

Source Assessment: Noncriteria Pollutant Emissions (1978 Update)

RESEARCH REPORTING SERIES

Research reports of the Office of Research and Development, U.S. Environmental Protection Agency, have been grouped into nine series. These nine broad categories were established to facilitate further development and application of environmental technology. Elimination of traditional grouping was consciously planned to foster technology transfer and a maximum interface in related fields. The nine series are:

1. Environmental Health Effects Research
2. Environmental Protection Technology
3. Ecological Research
4. Environmental Monitoring
5. Socioeconomic Environmental Studies
6. Scientific and Technical Assessment Reports (STAR)
7. Interagency Energy-Environment Research and Development
8. "Special" Reports
9. Miscellaneous Reports

This report has been assigned to the ENVIRONMENTAL PROTECTION TECHNOLOGY series. This series describes research performed to develop and demonstrate instrumentation, equipment, and methodology to repair or prevent environmental degradation from point and non-point sources of pollution. This work provides the new or improved technology required for the control and treatment of pollution sources to meet environmental quality standards.

EPA REVIEW NOTICE

This report has been reviewed by the U.S. Environmental Protection Agency, and approved for publication. Approval does not signify that the contents necessarily reflect the views and policy of the Agency, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

This document is available to the public through the National Technical Information Service, Springfield, Virginia 22161.

Source Assessment: Noncriteria Pollutant Emissions (1978 Update)

PREFACE

The Industrial Environmental Research Laboratory (IERL) of the U.S. Environmental Protection Agency (EPA) has the responsibility for insuring that pollution control technology is available for stationary sources to meet the requirements of the Clean Air Act, the Federal Water Pollution Control Act, and solid waste legislation. If control technology is unavailable, inadequate, or uneconomical, then financial support is provided for the development of the needed control techniques for industrial and extractive process industries. The Chemical Processes Branch of the Industrial Processes Division of IERL has the responsibility for investing tax dollars in programs to develop control technology for a large number of operations (more than 500) in the chemical industries.

Monsanto Research Corporation (MRC) has contracted with EPA to investigate the environmental impact of various industries which represent sources of pollution in accordance with EPA's responsibility as outlined above. Dr. Robert C. Binning serves as MRC Program Manager in this overall program entitled "Source Assessment," which includes the investigation of sources in each of four categories: combustion, organic materials, inorganic materials, and open sources. Dr. Dale A. Denny of the Industrial Processes Division at Research Triangle Park serves as EPA Project Officer. Reports prepared in this program are of three types: Source Assessment Documents, State-of-the-Art Reports, and Special Project Reports.

Source Assessment Documents contain data on emissions from specific industries. Such data are gathered from the literature, government agencies, and cooperating companies. Sampling and analysis are also performed by the contractor when the available information does not adequately characterize the source emissions. These documents contain all of the information necessary for IERL to decide whether emissions reduction is required.

State-of-the-Art Reports include data on emissions from specific industries which are also gathered from the literature, government agencies, and cooperating companies. However, no extensive sampling is conducted by the contractor for such industries. Results from such studies are published as State-of-the-Art Reports for potential utility by the government, industry, and others having specific needs and interests.

Special projects provide specific information or services which are applicable to a number of source types or have special utility to EPA but are not part of a particular source assessment study. This special project report, "Source Assessment: Noncriteria Pollutant Emissions," was prepared to provide an updated listing of the mass emissions of each of 389 noncriteria pollutants from various stationary sources.

ABSTRACT

This report provides a listing of stationary source types that emit each of 389 noncriteria pollutants. Quantities of such emissions are also indicated. A source type is defined as a group of emission sources which have the same process and emission characteristics.

The listing was prepared using a computerized data base established for emissions of air pollutants from approximately 800 stationary source types in the combustion, organic materials, inorganic materials, and open source categories. Emissions included in the data base consist of criteria pollutants (i.e., particulates, sulfur dioxide, nitrogen oxides, hydrocarbons, and carbon monoxide) and noncriteria pollutants (such as trace metals and polycyclic organic matter). The data base is updated continuously to incorporate related new findings and covers a large number of source types; however, it is not an exhaustive list of all stationary emission points in the United States.

This report was submitted in partial fulfillment of Contract 68-0268-02-1874 by Monsanto Research Corporation under the sponsorship of the U.S. Environmental Protection Agency. This updated listing, prepared during the period April-July 1978, supersedes a document of the same title published in July 1977 (EPA-600/2-77-107e).

SECTION 1

INTRODUCTION

During the performance of the Source Assessment Program for EPA on Contract 68-02-1874, a computerized data base was established for emissions of air pollutants from approximately 800 stationary source types in the combustion, organic materials, inorganic materials, and open source categories. A source type is defined as a group of emission sources which have the same process and emission characteristics; e.g., rubber processing, beef cattle feedlots, etc. Emissions included in the data base consist of criteria pollutants (i.e., particulates, sulfur dioxide, nitrogen oxides, hydrocarbons, and carbon monoxide) and noncriteria pollutants (such as trace metals and polycyclic organic matter).

The data base is updated continuously to incorporate related new findings from the investigation of individual emission source types on this program. Although the data base covers a large number of source types, it is not an exhaustive list of all stationary emission points in the United States. The source list was selected to cover over 90% of the emissions in those areas under the original jurisdiction of EPA's Chemical Processes Branch at IERL-RTP. In other areas, such as metallurgical processes, some additional source types were later added to the data base to provide a better coverage of national emissions. However, this coverage is by no means as complete as that for the four categories selected for intensive study.

Using the data base described above, this report was prepared to provide the mass emissions of each of 389 ncriteria pollutants from various stationary source types. The report also shows the relative importance of source types in terms of their contribution to the total national emissions of a particular noncriteria pollutant.

Emissions reports for compounds of trace metals (e.g., cerium, molybdenum, rhenium, zirconium) and certain other noncriteria pollutant species (e.g., chlorine and fluorine) are based on elemental analyses. Due to the complexity of quantifying individual inorganic compounds in environmental samples, emissions of the above materials are grouped and listed under the appropriate element name. However, this does not imply that these species are necessarily emitted as free elements.

Criteria pollutants are not included in this report. A separate report entitled "Source Assessment: Overview Matrix for National Criteria Emissions" gives an alphabetical listing of stationary source types and their national total emissions of criteria pollutants. A detailed state-by-state listing of stationary emission sources which emit at least 1% of the state's total mass emissions of any criteria pollutant is given in another separate report entitled "Source Assessment: State-by-State Listing of Criteria Pollutant Emissions."

Noncriteria pollutants are listed in Section 2 together with the stationary sources that emit each pollutant. The following explanatory remarks are provided:

1. The first line of each computer-printed table identifies the noncriteria pollutant emitted by the source types shown, and the corresponding threshold limit value (TLV®) for those species listed in Reference 1.^a
2. The first column, designated SOURCE, lists the stationary source types that emit the named pollutant on the basis of decreasing mass of emissions.
3. The second column, labeled UL, indicates the uncertainty level of the emissions data for a source type in the data base and is defined as follows:

<u>UL</u>	<u>Meaning</u>
A	Adequate data of reasonable accuracy.
B	Partly estimated data of indeterminate accuracy.
C	Totally estimated data of indeterminate accuracy.
D	Missing data on known emissions of other pollutants for the source type.

^a Benzene, benzo(a)pyrene, *bis*(chloromethyl) ether, chloroform, nitrosodimethylamine, tetrachloroethylene, trichloroethylene, and vinyl chloride are suspected carcinogens for which the TLV was estimated as 0.001 mg/m³ (personal communication between Dr. I. A. Jefcoat, U.S. Environmental Protection Agency, Industrial Environmental Research Laboratory, Research Triangle Park, North Carolina, and T. W. Hughes, Monsanto Research Corporation, Dayton, Ohio, 4 August 1977).

(1) TLVs® Threshold Limit Values for Chemical Substances and Physical Agents in the Workroom Environment with Intended Changes for 1976. American Conference of Governmental Industrial Hygienists, Cincinnati, Ohio. 94 pp.

4. The third column, designated CAT, identifies the source category as follows:

<u>CAT</u>	<u>Category</u>
1	Combustion Source
2	Organic Materials Source
3	Inorganic Materials Source
4	Open Source

5. The fourth column, MASS (1,000 KG/YR), gives the annual mass emissions in 10^3 kg/yr (= metric ton/yr) for each source type.
6. The fifth column, PERCENT, shows the percent contribution of the particular noncriteria pollutant from a particular source type to the total national emissions of that pollutant from all stationary sources in the data base.
7. The sixth column, CUM PERCENT, shows the cumulative percent contribution of the particular noncriteria pollutant from a specific number of source types to the total national emissions of that pollutant from all stationary sources in the data base.
8. The source types and noncriteria pollutant emissions listed in this report are based on our data base contents as of 1 July 1978.

Example:

For benzoic acid:

- a. Phthalic anhydride manufacture from *o*-xylene is the largest stationary source of benzoic acid emissions, emitting $39,517.6 \times 10^3$ kg/yr, which represents 82.6% of all benzoic acid emitted by the stationary sources in our data base.
- b. Phthalic anhydride manufacture from naphthalene and benzoic acid manufacture emit $8,278.2 \times 10^3$ kg/yr and 52.7×10^3 kg/yr of benzoic acid, respectively. These two sources, together with phthalic anhydride manufacture from *o*-xylene, emit over 99% of the total benzoic acid emissions from all stationary sources in our data base.

1. REPORT NO. EPA-600/2-78-004t		2.	3. RECIPIENT'S ACCESSION NO.	
4. TITLE AND SUBTITLE SOURCE ASSESSMENT: Noncriteria Pollutant Emissions (1978 Update)		5. REPORT DATE July 1978		6. PERFORMING ORGANIZATION CODE
7. AUTHOR(S) E. C. Eimutis, R. P. Quill, and G. M. Rinaldi		8. PERFORMING ORGANIZATION REPORT NO. MRC-DA-798		
9. PERFORMING ORGANIZATION NAME AND ADDRESS Monsanto Research Corporation 1515 Nicholas Road Dayton, Ohio 45407		10. PROGRAM ELEMENT NO. LAB015; ROAP 21AXM-071		
		11. CONTRACT/GRANT NO. 68-02-1874		
12. SPONSORING AGENCY NAME AND ADDRESS EPA, Office of Research and Development Industrial Environmental Research Laboratory Research Triangle Park, NC 27711		13. TYPE OF REPORT AND PERIOD COVERED Task Final; 4-7/78		
		14. SPONSORING AGENCY CODE EPA/600/13		
15. SUPPLEMENTARY NOTES IERL-RTP project officer is Dale A. Denny, Mail Drop 62, 919/541-2547. EPA-600/2-77-107e was the previous report.				
16. ABSTRACT The report lists stationary sources that emit each of 389 noncriteria pollutants. It also indicates quantities of such emissions. The list was prepared using a computerized data base established for emissions of air pollutants from approximately 800 stationary source types in the combustion, organic materials, inorganic materials, and open source categories. (A source type is defined as a group of emission sources which have the same process and emission characteristics.)
