## FOREWORD

This report was prepared by Cornell Aeronautical Laboratory, Inc. (CAL), Buffalo, New York under Environmental Protection Agency (EPA) Contract No. 68-04-0040. The work was administered under the direction of the Office of Air Programs, Characterization & Control Development Branch, Division of Emission Control Technology, Mr. Barry D. McNutt, Project Officer.

This is the Phase I Technical Report that describes and summarizes the results of studies conducted during the period from June 1971 through September 1971 to translate field-measurement data on aircraft engine emissions into a format useful for the promulgation of realistic standards. The basic input data were supplied by the EPA.

The effort was performed jointly by the Vehicle Research Department and the Systems Research Department of CAL. Acknowledgement is made of the significant technical contributions to the program by P. A. Reese and G. D. Higgins who were responsible for computer programming. A special note of acknowledgement is in order for Mrs. A. Guendel, Mrs. S. J. Sweet and Mr. J. E. Blickenstaff who so ably performed the operational functions of data logging and transcription, curve fairing and related tasks. R. A. Grom and his staff merit recognition for prompt and efficient response to digitization requirements in the context of meeting crucial program deadlines.

## ACKNOWLEDGEMENT

The Office of Air Programs, Environmental Protection Agency, would like to acknowledge valuable assistance (in terms of time, manpower and material) received from the following organizations in gathering the data in this report.

American Airlines, Overhaul Facilities, Tulsa, Oklahoma.  
TWA, Overhaul Facilities, Kansas City, Missouri.  
United Airlines, Overhaul Facilities, San Francisco, California.  
United States Air Force, Kelly Air Force Base, San Antonio, Texas.  
United States Navy, Naval Air Rework Facility, Norfolk, Virginia.  
United Aircraft, Pratt and Whitney Aircraft Division, East Hartford, Conn.  
General Motors, Detroit Diesel Allison Division, Indianapolis, Indiana.  
Garrett Corporation, Air Research Manufacturing Company of Arizona, Phoenix, Arizona.  
Continental Teledyne, Muskegon, Michigan.  
Department of Transportation, Federal Aviation Administration.  
Air Transport Association.  
Aerospace Industries Association.  
U.S. Bureau of Mines, Bartlesville Energy Research Center, Bartlesville, Oklahoma.  
Southwest Research Institute, Vehicle Emission Laboratory, San Antonio, Texas.  
Scott Research Laboratories, Plumsteadville, Pennsylvania.  
Office of Air Programs, DECT, Test and Evaluation Branch, Ypsilanti, Michigan.  
Cornell Aeronautical Laboratory, Buffalo, New York.

## ABSTRACT

An account is presented of the analytical procedures and data processing techniques employed in translating field-measurement data of aircraft exhaust emissions into a form consistent with the needs for the promulgation of realistic standards. Pollutant mass emissions for carbon monoxide (CO) hydrocarbons (HC) and the oxides of nitrogen ( $\text{NO}_x$ ) are computed for an aircraft operational cycle comprised of the following modes: taxi/idle, take-off, climb out and approach. The calculations are for specific engine power (or thrust) settings for each mode as well as for specified times in mode. Numerical results are tabulated for each individual engine tested together with summaries obtained by aggregating engine data on a model basis. Data are presented for turboprop/turbine engines, light-utility piston engines and auxiliary power units.

**Part 1**  
**TECHNICAL REPORT**

## 1.1 INTRODUCTION

The constituent components of the exhaust emissions resulting from aircraft operations include the same pollutants produced by highway vehicular traffic as well as certain other sources of pollutants, and thus play a similar role in the general air pollution problems. While aircraft exhaust emissions presently are considered to constitute a small portion of the total atmospheric pollution burden of a community (Ref. 1), the relative proportion of this burden is expected to increase in the future because of (a) the continuing development of technology for successfully decreasing emissions from highway vehicles and (b) the anticipated growth in the number of aircraft and aircraft operations in the next decade. It is the more tangible evidence of the aircraft emissions in the form of smoke and odors that has generated a reaction from the public. That aircraft exhaust emissions constitute a segment of the general air pollution problem that warrants a technically-based assessment is manifest.

Recognition of the dimensions of these problems at the federal level of government is reflected by the passage of an Act cited as the "Clear Air Amendments of 1970". This act specifically directed the initiation of a study to determine the effects of aircraft emissions on air quality, the technological feasibility of controlling such emissions and, finally, the issuance of proposed emission standards. In compliance with the last of these directives, the EPA instituted a broadly-based experimental program to measure the exhaust emissions from aircraft engines currently used in the commercial, military and general aviation sectors that comprise the aviation scene within the country. Auxiliary power units (APU) were also included within the scope of this effort. These basic or "raw" measurements consisted of data on emission concentrations together with pertinent information on engine maintenance history, engine settings and ambient conditions during test. These data were forwarded to CAL for processing and analysis directed to the ultimate objective of producing a statistical format conducive to the promulgation of realistic standards. Numerical specifications for typical operational

landing-take-off (LTO) cycles for the various model engines were provided by the EPA.

Part 1 of this report discusses the methodology adopted at CAL for processing the input data and presents the rationale underlying the selection of the specific analytical procedures. The objective was to generate an output in the form of a set of best estimates, comprising a mean value supplemented by a measure of statistical dispersion, for emissions for specific engines, specific categories of operational modes and other applicable constraints. The end purpose of this analysis was the establishment of a rational basis for specifying engine exhaust emission standards. An additional objective involved the identification and possible isolation of the sources of variability in engine emissions and, to the maximum extent possible with the available data, the appraisal of the relative importance of the sources. Results of these latter studies will be incorporated in a separate report to be published during November 1971.

Summaries of the numerical data and the results obtained for light-utility piston engines, auxiliary power units and turboprop/turbine engines are included in Part 2. Because each of these engine categories required a unique analytical procedure in data treatment, a brief description of these procedures, together with pertinent observations, precedes the set of data sheets.

The test data presented represent a complete inventory of all of the pertinent information received by CAL.

## 1.2 METHODOLOGY OF DATA ANALYSIS

### 1.2.1 General Comments

The specific methods and details pertinent to the data processing and the analytical procedures that are described constitute an attempt to best adjust the methodology to the ultimate objectives and the nature of the input

data supplied for processing. In this respect a learning cycle was involved with the methodology subject to adjustment as the results from the processing of the initial quantities of test data were assessed (the field data were received at CAL in a piecemeal fashion). The unique flexibility and advantages realized by virtue of those methods ultimately selected is made apparent in the succeeding discussion.

For reasons that will be clarified later, different methodologies for data analysis were required for each of the following categories of engines: (a) thrust turbines and turboprops, (b) piston engines and (c) auxiliary power units. Even within these general categories there were further variations in the manner of processing as dictated by the type of data which were provided. All of these factors are discussed in detail in their appropriate places in this report. Because of the high level of interest of the EPA in the commercial thrust turbines and turboprops, this engine category was the object of the most extensive data processing. Also, the major portion of all tests submitted for analysis were in this category. For example, this report contains data on a total of 392 engine tests comprised of 199 turbine/turboprop tests, 140 piston engine tests and 53 tests on APU's.

A concise overview of the entire set of operations comprising data processing and analysis is obtained by reference to the flow chart of Figure 1. In its entirety, this flow chart is applicable only to the analysis performed upon data for turboprop and turbine (commercial) engines. Certain portions of the flow chart operations were common to other engine categories as well (for example, data for all categories of engines was at least coded and keypunched). The following descriptive summary faithfully follows the sequence of the flow chart.

#### 1.2.2 Detailed Procedures

##### Editing

Upon arrival at CAL, the primary data sheets were logged and examined for completeness of information, consistency of parameter dimensions and

Figure 1 FLOW CHART – DATA PROCESSING AND ANALYSIS – TURBINE AND TURBOPROP ENGINES

reasonableness of the data. Where feasible, the necessary dimensional conversions and calculations were made; otherwise, missing information was obtained, if possible, by contacting the testing organization. A complete listing of testing organizations, the geographical location of the respective test sites and the types of engines tested at each is shown in Table 1.

At this stage of the process the rated take-off power or thrust setting for each engine was entered since, as will be demonstrated, this parameter represents the common base against which the exhaust emissions and engine fuel flow were plotted.

#### Format

As shown in the flow chart, the primary data supplied by the various test organizations were to have been presented in a standard format devised by the EPA. Standard format sheets for the turbine engines and piston engines are shown in Figures 2 and 3 respectively. In the majority of the cases, however, the data received departed in varying degrees from the standard sheet, both in format and in the actual data content supplied. For example, relevant information such as engine history data, data on ambient conditions and pollutant emissions often were lacking. Most troublesome of all were those numerous cases in which certain elements of information essential to data reduction and analysis were missing. As an example, thrust data was not always given for all test modes, and in some cases, CO<sub>2</sub> concentrations were not recorded. In addition, there were inconsistencies in the basis of reporting pollutant concentrations, whether wet or dry basis, whether hydrocarbons were recorded as methane or as carbon, and whether all units of measurement were consistent throughout. A significant amount of time and effort was consumed, therefore, in editing the received data, in attempting to retrieve missing information, and in modifying the format to a sufficient extent to make it compatible with established processing procedures.\* In many cases, such

---

\* Keypunch operators had been pre-trained to work directly from data entered on the standard format sheets.

modification was not possible; a complete transcription of the data into standard sheets was necessitated.

### Coding and Key Punching

Once the data were edited to a sufficient extent to be useable in the analysis process, these data had to be coded and key punched for entry into subsequent computer processing. Coding consisted of such matters as assigning serial numbers to engine models, fuel types, testing organizations and engine suppliers by which they could subsequently be identified, identifying the various pollutants by an appropriate code, and assigning a sequence of numbers to the various power settings in a test in such a way that the several test points could retain their time sequence identity in subsequent processing. In addition pertinent comments related to the particular test (such as presence of retrofits on the engine, use of fuel additive, unusual test problems, etc.) were encoded. The data was then key punched in a format which allowed retrieval of substantially all the information received from any one test organization.

### Conversion of the Data

As seen by reference to the data sheets shown in Figures 2 and 3, all of the pollutant emissions were given in terms of concentrations, either as parts per million by volume or as a percentage volume. A more useful and meaningful quantity for data analysis is the mass emission rate of the pollutant.

Equations for converting concentration data into mass emissions data were derived from the basic chemical equation for the combustion of a hydrocarbon fuel in air. The details of this derivation will not be included in this report. Instead, only the final conversion formulae will be documented with the observation that they are in general accord with those given in Ref. 2. The pertinent equations are listed below:

$$w_{CO} = \frac{M_{CO} \frac{CO}{10^4} F}{(M_C + \alpha M_H) \left( \frac{CO}{10^4} + CO_2 + \frac{HC}{10^4} \right)} \quad (1)$$

$$w_{HC} = \frac{M_{HC}^* \frac{HC}{10^4} F}{(M_C + \alpha M_H) \left( \frac{CO}{10^4} + CO_2 + \frac{HC}{10^4} \right)} \quad (2)$$

$$w_{NO_x} = \frac{M_{NO_x} \frac{NO_x}{10^4} F}{(M_C + \alpha M_H) \left( \frac{CO}{10^4} + CO_2 + \frac{HC}{10^4} \right)} \quad (3)$$

$$w_{CO_2} = \frac{M_{CO_2} CO_2 F}{(M_C + \alpha M_H) \left( \frac{CO}{10^4} + CO_2 + \frac{HC}{10^4} \right)} \quad (4)$$

The above equations were programmed for the IBM 370/165 computer to perform the data conversion. To utilize these particular equations, the emission concentrations must be expressed on a wet (or actual) concentration basis. Since some of the input data received were measured on a dry basis (see Table 1 for details), appropriate corrections to these data were necessary. Correction simply involves the multiplication of the dry concentration data by a correction factor to obtain the required wet concentration data. The appropriate equations that define the correction factors are listed below:

- a. CO and CO<sub>2</sub> are measured on a wet basis, NO on a dry basis and NO to be converted to a wet basis  
(K = correction factor)

$$K = \frac{100 - \frac{\alpha}{2} \left( \frac{CO}{10^4} + CO_2 \right)}{100} \quad (5)$$

---

\* In this report the hydrocarbon mass emissions are always given in terms of methane,  $M_{HC} = 16.04$ .

- b. All measurements are on a dry basis

$$K = \frac{100}{100 + \frac{\alpha}{2} \left( \frac{CO}{10^4} + CO_2 \right)} \quad (6)$$

In both cases, the correction is for the water of combustion.

One observation common to all of the preceding equations is that the carbon dioxide component is overwhelmingly dominant in terms of the concentrations and mass rate emissions among all the effluents.

#### Data Plotting

Following the conversion of CO, HC and NO<sub>x</sub> concentration data to mass emission rates, a set of four plots was made for each turbine and turbo-prop engine tested by means of Long Distance Xerography (LDX).

The Xerox LDX plotter is basically a combination of the Xerox process (light-sensitive electrostatic drum) and a flying-spot scanner. The beam of the cathode-ray tube in the LDX plotter has discrete beam locations addressable in two coordinates. The output of the plotter is recorded on paper strip 8-1/2 inches wide. The usable width for recording purposes is 7.82 inches. This width accommodates 1024 discrete addressable locations separated by 1/131 inch. Along the length of the paper strip, the same distance between addressable locations applies, but recording can be carried out continuously up to a total length of 2000 feet, the length of the roll of paper. In practice, the paper is usually cut into 11-inch lengths to provide standard-sized 8-1/2 inch by 11-inch sheets. For present purposes it was found convenient to use a standard 5-inch by 5-inch plot and to scale the data in such a way as to conform to this standard format. For thrust-rated engines, each measured thrust value in the test was expressed as a percentage of the take-off thrust rating for the engine, and these normalized thrust

values were used as the abscissae for the LDX plots. Three of the plots in the series employed pounds of pollutant per thousand pounds fuel as ordinates. The other one showed the relation between thrust and fuel flow. By means of the LDX process, the points were plotted and displayed very rapidly. Continuous curves were faired (manually) to these points for subsequent interpolative use. One major advantage of this approach was that the plots made evident any discrepancies in the data and thus introduced an additional control on the quality of the data included in the final analysis of emissions. This approach also provided a means whereby engineering judgment could be brought to bear on the problem, especially where data were sparse in some regions of the curve. Purely analytical methods such as least-squares curve fitting would not have permitted this interpretive process.

#### Curve Fairing

Fairing of the LDX plots was purely a manual procedure. The normal process involved a visual scanning of a large quantity of plots for a given type engine to help define the general shape of the various curves. This knowledge proved useful in the fairing process in those test situations where data points were sparse, missing or poorly spaced. The plots for HC and CO generally approximate an equilateral hyperbola with a sharp "knee" just above the idle/taxi thrust settings. Unfortunately much of the initial test data obtained had very few points in this critical region in the 10% to 30% range of rated power or thrust.\* By relying on data from those test runs where adequate data were available to reliably define the shape of the entire curve, it was possible to fair (and use) the data from tests where a poor spacing of the data points existed. In addition, random data points widely divergent from the normal trend of the bulk of the data were excluded by the fairing process. These points were first checked to ascertain they were not influenced by an processing errors.

---

\* This information was relayed later to the EPA who in turn requested the test organizations to take measurements in this region of power settings. Accordingly some of the later data received provided LDX plots that were very well defined in all regions of the curve.

### Digitizing of the Faired Curves

With the fairing of curves to the points plotted by LDX, a means was available for interpolating emission rates for any desired thrust ratio. Also by virtue of the fuel flow versus thrust curve, pounds of emission per pound of fuel could be converted to pounds of pollutant per hour for each of the interpolated points. In order to extract these quantities from the curves, however, it was necessary to read the curves for each desired input datum.

At this point in the analysis, several options were available. The curves could have been read, for example, with or without mechanical aids; moreover, the curves could have been read only at those values of thrust or power associated with a particular operational mode, or they could have been read at a number of points in consideration of any future changes in the definition of the operating modes. In the interest of flexibility, it was decided that the curves should be read at a sufficient number of points to permit them to be approximated by connecting straight-line segments. Accordingly, for the CO, HC and NO<sub>x</sub> curves, twelve points were read from each of the faired curves. These points were closely spaced in regions of the curve exhibiting high curvature and spaced relatively far apart in regions of the curve which were approximately linear. Because the fuel flow vs thrust curves were monotonic and exhibited relatively little curvature, it was concluded that they could be well approximated by fewer straight-line segments. Hence these curves were only read at five points. Samples of the faired LDX plots showing the points at which the curves were read are shown in Figure 4. These figures represent a complete set of plots for a test run identified as CAL ID No. 393. The alphabetical sequence of the letters (and progression of other symbols) preserves the original chronological order in which the test points were taken. Precise location of the original data point input represented by each letter (or symbol) is at the lower left-hand corner of the symbol in each instance.

Figure 4 TYPICAL SET OF FAIRED LDX PLOTS FOR A TEST

The sample plots represent one of the better sets of data in that there are an adequate number of well-spaced test points. Each curve was read at that point marked with an 'x' as shown.

To facilitate curve reading, a Calma Model 303 Digitizer<sup>\*</sup> was used. The Calma digitizer reduces graphical analog data to digital magnetic tape for subsequent computer processing and analysis. The equipment consists of the console, a backlighted tracking bed, balanced torque-motor chart drive, stylus-carriage assembly, direct digital pick-off mechanism, data and control electronics frame and an output incremental tape drive.

To digitize graphical analog data directly on magnetic tape, the operator traces the analog plot with a movable stylus/carriage assembly. As the plot is traced, movement of the stylus in either the X or Y direction causes pulses to be generated by the direct digital pick-off mechanism. For purposes of this program, the device was operated in its single-point mode. By locating the stylus on each of the points to be read,<sup>\*\*</sup> the operator could rapidly and efficiently record the X, Y coordinates of the curve points for subsequent use in the interpolation process.

To evaluate the repeatability of the digitizing process, one of the plots was read in duplicate. A comparison of the results of the two sets of coordinates is shown in Table 2. As can be seen, the maximum difference between duplicate readings is considerably less than 1% of full scale.

---

<sup>\*</sup>The Calma Company, 346 Mathew Street, Santa Clara, California.

<sup>\*\*</sup>These points were pre-marked as a part of the fairing process.

#### Interpolation for Selected Modes

After the curves were faired and digitized, the data were loaded on a computer tape and the tape processed by a program which interpolated for selected operating modes for each engine. Mode selection, time-in-mode information and the corresponding engine settings were supplied by the EPA. The following modes were specified: taxi/idle, take-off, climb-out, approach and taxi/idle. Climb-out and approach times correspond to those associated with operations below an altitude of 900 meters above ground level. Engine settings for turboprops were given in terms of a percentage rated take-off horsepower while those for thrust-type turbines were in terms of percentage rated take-off thrust.

By virtue of the available plots, now stored in the computer and accessible by interpolation, specified percentage rated thrust values were then used as the basis for interpolating mass emission rates for CO, HC and NO<sub>x</sub> as well as the fuel mass rate. These rate values, when combined with the given times in mode, made possible the computation of the total mass of emissions for a typical landing-take-off (LTO) cycle.

The engine power settings initially were subject to changes by the EPA to permit an evaluation of the effects of such variations within the operational modes on individual and aggregated mass emissions of pollutants. One of the salient features of the data processing procedures adopted is the ease of accommodating such changes of input. Engine settings used in the processing of the turbine/turboprop data to establish the so-called "base line" from which proposed standards were promulgated are given in Figure 6 of this report.

A significantly different procedure was employed for processing the piston engine data, which came from two independent sources (as shown in Table 1). This change in method was necessitated since these sets of data were incompatible with each other and with the turbines from the data processing standpoint. Specifically, the one set (Continental Teledyne) lacked CO<sub>2</sub> measurements while the other (Scott Research Laboratories) lacked horsepower data for the various engine power settings. The auxiliary power units comprised a distinct category apart from the other engines and were accorded separate treatment.

### 1.3 STATISTICAL ANALYSIS

Outputs from the overall assessment were subjected to only a routine statistical treatment during this first phase of the program. Identifiably different engine types and models were separated into individual groupings. For the set of engines pooled within each group, mean values and standard deviations from the mean were computed for various engine operational parameters and pollutant quantities for each mode. Specific details concerning these

quantities are included in the next section of the report. Standard deviations were computed on a "best estimate" basis by applying the theory of small number statistics. In essence, this involves using the quantity  $N-1$  as the divisor of the sums of squares ( $N$  = number of samples summed).

A more thorough statistical treatment of these data will be conducted during the second phase of this program. A report of this study will be published during November 1971. The objective of this analysis will be to attempt to identify and isolate those factors which contribute significantly to the variance in the data and to define the relative magnitude of the contribution of each.

#### 1.4 PRESENTATION OF RESULTS

All of the numerical data presented in the report are in the form of computer print-out data sheets. Each engine test for which data were received has been included in the listing. In all cases the data for each engine test have been processed to the maximum extent possible (i.e., each mode in the LTO cycle appropriate to that engine as well as the aggregation of the emissions over the entire cycle). In those cases where insufficient data are provided to permit complete processing, the emission data are converted from a concentration basis to a mass emission basis. On the other hand, when engine fuel flow data are unavailable, the conversion to mass emissions is not possible and the test organization's raw measurement results are simply reproduced.\*

The general format employed on the computer print-out sheets is specified by the EPA. The data given for each engine test include the test information received as well as the results of the data analysis procedures. Input data is reproduced following the general guidelines of the standard EPA data sheets (Figures 2 and 3), and, in substance, includes almost all of

---

\* Only about 2% of the data are included in this category.

the data initially supplied by the testing organization.\*

Following this "replay" of the input data, the calculated mass emissions data are tabulated for each engine power setting of the test sequence. These data are expressed as mass pollutant per 1000 lbs fuel, mass pollutant per hour and mass pollutant per 1000 horsepower-(or thrust) hours (when CO<sub>2</sub> measurements are available, similar data are given for CO<sub>2</sub> although it is not classified as a pollutant).

The final tabulation of data is that for the emissions for the LTO cycle for that engine. Data format provided by the EPA for these data is shown in Figure 5. For the turbine/turboprop engine category the EPA also provided the following data for each model (note that the initial idle/taxi and final idle/taxi modes are treated as distinct and separate parts of the LTO cycle): engine power setting, useage weighting factor and time in mode. Numerical specifications for these quantities are given in the commentaries pertinent to each data set.\*\*

Piston engines were tested at power settings corresponding to various nominal modes (the number of modes generally being a larger number than that given in Figure 5). As a consequence, with EPA concurrence, the modes corresponding to the EPA LTO cycle were directly selected from the testing organizations test sequence (no interpolation on power settings was done as for the turbine/turboprop category). In this case, the EPA provided only specifications for weighting factors and times in mode (no power settings).

---

\* Some testing organizations, which did not use the standard data forms, provided additional engine parameter data not required for present data processing purposes. In such cases not all of these inputs are reproduced.

\*\* In the context of this report the following data sets are recognized: turbine/turboprop, piston engine (Scott), piston engine (Continental), APU.

| MODE                           | POWER<br>SETTING | POWER<br>OUTPUT | EMISSION<br>RATE | FUEL<br>RATE | USEAGE<br>WEIGHTING<br>FACTOR | TIME IN<br>MODE | POLLUTANT<br>MASS | FUEL<br>MASS | #POL/<br>1000 #<br>FUEL | ENERGY<br>OUTPUT | # POL /<br>ENERGY<br>OUTPUT |

Figure 5 LTO CYCLE EMISSIONS - EPA FORMAT SHEET

The arrangement of the data within the data sets groups the engines by model. Following each group is an aggregated summary of the LTO-cycle emissions for this model engine. The number of engines included in each summary is shown at the top of the summary sheet. Since the summary accounts show means and standard deviations in each of the tabular columns, engines that did not have complete data (e.g., HC or CO was missing or possibly a mode was missing) are not included in the summary because of the distortions that would be thereby produced in the results.

As per instructions, all emissions data for the military turbine engines are converted into a mass basis. Data for the auxiliary power units are also on a mass basis. An additional calculation is made for the APU's (where applicable) to determine the so-called "air power" for those units operated with air bleed loading. This quantity is added to the shaft horsepower (if any) of the unit to provide a measure of the total energy output.

It is important to note that the mass emissions of the hydrocarbons are in terms of methane while those for nitric oxides ( $\text{NO}_x$ ) are in terms of  $\text{NO}_2$ . This usage is consistent throughout this report.

## 1.5 DISCUSSION

To date the principal function of CAL in this program has been in coordinating and consolidating the mass of field test data, in developing suitable data processing procedures and, finally, in processing the raw data in accordance with guidelines supplied by the Office of Air Programs of the EPA. There has been no requirement or intent to draw conclusions or inferences from the final results that have been obtained. Rather the objective of this report is to present the raw data input, describe the details of the data processing procedures and to present the results. Thus the substance of this section of the report is devoted to generally clarifying sundry background details concerned with data handling and to explanatory comments related to the tabulated data.

Despite the somewhat circumscribed role of CAL in this program (as described above), CAL's view of its overall function has been broader than mere calculations of the results of engine emission tests. CAL has believed an analysis of data must proceed within a framework that includes an engineering awareness and understanding of the real world within which the test results have been obtained. Accordingly, very early in the program (29 June 1971), project personnel visited Pratt & Whitney Aircraft to observe testing operations in progress and to discuss operational and instrumentation details with cognizant personnel. This trip was extremely valuable in providing the "real world" background within which the data transmitted for analysis had been obtained.

The ultimate purpose of the data processing was to obtain results for the emission of each engine for the complete LTO cycle in accordance with Figure 5. A listing of the specific information provided by the EPA to accomplish this purpose is given in Figure 6. Engine operating cycles, as supplied by EPA, have been constructed based on time-in-mode considerations of high activity periods at major air carrier airports. The first taxi-idle mode is defined to include the total time between propulsion engine start-up and the initiation of the turn into the runway. The take-off, climb-out and approach modes approximate the times spent in these modes. The last taxi-/idle mode includes the taxi/idle time between termination of the landing run and final shutdown of the propulsion engine. Both the time-in-mode and power setting information was obtained by the EPA from engine manufacturers, air frame manufacturers, the airlines and the FAA. The weighting factors are the fraction of the propulsion engines operating on a given aircraft in any given mode. Results obtained from processing the data in accordance with the requirements of Figure 6 are presented in Tables I, II and IV. This set of results constitutes the aircraft emissions baseline data. Summaries obtained by aggregating all engines of a given model are included also.

The basic emissions data was reprocessed a number of times using power settings and weighting factors different from those given in Figure 6. These inputs, provided by the EPA, were designed to evaluate the effects of

operational changes on emissions. Table V presents model summary data for the turboprop/turbine category generated by using altered weighting factors and power settings. This data represents a recomputation of the baseline data, taking into account possible ground operational changes. The tables reflect what the emissions would be for those engines normally used on 3 engine aircraft if one engine was shut off during both taxi/idle modes (2/3 weighting factor) and the power output of the remaining engines was increased 50% to maintain total aircraft power at the same level. For engines normally used on 2 or 4 engine aircraft the tables reflect what the emissions would be if 1/2 of the engines were shut off during both taxi/idle modes (1/2 weighting factor) and the power output of the remaining engines was increased 100% to keep the total aircraft power at the same level.

A few comments on grouping within models are appropriate. Special treatment was accorded the JT8D models as per directions. The JT8D engine is somewhat unique in that the by-pass airflow and the combusted exhaust gases exit through a common duct. Mixing of the exhaust gases with the bypass airflow was found to occur at engine idle settings resulting in dilution of the sampled gases when the nominal multi-probe gas sampling configuration was used. To combat this problem Southwest Research Institute (SWRI) measured emissions of the JT8D engines in the idle mode using a single axial probe (Ref. 3). Thus all SWRI JT8D data has been treated as "undiluted" and all other JT8D data as "diluted".

Another factor unique to JT8D engines is the presence of smokeless combustor cans (retrofits) on some of the older models. These are identified by remarks of the test organization under the "comments" section of each engine data sheet. Thus Table IV has four separate summaries for the JT8D model: diluted-ordinary, diluted-smokeless, undiluted-ordinary, undiluted-smokeless.

A separate grouping was also accorded the T56-A7 and the T56-A15 turboprop engines. The former represent overhauled engines tested at Kelly AFB by SWRI while the latter are new engines tested by the manufacturer, Allison.

In all cases, model groupings exclude engines which lack complete data (either missing data on one of the pollutants, or, in the case of piston engines, a missing mode). Their inclusion would bias and distort the means and standard deviations computed for each model.

Reference to the data sheets will show that in some cases data were measured on aldehyde concentration, smoke index and particulates. These data were not processed and are simply reproduced for completeness. Analysis of these quantities was performed by the individual testing organizations and the results are included in their respective final reports. These final reports should be consulted for specific details concerning the background of the emissions concentration data which have been processed on this program.

In general, that portion of the tabulated data for each engine that corresponds to input information from the test organization, has been reproduced without change. In some cases the units of certain quantities were changed to preserve consistency among the data sets and in others approximate values were estimated. For example, H/C information was not often provided on the data sheets since the fuel had not been analyzed in situ.\* CAL-estimated values would therefore be inserted to permit data processing. An H/C value of approximately 2 was used for turbine fuel.

Relative humidity and temperature at the test sites were usually given but not the corresponding specific humidity (lbs water per lb dry air). In these circumstances the specific humidity data, as read from a graphical presentation (Ref. 4), were entered.

---

\* SWRI provided an initial measured H/C value for tests at TWA. Since this value (1.722) seemed too low, CAL chose to ignore this figure and used a value of 2.02. Later SWRI notified CAL that a reappraisal indicated a value of 1.968 for H/C. Since these two values were so close and time so critical, the H/C ratio was not changed.

Averaged data were used if a range of values for ambient parameters was given. For example, the Bureau of Mines reported sizeable variations in the sample line temperature during test operations (of the order of 70°C). The figure given is the arithmetic mean of the extremes.

In the tabulated data, all missing, unavailable or non-measured information is denoted by -0.00 to differentiate it from a true measurement which is actually zero. Concentration measurements shown as a true zero represent a value of less than one part per million.

No mode-type operational data for military engines was provided; consequently only the conversion to mass emissions was made. The T56 turboprop, although a military engine, is considered to be equivalent to the 501 civil version and hence was used in the baseline calculations.

The Office of Air Programs conducted a program of span gas checks at each of the test sites to gain assurance that there were no large discrepancies among these test organizations attributable to poor quality calibration gases or poor sampling techniques. Results of these tests are given in Appendix A.

In the preparation of this report, every possible effort has been made to eliminate errors in data transcription, conversion of pollutant concentration data to mass emission form, and calculation of pollutant burden over the LTO cycle. In view of the stringent time constraints of the program, however, it will be appreciated that it is virtually impossible to guarantee that the report will be error free. If a particular entry appears out of context, therefore, it may need to be validated by checking with the original data source.

The methods employed to reduce the concentration data to mass emission form and to calculate the pollutant burden over the LTO cycle were selected as the most reasonable and timely within the constraints of the program. We recognize, however, that there will undoubtedly be instances

in which the reader may wish to depart from the methods employed in the report or to undertake an alternative analysis for specific purposes. It is for these reasons that we have provided, wherever possible, the raw input concentration data as well as the data in mass-emission form.

In the case of the turbine engines we have employed a computer-aided graphical technique to interpolate emissions at specified power or thrust values. Such interpolation suffers from the limitations of all interpolative procedures in that a certain arbitrariness is involved in extending the results obtained from a limited number of test points to situations in which actual observations were not available. Unfortunately, the engine operating condition most subject to this type of error is the taxi/idle mode with its attendant heavy influence on the total emissions calculated for the LTO cycle. In many instances, the taxi/idle mode as actually run in the test is at a higher percentage of rated power or thrust than is called for by the EPA-designated LTO cycle (see Fig. 6). In these cases, it was necessary to extrapolate to the desired power or thrust setting. Such extrapolation is difficult at best and, in the present analysis, was often further aggravated by lack of test points in the critical "knee" of the CO and HC curves at engine settings slightly above taxi/idle values. The only recourse under these circumstances is to rely on engineering judgment or to invoke mathematical conventions, such as regression analysis, which may be equally arbitrary. For final arbitration of this question, the reader may wish to make his own interpolations from either the raw concentration data or the data as converted to mass emission form, both of which have been provided in the report. The method of analysis employed in this report is not claimed to be absolute any more than any other interpolative procedure can make such claim.

As has been previously pointed out, a major advantage which can be claimed for the computer-aided graphical analysis is the speed with which data may be manipulated in compliance with changes in the questions to be answered by the data base. For example, if it is desired to know the effect on emissions of a change in ground-operation tactics, the relevant information can be quickly and efficiently retrieved from the data. The same facility is available

as a means for checking the accuracy of the plotted data. By virtue of the accessibility of the digitized curves in the computer, the original curves could be "reconstituted" and visually scanned for possible errors. In addition to performing this error check, we also performed an extrapolation check in that region of the pollutant curve where it was necessary to extrapolate in order to obtain mass emissions for the taxi/idle mode. It is for these reasons that the results for the LTO cycle can be reported with considerable confidence.

#### 1.6 SUMMARY

Experimental data consisting of concentration measurements of pollutants in the exhaust gases generated by turboprop and thrust turbine aircraft engines, light-utility piston aircraft engines and auxiliary power units have been processed, wherever applicable and possible, to establish mass emissions over specified landing-take-off (LTO) cycles. These experimental data and the LTO cycle specifications were furnished by the Office of Air Programs, EPA and the intent of the processing was to provide baseline data with the view of promulgating emission standards.

Processing of the data for commercial engines in the turboprop/turbine category was designed to permit calculation of pollutant mass emissions over an entire LTO cycle where the engine power settings could be arbitrarily specified. This purpose was achieved by graphically establishing a functional relationship between mass pollutants/unit fuel consumed and percent rated power for each individual engine. Thus by interpolation techniques, emissions corresponding to any desired engine power setting could be determined. This capability permitted evaluation of the effects of changes in engine operating cycles on mass emissions over the LTO cycle (compare engine model summary data between Table IV and Table V).

In contrast to the situation for the turboprop/turbine engine category, the piston engine emission data were measured under conditions of very uniform consistency between engine power setting and engine operational mode. LTO

cycle emissions for this class of engines were computed by using the measured in-mode concentration measurements. No interpolative routines were necessary.

Military turbine engine emissions data were only converted from a concentration basis to a mass emission basis. No LTO cycle criteria were defined for these engines.

Auxiliary power units represent a distinctly unique source of exhaust pollutants within the context of the types of aircraft engines tested. Only the mass emissions for each power setting employed in the test sequence are given. Total horsepower loading for each unit is given by calculating the power associated with air bleed loading (as contrasted with shaft power loading) wherever appropriate.

All of the pertinent data on each engine tested and supplied to CAL has been reproduced in this report.

All of the emissions data has been processed to the maximum extent possible within the constraints imposed by the available supporting information and the requirements of the Office of Air Programs. A total of 392 engine test runs are reported. This total includes 199 turboprop/turbine engines, 140 piston engines and 53 auxiliary power units.

## Appendix A

### SPAN-GAS CHECKS OF TEST ORGANIZATIONS INSTRUMENTATION

Seven span gas cylinders were analyzed by three of the laboratories involved in the aircraft baseline emission. These initial checks were made at those aircraft study laboratories located in the Western half of the country; EPA (T&EB Mobile) at Phoenix (AiResearch), Southwest Research Institute (SWRI) at San Antonio (Kelly AFB) and Bureau of Mines (BOM) at Tulsa (American Airlines). The exercise was not intended to be a correlation of laboratories but an attempt to uncover major differences in analysis among laboratories which might be caused by the use of poor quality calibration gases or poor sampling techniques. The results that have been obtained raise questions concerning carbon monoxide analyses but the overall effort has been worthwhile in building confidence in comparability among the above-named laboratories engaged in the emissions measurement program.

Table A-1 is a summary of the data collected. Detailed information was accumulated also concerning the physical specifications of each instrument used so that an estimate could be made of instrumental sensitivity and expected accuracy. The sample cell length and calibration range were found to vary considerably from one instrument to another. Based on this type of information, an optimistic accuracy band was estimated for each instrument and is given as a parenthetical value adjacent to each data point in Table A-1. The largest variation in expected accuracy is seen to occur among the CO instruments. Variation in concentration measurements was also the largest for CO but this fact is not considered entirely attributable to instrument variation.

Sampling systems were checked for leaks by plugging the sample line and observing the flow drop-off. All systems appeared to be tight.

A cylinder of hydrocarbon-free air was used to check the hydrocarbon level in the zero gas being used by these laboratories. The zero gas at SWRI

was found to contain less than 0.6 ppm propane and the BOM span gas contained 1.6 ppm propane. The EPA span gas at Phoenix contained zero hydrocarbon relative to the reference cylinder.

At those laboratories using chemiluminescence instrumentation for oxides of nitrogen measurement, a determination of the  $\text{NO}_2$ -NO converter efficiency was made. EPA and SWRI converters approached 100% efficiency. This particular test is made by introducing oxygen into a bag of NO in  $\text{N}_2$  span gas and observing the oxidation of NO to  $\text{NO}_2$ . If the  $\text{NO}_x$  line remains constant during the oxidation process, the indication is that the thermal converter is working properly.

A similar series of cross checks was then conducted at those emissions measuring laboratories in the Eastern half of the country. These test sites included the following: Detroit Diesel Allison Division (Indianapolis, Indiana), Teledyne Continental Motors (Muskegan, Michigan), Pratt & Whitney Aircraft (East Hartford, Connecticut), Scott Research Laboratories (temporary lab at Allentown Pennsylvania Airport) and Scott Research Laboratories (temporary lab at Naval Air Station, Norfolk, Virginia). Addition cylinders of high-concentration gases were employed at those labs involved in light-utility piston engine studies (Teledyne Continental and Scott Allentown). These additional results are given in Table A-2 which is similar in format to Table A-1.

[NOTE: The material in Appendix A has been abstracted by CAL from two internal memoranda of the Office of Air Programs, Tests & Evaluation Branch, Ypsilanti (to R.C. Stahman from M.W. Korth). This inclusion is at the behest of the EPA.]

Part 2  
SUMMARY OF DATA

## 2.1 DATA TREATMENT AND COMMENTARY

Data for light-utility piston engines and auxiliary power units are presented in the first three tables following this discussion. Table I contains data on piston engines tested by Scott Research Laboratories and Table II contains similar data obtained from Teledyne Continental Motors. Table III is a compilation of data on auxiliary power units (APU); these data were provided by AiResearch.

### 2.1.1 Piston Engines

Tests on piston engines were conducted by Scott Research Laboratories on engines installed in aircraft. Accordingly, these engines span a broader spectrum of engine age and condition than do the "brand new" engines tested by Teledyne Continental. Differences in the methods of testing and data reduction employed by Scott and by Teledyne Continental, however, necessitated different approaches to mass emissions analysis and precluded incorporating the two sets of data into a single compilation. In view of this fact, care should be taken in comparing results from the two sources, particularly if the intent is to establish emission response to factors such as engine age. Observed differences in emissions may be artifacts of the differences in testing procedures rather than being attributable to independent causes.

#### 2.1.1.1 Scott Research Laboratories

Piston engines tested by Scott Research Laboratories are included in Table I. For the most part, these engines were subjected to a 10-mode test cycle, but in a few instances certain of the modes are missing. From among the ten modes used by Scott, five were selected as being equivalent to those designated by EPA in their LTO cycle. These five modes were then employed in the LTO cycle calculations. Since no horsepower measurements were provided by Scott, it was not possible to reduce the emissions to the basis of pounds pollutant per thousand horsepower hours.

All concentration data provided by Scott Research Laboratories were expressed on a dry basis. To convert these data to emission mass form, therefore, it was necessary to introduce a correction to convert concentrations from dry to wet basis. Correction was made only for the water of combustion, it being assumed that water vapor in the intake air was negligible. The correction factor used was the one proposed by the SAE E-31 Committee\* :

$$K = \frac{100}{100 + \alpha/2 (CO + CO_2)}$$

where CO and CO<sub>2</sub> concentrations are expressed as percent by volume, and  $\alpha$  is the atomic hydrogen/carbon ratio of the fuel. Then,

$$\text{Concentration (Wet basis)} = K \cdot \text{Concentration (dry basis)}$$

and the corrected concentrations were converted to pounds pollutant per pound of fuel by the formulas proposed by the E-31 Committee and presented in Part 1 of this report.

It should be noted that, for many of the engines tested by Scott, triplicate runs were made. In the statistical summary for an engine model, these replicate runs were not distinguished from runs on separate engines; consequently, the standard deviations computed for the emission quantities are expected to be somewhat underestimated relative to what might have been observed if there had been no replication of engines. In the triplicate runs on 0-200 engines, the first two runs were done on one exhaust and the third run was done on the other.\*\*

In the statistical summaries it will be noted that the number of engines included in each model summary is sometimes less than the number of engines actually processed as individuals. The difference resides in the fact that for

several of the engines the data was incomplete in some sense. For example, if data for one of the pollutants or for one of the modes was missing for a particular engine, that engine was excluded from the statistical summary so as not to bias the mean value or standard deviation.

#### 2.1.1.2 Teledyne Continental Motors

Table II summarizes twenty-one engines belonging to model categories 0-200-A, 0-470-R or IO-520-P. For the most part, these engines were subjected to a 13-mode test cycle, including Idle-Taxi, Take-Off, Climb, and Pattern. Two forms of the Idle-Taxi mode were employed, Idle-Taxi-Low and Idle-Taxi-High. Similarly, two versions of the Climb mode, Rich and Lean, were used, but in some of the tests only one of these modes was run. Some convention was necessary, therefore, in order to comply with the 5-mode LTO cycle designated by EPA. In all cases, Idle-Taxi-High was used as the EPA-designated Idle-Taxi mode, and the mode designated Pattern by Teledyne Continental was renamed Approach, to comply with the EPA designation. In the case of the Climb mode, the LTO cycle computations were made with both Climb-Rich and Climb-Lean data. In all cases where both modes were run, two LTO cycle computations are included; otherwise, the LTO cycle computation is made with whichever of the two Climb modes is available.

A distinguishing feature of the Teledyne Continental tests is that CO<sub>2</sub> was not measured. Consequently, the normally used formulas for converting concentrations to mass emissions are not applicable, and an alternative conversion had to be invoked. The method employed in Table II is the one used by Teledyne Continental and was kindly provided by them.

First, it should be noted that all effluents except Total Hydrocarbons are expressed in the raw data on a dry basis. Except for hydrocarbons, therefore, the following dry-to-wet correction factor was employed:

$$\text{Correction Factor, } K = 1 - \alpha (F/A)$$

where  $\alpha$  = Hydrogen/carbon atom ratio  
 $F$  = Fuel flow, lb/hr  
 and  $A$  = Air flow, lb/hr

This expression for the correction factor is an approximation that is accurate when the specific humidity of the inlet air is low. The complete equation is given in SAE procedure J177. Conversion of CO and NO concentrations to the corresponding mass flow rates was then accomplished by means of the following formula:

$$\text{Pollutant Mass Flow Rate (lb/hr)} = \frac{M}{M_{EX}} \cdot \frac{\text{conc (PPM)}}{10^6} \cdot (F + A) \cdot K$$

where  $M$  = molecular weight of pollutant  
 and  $M_{EX}$  = molecular weight of exhaust

For conversion of total hydrocarbon concentrations to mass flow rate, the formula is:

$$\text{Pollutant Mass Flow Rate (lb/hr)} = \frac{M}{M_{EX}} \cdot \frac{\text{conc (PPM)}}{10^6} \cdot (F + A)$$

The exhaust molecular weight,  $M_{EX}$ , varies as a function of air/fuel ratio. This relationship can be approximated as a straight line, and was represented in the computer calculation by the equation

$$M_{EX} = 21.236 + 0.515 A/F$$

According to Teledyne Continental, this expression is valid for air/fuel ratios less than stoichiometric, but  $M_{EX}$  assumes the constant value 28.96 for air/fuel ratios greater than stoichiometric.\*

---

\* Justification for these relationships can be found in C.F. Taylor and E.S. Taylor, The Internal Combustion Engine, Second Edition, International Textbook Company, Scranton, Pa. (1969) pp. 37-39.

Certain conventions must also be followed with regard to molecular weights. To maintain consistency with other data in this report, some modification of the Teledyne Continental input parameters was made. For example, elsewhere in this report it has been customary to express Total Hydrocarbons as methane, molecular weight 16.04. This value departs somewhat from the value of 14.67 used by Teledyne Continental on the basis of formulas employed by the State of California for heavy duty gasoline engine tests. Also, in the interest of consistency, the hydrogen-carbon ratio was taken as 1.84 rather than the 2.12 used by Teledyne Continental on the assumption of a representative gasoline with formula  $C_8H_{17}$ . NO was computed as  $NO_2$  equivalent, using the molecular weight 46.01.

Separate statistical summaries were made for the Climb-Rich and Climb-Lean categories. It will be noted that the number of engines included in each model summary is often less than the number of engines actually processed as individuals. As previously noted, the difference resides in the fact that for several of the engines the data was incomplete in some sense. For example, if data for one of the pollutants or for one of the modes was missing for a particular engine, that engine was excluded from the statistical summary so as not to bias the mean value or standard deviation.

#### 2.1.2 Auxiliary Power Units -- AiResearch

Table III is a compendium of emissions tests made by AiResearch on auxiliary power units. Concentrations in this table are on a wet basis -- that is, the emission concentrations are corrected to concentration in wet exhaust from combustion with dry air.

Mass of pollutant per 1000 pounds of fuel was computed by AiResearch and submitted as part of their report; consequently, it was not necessary to convert pollutant concentrations to mass emission form. Though AiResearch also provided figures for mass of pollutant per hour, it was found more expeditious to compute the mass flow by multiplying pounds pollutant per 1000 pounds of fuel by the corrected fuel flow rate. Note that NO and  $NO_2$  concentrations

were reported separately by AiResearch. These separately measured quantities, as well as the combined concentration of total oxides of nitrogen ( $\text{NO}_x$ ), are reproduced in Table III, but mass emission rates are included only for  $\text{NO}_x$ . The total nitrogen oxides are computed as  $\text{NO}_2$ , molecular weight 46.01.

In addition to the computations performed by AiResearch and incorporated in Table III, additional computations were performed to express emissions on the basis of pounds pollutant per horsepower hour. For this purpose, it was considered advisable to take into account, wherever possible, both shaft horsepower and the horsepower induced by bleed air loading. In this way, emissions can be charged against the combined equivalent horsepower rather than against the less realistic value of shaft horsepower, which is often small or negligible.

The basis for computing total horsepower as the sum of shaft horsepower and air horsepower was provided by Mr. Charles Dawson of the Environmental Protection Agency, Ann Arbor.

The ideal compression power was taken as isentropic, and the applicable formula for air horsepower is based on the assumption of perfect gas laws and the belief that constant specific heats can be assumed with sufficient accuracy. Typical pressure ratios are about 3 (temperature ratio  $\approx 1.36$ ) and inlet compressor temperatures are near normal ambients. For steady flow,

$$\text{Air HP} = 1.415 W \bar{c}_p T_1 \left[ \left( P_2/P_1 \right)^{\frac{K-1}{K}} - 1 \right]$$

where       $W$     =    corrected bleed flow, lbs/sec  
                $T_1$    =    compressor inlet temperature, °F  
                $P_2$    =    compressor discharge pressure, psia  
                $P_1$    =    compressor inlet pressure, psia

Mean compression temperatures are taken as 190°F (650° Rankine) and  $K = 1.398$ . The formula thus reduces to

$$\begin{aligned}
 \text{Air HP} &= (1.415) \cdot W \cdot (0.241) \left[ \left( \frac{P_2}{14.7} \right)^{0.285} - 1 \right] \\
 &= 0.341 W \left[ \left( \frac{P_2}{14.7} \right)^{0.285} - 1 \right]
 \end{aligned}$$

In reducing the AiResearch data to horsepower basis, the air horsepower as computed from the above formula was added to the corrected shaft horsepower. This combined quantity was used as divisor in reducing pounds of pollutant per hour to pounds of pollutant per horsepower hour.

### 2.1.3 Turbine/Turboprop Engines

Data for turbine and turboprop engines are presented in Tables IV and V. Table IV contains baseline data, in which a normal LTO cycle and conventional ground-operation tactics are employed. The basis of the LTO cycle, as prescribed by EPA, is discussed in Part I of this report. Basically, the cycle consists of taxi/idle prior to takeoff, takeoff, climbout, approach and taxi/idle subsequent to landing. To each of these modes a time in mode is assigned in accordance with airport experience.

Table IV presents, for the most part, two pages of information for each engine. On the first page is tabulated the identification of the engine, the engine supplier, the test organization, such essential engine data as thrust or power rating and engine-overhaul history, and prevailing ambient test conditions. This information is followed by a tabulation of test data, including pollutant concentrations and a description of the test modes in terms of engine operating conditions.

At this juncture it should be pointed out that verbal names assigned to the various test modes varied considerably from one test organization to another. In view of this fact and the fact that subsequent designation of modes is mandated by the EPA-prescribed LTO cycle, test modes are tabulated

only in numerical terms. Each test mode is tabulated as a pair of integers separated by a slash. The number preceding the slash denotes the mode under test, whereas the number following the slash denotes the mode previously tested. Thus the entry "3/5" denotes that the data in that line of the table is for the third mode and that the mode which preceded it is in the test sequence was mode 5. Similarly, "3/2" denotes that the third mode was preceded in the test sequence by mode 2. The modes are numbered in ascending order of power or thrust settings; accordingly, the slash notation makes evident whether a particular mode was tested as part of an ascending or descending sequence of power or thrust settings. The sequence of testing is further elucidated by the column labeled either "Clock-Time" or "Elapsed Time." Clock time, such as 2037, denotes "2037 hours", or 8:37 p.m. Elapsed time is in minutes and is measured from a zero time reference at the beginning of the test sequence. If the time entry is -0.00, no time-of-test information was available.

For each test mode, the actual thrust or shaft horsepower is tabulated; this number is followed by "Percent Rated T.O." obtained by dividing the test-mode setting by the rated thrust or horsepower. The resulting values are expressed as integer percentages and are truncated, rather than rounded, quantities. Thus, for example, 5% brackets a range from 5.00% to 5.99%. This fact should be borne in mind in comparing the mass emissions computed from raw data with mass emissions values interpolated for the LTO-cycle calculations.

Mass emissions for each test mode were computed according to the conversion formulas of Section 1.2, Methodology of Data Analysis, and are expressed as pounds of pollutant per thousand pounds of fuel and as pounds of pollutant per hour. Pounds of pollutant per hour is the product of fuel consumption rate, in pounds per hour, and pounds of pollutant per pound of fuel. Finally, the pollutant mass is expressed on the basis of mass of pollutant per unit of energy. For turboprops, this unit is taken as 1000 horsepower hours; for turbines, the corresponding unit is 1000 pounds thrust hours, since horsepower rating is not applicable in this instance.

The converted quantities expressed as pounds of pollutant per pound of fuel were plotted against percent power or thrust and processed as described in Section 1.2 to obtain interpolated values at specified settings for idle/taxi, takeoff, climbout and approach, as specified by EPA. These interpolated values then formed the basis for the calculations tabulated as the second page of information for each engine. If for some reason, such as incomplete data, it is impossible to complete the LTO-cycle calculation, then the second page of information is omitted.

Pollutant mass for a particular mode is computed by multiplying pounds of pollutant per hour by time in mode. Similarly, energy for that mode is found by multiplying thrust or power by time in mode. Division of pollutant mass by energy for each mode gives the corresponding pounds of pollutant per horsepower hour or per pound thrust hour. In a similar manner, pounds of pollutant per pound of fuel for the entire cycle is obtained by dividing the total pollutant mass for the cycle by the total fuel mass for the cycle. The result is a quantity which can be interpreted as the average rate at which pollutant is generated per pound of fuel, the average reflecting appropriately the times spent in the various modes. The pounds of pollutant per 1000 horsepower hours or per 1000 pounds thrust hours is similarly computed by dividing the total pollutant mass for the cycle by the total energy for the cycle.

It will be noted that in some instances the emission rate or mass is recorded as 0.0. This type of entry may occur, for example, when it is necessary to obtain CO or HC values at 100 percent thrust by extrapolation of the corresponding plots of pollutant mass emission versus power or thrust. If the extrapolation yields a negative value, the extrapolated value is defined to be zero. Such a result is completely consistent with facts, because it will not occur unless the pollutant mass is indeed negligible at high power or thrust settings.

Statistical summaries following the results for individual engines are computed in two ways, the two summaries being differentiated by changes in "usage weighting factors." The summary appearing in Table IV applies to

the data for individual engines as displayed in that table and is based on useage weighting factors of unity for all modes. In Table V, the useage weighting factors are 1.00 for takeoff, approach and climb modes but are reduced to either 0.50 or 0.67 for the two taxi/idle modes. The reduced values are based on a modification of ground-operation tactics in which, for two-engine or four-engine aircraft, only half of the engines are in operation and for three-engine aircraft only two-thirds of the engines are in operation. The thrust or power settings for the engines remaining in operation are increased proportionately to compensate for the engines not in operation. Comparison of the two statistical summaries will reveal that substantial reductions in CO and HC emissions may occur as a result of this change, primarily because of the steep negative slope of the CO and HC curves at low power or thrust settings.

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 167 ENGINE TYPE AND MODEL: O-200-A

SERIAL NUMBER: 204598-9-AB

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 284. HRS

FUEL: AV GAS 80/87

FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 80.50 FINISH 82.00

ATMOSPHERIC PRESSURE: START 30.00 FINISH 30.00

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 56.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 168 ENGINE TYPE AND MODEL: O-200-A

SERIAL NUMBER: 204598-9-AC

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 284. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 82.00 FINISH 81.00

ATMOSPHERIC PRESSURE: START 30.02 FINISH 30.02

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 51.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.0C, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 79.00 FINISH 78.50

ATMOSPHERIC PRESSURE: START 30.28 FINISH 30.28

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 65.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 181 ENGINE TYPE AND MODEL: O-200-A SERIAL NUMBER: 213 175-70-AA  
RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 311. HRS

FUEL: AV GAS 80/87 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 74.00 FINISH 75.00

ATMOSPHERIC PRESSURE: START 29.92 FINISH 29.92

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 73.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 183 ENGINE TYPE AND MODEL: O-200-A

SERIAL NUMBER: 213 175-70-AC

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 311. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 77.80 FINISH 77.80

ATMOSPHERIC PRESSURE: START 29.94 FINISH 29.94

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 62.00 PERCFNT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA .....

CAL ID NUMBER: 184 ENGINE TYPE AND MODEL: O-200-A

SERIAL NUMBER: 199599-9-AA

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 809. HRS

FUEL: AV GAS 80/87

FUEL M/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 79.80 FINISH 79.80

ATMOSPHERIC PRESSURE: START 30.03 FINISH 30.03

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 58.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 186 ENGINE TYPE AND MODEL: D-200-A SERIAL NUMBER: 199599-9-AC  
 RATED HORSEPOWER: 100.  
 ENGINE TOTAL TIME: 809. HRS  
 FUEL: AV GAS 80/87 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 80.00 FINISH 80.00  
 ATMOSPHERIC PRESSURE: START 30.03 FINISH 30.03  
 INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01  
 RELATIVE HUMIDITY: 53.00 PERCENT  
 SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00  
 SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA .....

CAL ID NUMBER: 188 ENGINE TYPE AND MODEL: D-200-A

SERIAL NUMBER: 199196-8-48

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 952. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 86.50 FINISH 88.00

ATMOSPHERIC PRESSURE: START 29.97 FINISH 29.97

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 48.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 190 ENGINE TYPE AND MODEL: O-200-A

SERIAL NUMBER: 204579A

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 714. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 90.50 FINISH 87.50

ATMOSPHERIC PRESSURE: START 29.85 FINISH 29.85

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 50.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 191 ENGINE TYPE AND MODEL: D-200-A SERIAL NUMBER: 204579B

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: 714. HRS

FUEL: AV GAS 80/87 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 89.00 FINISH 89.50

ATMOSPHERIC PRESSURE: START 29.86 FINISH 29.86

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 50.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 384 ENGINE TYPE AND MODEL: D-320-B3B

SERIAL NUMBER: L-4393-39

RATED HORSEPOWER: 160.

ENGINE TOTAL TIME: 563. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 84.00 FINISH 77.00

ATMOSPHERIC PRESSURE: START 29.80 FINISH 29.80

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 78.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

ENGINE TOTAL TIME: 563. MRS

FUEL: AV GAS 100/130 FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 76.50 FINISH 72.00

ATMOSPHERIC PRESSURE: START 29.80 FINISH 29.80

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 94.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 386 ENGINE TYPE AND MODEL: O-320-B3B

SERIAL NUMBER: L-4393-39B

RATED HORSEPOWER: 160.

ENGINE TOTAL TIME: 563. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 66.00 FINISH 68.00

ATMOSPHERIC PRESSURE: START 29.97 FINISH 29.97

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 51.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 387 ENGINE TYPE AND MODEL: O-320-B38 SERIAL NUMBER: L-4336-39

RATED HORSEPOWER: 160.

ENGINE TOTAL TIME: 433. HRS

FUEL: AV GAS 100/130 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 70.00 FINISH 72.00

ATMOSPHERIC PRESSURE: START 29.97 FINISH 29.97

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 44.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA .....

CAL ID NUMBER: 232 ENGINE TYPE AND MODEL: O-320-E2A

SERIAL NUMBER: L-26201-27AA

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 1394. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 81.00 FINISH 81.00

ATMOSPHERIC PRESSURE: START 30.05 FINISH 30.05

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 48.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 234 ENGINE TYPE AND MODEL: O-320-E2A

SERIAL NUMBER: L-26201-27AC

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 1394. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 84.50 FINISH 84.50

ATMOSPHERIC PRESSURE: START 30.05 FINISH 30.05

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 44.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

INLET AIR TEMPERATURE, DEGREES F: START 76.50 FINISH 76.50

ATMOSPHERIC PRESSURE: START 29.76 FINISH 29.76

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 50.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 242 ENGINE TYPE AND MODEL: D-320-E2A

SERIAL NUMBER: L-27848-27AB

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 768. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 82.50 FINISH 82.50

ATMOSPHERIC PRESSURE: START 29.80 FINISH 29.80

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 40.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 71.00 FINISH 72.00

ATMOSPHERIC PRESSURE: START 29.85 FINISH 29.85

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 57.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 261 ENGINE TYPE AND MODEL: D-320-E2A

SERIAL NUMBER: L-29302-27AC

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 130. MRS

FUEL: AV GAS 80/87

FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 88.00 FINISH 88.00

ATMOSPHERIC PRESSURE: START 30.15 FINISH 30.15

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 49.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 161 ENGINE TYPE AND MODEL: O-320-E2D

SERIAL NUMBER: L-23495-27AB

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 527. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 85.50 FINISH 85.50

ATMOSPHERIC PRESSURE: START 30.10 FINISH 30.10

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 58.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 89.00 FINISH 89.00

ATMOSPHERIC PRESSURE: START 30.10 FINISH 30.10

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 43.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 175 ENGINE TYPE AND MODEL: D-320-E2D

SERIAL NUMBER: L-26284-27AA

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 426. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 82.00 FINISH 82.50

ATMOSPHERIC PRESSURE: START 30.17 FINISH 30.17

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 73.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 176 ENGINE TYPE AND MODEL: O-320-E20 SERIAL NUMBER: L-26204-27AB

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 426. HRS

FUEL: AV GAS 80/87 FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 81.50 FINISH 81.00

ATMOSPHERIC PRESSURE: START 30.16 FINISH 30.16

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 72.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 177 ENGINE TYPE AND MODEL: O-320-E2D

SERIAL NUMBER: L-26284-27AC

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 427. HRS

FUEL: AV GAS 80/87

FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 85.00 FINISH 85.50

ATMOSPHERIC PRESSURE: START 30.16 FINISH 30.15

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 66.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA .....

CAL ID NUMBER: 239

ENGINE TYPE AND MODEL: D-320-E30

SERIAL NUMBER: L-29465-27AB

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 55. HRS

FUEL: AV GAS 80/87

FUEL W/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 82.00 FINISH 82.00

ATMOSPHERIC PRESSURE: START 29.70 FINISH 29.70

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 43.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 240 ENGINE TYPE AND MODEL: O-320-E30

SERIAL NUMBER: L-29465-27AC

RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 55. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 78.00 FINISH 78.00

ATMOSPHERIC PRESSURE: START 29.70 FINISH 29.70

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 40.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 0/ 6/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 271 ENGINE TYPE AND MODEL: IO-360-A1A SERIAL NUMBER: L-2920-51AA

RATED HORSEPOWER: 200.

ENGINE TOTAL TIME: 1023. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 89.00 FINISH 89.00

ATMOSPHERIC PRESSURE: START 30.20 FINISH 30.20

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 36.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 0/ 6/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 273 ENGINE TYPE AND MODEL: IO-360-A1A SERIAL NUMBER: L-2928-51AC

RATED HORSEPOWER: 200.

ENGINE TOTAL TIME: 1024. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 77.00 FINISH 80.00

ATMOSPHERIC PRESSURE: START 30.18 FINISH 30.18

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 79.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 178 ENGINE TYPE AND MODEL: IO-360-A186 SERIAL NUMBER: L-7682-514A

RATED HORSEPOWER: 200.

ENGINE TOTAL TIME: 660. HRS

FUEL: AV GAS 80/87 FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 89.00 FINISH 90.50

ATMOSPHERIC PRESSURE: START 30.13 FINISH 30.13

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 59.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 180 ENGINE TYPE AND MODEL: IO-360-A186 SERIAL NUMBER: L-7682-91AC

RATED HORSEPOWER: 200.

ENGINE TOTAL TIME: 666. HRS

FUEL: AV GAS 80/87 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 89.00 FINISH 89.00

ATMOSPHERIC PRESSURE: START 30.11 FINISH 30.11

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 58.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/30/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA .....

CAL ID NUMBER: 256 ENGINE TYPE AND MODEL: IO-360-B1E

SERIAL NUMBER: L-4035-51AA

RATED HORSEPOWER: 180.

ENGINE TOTAL TIME: 1179. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 80.00 FINISH 85.00

ATMOSPHERIC PRESSURE: START 30.15 FINISH 30.15

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 40.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 7/30/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 257 ENGINE TYPE AND MODEL: IO-360-BIE SERIAL NUMBER: L-4835-51AB

RATED HORSEPOWER: 180.

ENGINE TOTAL TIME: 1180. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 85.00 FINISH 83.00

ATMOSPHERIC PRESSURE: START 30.15 FINISH 30.15

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 38.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

ANALYSIS DONE ON FRONT EXHAUST.

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 196 ENGINE TYPE AND MODEL: IO-360-C

SERIAL NUMBER: F/51634-70CA

RATED HORSEPOWER: 210.

ENGINE TOTAL TIME: 169. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 90.00 FINISH 88.00

ATMOSPHERIC PRESSURE: START 30.14 FINISH 30.14

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 51.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 198 ENGINE TYPE AND MODEL: 10-360-C SERIAL NUMBER: F/51634-70CC

RATED HORSEPOWER: 210.

ENGINE TOTAL TIME: 170. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 94.00 FINISH 94.00

ATMOSPHERIC PRESSURE: START 30.12 FINISH 30.12

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 46.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/17/61

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 362 ENGINE TYPE AND MODEL: IO-360-C

SERIAL NUMBER: 50591-6CA

RATED HORSEPOWER: 210.

ENGINE TOTAL TIME: 700. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 79.00 FINISH 80.00

ATMOSPHERIC PRESSURE: START 30.24 FINISH 30.24

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 75.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYME-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 365 ENGINE TYPE AND MODEL: IO-360-C SERIAL NUMBER: 55651-6-D  
RATED HORSEPOWER: 210.

ENGINE TOTAL TIME: 700. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 79.00 FINISH 81.00

ATMOSPHERIC PRESSURE: START 30.21 FINISH 30.21

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 74.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 253 ENGINE TYPE AND MODEL: IO-470-C

SERIAL NUMBER: 71018-7-CA

RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 761. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 71.00 FINISH 76.00

ATMOSPHERIC PRESSURE: START 30.15 FINISH 30.15

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 60.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/30/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 255 ENGINE TYPE AND MODEL: IO-470-C

SERIAL NUMBER: 71010-7-CC

RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 761. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 80.00 FINISH 80.00

ATMOSPHERIC PRESSURE: START 30.15 FINISH 30.15

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 43.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA .....

CAL ID NUMBER: 193 ENGINE TYPE AND MODEL: IO-470-V SERIAL NUMBER: 170012-7-V-RA

RATED HORSEPOWER: 260.

ENGINE TOTAL TIME: 971. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 85.00 FINISH 85.00

ATMOSPHERIC PRESSURE: START 30.23 FINISH 30.23

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 47.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 194 ENGINE TYPE AND MODEL: IO-470-V

SERIAL NUMBER: 170012-7-V-RB

RATED HORSEPOWER: 260.

ENGINE TOTAL TIME: 971. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 94.00 FINISH 94.00

ATMOSPHERIC PRESSURE: START 30.23 FINISH 30.23

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 34.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEOVNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 195 ENGINE TYPE AND MODEL: IO-470-V

SERIAL NUMBER: 170012-7-V-RC

RATED HORSEPOWER: 260.

ENGINE TOTAL TIME: 971. HRS

FUEL: AV GAS 100/130

FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 96.00 FINISH 96.00

ATMOSPHERIC PRESSURE: START 30.14 FINISH 30.14

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 31.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 379 ENGINE TYPE AND MODEL: IO-470-V0

SERIAL NUMBER: 149063V0A

RATED HORSEPOWER: 260.

ENGINE TOTAL TIME: 185. HRS

FUEL: AV GAS 100/130

FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 89.00 FINISH 90.50

ATMOSPHERIC PRESSURE: START 30.06 FINISH 30.06

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 45.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA .....

CAL ID NUMBER: 382 ENGINE TYPE AND MODEL: IO-470-VO

SERIAL NUMBER: 49055VOA

RATED HORSEPOWER: 260.

ENGINE TOTAL TIME: 185. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 90.00 FINISH 90.00

ATMOSPHERIC PRESSURE: START 30.05 FINISH 30.04

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 55.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 363 ENGINE TYPE AND MODEL: IO-470-VO

SERIAL NUMBER: 49055V08

RATED HORSEPOWER: 260.

ENGINE TOTAL TIME: 185. HRS

FUEL: AV GAS 100/130

FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 77.50 FINISH 78.00

ATMOSPHERIC PRESSURE: START 30.04 FINISH 30.04

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.04

RELATIVE HUMIDITY: 168.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 390 ENGINE TYPE AND MODEL: O-470-R SERIAL NUMBER: 133510-6-R  
 RATED HORSEPOWER: 230.

ENGINE TOTAL TIME: 69. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 75.00 FINISH 74.50

ATMOSPHERIC PRESSURE: START 30.12 FINISH 30.12

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 47.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 367 ENGINE TYPE AND MODEL: TS10-520-E SERIAL NUMBER: 206193-9-EA

RATED HORSEPOWER: 300.

ENGINE TOTAL TIME: 214. MRS

FUEL: AV GAS 100/130 FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 76.50 FINISH 77.50

ATMOSPHERIC PRESSURE: START 30.16 FINISH 30.16

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 79.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 369 ENGINE TYPE AND MODEL: TS10-520-E SERIAL NUMBER: 206211-9-E

RATED HORSEPOWER: 300.

ENGINE TOTAL TIME: 214. MRS

FUEL: AV GAS 100/130 FUEL M/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 75.50 FINISH 75.50

ATMOSPHERIC PRESSURE: START 30.14 FINISH 30.14

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 78.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 371 ENGINE TYPE AND MODEL: TS10-520-E SERIAL NUMBER: 206211-9-EB

RATED HORSEPOWER: 300.

ENGINE TOTAL TIME: 214. HRS

FUEL: AV GAS 100/130 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 73.00 FINISH 73.00

ATMOSPHERIC PRESSURE: START 30.14 FINISH 30.14

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 8.20 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 245 ENGINE TYPE AND MODEL: IO-540-C485 SERIAL NUMBER: L-6246-488  
RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 1746. HRS

FUEL: AV GAS 100/130 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 82.00 FINISH 83.00

ATMOSPHERIC PRESSURE: START 29.82 FINISH 29.82

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 52.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 247 ENGINE TYPE AND MODEL: IO-540-C4B5 SERIAL NUMBER: L-6239-48A  
 RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 1760. HRS

FUEL: AV GAS 100/130 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 65.00 FINISH 70.00

ATMOSPHERIC PRESSURE: START 29.80 FINISH 29.80

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 95.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 7/28/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 249 ENGINE TYPE AND MODEL: IO-540-C485 SERIAL NUMBER: L-6239-48C  
RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 1741. HRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 71.00 FINISH 71.00  
ATMOSPHERIC PRESSURE: START 29.73 FINISH 29.73  
INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02  
RELATIVE HUMIDITY: 98.00 PERCENT  
SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00  
SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/ 6/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 267 ENGINE TYPE AND MODEL: 1D-540-C485 SERIAL NUMBER: L-1623-40C

RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 1218. HRS

FUEL: AV GAS 100/130 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 82.00 FINISH 82.00

ATMOSPHERIC PRESSURE: START 29.90 FINISH 29.90

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 92.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA .....

CAL ID NUMBER: 373 ENGINE TYPE AND MODEL: O-540-A1B5

SERIAL NUMBER: L-3141-40A

RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 1133. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START 86.50 FINISH 83.00

ATMOSPHERIC PRESSURE: START 30.29 FINISH 30.29

INLET AIR HUMIDITY, GRAM H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 36.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.0C, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 376 ENGINE TYPE AND MODEL: O-540-A1B5 SERIAL NUMBER: L-3454-40A

RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 932. MRS

FUEL: AV GAS 100/130 FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 75.50 FINISH 78.50

ATMOSPHERIC PRESSURE: START 30.28 FINISH 30.28

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01

RELATIVE HUMIDITY: 50.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 11

COMMENTS:

DATE: 7/30/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 259 ENGINE TYPE AND MODEL: O-320-E2A SERIAL NUMBER: L-29302-27AA  
 RATED HORSEPOWER: 150.

ENGINE TOTAL TIME: 129. HRS

FUEL: AV GAS 80/87 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 87.00 FINISH 86.00  
 ATMOSPHERIC PRESSURE: START 30.15 FINISH 30.15  
 INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01  
 RELATIVE HUMIDITY: 45.00 PERCENT  
 SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00  
 SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 8

DATE: 8/17/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 363 ENGINE TYPE AND MODEL: ID-360-C SERIAL NUMBER: 90591-6CB

RATED HORSEPOWER: 210.

ENGINE TOTAL TIME: 700. MRS

FUEL: AV GAS 100/130 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 84.00 FINISH 84.00

ATMOSPHERIC PRESSURE: START 30.24 FINISH 30.24

INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 66.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 8

COMMENTS:

DATE: 7/16/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 164 ENGINE TYPE AND MODEL: O-470-R SERIAL NUMBER: 203247-TORB  
 RATED HORSEPOWER: 230.  
 ENGINE TOTAL TIME: 182. HRS  
 FUEL: AV GAS 80/87 FUEL W/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 91.00 FINISH 91.00  
 ATMOSPHERIC PRESSURE: START 29.95 FINISH 29.95  
 INLET AIR HUMIDITY, GRN H2O/LB AIR: 0.01  
 RELATIVE HUMIDITY: 40.00 PERCENT  
 SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00; FLOW RATE, LITERS/MIN: 7.00  
 SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

DATE: 8/ 6/71

TEST ORGANIZATION: SCOTT/GEN AVIATION

ENGINE SUPPLIER: LYCOMING

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 262 ENGINE TYPE AND MODEL: IO-540-C405

SERIAL NUMBER: L-901-48A

RATED HORSEPOWER: 250.

ENGINE TOTAL TIME: 1318. HRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START 82.00 FINISH 83.00

ATMOSPHERIC PRESSURE: START 29.90 FINISH 29.90

INLET AIR HUMIDITY, GRM H2O/LB AIR: 0.02

RELATIVE HUMIDITY: 65.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: 7.00

SAMPLE LINE TRANSPORT TIME, SEC: 1.60

NUMBER OF TESTS: 10

COMMENTS:

NO FUEL FLOW DATA

DATE: 6/23/71

TEST ORGANIZATION: TELEDYNE-CONTINENTAL

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 2D6 ENGINE TYPE AND MODEL: D-200-A

SERIAL NUMBER: 213500A

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: -0. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START -0.00 FINISH -0.00

ATMOSPHERIC PRESSURE: START 28.71 FINISH -0.00

INLET AIR HUMIDITY, GRN H2O/LB AIR: 83.00

RELATIVE HUMIDITY: -0.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: -0.00

SAMPLE LINE TRANSPORT TIME, SEC: -0.00

NUMBER OF TESTS: 9

DATE: 6/24/71

TEST ORGANIZATION: TELEDYNE-CONTINENTAL

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 208 ENGINE TYPE AND MODEL: D-200-A

SERIAL NUMBER: 213500L

RATED HORSEPOWER: 100.

ENGINE TOTAL TIME: -0. HRS

FUEL: AV GAS 80/87

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START -0.00 FINISH -0.00

ATMOSPHERIC PRESSURE: START 28.68 FINISH -0.00

INLET AIR HUMIDITY, GRN H2O/LB AIR: 91.00

RELATIVE HUMIDITY: -0.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: -0.00

SAMPLE LINE TRANSPORT TIME, SEC: -0.00

NUMBER OF TESTS: 9

DATE: 6/21/71

TEST ORGANIZATION: TELEDYNE-CONTINENTAL

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA .....

CAL ID NUMBER: 210 ENGINE TYPE AND MODEL: 10-520-P

SERIAL NUMBER: 159850A

RATED HORSEPOWER: 300.

ENGINE TOTAL TIME: -0. MRS

FUEL: 4V GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA .....

INLET AIR TEMPERATURE, DEGREES F: START -0.00 FINISH -0.00

ATMOSPHERIC PRESSURE: START 28.96 FINISH -0.00

INLET AIR HUMIDITY, GRM H2O/LB AIR: 63.00

RELATIVE HUMIDITY: -0.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: -0.00

SAMPLE LINE TRANSPORT TIME, SEC: -0.00

NUMBER OF TESTS: 10

DATE: 6/24/71

TEST ORGANIZATION: TELEDYNE-CONTINENTAL

ENGINE SUPPLIER: TELEDYNE-CONTINENTAL

ENGINE DATA \*\*\*\*\*

CAL ID NUMBER: 216 ENGINE TYPE AND MODEL: IO-520-P

SERIAL NUMBER: 159983

RATED HORSEPOWER: 300.

ENGINE TOTAL TIME: -0. MRS

FUEL: AV GAS 100/130

FUEL H/C RATIO: 1.840

OPERATIONAL DATA \*\*\*\*\*

INLET AIR TEMPERATURE, DEGREES F: START -0.00 FINISH -0.00

ATMOSPHERIC PRESSURE: START 28.76 FINISH -0.00

INLET AIR HUMIDITY, GRN H2O/LB AIR: 83.00

RELATIVE HUMIDITY: -0.00 PERCENT

SAMPLE LINE: TEMPERATURE, DEGREES C: -0.00, FLOW RATE, LITERS/MIN: -0.00

SAMPLE LINE TRANSPORT TIME, SEC: -0.00

NUMBER OF TESTS: 10

COMMENTS:
