Environmental Monitoring Series

LABORATORY ANALYSES OF ATMOSPHERIC HYDROCARBONS - CALIFORNIA SOUTH COAST AIR BASIN LOS ANGELES AIR QUALITY CONTROL REGION) AUGUST - NOVEMBER 1973

Office of Research and Development
U.S. Environmental Protection Agency
Washington, D.C. 20460

RESEARCH REPORTING SERIES

Research Reports of the Office of Research and Development, U. S. Environmental Protection Agency, have been grouped into series. These broad categories were established to facilitate further development and application of environmental technology. Elimination of traditional grouping was consciously planned to foster technology transfer and maximum interface in related fields. These series are:

1. ENVIRONMENTAL HEALTH EFFECTS RESEARCH
2. ENVIRONMENTAL PROTECTION TECHNOLOGY
3. ECOLOGICAL RESEARCH
4. ENVIRONMENTAL MONITORING
5. SOCIOECONOMIC ENVIRONMENTAL STUDIES
6. SCIENTIFIC AND TECHNICAL ASSESSMENT REPORTS
9. MISCELLANEOUS

This report has been assigned to the ENVIRONMENTAL MONITORING series. This series describes research conducted to develop new or improved methods and instrumentation for the identification and quantification of environmental pollutants at the lowest conceivably significant concentrations. It also includes studies to determine the ambient concentrations of pollutants in the environment and/or the variance of pollutants as a function of time or meteorological factors.

EPA REVIEW NOTICE

This report has been reviewed by the National Environmental Research Center - Research Triangle Park, Office of Research and Development, EPA, and approved for publication. Approval does not signify that the contents necessarily reflect the views and policies of the Environmental Protection Agency, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

This document is available to the public for sale through the National Technical Information Service, Springfield, Virginia 22161.

Analysis of Hydrocarbons

Description of Method

Air samples were supplied to the laboratory in Tedlar plastic bags equipped with brass ports closed with rubber serum caps. 100 cc syringes were used to transfer samples to the gas chromatographs for analysis. Four instruments were used for analysis of air samples. All samples were analyzed for C_1 through C_6 hydrocarbons, and a few selected samples were also analyzed for hydrocarbons through n-nonane.

Methane Analysis

Methane was determined using a Hewlett Packard 5750 gas chromatograph equipped with flame ionization detector.

Samples of air were transferred by syringe to a 2 cc gas sample valve for introduction into the gas chromatograph. The chromatographic column consisted of a 6 foot length of 1/8 inch stainless steel packed with 80-100 mesh phenyl isocyanate/porosil C. Analyses were run isothermally at 18° C. Flow conditions were 300 cc/min oxygen, 30 cc/min hydrogen, 60 cc/min helium through the column, with a splitter allowing 15 cc/min helium to the detector. An Autolab System IV computing integrator was used to quantitate the data from the chromatograph.

Analysis of Ethane through Hexanes

To schedule as many as 30 analyses per day, it was necessary to employ two gas chromatographs, Varian Aerographs Model 202 and Model 660. These were equipped with appropriate columns for the analyses, and with freeze-traps and associated plumbing for preconcentration of air samples.

The procedure consisted of passing 300 cc of sample through a stainless steel freeze - trap immersed in liquid nitrogen coolant, to concentrate the sample prior to analysis. Next, a seven minute helium flush accomplished removal of liquefied air from the sample. The sample was then isolated, heated

to ca 70° C, using hot water bath and introduced into the gas chromatograph via an 8 port sample valve. The chromatographic column, made of 6 ft. x 1/8" stainless steel, packed with 120-150 mesh n-octane/porasil C, was temperature programmed from 20° C to 45° C at 2° C/min. Column effluent passed to a splitter, and from the splitter half of the flow proceeded directly to a flame ionization detector. The other half of the flow was routed through a subtractor to a second flame ionization detector. The function of the subtractor was to remove olefins and other unsaturated hydrocarbons, without removing paraffins. In this way, olefin-paraffin mixtures were better resolved and identified. Flow parameters were: 100 cc/min oxygen, 30 cc/min hydrogen, and 60 cc/min nitrogen, with half of carrier going to each detector.

Recording and Processing of Data

Data from the gas chromatographs was recorded on strip charts to provide a visual analog chromatogram, while punched paper tape with teletype printout recorded digital output consisting of retention times and peak areas. Electron digital integrators were employed to generate the digital output.

At least once a day each gas chromatograph was calibrated using a calibration standard composed of thirteen hydrocarbons at concentrations similar to those anticipated. Daily calibration data are contained in the last section of the report. Calibration factors were applied to the data from each run, and reports were generated via computer assisted data processing procedures. Each analysis report was output in the form of ascii punched paper tape and as teletyped hard copy reports. Ascii punched tapes were delivered as generated, to the program director for rapid inclusion in the date bank.

Analyses for Higher Molecular Weight Hydrocarbons

A Perkin-Elmer Model 900 gas chromatograph equipped with inlet splitter and a 200 ft. by 0.01" ID Squalane wall-coated open tubular column was used to analyze air samples for hydrocarbons up through normal nonane. The 40 hydrocarbons from n-butane through n-nonane present in measurable quantities were all separated using the instrument under the prescribed conditions.

In a preconcentration step similar to that previosly described, 800 cc of air sample was prepared for introduction into the gas chromatograph. To conserve sample, the inlet splitter vent was left closed until one minute after sample introduction. The analysis employed a sub-ambient temperature program, consisting of a 4 minute isothermal segment at -25° C, followed by a program of 2° C/min to 95° C. Data was output in digital form via an Autolab System IV computing integrator, and in analog form by strip chart recorders. The peaks were identified manually and by computer and punched tapes were prepared for processing and report generation by computer.

Flow Parameters for Perkin-Elmer 900

Splitter Restrictor #1	
Column flow:	2.45 cc/min @ -25° C
	1.8 cc/min @ 21° C
Carrier Gas:	Helium
Makeup Gas:	Helium
Makeup flow:	25 cc/min
Hydrogen flow:	40 cc/min
Split ratio with vent closed:	8.6 to 1

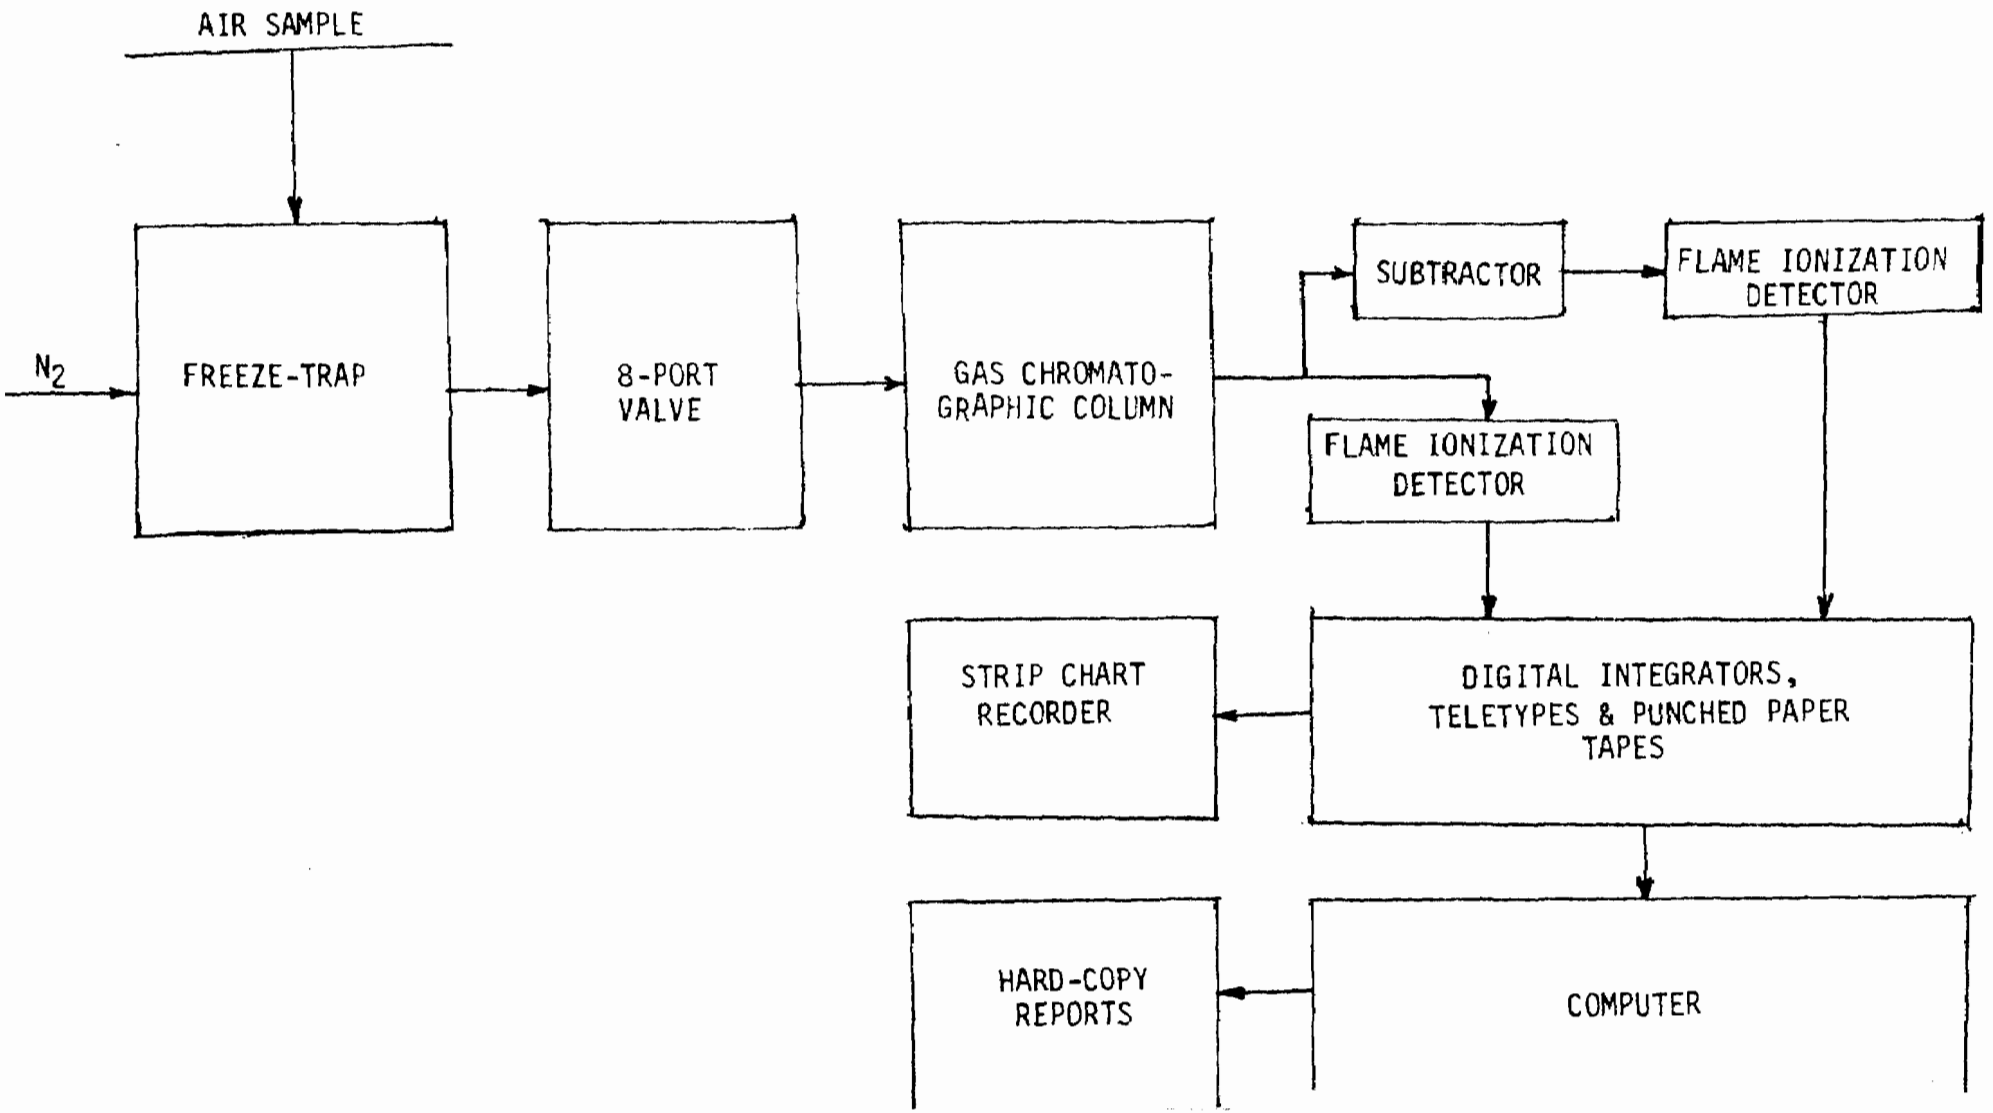

Sensitivity of Analytical Procedure

The sensitivity for methane analyses was ca 10 parts per billion, or less than 1% of usual ambient concentrations. In the analyses of ethane through hexanes, the sensitivity was ca 0.5 PPBC for ethane through n-butane, and ca 1 PPBC (0.1 PHMC) for butenes, petanes and hexanes. For the P.E.-900 data, the sensitivity was ca 1 PPBC. Data which indicate concentrations below these values should be disregarded or interpreted cautiously.

Notes

A few samples exhibited anomalous concentration ratios among components. As an example, high ethylene values found in several early runs were attributed to contamination from ethylene being vented from a chemiluminescence instrument used to monitor ozone. Other analyses which indicated unusual concentrations were confirmed by repetitive analyses.

FLOW CHARTS FOR GAS CHROMATOGRAPH - 202 & 660

16. ABSTRACT

A complete listing is given of all hydrocarbon analyses and supporting calibrations performed by the Gas Chromatographic Laboratory, Atmospheric Studies Section of the State of California Air Resources Board.

Gas chromatographs were used for analysis. All samples were analyzed for C_1 through C_6 hydrocarbons, and a few selected samples were also analyzed for hydrocarbons through n-nonane. A description of the methods used precedes the 1015 pages of raw data.
