi) NOX	COMMENTS	PAG
102	A B	2.22 1.49	27.48 18.97		AIR BYPASS/DIVERTOR VALVE STUCK. FAILED AT LANE, HC-735, CO-11%. THE DIVERTOR VALVE DUMPS OFF IDLE CONTINOUSLY, MAY BE ELECTRICAL OR COMPUTER BOX. MAY HAVE DAMAGED CONVERTOR. I CAN HEAR DUMPING, SHOULD NOT HAVE BEEN DIFFICULT TO CORRECT. OWNER GOT TUNE, NEW EGR, AND REBUILT CARB BY 2 PLACES FOR TOTAL \$278.34.	
103	A B	1.48 2.88	14.00 93.86	1.58 1.38	CHOKE MALADJUSTED RICH. FAILED CO AT LANE AT 2.25%. CHOKE IS RIVETED AND CANNOT BE SET. CODES 24 AND 35 SET. MIXTURE SOLENOID GOING RICH. OWNER SPENT \$350.99 ON TWO TUNE-UPS, CARB OVERHAUL.	
104	A	. 38	5.19	2.78	IDLE SPEED 200 RPM HIGH. TIMING +6 DEG OVER SPEC. IDLE MIX LIM DEVICE ALTERED. CHOKE VAC HOSE DISCONNECTED. EGR TVS DISCONNECTED & HOSES MISROUTED. FAILED HC AT 671 AND CO AT 13% AT LANE.	
	В	. 27	3.25	2.54	HEATED AIR DOOR TEMP SENSOR INOP BY VAC LINE PLUGGED. IDLE SPEED STILL HIGH. TVS VAC LINE TO CHOKE PRIMARY VAC BREAK AND EGR STILL DISABLED. TIMING STILL HIGH. BUICK DEALER REPLACED ECM. SAYING CODE 54&55 DISPLAYED, NO APPARENT CHAR	GE.
	С	. 25	3.12	1.47	FIXED TVS SO EGR AND CHOKE WORKING.	
105	Α	1.16	14.42	1.19	IDLE MIXTURE RICH. COOLANT TEMP SENSOR HAS BAD CONNECTION. FAILED AT LANE HC-445 (SPEC 300), AND CO 4.06% (SPEC 1.5%).	
	В	.97	13.14	1.19	TIMING AND IDLE SPEED MEASURED DIFF THAN BEFORE BUT NO APPARENT ADJUSTMENTS WERE MADE BY GARAGE. SERV STN CHG \$11.13 FOR REINSP.	
108	Α	.39	6.70	. 35	NO EMISSION LABEL. ALL ELSE OK. IDLE SPEED +180, TIMING -3 DEG FAILED CO AT	
	В	. 34	5.60	. 34	LANE - 4.88%. NO LABEL. IDLE SPEED AND TIMING SAME. DEALER IN D.C. CLEANED CARB AND TUNED ENG FOR EST \$186.04.	
109	Α	10.30	179.85	.73	CODE 13 - POSSIBLE O2 CIRCUIT RICH. EGR VALVE APPEARS TO BE STUCK. AIR FILTER VERY DIRTY. HIGH CO AT ALL CONDITIONS. OWNER REPORTEDLY HAD A DEALERSHI	Ρ
	В	1.80	10.93	2.21	TUNE-UP WITHIN LAST 3 MONTHS FOR \$125.00. FAILED AT LANE HC-799 & CO-8.44%. OK. OWNER REPORTED HAVING NEW EGR INSTALLED, CARB OVERHAULED & MAJOR TUNE-UP BY SAME DEALER.	
111	Α	. 31	5.11	1.60	MIXT LIM DEVICE BROKEN. IDLE CO GOES RICH AFTER SHORT IDLE PERIOD. TIMING -4 DEG FROM SPEC. EGR VAC LINE PLUGGED. AIR DOWNSTREAM AIR LINE KINKED. OIL 1 1/2	!
	8	. 29	2.13	1.47	QTS HIGH. FAILED CO AT STATE LANE AT 4.76%. CHOKE IS RIVETED AND CANNOT BE SET. AIR AND EGR HOSES SAME CONDITION. GOT TWO TUNE-UPS FOR \$83.75.	
115	A	.53	19.87	1.32	BUILD DATE NOT AVAILABLE. CODES 34, 35 & 55 STORED. FAILED CO AT LANE-4.64%,	
	В	. 49	18.76	1.53	LIMIT 1.5%. CHOKE NON-ADJUSTABLE, RIVETED. SAME CODES STILL STORED, IDLE CO VARIES, SOMETIMES LOW, SOMETIMES HIGH. PAID \$99.37 FOR A TUNE-UP & RE-INSP AT A DC EXXON STN.	
120	A	.46	8.60	1.61	IDLE MIXT LIM ALTERED. IDLE SPEED +400. IDLE CO MEASURED HIGH DURING UNDERHOOD	<b>,</b>
	В	. 48	8.29	1.81	INSP, BUT VERY LOW DURING SHORT TESTS. FAILED CO AT LANE. IDLE SPEED +700 NOW. DEALER PERFORMED 36K MAINTENANCE INTERVAL BUT ONLY APPEARED TO ADJUST THE IDLE SPEED, COST \$75.87, AND GAVE CAR REINSP TO PASS.	

VEH#	TEST SEQ.	FTP HC	RESULTS CO	(g/mi) NOX	COMMENTS	PAGE B-5
121	A	. 22	2.76		RPM +250. TIMING +6 DEG. EMISSIONS VERY LOW ON ALL SHORT TESTS, BUT FAILED AT LANE. HC-499, LIMIT 300.	
	В	. 26	3.19	.77	RPM & TIMING SAME. SEARS GAVE ENGINE DIAGNOSIS AND TUNE-UP FOR \$69.90.	
124	A B	3.68 2.94	27.44 28.11	2.67 1.92	IDLE SPEED +180, AIR BYPASS VALVE STUCK. FAILED HC-1105 AND CO-3.87% AT LANE. FAST IDLE SPEED GREATER THAN SPECIFIED. DUMP VALVE NOT OPERATING CORRECTLY. TIMING IS ADVANCED 10 DEG. IDLE CO TOO RICH. MECHANIC INDICATES PROBLEM WITH COMPUTER SYSTEM, WILL NOT DO THIRD SEQUENCE. FORD DEALER CHG \$136.38 FOR EMISSIONS TEST AND NEW FUEL PUMP.	
126	A B	2.11 2.06	51.09 54.05	1.59 .43	IDLE SPEED +200, RICH IDLE CO. OIL ONE QUART LOW. PCV FILTER DIRTY. GULF STN IN VA CHG \$20.00 FOR "CLEAN CARB & ADJ TMG". IDLE & FTP EMISSIONS SAME.	
127	A B	.52 .77	10.96 17.22	.31 .30	EGR VALVE STICKING IN OPEN POSITION. IDLE SPEED +600. FAILED CO AT LANE. O2 SENSOR MAY BE FAULTY, BUT NO CODES STORED. OWNER GOT UNKNOWN REPAIRS FOR ABOUT \$20.	
130	A	1.24	11.82	. 62	WORN CAP, ROTOR, PLUGS. TIMING +7 DEG. EGR DIAPHRAGM LEAKS. AIR BYPASS VALVE STUCK. PCV VALVE & FILTER DIRTY. NO LANE TICKET. PROBABLY FAILED BOTH HC & CO.	
	В	.97	11.96	.57	RPM +160, TIMING -2 DEG. CAR NEEDS THE RESTART IDLE TEST, OTHERWISE HIGH IDLE HC & CO. OWNER GOT MINOR TUNE-UP FOR ABOUT \$37.	
131	A	.85	14.30	.38	IDLE MIXTURE TOO RICH AT IDLE. CHOKE LIM DEVICE ALTERED. TIMING 8 DEG BELOW SPEC. OZ SENSOR SEEMS TO BE PEGGED LEAN AT IDLE, CAUSING RICH MIXT. OWNER HAD CARB OVERHAULED RECENTLY. FAILED CO AT LANE-4.26%, LIMIT 1.5%.	
	В	.34	6.27	. 42	OIL LEVEL LOW. SEARS DID AN "ENGINE DIAGNOSIS", BUT UNCLEAR WHAT WAS DONE. NO CHARGE BEC SEARS RECENTLY DID SOME WORK. EMISSIONS LOW NOW. NO CHANGE TO TIMING OR IDLE SPEED.	
133	A	1.16	19.92	. 73	IDLE RPM +500. TIMING 6 DEG LOW. AIR BYPASS DIVERTER VALVE STUCK. FAILED HC-609 AND CO-6.48% AT LANE, LIMITS 300 & 1.5%	
	В	.96	14.65	. 75	COOLANT SLIGHTLY RUSTY. OIL IS SLIGHTLY OVERFULL. CARBURETOR HAS GUM DEPOSITS ON THE EXTERIOR EVAPORITIVE FAMILY IS EQ. EMISSIONS ARE STILL VERY HIGH. NO APPARENT CHANGES MADE. AMOCO STN DID "SERVICE CARB & ADJ TO PASS", PLUS OIL CHG, FOR \$64.11.	
134	A	1.57	38.31	. 67	RPM +200. TIMING +3 DEG. RICH IDLE CO. IDLE LIMITER DISABLED. CHOKE VAC DIAPHRAGM LEAKS. PLUGS WORN. FAILED CO AT LANE-4.59%, LIMIT 1.5%.	
	В	1.07	19.95	. 65	ENGINE IDLE SPEED IS NON-ADJUSTABLE. RPM +100, TIMING +3 DEG. A TUNE-UP PLACE IN DC GAVE "ADJ CARB" & RE-INSP. FOR \$31.75.	
135	A	. 16	1.51	.94	ADDED TWO QUARTS OF OIL. NO BUILD DATE AVAILABLE. CAR FAILED AT LANE HC-146 AND CO-15.0%, BUT ALL EMISSIONS AT LAB VERY LOW.	
	В	. 38	4.63	. 9 1	DEALER GAVE AN EMISSIONS CHECK AT NO CHARGE. PASSED AT LANE.	
139	Α	. 45	6.19	1.02	MIXTURE IS RICH, FUEL ANALYSIS NOT AVAILABLE. MIXTURE LIMITER ALTERED. IDLE SPEE +300, TIMING +5 DEG. FAILED AT LANE HC-409 AND CO-12.3%.	
	В	. 27	2.87	1.03	IGNITION TIMING IS 7 DEG RETARD. IDLE SPEED IS +240. OWNER WENT TO DLR TWICE BEFORE PASSING AT LANE. GOT CARB OVERHAUL & MISC TUNE-UP WORK FOR \$200.	

VEH#	TEST SEQ.	FTP HC	RESULTS CO	(g/mi) NOX	COMMENTS	PAGE B-6
144	A B	.37 .37	10.87 9.08		NO APPARENT PROBLEMS. ALL SHORT TEST EMISSIONS LOW. FAILED CO AT LANE - 4.29%. CARBURETOR VENTURI HAS DIRT ON WALLS. IDLE ADJUSTMENT LIMITING DEVICE BROKEN, (PLUG REMOVED). IGNITION TIMING IS 2 DEG LOW. PLUMBTESMO SHOWS VERY SLIGHT AMT OF PINK. CHEV DEALER CHECKED EMISSIONS, LOW, NO CHG & NO REPAIRS.	
	С	.34	8.69	. 45	IDLE MIXTURE SCREW TURNED IN TO BRING MIXTURE SOLENOID DWELL TO 30 DEG. PULSE AIR SYSTEM NOT WORKING PROPERLY.	
145	A B	. 29 . 30	5.52 4.57		CARB VERY DIRTY, PLUGS WORN. ALL SHORT TESTS LOW. FAILED AT LANE HC-470. IDLE SPEED IS SLIGHTLY HIGHER THAN SPECIFIED, (+70). OWNER REPORTED PAYING	
					\$150 FOR TUNE-UP.	*
146	A	.54	4.75	. 36	ALTERNATOR BELT WORN. IDLE SPEED +125. NO FUEL LEAD ANALYSIS AVAILABLE. IDLE CO RICH DURING UNDER-HOOD INSP. BUT LOW ON SHORT TESTS. FAILED LANE, CO-5.23%.	
	В	.36	4.50	. 41	ENGINE CURB IDLE SPEED +150. GULF STN DID "LOW EMISSION TUNE", PLUS SCOPE, CLEAN CARB FOR \$128.	
156	A	. 45	3.37	. 43	IDLE MIXTURE LIMITING DEVICE PLUG HAS BEEN PUNCHED OUT. SPARK PLUGS SOOTY. PCV FILTER DIRTY. OIL 1/2 QUART LOW. DUMPS AIR TO ATMOSPHERE AT PROLONGED IDLE. FAILED HC-576 PPM & CO-4.42% AT LANE.	
	В	. 43	3.69	.77	FAST IDLE SPEED LOWER THAN SPEC. IDLE SPEED +250. TIMING IS 8 DEG RETARDED. TIRE STORE ADJ CARB & REINSP FOR \$35.51.
