FORWARD

In December, 1985, the Regulatory Program Development Branch (CCD/RPDB) and the Information Management Division (IMD) requested the assistance of the Environmental Effects Branch (EEB) to develop a data base program for selected aromatic amines used as dyes. The Regulatory Program Development Branch provided a data file of the 977 aromatic amines that had Color Index names and that were listed on the TSCA Inventory. This data file was created through a search of SANSS in the Chemical Information System (CIS). A typical record for any given chemical consisted of: the 8th and/or 9th Collective Index name, other chemical names, CAS Registry number, Color Index (CI) Name and Number and one or more trivial names by which the chemical is known.

The data base developed for RPDB consisted of CAS number, Color Index Name and Number, and the 8th C.I. Name for each chemical. To create this data base, it was necessary to write a series of utility programs in Basic Language to extract the required information. To obtain the Color Index Name and Number, it was necessary to search through a long list of trivial names, since the C.I. Name and Number were imbedded in the alphabetical listing of trivial names.

The concept of a dictionary of trivial names for this class of dyes was conceived during the development of the data base for RPDB. The number of names for any given compound may vary from a few to over 150. Sometimes in the evaluation of these dyes, reference is made to one of the dyes using only the trivial name. To obtain additional information on the dye other means, such as, searching data bases or reference books must be used. It was reasoned that since the information was available, it could easily be extracted and alphabetized to form a reference dictionary of trivial names used for this class of dyes.

Upon completion of the data base for RPDB, the original data file was edited using utility programs to eliminate all unwanted information and to create a new file containing only the CAS Numbers and trivial names. This new file was transformed into a data base file using dBase III software. Using dBase III, the trivial names were sorted and arranged alphabetically. Further file manipulation produced the Dictionary of Trivial Names for Aromatic Amines used as Dyes.

The dictionary contains over 17,000 entries cross-referenced to CAS Number. Included in the entries are the Color Index Name and Number. As a further aid to users, the CAS Numbers are cross-referenced to the 9th Collective Index name for each chemical beginning on page 173. The CAS Numbers are arranged numerically for the 977 chemicals.

During the preparation of the Dictionary, several people provided assistance which is greatly appreciated. Peter Principe, RPDB, initiated the request to EEB and provided encouragement and suggestions for the dictionary. Doug Sellers, IMD, provided helpful suggestions during the development of the database and the dictionary. Vivian L. Hart, HERD, created the original data file from SANSS, which made the dictionary possible. The Chemical Information Service provided the large data base from which the original file was created.
