This report is issued by the Environmental Protection Agency to report technical data of interest to a limited number of readers. Copies are available free of charge to Federal employees, current contractors and grantees, and nonprofit organizations - in limited quantities - from the Library Services Office (MD35), Research Triangle Park, North Carolina 27711; or, for a fee, from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161.

Publication No. EPA-450/2-76-007

ABSTRACT

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of The Clean Air Act, as amended 1970, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.7. Summary data are presented for the nation as a whole, for individual states, for intrastate and individual interstate portions of Air Quality Control Regions, and for total interstate Air Quality Control Regions.

The data compilations presented result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711.

ACKNOWLEDGMENT

The adequacy of the content and the timeliness of publication of this series of reports are the result of the generous cooperation and diligent efforts of personnel at all levels of government and in industry. In that their participation has greatly enhanced the overall effort to achieve national air standards, especial gratitude is extended to each.

1973

NATIONAL EMISSIONS REPORT

INTRODUCTION

The National Emissions Report summarizes estimates of emissions in 1973, by source category, of criteria pollutants; that is, those air pollutants for which national standards have been promulgated. The criteria pollutants are particulates, sulfur oxides (SO_x), nitrogen oxides (NO_x), hydrocarbons (HC), and carbon monoxide (CO). The reports are compiled from information contained in the National Emissions Data System (NEDS) on emission sources. Compilations of emission data are presented for the nation as a whole, for individual states, for intrastate Air Quality Control Regions (AQCRs), for respective state portions of interstate AQCRs, and for interstate AQCRs. This annual report represents the best available indicators of national emissions for the calendar year 1973. The estimates reported are based on emission-source records contained in NEDS as of December 6, 1975. State-submitted Semiannual Reports that were successfully updated to NEDS files prior to this date are included. Thus, the data are generally comparable to data collected for the development of State Implementation Plans (SIPs), but include revisions and updates where they are available. These data are subject to validation as indicated below.

EMISSIONS INVENTORY

A considerable amount of detailed information concerning sources and their operations is needed for the development of the emissions inventory by which the impact of source emissions on an area's air quality can be assessed at the state or local level. The NEDS, operating through the EPA Office of Air Quality Planning and Standards (OAQPS), processes source and emissions information for the whole nation. Since NEDS operations were initiated in 1971, the National Air Data Branch (NADB) of OAQPS and EPA Regional Offices have been engaged actively in the collection and analysis of air pollutant emissions. A detailed description of the NEDS and of its methodology for compiling an emissions inventory is available

in OAQPS Guideline AEROS Manual Series, Volume II: AEROS Users Manual (OAQPS No. 1.2-039). Brief discussions of the NEDS basic elements, used for the generation of the National Emissions Reports, are given below.

NEDS POINT SOURCE FILE

The NEDS point-source file contains data concerning stationary facilities that are individual emitters of relatively large quantities of one or more air contaminants. Nearly all point-source data originate at state air pollution control agencies. A point-source is defined for state reporting purposes as a facility at which the potential for annual emission of any one criteria pollutant equals or exceeds 100 tons per year. Potential emissions are defined as the emissions that would occur if existing emission control equipment were removed or deactivated. In general, individual emission points are defined within such a facility to represent the emissions from individual stacks and processes. Emitting points may exist at a facility that individually have potential emissions of fewer than 100 tons per year, but emissions from such points are included in NEDS if the criterion of potential emissions of 100 tons per year for the entire facility is met. Data for other facilities, regardless of potential emissions, may also be included if reported from state files. Data on facilities and sources as described comprise the NEDS point-source file.

At the present time, NEDS contains data from approximately 93,000 emitting points at 34,000 facilities in all states, the District of Columbia, and three territories. Considerable information is stored for each point source. For example, NEDS stores data on annual operating rates or activity levels of a process (that is, amount of fuel consumed by a boiler, quantity of product produced by an industrial process, or some comparable measure). Information identifying existing air pollution control devices and their efficiencies is also recorded. These and similar data are subsequently used to determine source emissions according to the procedures outlined in the following discussion of the NEDS emission factor file.

NEDS point-source data are reviewed continually through extensive and cooperative efforts by the National Air Data Branch, the EPA Regional Offices, and the state and local air pollution control agencies. The original acquisition of data from state records and the conversion of those data to the NEDS format

were accomplished primarily through EPA internal and contractual efforts. Under provisions of the Clean Air Act and SIP requirements, state agencies must submit revised source data in NEDS format to EPA semiannually for (1) each source achieving final compliance with a SIP emission-limitation regulation or strategy; (2) each new or modified source receiving approval to begin construction or operation; and (3) each source that terminated operations during a reporting period. Thus, the basic data of the NEDS are revised and updated periodically and reflect achievement progress of the SIPs.

The point source file contains the data reported to NEDS by the state air pollution control agencies. Some states still rely on manual procedures for maintenance of their own source/emissions files. The majority of states have installed or are in the process of installing automated data systems and EPA has assisted many of the states in these efforts. The most common system in use is an EPA-designed and maintained system, the Emission Inventory/Permits and Registration Subsystem (EIS/P&R) of the Comprehensive Data Handling System (CDHS). EIS/P&R has the capability to output data in NEDS format for reporting to EPA. A similar capability exists for a number of state-designed and maintained systems. Data can be easily reported to NEDS by means of data format conversion programs. At the time of preparation of this report, data for the State of New York had not been completely converted to NEDS from state data files because of the complexity of conversion involved. Thus, the data reflected in this report for New York represent only a small portion of the point source data in the state files. During 1976 substantial additional data will be submitted to NEDS to upgrade the point source file for New York. In addition, no point source data have been submitted to NEDS for American Samoa. Based on the implementation plan for American Samoa, it is expected that point source emissions are very small, however.

NEDS AREA SOURCE FILE

Area sources are all emission sources not identified as point sources. For example, the NEDS area-source file contains data on all mobile sources (motor vehicles, aircraft, railroads, etc.); small stationary sources; and miscellaneous sources such as forest fires, agricultural burning, and retail gasoline-marketing operations. Unlike data for point sources, however, data for each of these small individual sources are not stored in NEDS. Rather, estimates of total emission

levels for specific categories of area sources are stored for individual geographic areas. Generally, data relevant to area source emissions (for example, total amount of gasoline consumed by all motor vehicles) are grouped for each of the approximately 3100 counties or county equivalents in the United States. Area source data are developed primarily from reports published by other Federal agencies and, when possible, from valid data collected by state air pollution control agencies. Detailed procedures for the determination of levels of area-source activity are discussed in AEROS Manual, Volume II (OAQPS No. 1.2-039). Under current SIP requirements, states are not required to submit area-source data to EPA. Therefore, area-source data are updated annually by NADB; states are given the opportunity, however, to review the EPA-generated area-source data for accuracy and completeness. In addition, a number of state agencies have voluntarily submitted their own area-source data for inclusion in NEDS. These data are reviewed for consistency with the NEDS point-source data and are added to the NEDS file if they are acceptable for inclusion.

NEDS EMISSION FACTOR FILE

In normal NEDS operations, new source emissions are calculated automatically via computer program based on the data previously stored in point- and area-source files. The principal vehicle for these calculations is the NEDS emission factor file. An emission factor is a statistical average--a quantitative estimate--of the rate at which a pollutant is released to the atmosphere (as a result of an activity such as combustion or industrial production) divided by the level of that activity. Thus, an emission factor relates the quantity of pollutants to an indicator of activity such as production capacity or quantity of fuel burned. Because factors are statistical averages, they are not necessarily precise indicators of emissions from an individual source. When they are applied to a large number of sources, however, a reasonable estimate of total emissions can be obtained. In general, the larger the sample, the lower the percentage of error. Therefore, for the entire nation, an emission estimate based on emission factors may be quite precise, but for smaller geographic areas the percentage of error increases. Emission factors are usually determined from results of source tests in which quantities of air pollutants are measured from specific processes. Emission factors may also be determined from process material balances and engineering appraisals of particular processes. A collection of derived emission factors is given in Compilation of Air Pollutant Emission Factors (U.S. Environmental Protection Agency, Research

Triangle Park, N.C. Publication No. AP-42. March 1975) and its supplements.

The emission factors in AP-42 and associated data maintained by NADB are related to the activity levels for sources covered by NEDS. Area-source emission factors are designated for each area-source category represented in NEDS. The emissions are determined by multiplying the appropriate emission factor by the activity level recorded.

Similarly, point-source emission factors are related to point-source activity levels through the NEDS Source Classification Code (SCC) determined and recorded for each point source. These codes give specific identification of the source (that is, industrial coal-fired boiler, solid-waste incinerator, gray-iron cupola, etc.) and define the units of the activity level recorded in the point-source file. Appropriate emission factors are designated for each SCC and are multiplied by the activity level to calculate the emissions. Where a control device is indicated in the point-source file, the given control device efficiency is included in the emission calculation so that estimated actual emissions are computed for all sources. Additionally, provision is made for the direct recording of emissions determined by stack tests or engineering material balances for specific sources. It is assumed that the determination of emissions by these latter methods provides a more precise estimate than the calculation of emissions by the application of an emission factor. Further, when the point-source file indicates that the recorded emission estimates were determined by a source test or material balance, the computer program that calculates emissions will substitute these data for emission estimates that were calculated through the use of factors.

Some SCCs do not have corresponding emission factors in the NEDS emission-factor file. These SCCs are general in nature (that is, termed miscellaneous or unspecified) and are used for the categorization of point sources that are otherwise not classifiable. A source will fall in these categories when (1) no emission information is available; (2) the source is inadequately identified; or (3) the source is unique, or nearly unique, and therefore cannot be assigned a specific SCC.

Some of the sources in such miscellaneous categories are subjected to engineering analysis and assumptions of emissions are derived. The resulting emission estimates are incorporated into the point-source file and carry the same weight as calculated emission estimates. The National Emission Reports are based on all emissions estimates in the NEDS point source file, however derived.

The error caused by having no estimates for some point sources and "guess" estimates for a few others is insignificant when emissions are summarized for the nation as a whole; but that error may be fairly sizable for local areas in which a number of point sources could not be assigned a specific SCC. All the evidence suggests that the problem of missing emission estimates for a few point sources is not major when considered in relation to (1) potential imprecision introduced through an application of emission factors to specific point sources; or (2) the imprecision introduced through the calculation of area-source activity levels for small geographic areas.

TABULATED DATA

Nationwide emissions of the five criteria pollutants in 1973 are summarized by emission source category in the first table (page 1) of this report. The second group of tables presents a summary of air pollutant emissions for that year in individual states, in intrastate AQCRs, and in the portions of interstate AQCRs within each state. Air pollutant emissions data for each interstate AQCR are presented in the third group of tables.

ADJUSTMENTS TO GRAND TOTAL (1973)

The United States summary contained herein does not reflect certain source categories and data deficits. For a more accurate picture of the nationwide emissions, the following additions to the grand total should be considered part of the United States summary.

Category	Emissions, tons/yr				
	Particulates	SO_x	NO_x	HC	CO
New York industrial processes	113,000	21,000	2,100	43,000	6,000
Forest wild fires	157,000	0	36,000	222,000	1,291,000
Agricultural burning	124,000	0	15,000	146,000	730,000
Structural fires	38,000	0	3,700	10,000	87,000
Coal refuse fires	110,000	141,000	34,000	68,000	340,000

16. ABSTRACT

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U. S. Environmental Protection Agency under provisions of Section 110 of The Clean Air Act, as amended 1970, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.7. Summary data are presented for the nation as a whole, for individual states, and for Air Quality Control Regions and individual interstate portions thereof.

The data compilations result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U. S. Environmental Protection Agency, at Research Triangle Park, North Carolina 27711.
