## F O R E W O R D

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

### OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

### ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

### LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the New York Department of Environmental Conservation and the Pennsylvania Department of Environmental Resources for professional involvement and to the New York and Pennsylvania National Guards for conducting the tributary sampling phase of the Survey.

Henry L. Diamond, commissioner, and Leo J. Hetling and Italo G. Carcich of the New York Department of Environmental Conservation; and Walter J. Lyon, Director, and Richard A. Boardman and James T. Ulanoski of the Pennsylvania Bureau of Water Quality, provided invaluable reservoir documentation and counsel during the Survey, reviewed the preliminary report, and provided critiques most useful in the preparation of this report on Allegheny Reservoir.

Major General John C. Baker, Chief of Staff to the Governor of New York; Major General Harry J. Mier, Jr., Adjutant General of Pennsylvania; and Project Officers Lt. Colonel Fred Peters and Major Ronald E. Wickard, who directed the volunteer efforts of the New York and Pennsylvania National Guardsmen, respectively, are also gratefully acknowledged for their assistance to the Survey.

## ALLEGHENY RESERVOIR\*

STORET NO. 3641

### I. CONCLUSIONS

#### A. Trophic Condition:

Survey data indicate that the New York portion (station 1, northeast embayment) and the Kinzua Creek portion in Pennsylvania (station 4, southeast embayment) of Allegheny Reservoir are eutrophic. The quality of the central portion of the reservoir differs from these two areas and, based on the low median total phosphorus, mean chlorophyll a, and mean Secchi disc values at each sampling site (stations 2, 3, and 5), it appears to be mesotrophic. The reservoir ranked tenth in overall trophic quality when the 17 Pennsylvania lakes sampled in 1973 were compared using a combination of six parameters\*\*. Seven of the lakes had less median total phosphorus, five had less and three had the same median dissolved phosphorus, ten had less median inorganic nitrogen, four had less mean chlorophyll a, and six had greater mean Secchi disc transparency. Depression of dissolved oxygen with depth occurred at station 1 in July of 1972; at stations 2, 3, and 5 in July, 1973; and at stations 2 and 3 in September, 1973.

Survey limnologists noted moderate algal blooms at station 1 in July of 1972. The four sites sampled in 1973 were reported to be free of algal blooms and macrophytes.

\* Table of metric conversions--Appendix A.

\*\* See Appendix B.

**B. Rate-Limiting Nutrient:**

The algal assay results indicate that Allegheny Reservoir was limited by phosphorus at the time the sample was taken. These results are substantiated by the lake data; i.e., the mean inorganic nitrogen to orthophosphorus (dissolved phosphorus at station 1) ratios were 23 to 1 or greater at all sampling times.

**C. Nutrient Controllability:**

1. Point sources--The phosphorus contribution of the listed point sources accounted for 26.3% of the total load to Allegheny Reservoir. Bradford, PA, contributed 9.1% of this total, Olean, NY, contributed 7.5%, and Salamanca, NY, contributed 2.2%. The remaining listed point sources collectively contributed 7.5% of the total.

There are other known point sources beyond the 40-kilometer limit of the Survey\* that impact tributaries of Allegheny Reservoir. For this reason, it is likely that the percentage of the total phosphorus load contributed by point sources is greater than indicated above.

The present loading rate of  $3.31 \text{ g/m}^2/\text{yr}$  is two times the rate proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic rate (see page 20). For this reason, all phosphorus inputs should be minimized to the greatest practicable

\* See Working Paper No. 175, "...Survey Methods, 1973-1976".

extent. While even complete removal of phosphorus at the listed point sources would only reduce the loading rate to 2.44 g/m<sup>2</sup>/yr, it is likely that a high degree of phosphorus control at all of the point sources would at least slow the present rate of eutrophication. The relatively short hydraulic retention time (77 days) would facilitate water quality improvement once phosphorus controls are initiated.

2. Non-point sources--The phosphorus contribution of non-point sources amounted to 73.7% of the total load to Allegheny Reservoir during the sampling year. The Allegheny River contributed the major portion of this load (66.2%). The remaining 13 sampled tributaries collectively contributed 4.9%. Ungaged tributaries were estimated to have contributed 2.1%.

The phosphorus export rate of the Allegheny River was appreciably higher than the rates of the other reservoir tributaries (see page 19). It is probable that the higher rate is due to the known but unmeasured point-source phosphorus contributions noted above.

## II. LAKE AND DRAINAGE BASIN CHARACTERISTICS

### A. Lake Morphometry<sup>†</sup>:

1. Surface area: 48.77 kilometers<sup>2</sup>.
2. Mean depth: 14.4 meters.
3. Maximum depth: 39.0 meters.
4. Volume:  $702.288 \times 10^6 \text{ m}^3$ .
5. Mean hydraulic retention time: 77 days.

### B. Tributary and Outlet:

(See Appendix C for flow data)

#### 1. Tributaries -

<u>Name</u>	<u>Drainage area (km<sup>2</sup>)<sup>††</sup></u>	<u>Mean flow (m<sup>3</sup>/sec)<sup>††</sup></u>
Sawmill Run	27.7	0.5
Bone Run	28.7	0.5
Cold Spring Creek	72.8	1.3
Allegheny River	4,256.9	76.2
Red House Brook	67.9	1.3
Quaker Run	67.9	1.3
Little Valley Creek*	120.2	2.2
S. Br., State Line Run	11.7	0.3
Willow Creek	40.9	1.2
N. Br., Sugar Run	30.6	0.4
Sugar Run	62.2	0.8
Chappel Fork	55.7	0.6
Kinzua Creek	176.6	3.0
S. Br., Kinzua Creek	101.0	1.4
Minor tributaries & immediate drainage -	<u>476.6</u>	<u>9.8</u>
Totals	5,597.4	100.8

#### 2. Outlet -

Allegheny River	5,646.2**	105.6
-----------------	-----------	-------

### C. Precipitation\*\*\*:

1. Year of sampling: 108.4 centimeters.
2. Mean annual: 107.5 centimeters.

<sup>†</sup> Ulanoski, 1975.

<sup>††</sup> For limits of accuracy, see Working Paper No. 175.

\* Since Little Valley Creek is upstream of the Allegheny River inlet station (D-1), the drainage area and flow of the creek was subtracted from the drainage area and flow of Allegheny River (see Appendix C).

\*\* Includes area of lake.

\*\*\* See Working Paper No. 175.

### III. LAKE WATER QUALITY SUMMARY

By means of a pontoon-equipped Huey helicopter, the New York portion of the Allegheny Reservoir was sampled three times at station 1 during the open-water season of 1972; and the Pennsylvania portion of the reservoir was sampled three times at stations 2, 3, 4, and 5 during the open-water season of 1973 (see map, page vi). Each time, samples for physical and chemical parameters were collected from the stations and from a number of depths at each station. During each visit, a single depth-integrated (4.6 m or near bottom to surface) sample was collected from the New York station and composited from the four Pennsylvania stations for phytoplankton identification and enumeration; and during the last visit in New York and the first visit in Pennsylvania, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 7.6 meters at station 1, 29.9 meters at station 2, 28.0 meters at station 3, 1.5 meters at station 4, and 21.6 meters at station 5.

The 1972 and 1973 lake sampling results are presented in full in Appendix D and are summarized in the following tables.

## C. Limiting Nutrient Study:

## 1. Station 1 (1972)--autoclaved, filtered, and nutrient spiked -

<u>Spike (mg/l)</u>	<u>Ortho P Conc. (mg/l)</u>	<u>Inorganic N Conc. (mg/l)</u>	<u>Maximum yield (mg/l-dry wt.)</u>
Control	0.034	0.566	10.4
0.010 P	0.044	0.566	11.9
0.020 P	0.054	0.566	11.9
0.050 P	0.084	0.566	13.4
0.050 P + 5.0 N	0.084	5.566	29.2
0.050 P + 10.0 N	0.084	10.566	28.9
10.0 N	0.034	10.566	11.3

\* Because of instrumentation problems during the 1972 sampling, these values may be in error by plus or minus 20 percent.

## 2. Stations 2-5 (1973)--filtered and nutrient spiked -

<u>Spike (mg/l)</u>	<u>Ortho P Conc. (mg/l)</u>	<u>Inorganic N Conc. (mg/l)</u>	<u>Maximum yield (mg/l-dry wt.)</u>
Control	0.010	0.347	0.2
0.050 P	0.060	0.347	10.4
0.050 P + 1.0 N	0.060	1.347	17.6
1.0 N	0.010	1.347	0.2

## 3. Discussion -

The control yields of the assay alga, Selenastrum capricornutum, indicate that at the time the samples were taken, the potential primary productivity of Allegheny Reservoir was high at station 1 (in 1972) and moderate at stations 2-5 (in 1973). Also, in both assays the significant increase in yield with the addition of orthophosphorus indicates that both areas of the lake were limited by phosphorus at those times. Note that in both assays, the addition of nitrogen alone resulted in a yield which was not significantly different than the control.

The differences shown by the control yields at station 1 (north end of the lake) and at stations 2-5 (central and south end of lake) indicate the differences in availability of nutrients for primary production. Note that the sample orthophosphorus concentration was three times greater at station 1 (34 µg/l) than at stations 2-5 (10 µg/l).

The lake chemistry data further indicate that Allegheny Reservoir was limited by phosphorus. At all sampling times, the mean inorganic nitrogen to orthophosphorus (dissolved phosphorus at station 1) ratios were 23 to 1 or greater.

#### IV. NUTRIENT LOADINGS

(See Appendix E for data)

For the determination of nutrient loadings, the New York and Pennsylvania National Guards collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page vi), except for the high runoff months of April and May in New York and February and March in Pennsylvania when two samples were collected. In New York, sampling was begun in November, 1972, and was completed in October, 1973. In Pennsylvania, sampling was begun in May, 1973, and was completed in April, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the New York and Pennsylvania District Offices of the U.S. Geological Survey for the tributary sites nearest the lake.

In this report, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings\*. Nutrient loads shown are those measured minus point-source loads, if any.

Nutrient loads for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the means of the nutrient exports, in kg/km<sup>2</sup>/year, at stations F-1, H-1, J-1, K-1, L-1, and M-1 and multiplying the means by the ZZ area in km<sup>2</sup>.

\* See Working Paper No. 175.

The operators of the Cuba, Olean, Portville, Salamanca, Kane, Bradford, Quaker State Oil, Zippo Manufacturing Co., and W. R. Case and Sons Cutlery wastewater treatment plants provided monthly effluent samples and corresponding flow data. The operator of the wastewater treatment plant at Allegany did not participate in the sampling program, and nutrient loads were estimated at 1.134 kg P and 3.401 kg N/capita/year. Nutrient loads in the untreated wastes of the town of Ellicottville were estimated at 1.587 kg P and 4.263 kg N/capita/year.

The operators of a number of other wastewater treatment plants provided monthly samples, and the data are included in Appendix C. The locations of these plants are shown on the map (page vi), but nutrient contributions were not identified in the loadings of Allegheny Reservoir because the plants are beyond the 40-kilometer limit of the Survey\*. However, the nutrient contributions of these sources are included in the loads attributed to the Allegheny River at station D-1.

Estimates of nutrient contributions by wild ducks and geese were based on the following numbers of waterfowl using the Pennsylvania portion of Allegheny Reservoir as provided by the Pennsylvania Department of Environmental Resources (Ulanoski, 1975):

Summer resident ducks	100
Migratory ducks	1,500
Migratory geese	400

\* See Working Paper No. 175.

In calculating the nutrient loads, the following assumptions were made:

1. Twice as many waterfowl utilize the New York portion of the reservoir (the main waterfowl populations occur there; Ulanoski, op. cit.).
2. Each wild duck contributes 0.45 kg total nitrogen and 0.20 kg total phosphorus per year (Paloumpis and Starrett, 1960).
3. Each wild goose contributes the same amount as one duck since geese typically feed in fields away from the lake several hours each day.
4. Summer or winter resident waterfowl are at the lake for six months of the year.
5. Migratory waterfowl spend a total of one month per year at the lake; i.e., 15 days during Spring migration and 15 days during Fall migration.

## A. Waste Sources:

## 1. Known municipal -

<u>Name</u>	<u>Pop. Served</u>	<u>Treatment</u>	<u>Mean Flow (m<sup>3</sup>/d)</u>	<u>Receiving Water</u>

## 2. Known industrial -

<u>Name</u>	<u>Product</u>	<u>Treatment</u>	<u>Mean Flow (m<sup>3</sup>/d)</u>	<u>Receiving Water</u>
Quaker State Oil	oil refinery	NaOH and Cl removal	23,693.5	Potato Creek
W. R. Case and Sons Mfg. Co.	cutlery mfg.	none	37.9	Tunungwant Creek
Zippo Mfg. Co.	plating	ppt of nickel & chrome; pH adjustment; oxidizing of cyanide waste	45.4	Tunungwant Creek

\* Anonymous, 1971 (population shown is 1970 Census).

\*\* Treatment plant questionnaires.

\*\*\* Estimated at 0.3785 m<sup>3</sup>/capita/day.

## B. Annual Total Phosphorus Loading - Average Year:

## 1. Inputs -

<u>Source</u>	<u>kg P/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Sawmill Run	230	0.1
Bone Run	460	0.3
Cold Spring Creek	1,375	0.9
Allegheny River	106,950	66.2
Red House Brook	675	0.4
Quaker Run	400	0.2
Little Valley Creek	1,270	0.8
S. Br., State Line Run	120	0.1
Willow Creek	555	0.3
N. Br., Sugar Run	140	0.1
Sugar Run	260	0.2
Chappel Fork	195	0.1
Kinzua Creek	1,400	0.9
S. Br., Kinzua Creek	790	0.5
b. Minor tributaries & immediate drainage (non-point load) -	3,415	2.1
c. Known municipal STP's -		
Cuba	2,855	1.8
Olean	12,030	7.4
Portville	740	0.5
Salamanca	3,570	2.2
Allegany	2,325	1.4
Bradford	14,665	9.1
Kane	1,990	1.2
Ellicottville	1,515	0.9
d. Septic tanks* -	10	<0.1
e. Known industrial -		
Quaker State Oil Co.	2,740	1.7
W. R. Case and Sons Cutlery	5	<0.1
Zippo Mfg. Co.	5	<0.1
f. Wild ducks and geese -	125	0.1
g. Direct precipitation** -	855	0.5
Total	161,665	100.0

## 2. Outputs -

Lake outlet - Allegheny River 102,530

3. Net annual P accumulation - 59,135 kg.

\* Estimate based on 5 campgrounds and 1 park; see Working Paper No. 175.  
 \*\* See Working Paper No. 175.

## C. Annual Total Nitrogen Loading - Average Year:

## 1. Inputs -

<u>Source</u>	<u>kg N/ yr</u>	<u>% of total</u>
<b>a. Tributaries (non-point load) -</b>		
Sawmill Run	6,805	0.3
Bone Run	8,470	0.3
Cold Spring Creek	22,065	0.9
Allegheny River	1,510,945	61.0
Red House Brook	23,195	0.9
Quaker Run	19,485	0.8
Little Valley Creek	86,860	3.5
S. Br., State Line Run	11,830	0.5
Willow Creek	30,030	1.2
N. Br., Sugar Run	17,330	0.7
Sugar Run	27,795	1.1
Chappel Fork	21,010	0.8
Kinzua Creek	111,730	4.5
S. Br., Kinzua Creek	64,525	2.6
<b>b. Minor tributaries &amp; immediate drainage (non-point load) -</b>		<b>271,820</b>
		11.0
<b>c. Known municipal STP's -</b>		
Cuba	5,990	0.2
Olean	64,550	2.6

Salamanca	14,120	0.6
Allegany	6,970	0.3
Bradford	74,495	3.0
Kane	6,840	0.3
Ellicottville	4,070	0.2
<b>d. Septic tanks* -</b>		<b>385</b>
		<0.1
<b>e. Known industrial -</b>		
Quaker State Oil Co.	7,075	0.3
W. R. Case and Sons Cutlery	25	<0.1
Zippo Mfg. Co.	35	<0.1
<b>f. Wild ducks and geese -</b>		<b>285</b>
		<0.1
<b>g. Direct precipitation** -</b>		<b><u>52,650</u></b>
		<b><u>2.1</u></b>
Total	2,478,220	100.0

## 2. Outputs -

Lake outlet - Allegheny River 4,461,615

3. Net annual N loss - 1,983,395 kg.

\* Estimate based on 5 campgrounds and 1 park; see Working Paper No. 175.  
 \*\* See Working Paper No. 175.

## D. Mean Annual Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km<sup>2</sup>/yr</u>	<u>kg N/km<sup>2</sup>/yr</u>
Sawmill Run	8	246
Bone Run	16	295
Cold Spring Creek	19	303
Allegheny River	25	355
Red House Brook	10	342
Quaker Run	6	287
Little Valley Creek	11	723
S. Br., State Line Run	10	1,011
Willow Creek	14	734
N. Br., Sugar Run	5	566
Sugar Run	4	447
Chappel Fork	4	377
Kinzua Creek	8	633
S. Br., Kinzua Creek	8	639

E. Yearly Loading Rates:

In the following table, the existing phosphorus loading rates are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" rate is the rate at which the receiving water would become eutrophic or remain eutrophic; his "permissible" rate is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic rate would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus Total	Total Phosphorus Accumulated	Total Nitrogen Total	Total Nitrogen Accumulated
grams/m <sup>2</sup> /yr	3.31	1.21	50.8	loss*

Vollenweider loading rates for phosphorus (g/m<sup>2</sup>/yr) based on mean depth and mean hydraulic retention time of Allegheny Reservoir:

"Dangerous" (eutrophic rate)	1.56
"Permissible" (oligotrophic rate)	0.78

---

\* There was an apparent loss of nitrogen during the sampling year. This may have been due to nitrogen fixation in the reservoir, solubilization of previously sedimented nitrogen, recharge with nitrogen-rich ground water, or unknown and unsampled point sources discharging directly to the reservoir. Whatever the cause, a similar loss of nitrogen has occurred at Shagawa Lake, Minnesota which has been intensively studied by EPA's National Eutrophication and Lake Restoration Branch (Malueg et al., 1975).
