About this Bibliography

The entire EPA collection at the National Technical Information Service can be accessed through the *EPA Publications Bibliography, Quarterly Abstract Bulletin* and earlier publications in this series. The *EPA Cumulative Bibliography, 1970 - 1976,* (order number PB-265920) contains bibliographic citations of reports generated by EPA and its predecessor agencies and entered into the NTIS collection through 1976. It contains bibliographic citations with abstracts, plus six indexes: Title, Subject (Keyword), Corporate Author, Personal Author, Contract Number, and Accession/Report Number.

The next publication in this series, the *EPA Publications Bibliography, 1977 - 1983,* (order number PB84-158500) contains EPA reports entered into the NTIS collection and published in the *EPA Publications Bibliography, Quarterly Abstract Bulletin* from its inception in 1977 through December, 1983. This volume contains all the indexes of the original 7-year cumulation, plus a Sponsoring EPA Office index. Original hardbound copies of this publication are no longer available; stock has been reproduced by NTIS in order to continue making it available.

A new *EPA Publications Bibliography, 1984 - 1990,* (order number PB91-205500) again cumulates 7 years of EPA reports in a 2-part, hardbound publication which contains the same 7 indexes as the prior edition.

Quarterly supplements to this series continue to be published in the form of the *EPA Publications Bibliography, Quarterly Abstract Bulletin.* Each issue contains an indexed listing of all EPA technical reports and journal articles added to the NTIS collection during the preceding quarter. The fourth issue of each calendar year contains its appropriate abstracts plus complete cumulated indexes for that year.

Bibliographic records of all EPA reports in the NTIS collection are contained in the NTIS Bibliographic Database and are searchable online through various commercial vendors. Copies of individual reports are available in paper or microfiche form. To order documents, computer products, or subscriptions, complete and return the order form at the back of this publication to the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. Current telephone numbers are listed on the order form. Prices for products are indicated in each catalog entry by price codes. To determine a current price, consult the price code table printed on the outside back cover of this publication.

Orders for stocked reports are mailed first class, or its equivalent, normally the day after the order is received. If a document you order must be reproduced by NTIS, it will usually be mailed within two weeks. Orders for documents in the process of being printed outside NTIS may take longer to fill, and you will be notified if NTIS anticipates an unusual delay. Orders for computer products may take slightly longer to fill than those for papercopy documents because of the differences in duplication processes.

The *EPA Publications Bibliography* is available on annual subscription from NTIS at a cost of $145 for U.S., Canada, and Mexico. Single copies are $38. Customers in other countries should contact NTIS for prices.

New EPA Document Numbering System (January, 1992)

The following document numbering system has been adopted by EPA to indicate the Assistant Administrator/Program Office or Regional Office originating each report. Each 2-digit series listed below is preceded by "EPA" and is followed immediately by a single numeric digit representing the appropriate office within the primary organization. Other alpha/numeric elements follow that indicate the type of publication, calendar year of publication, and sequential publication number. This information is provided as a guide to allow the users of this bibliography to use the report number to know program sponsorship of documents listed.

ABOUT NTIS

As a cornerstone of the technological publishing structure in the United States, the National Technical Information Service (NTIS) is a key participant in the development of advanced information products and services for the achievement of U.S. productivity and industrial innovation goals in the 90's.

NTIS, an agency of the U.S. Department of Commerce, is the central source for the public sale of U.S. Government-sponsored research, development, and engineering reports and for sales of foreign technical reports and other analyses prepared by national and local government agencies and their contractors or grantees.

NTIS is the central source for:

- Federally-generated computerized datafiles, databases, and software.
- Licensing U.S. Government-owned patents.

NTIS also manages:

- the Federal Computer Products Center which provides access to software, datafiles, and databases produced by Federal agencies.
- the Center for the Utilization of Federal Technology (CUFT), which prepares a variety of directories, catalogs, and other information products linking U.S. firms to key and selected U.S. Government technologies, inventions available for licensing, and laboratory contacts.

Consequently, NTIS is one of the world's leading processors of speciality information.

Full summaries of current U.S. and foreign research reports and other specialized information, in hundreds of subject categories, are published regularly by NTIS in a wide variety of newsletters, journals, and indexes and in a variety of subscription formats for other Federal agencies. The complete texts of the technical reports cited are sold in paper and microform.

Approximately 70,000 information items from U.S. and foreign government sources are added to the NTIS collection annually. These consist of some 55,000 technical reports plus computerized datafiles, databases, and software and proceedings, guides, manuals, and other items. Anyone seeking the latest technical reports or wanting to compile unique subject groups of abstracts may either subscribe to a current awareness bulletin or search the NTIS Bibliographic Database online using the services of vendors or organizations that maintain the NTIS database for public use. The entire database in machine processable form may be leased directly from NTIS.

Bibliographies containing summaries of current research from worldwide information sources are available as NTIS Published Searches® and cover over 3,000 topical subject areas.

Customers with well defined continuing interests may subscribe to a standing order microfiche service (SRIM) which enables them to automatically receive the full texts of only those documents relating to their individual requirements.

Foreign reports from worldwide sources including Canada, England, Japan, Germany and Eastern Europe now make up over 20 percent of the NTIS collection.

NTIS sells its technical information products and services under the provisions of Title 15 of the U.S. Code. The law established a clearinghouse for scientific, technical, and engineering information within the Department of Commerce and directed that it be self-supporting.

NTIS, therefore, is a unique Government agency sustained only by sales revenue. The costs of NTIS salaries, marketing, postage, and all other operating costs are paid for from the sales of its products. Costs are not covered by tax-supported Congressional appropriations.

HOW TO ORDER

Telephone Orders (703) 487-4650: The NTIS sales desk is available between 8:30 a.m. and 5:30 p.m., Eastern time, Monday thru Friday. TDD for the hearing impaired (703)487-4639.

Mail Orders: Send orders to: NTIS, 5285 Port Royal Road, Springfield, VA 22161.

FAX or Telex Orders: FAX (703)321-8547. For assistance, call (703)487-4679. Telex 89-9405 or 64617(international).

Rush Service: For an additional $15 per item, orders will be ready for shipment within 24 hours and delivered by overnight courier to most U.S. cities or by Air Mail to Canada, Mexico and other countries. For customers outside the U.S., Canada, and Mexico, add $25 per item. To order Rush, call 1-800-553-NTIS. Outside the U.S., call (703)487-4650. Do not mail your Rush requests.

QuikSERVICE Online Ordering: QuikService allows customers to place orders directly into the NTIS system, thus eliminating the time it takes to mail orders. QuikSERVICE displays the cost, availability restrictions, and the approximate time of shipment. The $3 handling fee is waived for all orders placed with QuikService. For information, call (703) 487-4650.

Methods of Payment: Customers may pay for NTIS products by: (1) American Express, MasterCard, or VISA; (2) check or money order payable to NTIS in U.S. dollars; (3) an NTIS deposit account; or (4) purchase order - add $7.50 to the total order (available to U.S., Canada, and Mexico only).

Handling Fee: A $3 handling fee per order applies to orders from the U.S., Canada, and Mexico. For other countries, the handling fee is $4 per order. The handling fee does NOT apply to Rush orders.

Postage and Shipping: Orders are sent First Class or equivalent in the U.S. Orders to other countries are shipped surface mail unless Air Mail or courier service is requested. Air Mail for printed reports is $4 per report to Canada and Mexico ($8 per report to other countries). Air Mail for microfiche is $1 per report to Canada and Mexico ($1.25 per report to other countries).

Courier and Pickup Service: Call (703)487-4650 for information about our courier or pickup service.

Tracing an Order: If you have questions about your order, write or call NTIS Customer Services at (703)487-4660 between 8:30 a.m. and 5:30 p.m., Eastern time.

Discounts for Technical Reports: A 25 percent discount is available for most documents if five or more copies of a single title are ordered at the same time and shipped to the same address. For discounts on more than 100 copies, call (703) 487-4650.

Library Discount: Academic libraries can receive a 10 percent education credit on orders. Call the Deposit Account Department at (703) 487-4064 for information.

Report Title	Engineering and Environmental Aspects of Recycled Materials for Highway Construction
Corporate Author	University of Wyoming Research Corp., Laramie
Personal Authors	D. Bloomquist, G. Diamond, M. Oden, B. Ruth, and M. Tia.
Date	Jul 93
Pages	222p
Report Number	EPA/530/R-93/013A
Contract Number	DTFH61-93-C-00060
Abstract	The report represents an assessment of environmental aspects and engineering factors related to the utilization of recycled materials in highway construction. A basic overview and assessment of different technologies, processes, and methods of recycling various material into highway appurtenances and for highway construction are presented with consideration of environmental and health risks.
Keywords (Descriptors & Identifiers)	*Recycled materials, *Road materials, *Environmental impact assessments, Waste recycling, Materials recovery, Highway construction, Environmental issues, Emission factors, Risk assessment, Asphalts, Plastics, Glass, Rubber, Public health, Engineering assessment.

The Resource Conversation and Recovery Act (RCRA)/Underground Storage Tanks (UST), Superfund, and Emergency Planning and Community Right-to-Know Act (EPCRA) Hotline was established to respond to inquiries from the regulated community and the public concerning waste management, disposal, and emergency planning and response regulations. The document is a compilation of Questions and Answers and Federal Register summaries from individual Monthly Hotline Reports for the period of January to December 1993. It is divided into three parts: Questions and Answers, Federal Register summaries, and Indices to the questions, according to subject matter, regulatory and statutory citations. Neither the questions nor the Federal Register summaries are intended to fully represent or be used in place of the regulations.

Many industries have already found alternatives for mercury or have greatly decreased mercury use. However, the unique electromechanical and photoelectric properties of mercury and mercury compounds have made replacement of mercury difficult in some applications. The study was initiated to identify source reduction and recycling options for mercury in the electrical and electronics industry (SIC 36) and measurement and control instrument manufacture (SIC 382). The project identified trends in pollution prevention for mercury use throughout the U.S. economy by a review of the sources and use of mercury in the ecomony. Regulatory trends encouraging mercury pollution on prevention were examined, and current practices in the electrical and electronics industry were reviewed in details to identify potential source reduction and reuse options for mercury.

This industry profile presents the results of the EPA's Research into the domestic lead-zinc mining industry and is one of a series of profiles of major mining sectors. The report briefly characterizes the geology of lead-zinc ores and the economics of the industry. Following this discussion is a review of lead-zinc extraction and beneficiation methods; this section provides the context for descriptions of wastes and materials managed by the industry, as well as a discussion of the potential environmental effects that may result from lead-zinc mining. The report concludes with a description of the current regulatory programs that apply to the lead-zinc mining industry as implemented by EPA, Federal Land Management Agencies, and selected states.

Innovative Methods of Managing Environmental Releases at Mine Sites.
Environmental Protection Agency, Washington, DC. Office of Solid Waste.
Apr 94, 111p EPA/530/R-94/012

The report describes source reduction and recycling practices and innovative techniques for waste management currently used in mining. EPA's intent is the identification of these practices and the fostering of technology and information transfer throughout the mining industry. Source reduction can include process control to produce a purer product while reducing hazardous constituents in the waste stream and production of a new saleable product while reducing hazardous constituents in the waste stream. Recycling opportunities unique to mining are slag reprocessing, tailings reprocessing, pipe recycling/reuse, and recycling mine tires. The other practices section addresses topics of a more general nature and includes a description of best management practices for water management and the facility pollution prevention plan prepared by the cyprus baghdad mine. To assist with technical questions and issues, a list of technical contacts familiar with each technology is provided.

Keywords: *Mine wastes, *Acid mine drainage, *Waste management, Water pollution control, Land pollution control, Mine wastes, Tailings, Slag, Pyrite, Waste recycling, Materials recovery, Reprocessing, Flotation, Metal cleaning, Pipes(Tubes), Source reduction.

The Information Management Strategic Plan for the Environmental Monitoring and Assessment Program (EMAP) describes how EMAP information will be managed from field sampling through the delivery of products to the user. This plan cuts across the entire EMAP program and explains the process for developing an information management infrastructure which will enable EMAP to achieve its long-term objectives. The Plan provides a strategy for meeting hardware, software, documentation support, and system designs that will meet EMAP Resource and Coordinating Group requirements. Users of EMAP data and information are discussed in the Plan as well as the process and technology with which they can access EMAP data and other data sources.

The document gives statistical procedures for evaluating whether pollution parameter concentrations in remediated soil and solid media at Superfund sites are statistically above site-specific reference-based cleanup standards. The variability in the reference-area and cleanup-unit measurements is taken into by the testing procedures. The intended audience for this document includes EPA regional managers, Superfund site responsible parties, state environmental protection agencies, and contractors for these groups. The document can be applied to implement and evaluate emergency or routine removal actions, remedial response activities, final status surveys, and Superfund enforcement.

The Environmental Monitoring and Assessment Program (EMAP) is being implemented to provide quantitative assessments of status and trends in the condition of ecological resources within the United States. In 1992 the EMAP Arid Ecosystems Resource Group (EMAP-Arid) conducted a pilot study in the southeastern Utah portion of the Colorado Plateau. The report describes the results of that pilot study. This was the first field activity for the EMAP-Arid group and evaluates several indicators of arid ecosystem condition; assessing the ecological condition of the Colorado Plateau was beyond the scope of this initial study. Section 2 describes the study objectives, study area, site selection and sample plot design. Section 3 gives the indicator measurement methods. Section 4-7 provides results of the study objectives. Included in Section 8 are recommendations for 1993 and 1994 pilot studies.

Pub. in American Environmental Laboratory, p27-29 Dec 93. See also PB92-963201.

The goal of the Superfund Innovative Technology Evaluation (SITE) Monitoring and Measurement Technologies Program (MMTP) is to accelerate the recognition and use of technologies that have the potential to provide more cost-effective, better, faster, or safer means to detect and monitor contaminants and the geophysical characteristics of Superfund sites. Through the program, developers are provided with the opportunity to rigorously evaluate the performance of their technologies. The goals of the MMTP are to (1) identify existing technologies, (2) support development of monitoring capabilities not currently addressed, (3) demonstrate technologies, and (4) prepare protocols, guidelines, and SOPs for new methods.

The effect of water vapor on ozone monitoring instruments was investigated. Five UV type and two chemiluminescence type monitors were employed in this study. The results of the study indicate that in systems containing ozone, water vapor, and zero air only, the chemiluminescence monitors show a systematically higher reading than the UV monitors. Studies were also performed with a smog chamber with simulated polluted air and varying relative humidity. Although the presence of water vapor did not appear to be a problem, a slight positive interference was observed with the UV monitors. This interference was a result of the presence of toluene and some of its photooxidation products which are removed by the ozone scrubber and absorb some of the 254 nm radiaton used to measure ozone. It is concluded that under atmospheric conditions with moderate pollution and relative humidity, both types of instruments give satisfactory measurements for ozone.

Feb 94, 205p EPA/530/R-93/018

This report has been completed in response to congressional requests for EPA to conduct a study on the effects of existing regulations on metal recovery of the Nation's waste, how metal recovery can be encouraged, and how these materials should be regulated to protect human health and the environment. Chapters include an introduction and overview to metal recovery of Hazardous Waste and Resource Conservation and Recovery Act (RCRA) Hazardous Waste Regulation, report methodology and limitations, characterization of RCRA subtitle C metal-bearing hazardous wastes, RCRA subtitle regulations affecting metal recovery of hazardous waste, assessment of RCRA subtitle C regulation on metal recovery from hazardous waste in the United States, case studies of metal recovery operations subject to RCRA jurisdiction, assessment of U.S. balance of trade and strategic metals issues and their relationship to metal recovery of hazardous wastes, encouraging environmentally sound metal recovery. Appendices provide examples for source reduction in industries that generate metal-bearing hazardous waste and more specific information on hazards associated with metals.

Portions of this document are not fully legible. Sponsored by Environmental Protection Agency, Research Triangle Park, NC. Office of Air Quality Planning and Standards.

The primary purpose of this document is to assist in planning a network of monitoring sites for measuring particulate matter. The measurements will conform to the new PM10 standard, which replaces the former total suspended particulate (TSP) standard. As a secondary objective, this document will aid in understanding the relationship between PM10 measurements and the quality of air that is sampled. The information contained here will prove useful to both air quality surveillance personnel and the users of air quality monitoring data. In this document, the siting process is viewed dynamically.

The Illinois Solid Waste Management Act was enacted in September 1986. This law established the State's commitment to address solid waste handling, based on a solid waste management hierarchy as follows: (1) volume reduction at the source; (2) recycling and reuse; (3) combustion with energy recovery; (4) combustion for volume reduction; and (5) disposal in landfill facilities. The Illinois Environmental Protection Agency (IEPA) is required under the Illinois Solid Waste Management Act to publish an annual report 'regarding the projected disposal capacity availability for solid waste in sanitary landfills.' This is the seventh annual report prepared to meet the requirement. The information presented in this report reflects the reporting period April 1, 1992 - March 31, 1993.

The pulp and paper industry is one of the nation's largest industries. The U.S. Environmental Protection Agency (EPA) estimates that there are approximately 565 manufacturing facilities located in 42 states. These facilities comprise either integrated pulp and paper mills, where pulp is manufactured on-site from virgin wood fiber, secondary fiber, or non-wood fiber, and paper or paperboard products are produced from the pulp; and non-integrated paper mills where only paper or paperboard products are manufactured from purchased pulp or pulp produced elsewhere. The proposed regulation will provide important improvements in protecting human health and the environment by reducing toxic and hazardous pollutant releases to all media.

When a pesticide is eligible for reregistration, EPA announces this and explains why in a Reregistration Eligibility Decision (RED) document. The fact sheet summarizes the information in the RED for tebuthiuron. Tebuthiuron is a relatively nonselective, soil activated herbicide that acts by inhibiting photosynthesis. It is used to control broadleaf and woody weeds, grasses and brush on feed crop sites (pasture and rangeland) and a variety of non-food crop sites including airports/landing fields, outdoor industrial areas, non-agricultural rights-of-way, fencerows, hedgerows, uncultivated areas/soils, and under paved roads and sidewalks in areas where no future landscaping is planned. Primary uses include rangeland and near railroads and other industrial facilities.

May 94, 32p EPA/820/R-94/002
Prepared in cooperation with National Advisory Council for Environmental Policy and Technology, Washington, DC.

The Industrial Pollution Prevention Project (IP3) Focus Group was requested by EPA to provide specific recommendations on how best to promote industrial pollution prevention through the effluent guidelines process. In response to that request, the Group makes the following recommendations to EPA: To promote more industrial pollution prevention, the effluent guidelines process must (1) be more flexible, (2) address all media, and (3) impart a pollution prevention mindset to everyone throughout the effluent guidelines process. To accomplish this, EPA should adopt a specific new approach to the development and achievement of Best Available Technology (BAT) limits.

The Acid Extraction Treatment System (AETS) reduces the concentrations and/or leachability of heavy metals in contaminated soils so the soil can be returned to the site from which it originated. The objective of the project was to determine the effectiveness and commercial viability of the process. An account of the activities conducted during the project, the experiments performed, results and conclusions, are included in the report. A pilot-scale AETS was used to treat 5 different soils containing different combinations of seven heavy metals. The AETS can, in most cases, treat the entire soil, with no separate disposal or stabilization of the clay fines needed. The estimated treatment costs are between $80 and $180 per cubic yard.

Contract EPA-68-DO-0097
Prepared in cooperation with Colorado State Univ., Fort Collins. Dept. of Civil Engineering. Sponsored by Environmental Protection Agency, Research Triangle Park, NC. Air and Energy Engineering Research Lab.

A study has been completed which physically modeled, in a wind tunnel, the dispersion of exhaust plumes from active soil depressurization (ASD) radon mitigation systems in houses. The wind tunnel testing studied the effects of three different exhaust locations: midway up the roof slope, simulating an ASD stack interior to the house; at the eave, simulating an exterior stack; and grade-level exhaust (no stack). Plume dispersion effects were studied using both qualitative smoke visualization and quantitative tracer gas techniques, as the following variables were systematically varied: house height; roof pitch; wind direction; wind speed; and exhaust velocity. The tracer gas results show that grade-level exhausts consistently result in the highest tracer concentrations against the face of the house, although these concenrations may not be serious if exhaust concentrations are low. The wind tunnel physical modeling was supplemented by analytic and numeric modeling, to determine how well the analytic and numeric models reproduced the wind tunnel results. Existing analytic models over-predicted the exhaust gas concentrations that would be seen against the face and roof of the house, and downwind.

Sponsored by Environmental Monitoring Systems Lab., Las Vegas, NV. Advanced Monitoring Systems Div.

The U.S. Environmental Protection Agency has been examining the potential of combining sonication with existing measurement technologies for monitoring specific classes of organic pollutants in water. The research specifically addressed using ultrasound (ultrasonic) processors to decompose aqueous organochlorine compounds into ions as a screening method for organochlorine pollutants in water. Anions specific to the inorganic components would be produced in sonication. Changes in ion concentrations before and after sonication would be used in monitoring for the pollutants. The success with compounds served as proof-of-principle and forms a rationale for expanding the research to other pollutant classes.

The Survey Research Center at the University of Maryland at College Park conducted a survey of residents of counties in the watershed of the Chesapeake Bay. The target population for this telephone survey was adults age 18 or older residing in telephone households in the watershed of the Chesapeake Bay. The goal of the study was to provide baseline data on the attitudes, behaviors and opinions of the residents about pollution, water quality, funding, and clean-up efforts for the Bay and its tributaries. Therefore, the data represents both the entire Chesapeake Bay watershed and the individual jurisdictions. The survey was conducted from October 6, 1993 through January 27, 1994 and 2,004 respondents were interviewed. The margin of error for the overall data is between 2 and 3 percent.

Chesapeake Bay Basin Toxics Loading and Release Inventory: Technical Update - Point Source Loads by Facility.
Environmental Protection Agency, Annapolis, MD. Chesapeake Bay Program.
Apr 94, 33p CBP/TRS-114/94
See also PB94-163011.

This first technical update to the Chesapeake Bay Basin Toxics Loading and Release Inventory responds to the Chesapeake Executive Council Directive to develop an initial baseline inventory of toxics loading and release sources by facility (Chesapeake Executive Council, 1993). It replaces Appendix Table 11 in the 'Chesapeake Bay Basin Toxics Loading and Release Inventory' (Chesapeake Bay Program, 1994) by providing an expanded listing of chemical load estimates at the facility level. Consequently, the technical update summarizes the new and expanded point source loading information and provides replacements originally published in the 'Chesapeake Bay Basin Toxics Loading and Release Inventory.' Future technical updates will be published as additional and relevant information becomes available on the various sources of chemical contaminant loadings and releases within the Chesapeake Bay watershed. Technical updates describing more recent estimates for fall line loadings, urban/suburban stormwater, and 1992 industry-reported releases to air, water and land are planned to be published over the next year.

Striped bass spawning activity in the Roanoke River, North Carolina, was documented in 1991 by sampling for eggs at Barnhill's Landing (River Mile 117), which is just downstream of the spawning grounds between the towns of Halifax (RM 120) and Weldon (RM 130). Egg sampling was conducted every four hours near the surface and bottom from 15 April to 14 June. Water quality and changes in instream flow caused by water releases from Roanoke Rapids Reservoir at RM 137 also were monitored every four hours. Results were compared to similar studies funded by the Albemarle-Pamlico Estuarine Study during the springs of 1988, 1989, and 1990. Objectives were: (1) to continue the uninterrupted egg study data base of W.W. Hassler beginning in 1959; (2) to identify potential sources of bias in Hassler's egg production estimates; and (3) relate striped bass spawning activity to operation of the Roanoke Rapids hydroelectric dam upstream.

Four different devices were tested in the Pamlico Sound shrimp trawl fishery during October-November 1987 to determine their ability to reduce finfish bycatch while retaining shrimp. Testing was conducted aboard a local shrimp vessel using a randomized incomplete block design, including a control net. The four devices were (1) Scottish Separator Trawl (SST), (2) Florida Fish Excluder (FFE), (3) Georgia TED, and (4) Parrish TED. The SST appeared to separate flounder from non-demersal fishes, but lost shrimp. The Parrish TED caught less fish and shrimp than the control net. The Georgia TED and the FFE both had reduced bycatches of finfish and no significant difference in shrimp catch relative to the control net. Both of these gears deserve further testing in North Carolina. Because of its smaller size and ease of installation, the FFE is recommended over the Georgia TED at this time as a device for reducing finfish bycatch in the Pamlico Sound shrimp trawl fishery.

The goal of the U.S. EPA BIOME Agroecosystems Assessment Project is to evaluate the degree to which agroecosystems can be technically managed, on a sustainable basis, to conserve and sequester carbon, reduce the accumulation of carbon dioxide in the atmosphere, and provide reference datasets and methodologies for agricultural assessment. The report provides preliminary estimates of carbon sequestration potential for the central United States including the Corn Belt, the Great Lakes, and portions of the Great Plains. This study region comprises 44% of the land area and 60% to 70% of the agricultural cropland of the conterminous United States. The assessment methodology includes the integration of the RAMS economic model, the Century soil carbon model, meteorologic and soils data bases, and GIS display and analysis capabilities in order to assess the impacts on soil carbon of current agricultural trends and conditions, alternative tillage practices, use of cover crops, and Conservation Reserve Program policy.

The CAV-OX process was developed by magnum Water Technology to destroy organic contaminants in water. The process uses hydrodynamic cavitation, ultraviolet (UV) radiation, and hydrogen peroxide to oxidize organic compounds present in water at or below milligrams per liter levels. This treatment technology produces no air emissions and generated no sludge or spent media that requires further processing, handling, or disposal. Ideally, the end products are water, carbon dioxide, halides, and in some cases, organic acids. The process uses mercury vapor lamps to generate UV radiation. The principal oxidants in the process, hydroxyl radicals, are produced by hydrodynamic cavitation and direct photolysis of hydrogen peroxide at UV wavelengths.

Landscape ecology is the study of the structure, function, pattern, and changes in heterogeneous land areas. The Environmental Monitoring and Assessment Program's Landscapes component (EMAP-L) will focus on those landscape patterns that affect flows of energy, water, nutrients, and biota. The primary focus will be on the societal benefits derived from watershed integrity, biotic integrity and diversity, and landscape stability and resilience. The Plan is divided into five sections which describe: (1) the theoretical basis (landscape ecology) for monitoring landscapes and how this relates to and complements the objectives of EMAP; (2) the conceptual basis of the approach, including the societal values and assessment questions to be addressed; (3) the indicators of landscape condition; (4) the methods for monitoring and assessing the status and trends of landscape condition; and (5) the research and development activities needed to implement the plan.

The United States faces the challenge of effectively managing municipal solid waste (MSW) as the amount of waste generated per capita increases. The purpose of this document is not to compare recycling with other MSW methods but to provide a general overview of possible hazards associated with this practice. This report identifies the possible public health, occupational, and environmental hazards associated with MSW recycling. The report identifies activities that might present hazards to health or the environment. Such a risk assessment requires further study, particularly quantitative data on exposure. The scope of the document is thus limited, in line with an intent to survey for potential hazards and identify need for further work.

Prepared in cooperation with Texas Univ. at Austin. Dept. of Civil Engineering. and Computer Sciences Corp., Ada, OK.

This user's guide describes the Hydrocarbon Spill Screening Model (HSSM). The model is intended for simulation of subsurface releases of light nonaqueous phase liquids (LNAPLs). The model consists of separate modules for LNAPL flow through the vadose zone, spreading in the capillary fringe, and transport of chemical constituents of the LNAPL in a water table aquifer. These modules are based on simplified conceptualizations of the flow and transport phenomena which were used so that the resulting model would be a practical, though approximate, tool. Both DOS and Windows interfaces are provided to create input data sets, run the model, and graph the results. These interfaces simplify the procedures for running the model so that the model user may focus on analysis of his/her problem of interest. To that end, guidance is given for selecting parameter values and several utility programs are provided to calculate certain parameters. Typical example problems, which begin with a general problem statement, show exactly how each parameter of the model should be chosen.

The paper discusses technical issues associated with the use of landfill gas (LFG) compared with natural gas--which is the primary fuel used for energy conversion equipment such as internal combustion engines, gas turbines, and fuel cells. LFG is a medium-heating-value fuel containing trace constituents that require gas pretreatment and energy equipment modifications to operate successfully. There are more than 100 LFG-to-energy projects in the U.S., and their developers and operators have found different ways to minimize the potential problems associated with LFG utilization. The paper also gives an overview of developers and operators of these projects, data of European projects, non-technical issues such as project barriers and incentives, the relationship between LFG delivery and energy output, active landfill gas developers, and insights on project decision making.

The report includes emissions data from residential natural-gas furnaces and compares selected data to emissions data from residential oil furnaces and woodstoves. Natural-gas furnace emissions data are given for carbon monoxide (CO), unburned hydrocarbons, aldehydes, volatile and semivolatile organic compounds (including mono- and polyaromatic hydrocarbons), total particulate, and total extractable organics. Natural-gas furnace combustion emissions were collected in a laboratory setting under simulated residential conditions and usage. The study was part of the Integrated Air Cancer Project, a multidisciplinary, cross-EPA laboratory effort to apportion sources of mutagenicity in ambient emissions. Both high and low efficiency gas furnaces were tested. The results indicate that significant levels of CO, unburned hydrocarbons, aromatic volatile organic compounds, and aldehydes can be emitted. Based on emission factors relative to thermal input, residential natural-gas emissions are at least a factor of 10 to 100 less than comparable emissions from residential oil furnaces and woodstoves.

The paper presents Life Cycle Assessment (LCA) as a tool to assist the waste professional with integrated waste management. LCA can be the connection between the waste professional and designer/producer to permit the waste professional to encourage the design of products so material recovery is most efficient and markets can be better predicted. The waste professional can better monitor the involvement of the consumer in waste management by using LCA and looking upstream at how the consumer actually reacts to products and packaging. LCA can also help the waste professional better understand the waste stream.

MOUSE (Modular Oriented Uncertainty SystEm) is a Monte Carlo based simulation system designed to deal with the problem of uncertainties in Environmental engineering calculations, such as a set of engineering cost or risk analysis equations. It was especially intended for use by individuals with little or no knowledge on computer languages, programming, or simulation. However, it is also of benefit to those experienced in simulation and simulation languages who desire a quick and easy method to produce standard Monte Carlo simulation output. MOUSE system utilities run on MS-DOS-based personal computers, but MOUSE programs themselves can be run on any computer equipped with a FORTRAN compiler. It is easy and fast to learn and has all of the features needed for substantive uncertainty analysis, such as built-in probability distributions, plotting and graphing capabilities, sensitivity analysis, and interest functions for cost analyses.

A computational model was developed to simulate aquifer remediation by pump and treat for a confined, perfectly stratified aquifer. A split-operator finite element numerical technique was utilized to incorporate flow field heterogeneity and nonequilibrium sorption into a two-dimensional, radially symmetric advective-dispersive transport model. Simulations reproduced the tailing behavior commonly observed at remedial sites. Predicted remediation times were observed to increase as the degree of hydraulic conductivity heterogeneity and/or sorption nonequilibrium increased. Dimensional analysis was used to facilitate the general application of simulation results to a range of aquifer/contaminant systems. The effects of sorption nonlinearity, sorption capacity heterogeneity, and intermittent pumping were also analyzed. (Copyright (c) 1994 by the American Geophysical Union.)

Effect of Temperature and Pore Size on the Hydraulic Properties and Flow of a Hydrocarbon Oil in the Subsurface. Journal article.

Capillary pressure relationships in a porous medium determine the distribution of immiscible fluids under static conditions and can largely influence the movement of the fluids when the system is not at equilibrium. The capillary pressure-saturation curves measured here for hydrocarbon oil-water do not have a constant capillary pressure ratio with saturation when compared to the water-air system, and changes in ratio were found when comparing the water-air curves measured at different temperatures. Thus, the scaling theory based on interfacial tensions and contact angles does not adequately account for differences in capillary pressures due to different fluid pairs or temperatures. When the capillary pressure-saturation relationship is extended to the calculation of relative permeabilities and the prediction of fluid flow in the subsurface, the differences in measured and scaled capillary pressure curves lead to differences in the predicted flow rates and saturations of the immiscible fluids in the subsurface. Thus, care must be used when applying capillary pressure-saturation data from one fluid system to that of another, or when applying it to different conditions.

The paper gives results of an investigation of the sorption and desorption of gaseous elemental mercury by activated carbon sorbents. Two sorbents were chosen for the study, one (PC-100) thermally activated and the other (HGR) chemically impregnated with sulfur. The sorbents had similar particle size (approximately 20 micrometers) and surface area (approximately 1000 sq m/g). Different reaction conditions of temmperature--23 C (or ambient) and 140 C--and mercury concentration (30 and 60 ppb in nitrogen) were used. The type of activated carbon, the temperature, and the mercury concentration showed strong effects on overall sorption behavior. At 140 C, chemisorption was found to be the only mechanism for elemental mercury capture for both sorbents.

The paper discusses the EPA's new clean air technologies and opportunities for cooperative development. New clean air technologies for commercial application have recently been developed and patented by EPA/AEERL. These include: (1) furnace sorbent injection for dioxin/furan control (SICORE), (2) combined sulfur dioxide (SO2) and particulate matter (PM) control (E-SOx), (3) advanced silicate injection for SO2 control (ADVACATE), and (4) advanced fine PM controls--advanced electrostatic precipitation (SUPER ESP), electrostatically stimulated fabric filtration (ESFF), retrofit electrostatic filtration (REF), and reentrainment suppressor. New areas of research are also discussed for which EPA/AEERL would be interested in a CRD program, including combined sulfur oxide (SOx)/nitrogen oxide (NOx) control, toxic metals control, chlorinated waste destruction, and fine PM control.

The number of new and old chemical compounds to which the human race is exposed has quickly become astronomical. Methods of risk assessment have been slow to develop. Industry, government and academia have had to scrupulously examine the benefits-to-cost ratio of these studies. The limiting factors appear to be the questions of extrapolation and the compatibility of different metabolic processes in different species. The chapter discusses (1) pharmacokinetics, (2) model development, (3) flow-limited assumptions, (4) membrane-limited assumption, (5) micropharmacokinetic physiologic models and their implementation.

The report gives results of research to determine if the co-firing of coal with municipal solid waste (MSW) will decrease the downstream formation of chlorinated organic compounds, particularly polychlorinated dibenzo-p-dioxins and furans (PCDDs and PCDFs). Previous research had suggested that sulfur present in coal can interfere in PCDD/PCDF formation mechanisms. To test this hypothesis, both bench- and pilot-scale experiments simulating MSW incineration were carried out. Tests were conducted with a MSW fly ash in EPA's pilot-scale Innovative Furnace Reactor (IFR) and a bench-scale Short Time Differential Reactor (STDR). The IFR tests involved either natural gas or coal combustion, with MSW fly ash being injected into the post-combustion region of the furnace.

The goal of EPA's biocriteria and Environmental Monitoring and Assessment Program for Surface Waters (EMAP-SW) programs to embrace similar empirical standards and comparative processes for determining reference conditions would encourage the United States to evolve a more environmentally protective, defensible, and consistent monitoring and regulatory network. The goals of this chapter are to (1) explain the purpose and objectives of determining a reference condition for populations of aquatic ecosystems, (2) examine six approaches for determining a reference condition, (3) describe the process for selecting regional reference sites, and (4) propose a way to determine acceptable quantitative scores from reference condition data.

The report describes a method for assessing the exposure and effects of environmental contaminants on gallinaceous chicks imprinted on bantam chicken (Gallus domesticus) hens. The method may be applicable for assessing the effects of many contaminants to which young, foraging gallinaceous chicks may be exposed, including agricultural chemicals and hazardous waste site contaminants. The method also may be used with a variety of habitats, experimental designs, and statistical analyses. The experimental design and types of measurement endpoints selected depends upon the purposes and the environmental conditions of the study. The report is based on methods developed during three field studies with organophosphorus pesticides in which the procedure was used successfully for comparing results to results from laboratory tests. It is recognized that many procedural modifications may be necessary to adapt to different experimental designs and that many improvements in the procedures are possible. The report does not establish Agency policy for conducting avian field studies, however, it does present a method for consideration for assessing the exposure and/or the direct and indirect effects of environmental contaminants to free-ranging gallinaceous chicks.

In situ biodegradation may be used to treat low-to-intermediate concentrations of organic contaminants in place without disturbing or displacing the contaminated media. Although this technology has been used to degrade a limited number of inorganics, specifically cyanide and nitrate, in situ biodegradation is not generally employed to degrade inorganics or to treat media contaminated with heavy metals. During in situ biodegradation, electron acceptors (e.g., oxygen and nitrate), nutrients, and other amendments may be introduced into the soil and groundwater to encourage the growth of an indigenous population capable of degrading the contaminants of concern. This bulletin provides information on the technology's applicability, the types of residuals produced, the latest performance data, the site requirements, the status of the technology, and sources for further information.

Solvent extraction does not destroy hazardous contaminants, but is a means of separating those contaminants from soils, sludges, and sediments, thereby reducing the volume of the hazardous material that must be treated. Generally, it is used as one in a series of unit operations and can reduce the overall cost for managing a particular site. 2,4-Dichlorophenol (2,4-DCP) was degraded anaerobically in freshwater lake sediments. From observed intermediates in incubated sediment samples and from enrichment cultures, the following sequence of transformations was postulated. 2,4-DCP is dechlorinated to 4-chlorophenol (4-CP), 4-CP is dechlorinated to phenol, phenol is carboxylated to benzoate, and benzoate is degraded via acetate to methane and carbon carbon dioxide. At least five different organisms are involved sequentially. The rate-limiting step was the transformation of 4-CP to phenol. Sediment-free enrichment cultures were obtained that catalyzed only the dechlorination of 2,4-DCP, the carboxylation of phenols, and the degradation of benzoate, respectively.

Sequential extraction procedures consist of subjecting a given sediment sample to a series of increasingly strong reagents under specified conditions. The most carefully designed and most often followed method is that of Tessier et al. (1979). These procedures, which were conceived as an attempt to determine the particulate speciation of trade elements and radionuclides, have serious limitations. Despite several studies demonstrating the instability of published methods for sequential extraction to determine chemical entities definable by more than the analytical method itself. The purpose of the comment is to discourage the expanding uncritical use of sequential extractions for measuring the particulate speciation of trade elements. A portable reverse osmosis (RO) system was constructed and used to concentrate dissolved organic matter (DOM) from the Suwannee River in southeastern Georgia. Using this RO system, 150-180 l/h of river water could be processed with 90% recovery of DOM. After further cation exchange and lyophilization of the concentrated river water samples, large quantities of low-ash freeze-dried products were isolated. The authors highly recommend this RO method for concentration of DOM in fresh waters because (1) a very high percentage of DOM is recovered, which indicates minimal fractionation of the original sample, and (2) the process is quite rapid, which permits large quantities of DOM to be concentrated in a reasonable length of time.

The article gives results of a characterization of emissions of 76 organic hazardous air pollutants (HAPs) in flue gases from the combustion of pulverized coal in a small-scale down-fired combustor. The combustor was operated under different conditions to simulate baseline, high excess air firing, and nitrogen oxide (NOx) controls by combustion modifications. Samples were extracted near the combustor exit, upstream of any pollution control equipment. Data collected indicate that relatively low levels of organic HAPs are present in the flue gases for any of the combustion conditions; however, several compounds were present that have not been reported in previous studies. To the extent that these small-scale tests accurately simulate full-scale units, estimates based on these experiments indicate that the total HAP emissions from a large utility power plant are not likely to increase significantly due to installation of combustion modification techniques for NOx control.

Avian dietary toxicity tests were conducted with seven pesticides, two age groups (2 and 16 weeks old) of northern bobwhite (Colinus virginianus) and two durations (5 and 28 days) of exposure. Results were analyzed with an emphasis placed on comparing mortalities on similar test conditions. An analysis that used the entire dose-time-response results led to the calculation of a common measure (asymptotic rate e) of the temporal development of the response surface and served as a basis of comparison of diverse test results. The asymptotic median lethal concentrations were designated by ALC50 and the median lethal concentrations at the end of a test period by LC50. It was found that: (1) Young birds in 5- and 28-day tests were more sensitive to incremental increases in the duration of exposure than adults. (2) Young birds were less sensitive to incremental increases of dietary concentration than adults only in the 5-day test and displayed delayed response patterns in six of the seven chemicals in those tests.

Discharge-concentration relations in eight streams studied by the U.S. Geological Survey as part of the U.S. EPA Long-Term Monitoring Project (1983 - 1989) indicate acidification of some streams by sulfuric and nitric acid from atmospheric deposition, and organic acids from soils. Concentrations of major ions in precipitation were similar to those reported at other sites in the Northeast. Average concentrations of sulfate and nitrate were similar among streams; base cation

concentrations differed widely and the differences paralleled variations in acid neutralizing capacity (ANC). Baseflow ANC is not a strong predictor of stream acidity at high flow; some streams with high baseflow ANC showed declines to near zero ANC at high flow and one stream with low ANC at baseflow did not approach zero ANC as flow increased. Episodic decreases in ANC and pH during peak flows were associated with increases in concentrations of nitrate and dissolved organic carbon. Differences between measured ANC and concentrations of calcium and magnesium were equivalent to concentrations of sulfate. Episodic decreases in ANC and pH during peak flows were associated with increases in nitrate concentrations and dissolved organic carbon.

The report quantitatively assesses seasonal changes in community structure and habitat selection among seabirds in the Scotia-Weddell Confluence region, Antarctica. Discussed are biological and physical factors underlying the patterns. Data were derived from strip-transects on closely-coordinated multidisciplinary cruises that characterized the physics and biology during Spring 1983, autumn 1986 and winter 1988. Described for the first time ever for the Southern Ocean, seasonal changes in seabird communities in terms of composition, using cluster analysis, as well as relative density and diversity among species. Sea-surface temperature, distance to the pack ice edge and ice type, all physical characteristics of habitat, were the most important environmental variables that affected assemblage composition. Three recurrent assemblages of species were identified. One persistent assemblage, present year round, was associated with the pack ice; another was associated with open waters immediately adjacent to the ice; and a third was a far-from-ice assemblage.

In the future, there is a potential for anthropogenic microbial air pollution (MAP) associated with large-scale use of microbial pesticides and other microbials in forestry and agriculture, and other agricultural practices and urban activities, particularly sewage treatment and solid waste composting. If we are to manage the atmospheric bacterial loading from these sources, we must have a better understanding of the dynamics of airborne bacterial populations. The report describes a first step in understanding these dynamics by evaluating the flux of bacteria during daylight hours at an isolated location in the high desert chaparral. The idea here is to use the flux of bacteria from natural sources as a surrogate for micro-organisms applied to vegetation by man.

Immune function and hepatic MFO activity were examined in adult and nestling starlings administered a synthetic PAH, 7,12-dimethylbenz(a)anthracene (DMBA). Methods used to examine the starling immune system included immunopathology, macrophage phagocytosis, lymphocyte blastogenesis to concanavalin A, and hemagglutination of sheep erythrocytes (SRBC). Concomitant investigations of MFO activity were conducted in starlings exposed to DMBA. Ethoxyresorufin O-dealkylase (EROD) and pentoxyresorufin O-depentylase (PROD) were used as indicators of hepatic MFO activity. Changes in MFO activity were compared to chemically altered immune responses following DMBA exposure. Subcutaneous exposure of adult starlings to 125 mg/kg DMBA resulted in suppression of lymphocyte blastogenesis and antibody production to SRBC. EROD and PROD activity were increased 2.8- and 3.4-fold, respectively. Lymphocyte blastogenesis was impaired in adult starlings orally exposed to 125 mg/kg DMBA. The immune system of nestling starlings exposed orally to 100 mg/kg DMBA was altered, as evidenced by decreased phagocytic ability of macrophages and inhibition of lymphocyte blastogenesis. Oral exposure to DMBA did not induce MFO activity in starlings of either age class. Effects of DMBA on immune function and MFO activity in starlings varied with the age of birds and route and length of chemical exposure.

Distribution, type, accumulation, and source of marine debris on coastal beaches and in harbors of the United States were examined from 1989 to 1993. Information was compiled from annual beach cleanups coordinated by the Center for Marine Conservation, quarterly beach surveys at eight national parks, studies in Alaska that examined the deposition rate of select debris items, and surveys of floating debris in 10 harbors. Beach surveys provide important information on the distribution, type, accumulation, and source of marine debris. Continued monitoring will help determine whether present legislation is effective in reducing debris in U.S. marine waters.

Petroleum products comprise a vast continuum of hydrocarbons from gasoline which is mainly short chain and simple aromatic hydrocarbons, passing to kerosene, diesel, and heavy oils and to lubricating oils or vaseline, each gradation with increasing carbon chains and complexity. Gasoline alone may contain over twelve hundred compounds. Properties of these vary and this will be of analytical concern. Evaluation of the efficiency of treatment technology and site remediation progress will lean heavily on analytical techniques that are associated with accuracy, reproducibility and of real time value. The vast array of methods provide data of varying and questionable results. This paper examines the various analytical techniques available along with their special features, and it also discusses new methods currently under development that may reflect real soil contamination levels.

Determination of air pollution exposure to human beings ideally would involve the determination of dose to target organ of interest. The approach presented here provides a screening technique in ultimately linking exposure and subsequent short-term effects on lung function from the emissions of an incinerator. This approach combines air quality measurements, Geographical Information Systems (GIS), receptor and dispersion modeling to apportion the impact of an incinerator source to locations where individuals live in surrounding neighborhoods. GIS techniques establish the spatial relationships between the incinerator source and individuals. The receptor and dispersion model predictions are compared at the air quality monitoring location. A scaling factor is determined for use in predicting incinerator impact at other outdoor locations. This technique is applied to a Health and Clean Air Study investigating the respiratory effects of air emissions associated with 3 types of waste incinerators--biomedical waste and municipal waste incinerators, and a waste burning industrial furnace. The purpose of this larger investigation is to determine the potential impact of atmospheric emissions from incinerators on individuals residing near these sources.

Are There Carcinogens in Water for Human Consumption. An Epidemiologist's Viewpoint. Book chapter.

Carcinogenesis is a complex and dynamic interaction of host and environment. Important host factors include genetic constitution and health status. Among environmental factors, diet, pollutants in air and water, occupation, and life-style characteristics, such as smoking, are known to affect cancer development in the human population. This perspective represents a synthesis of the accumulated knowledge from epidemiology and animal experiments. Cancer epidemiology, in contrast to animal toxicological studies, requires no transference of the conclusions from the analysis of the animal data to indicate human carcinogenic potential. The long latency between the inception of cancer and its manifestation, and comparatively low incidence in human beings, as well as the difficulty of ascertaining exposure, have made an epidemiological approach demonstrating a cause-and-effect relationship between the suspected carcinogen and a specific cancer a very difficult if not impossible task. The recent flurry of activity in basic research in oncogenes also reinforces Knudson and others observations regarding genetic influences on cancer development.

The objectives of this paper are to review information on abiotic and biotic interactions of PCBs in soil and sediment, and to suggest possible approaches to coupling enhanced availability to increased biodegradation. The authors are currently studying the biodegradation of PCBs found in a former drag strip soil in New York State that exemplifies the problems associated with bioavailability. The PCB concentration in this soil is roughly 500 mg/kg, and no longer resembles commercial Aroclor 1242(TM). Depletion of the di- and trichlorobiphenyls, probably due to the evaporation of these more volatile congeners, has resulted in a PCB congener profile that more closely resembles Aroclor 1248(TM). After 13 weeks, the soil in the top 3 cm of the test plot showed approximately 20% biodegradation of the PCB; after 18 weeks, approximately 25% of the PCB had degraded. The rate of biodegradation at the drag strip was about 50% of the rate seen in the laboratory experiments. However, even in optimized laboratory studies, approximately 50% of the total PCBs was unavailable to microbial degradation. The soil-bound, less-available PCB fraction is the focus of this discussion.

The growing awareness of adverse effects of environmental contamination has lead to scrutiny of various biomarkers as early indicators of these effects. The use of splenic macrophage aggregates (MA) as indicators of fish health and environmental degradation was evaluated using three fish species from four sites. The sites were part of the Environmental Protection Agency's Environmental Monitoring and Assessment Program (EMAP). Water quality, benthic and fish community characteristics, sediment and fish tissue contaminant analysis were all conducted at these sites. In addition, tissues from pinfish (Lagodon rhomboides), spot (Leiostomus xanthurus) and gafftopsail catfish (Bagre marinus) were fished in the field. Histological sections of spleen were evaluated using a numerical rating system and image analysis. The MA number, size, and percent of tissue occupied by MAs of each species was compared among sites and related to either tissue or sediment contaminant levels. Spot MA parameters were all significantly higher at the site with the highest sediment contaminant levels. Catfish accumulated high tissue burdens of most contaminants when compared to other fish collected at the same site. Catfish MA parameters were also better indicators of tissue contaminant levels. The usefulness of MA as indicators of environmental stress is supported by this study. Choice of fish species to evaluate sites is discussed.

Comparative sequence analysis of ribosomal RNA molecules has led to a phylogenetic-based approach to characterize natural microbial communities. The approach has been applied to study natural communities of sulfate-reducing bacteria. Hybridization probes were used to measure relative amounts of specific sulfate reducer rRNAs in an estuarine sediment. Selective amplification, cloning, and comparative sequence analysis of 16S ribosomal RNA gene sequences have revealed new diversity among sulfate-reducing bacteria.

The paper gives results of a theoretical evaluation of the performance and efficiency of 11 non-chlorofluorocarbon (CFC) refrigerants. An analytical method using a limited set of property data is used as a tool. The performance of these refrigerants is determined for a variety of vapor-compression cycles which are thermodynamic analogies to existing systems. Through separation of the basic vapor-compression cycle into elemental cycles representing only throttling losses or only compression superheating losses, important information is drawn about the design implications of subcooling or superheating the refrigerant. It is shown through this analysis that alternative, as well as standard, refrigerants fall into two general performance classes. These classes result in important performance and efficiency information which can be used to develop a vapor-compression system design tailored to the refrigerant class.

The paper gives results of tests of 2 of 11 compounds and several mixtures selected for intensive evaluation from about 40 new synthesized compounds that may serve as environmentally safe and effective refrigerant alternatives over the long term. The two compounds are: 1,1,1,2,3,3-hexafluoropropane (HFC-236ea), a potential alternative for CFC-114; and 1,1,2,2,3-pentafluoropropane (HFC-245ca), a potential alternative for CFC-11. These two compounds have zero ozone depletion potential, low global warming potential, and thermophysical properties closely matching those of the chlorofluorocarbons (CFCs) they may replace. Limited toxicity tests to date reveal no adverse toxic effects. Flammability tests of HFC-236ea and HFC-245ca show the former to be nonflammable and the latter to be marginally flammable depending on humidity and ignition source energy. Both compounds have been shown to be thermally and hydrolytically stable, miscible with the new polyolester lubricants, and compatible with numerous construction materials commonly used in refrigeration.

The paper discusses an EPA program investigating fuzzy logic motor control for improved pollution prevention and energy efficiency. Initial computer simulation and laboratory results have demonstrated that fuzzy logic energy optimizers can consistently improve motor operational efficiency over conventional adjustable-speed drive (ASD) operation. This is significant in terms of both potential U.S. pollution prevention and energy savings possibilities. The addition of a fuzzy logic energy optimizer microchip to an ASD is minimal

in terms of cost because low-power microchips are very cheap when manufactured in volume. Thus, the energy savings and enhanced motor operation and lifespan should be regarded as almost free because cost payback is potentially so short.

The paper gives results of a thermodynamic evaluation that investigates the performance of 15 new chemicals as refrigerants, the impact of the new chemicals on compressor size and operating characteristics, and the efficiency of the refrigerants in vapor compression cycles. Their efficiency in the basic vapor compression cycle is low, but improves substantially in a cycle with internal heat exchange. Several alternatives are identified as promising replacements. As a step in evaluating the potential performance of the 15 compounds, the evaluation using limited property data was performed on the chemicals for use as refrigerants in supermarket, chiller, refrigerator/freezer, heat pump, and air conditioning applications. The paper gives an overview of the regulatory requiremets related to ambient ozone and discusses the related research programs of the Organics Control Branch of EPA's Air and Energy Engineering Research Laboratory (AEERL). The programs are part of AEERL's comprehensive research program to identify and demonstrate prevention and control approaches for reducing volatile organic compound (VOC) emissions. VOCs react in the atmosphere to form ozone at ground level. Failure to attain the ambient ozone standard is one of the most pressing air pollution problems in the U.S. The Clean Air Act Amendments of 1990 include stringent requirements to ensure attainment of the ozone standard in some areas as early as 1993, and attainment in all areas by 2010.

The 1991-92 field performance of 11 woodburning stoves in and around Crested Butte, CO, was evaluated. Measurements included particulate matter (PM), carbon monoxide (CO), total unburned hydrocarbons (THC), and weekly average burn rates. The monitored stoves included EPA-certified catalytic stoves and EPA-certified noncatalytic stoves. The main emphasis of the continuing study is to characterize the emissions of EPA-certified stoves as they age with normal use. The emissions of a previously monitored Phase II noncatalytic stove appeared to be unchanged when variations in field moisture content and burn rate were taken into account. A second Phase II noncatalytic stove also performed at the emission levels which has been observed for noncatalytic stoves in previous monitoring.

The paper discusses Enhanced Combustion Woodstove (ECW) technology, developed by EPA in response to the field observation that woodstoves certified by EPA as being clean burning were not achieving the level of emission control 'seen' in laboratory tests. ECW technology is based on the fact that woodstove emissions are caused by the incomplete combustion and pyrolysis of wood in the primary combustion zone. To achieve low emissions, the stove must incorporate a secondary combustion zone above the wood which will hold flame at all times. Current noncatalytic woodstoves can achieve satisfactory secondary combustion only under fairly ideal conditions. Stable secondary combustion may not be achieved at typical low-fire conditions, leading to high emissions. Initial work focused on using an electrical glowplug (ECW electric) to ignite and add energy to the secondary combustion zone. Later work has focused on using a gaseous fuel (ECW gaseous or ECWG) for this purpose.

The paper discusses a demonstration of waterbased platen adhesives as a viable alternative to the organic-based aerosol adhesives that are predominantly used by garment screen printers to affix garments or fabric pieces to print platens. To demonstrate this, the effectiveness of six waterbased platen adhesives was evaluated, compared to each other and to an aerosol adhesive, during actual manufacturing runs at a garment

screen printing facility. Quantitative data concerning the amount used during printing, the cost, and the constituents of each adhesive were collected so that emission estimates and comparative cost analyses could be completed. Demonstration results show that waterbased platen adhesives can perform effectively in garment screen printing operations when applied by an automatic spray system. In addition, waterbased products that contain no volatile organic compounds (VOCs) appear to be at least equal in performance to those waterbased products that contain VOCs. No-VOC waterbased adhesives are also the least expensive to use. There are several limitations to the study results.

The paper summarizes current research on abandoned underground coal mines. It forms an initial basis for developing an inventory of methane emissions from such mines. Early measurements have shown that some abandoned coal mines can liberate large volumes of high quality gas (up to 750,000 cu ft/day: 21,000 cu m/day). The research has focused on developing improved emission factors and relationships, and improving inventories for methane emissions from surface mining, coal handling, and abandoned underground mines. The work has initially focused on coal mining in the U.S., but will be extended to global coal production. Improved emissions inventories for coal mining operations will enhance the ability of researchers to assess the significance of coal mining in global scale processes. Determination of representative methane emissions relationships and mechanisms for coal mining (especialy abandoned mines) will also be useful to researchers and industrial groups exploring for potential sources of energy.

The paper discusses the performance of hydrocarbons in a household refrigerator/freezer (R/F). It focuses on the utilization of specific hydrocarbons (propane and isobutane) as drop-in replacements for CFC-12 in household R/Fs. Results from this experimental work can be extrapolated to R/F applications in developing countries. The charge and capillary tube length have been optimized for CFC-12 and each hydrocarbon composition; no other modifications were made to the R/F. Numerical evaluations show that several compositions come near to the performance of CFC-12. Also, experimental evaluation shows that some hydrocarbon compositions' energy consumption is equal to or less than that of CFC-12 (i.e., 60/40%, 70/30%, and 80/20% by weight of isobutane/propane).

Some radon mitigation systems draw air with a high radon concentration from under the basement floors of houses and exhaust it outdoors. The objective of the project was to measure reentry rates for radon released at roof level and at ground level near a house, to determine whether or not exhaust above the roof is necessary. This was done by using a portable mock-up of a radon mitigation system exhaust, with sulphur hexafluoride (SF6) as a tracer gas. The roof level exhaust produced maximum indoor sulphur hexafluoride concentrations significantly lower than the ground level exhaust. This suggests that the better radon discharge location is on the roof of a house.

Presented at the Air and Waste Management Association Annual Meeting, Cincinnati, OH., June 19-24, 1994. Sponsored by Environmental Protection Agency, Research Triangle Park, NC. Air and Energy Engineering Research Lab.

The paper gives results of an evaluation of innovative ink feed systems for the flexographic and gravure printing industries. The evaluation is part of an investigation and assessment of pollution prevention strategies involving ink-handling systems used in certain segments of the printing industry. Ink-handling systems include all steps as the ink is transported from a storage area to the substrate. Possible ink-handling processes include ink-mixing operations, transport of ink to the press, movement of ink from the sump to the printing cylinders by means of an ink feed system, and the actual printing operation in which the ink is transferred from the printing cylinder to the substrate. Modifications to the flexographic and gravure ink feed systems may potentially provide many benefits. Potential environmental benefits include reduced fugitive emissions, reduced emissions from cleaning solvents, and reduced amounts of hazardous waste. Benefits to the printer include savings from reduced purchases of diluent solvent and cleaning solvent as well as reduced hazardous waste disposal costs. In addition, many of these modifications will allow printers to better control their printing operations and achieve higher quality results.

Battery-Powered PM-10 Indoor Air Samplers Applied to Unvented Third World Residential Combustion Sources. Rept. for Jun 87-Mar 92.

Presented at the Air and Waste Management Association National Meeting, Kansas City, MO., June 1992.

The paper discusses a battery-powered PM-10 indoor air sampler applied to unvented Third World residential combustion sources. The limited availability of reliable electric power away from the main towns meant that battery-powered systems were needed to collect integrated samples of the actual indoor exposure. The samplers incorporate horizontal elutriator PM-10 inlets and 8 by 10 in. (20 by 25 cm) filters for large sample capacity at low system pressure drop. A requirement for an integrated 24-hour sample meant that the usual Ni-Cd battery of the 4 L/min personal sampling pump was replaced by a Pb-acid gelled-electrolyte unit. These samplers, which have been used to develop emissions, chemical and bioassay data for coals from several mines as well as emissions variability within each coal type, are described and typical data collected are presented. A new version using a 12 L/min pumping system is also described.

Developing embryos of the inland silverside fish, Menidia beryllina, were exposed to conidiospores of the insect pathogenic fungus, Beauveria bassiana, that possessed activity against the migratory grasshopper,

Melanoplus sanguinipes. Various adverse effects were observed in Menidia beryllina embryos and larvae. They included rupture of the chorion, embryo death, developmental defects (vertebral abnormalities) in the embryo or hatched larvae, and fungal infections on the mandibles of larvae. Although there was little evidence of a definitive dose-response trend based on densities of viable conidiospores, statistically significant ($p < or = 0.01$) responses were observed in tests in which conidiospore densities were as low as 7.1 times 10 to the third power/ml and as high as 1.3 times 10 to the sixth power/m. Viable spores were required for adverse effects to occur; heat-killed spores failed to cause significant adverse effects. (Copyright (c) 1994 Springer-Verlag New York Inc.)

Oocysts of the apicomplexan protozoan Calyptospora funduli were found in the liver of a gulf toadfish (Opsanus beta). The infected specimen was 1 of 54 (1.9%) toadfish livers examined histologically. The paraffin-embedded specimen containing the infection as well as similar material from Fundulus similis were processed for scanning electron microscopical (SEM) examination to view diagnostic surface features of C. funduli sporocysts. SEM examination confirmed sporopodia and a thin veil surrounding each of the 4 sporocysts per oocyst. Although a single case, the toadfish infection expands the broad host specificity of C. funduli to include a host other than an atheriniform fish species.

Eye infections by metacestodes of Gilquinia squali (Cestoda: Trypanorhyncha) were associated with mortality in chinook salmon Oncorhynchus tshawytscha reared in net-pens in seawater at two separate locations in British Columbia. Mortality associated with the disease was about 10% at one site and undetermined at the second site. The metacestode was found in the vitreous humor of moribund fish with eye lesions, whereas healthy fish from the same pen exhibited neither eye lesions nor the infection. The lesions were characterized by retinal folding and apparent retinal duplication, and cataractous changes; in severe cases, the cornea ruptured, and the lens was extruded. The spiny dogfish Squalus acanthias is the definitive host for the cestode. Spiny dogfish were prevalent in and around the affected net-pen sites, thus providing coracidia to infect the first intermediate host, which is most likely a crustacean. Although the metacestode is common in the eyes of European whiting Merlangius merlangus in the northeast Atlantic region, this is the first report of the infection in a salmonid.

A thermophilic sulfate-reducing vibrio isolated from thermal vent water in Yellowstone Lake, Wyoming, USA is described. The gram-negative, curved rod-shaped cells averaged 0.3 micrometers wide and 1.5 micrometers long. They were motile by means of a single polar flagellum. Growth was observed between 40 and 70 C with optimal growth at 65 C. Cultures remained viable for one year at 27 C although spore-formation was not observed. Desulfofuscidin and c-type cytochromes were present. The G + C content was 29.5 mol%. The divergence in the 16S ribosomal RNA sequences between the new isolate and Thermodesulfobacterium commune sugggests that these two thermophilic sulfate-reducing bacteria represent different genera. These two bacteria depict a lineage that branches deeply within the Bacteria domain and which is clearly distinct from previously defined phylogenetic lines of sulfate-reducing bacteria. Strain YP87 is described as the type strain of the new genus and species Thermodesulfovibrio yellowstonii.

A sulfate-reducing bacterium, designated strain ESC1, was isolated and found to be a new species. Strain ESC1 is a strictly anaerobic, gram-negative, non-sporeforming, motile, short, round-ended rod often occurring in pairs. Of 31 fermentative substrates tested, only pyruvate was utilized. Sulfate enhanced growth with pyruvate and allowed growth with ethanol, lactate, formate and hydrogen. Both sulfate and thiosulfate were reduced. Lactate was incompletely oxidized to acetate and CO2. The strain was desulfoviridin negative. The G+C content is 59.9%. These data suggested placement of strain ESC1 in the genus Desulfomicrobium. Comparative 16S rRNA analysis showed that strain ESC1 shares 98% rRNA sequence similarity with Desulfomicrobium baculatum and Desulfovibrio desulfuricans strain Norway 4. The latter two strains shared greater than 99% 16S rRNA sequence similarity. Strain ESC1 has been designated as the new species Desulfomicrobium escambium.

A two-stage, field-scale bioreactor system was used to determine the efficacy of bioremediation of creosote- and pentachlorophenol (PCP)- contaminated ground water at the abandoned American Creosote Works (ACW) site in Pensacola, Florida. In separate 15-day runs of the field-scale (454L) system, bioreactor performance in the presence of specially-selected microbial inoculants was compared to that observed using non-specific biomass. Results obtained with specialty organisms in the first run of the field-scale bioreactor showed that, on average, 70.6% of polycyclic aromatic hydrocarbons (PAHs) and heterocycles were degraded. Only 36.9% of the pentachlorophenol (PCP) present was biodegraded. In the second run, microorganisms from an industrial waste water treatment facility averaged 51.0% biodegradation of PAHs and heterocycles. Degradaton of PCP was 81.0%, a value substantially higher than in the first run. Reductions in toxicity/teratogenicity were also observed for effluent from the second run of the field-scale bioreactor but the magnitude of toxicity reduction was less than in the first run.

Chemical analyses and biological response data were used to assess the efficacy of a field-scale hyperfiltration unit in the removal of polycyclic aromatic hydrocarbons (PAHs) and other organic compounds from creosote- and pentachlorophenol (PCP)-contaminated ground water recovered from the former American Creosote Works in Escambia County, Pensacola, Florida. The hyperfiltration unit consisted of 4 modules containing porous stainless steel tubes which were coated with a formed-in-place zirconium hydrous oxide-polyacrylic acid (ZOPA) membrane. A 5-fold concentration of the feedwater (80% volume reduction) with up to 97% removal of high molecular weight PAHs was achieved during pre-demonstration and field-demonstration runs of the hyperfiltration unit. Toxicological and teratogenic data for embryonic inland silversides, Menidia beryllina, indicated that 100, 10 and 1% solutions of the ground water sample used in the pre-demonstration run caused statistically significant ($p < or = 0.05$) biological responses when compared to controls. Permeates from both runs, diluted to 1%, met the pre-condition of non-toxic responses in 48h tests with Ceriodaphnia dubia. Meeting this requirement allowed for discharge of diluted permeate into the county's sanitary sewerage collector system.

A comprehensive approach to predicting chronic toxicity from acute toxicity data was developed in which simultaneous consideration is given to concentration, degree of response, and time course of effect. A consistent endpoint (lethality) and degree of response (0%) were used to compare acute and chronic tests. Predicted no-effect concentrations were highly accurate 92% of the time (within a factor of 2.0 of the limits of the maximum acceptable toxicant concentrations for lethality) and did not vary by more than a factor of 4.8 when the technique was applied to a data base of 18 chemicals and 7 fish species. Growth effects can be predicted from chronic lethality, but reproductive effects should not be.

The fine particle fraction of sediments collected near bulkheads made of CCA-treated wood had elevated levels of the three metals. These decreased with distance from the bulkhead. Although the concentrations in the fine particle fraction of these sediments were quite high, the sediments had less than 1% fine particles, being primarily sand. Metal levels in benthic organisms were also elevated adjacent to the bulkhead and decreased with distance. However, tests with the sediments adjacent to the bulkhead did not reveal consistent toxicity, probably because the overall concentrations of metals were low. On the other hand, benthic community analysis revealed that there were reduced species numbers, total numbers of organisms, and diversity in the sediments adjacent to the bulkheads compared to reference sediments with lower metal concentrations.

Intersexuality in the form of masculinization has been observed among poeciliid fishes (i.e., mosquitofish, least killifish, and sailfin molly) from streams receiving paper mill effluent (i.e., draft mill effluent). The degree of masculinization is related to the relative concentration and duration of exposure to kraft mill effluent (KME). Compounds associated with KME apparently act as endocrine disruptors to the normal expression of secondary sex characters. Monitoring intersexuality in these fishes may serve as a useful sentinel to detect endocrine disruptors in the environment.

Ionization constants for 214 dye molecules were calculated from molecular structures using the chemical reactivity models developed in SPARC (SPARC Performs Automated Reasoning in Chemistry). These models used fundamental chemical structure theory to predict chemical reactivities for a wide range of organic molecules from molecular structure. The energy differences between the protonated state and the unprotonated state for a molecule of interest are factored into mechanistic components including the electrostatic and resonance contributions and any additional contributions to these energy differences.

Photolysis of an azo, a quinophthalone, and several anthraquinone smoke dyes was studied on soil surfaces. Initially, rapid photodegradation of each dye occurred, followed by a period of much slower rate of loss, indicating that the remaining fraction of the dye was photochemically protected. The average mean depths of photolysis ranged from 0.33 to 0.68 mm for outdoor studies and from 0.42 to 0.73 for lab studies. The magnitude of the mean depth of photolysis suggests that photo-degradation of the dyes occurs through indirect photochemical processes. Photolysis products for only two of the dyes could be identified. Photolysis of Disperse Red 9 resulted in the formation of 1-aminoantraquinone, whereas Solvent Yellow 33 photodegraded to give 2-carboxyquinoline and phthalic anhydride. Reaction mechanisms involving sensitized photo-oxidation by singlet oxygen are consistent with the formation of these reaction products.

An evaluation of five commercial software systems used for immunoassay data analysis revealed numerous deficiencies. Often, the utility of statistical output was compromised by poor documentation. Several data sets were run through each system using a four-parameter calibration function, and the results were compared to those from an independent method. Comparable results between systems were obtained, but often several attempts at analysis were necessary. The evaluation process revealed that it is difficult to monitor the numerous options available on these types of programs, and that incorrect results could easily be obtained if comparison analyses were not used. Recommendations for improved software functionality and for using the four-parameter calibration model are presented. (Copyright (c) 1993 Academic Press, Inc.)

Whether called 'performance-based methods' (emphasizing the products) or 'criteria-based methods acceptance' (the process), the topic currently is a hot one for the U.S. EPA. The EPA's Environmental Monitoring Management Council (EMMC) is considering approaches to pilot or implement the process in conjunction with a comprehensive strategy to reduce the confusing array of similar measurement methods adopted under various regulatory programs. This was the topic of a special session at the EPA's annual Solid Waste Testing and QA Symposium in July 1992. In September 1992, the Sixth Annual Interagency Workgroup Meetings on QA for Environmental Measurements (QAEM) featured the topic as one of its four major sessions.

Complexation followed by Supercritical fluid extraction (SFE) has been investigated for the extraction of

Cu(2+), Co(2+), and Zn(2+) ions from solid samples. Lithium bis(trifluoroethyl)dithiocarbamate (FDDC) was used as the complexing agent in the study. The metal-FDDC complexes in the SFE extracts were determined by gas chromatography (GC) with atomic emission detection. The recoveries of Cu(2+), Co(2+), Cd(2+), and Zn(2+) ions from filter paper, sand, and silica gel ranged from 70 to 100 percent. Relatively high concentrations of complexed Cu, Co, Cd, and Zn found in system blanks obtained with a stainless steel SFE system prompted the authors to modify the apparatus by using nonmetalic polyetheretherketone (PEEK) components.

The tritium content of streams, lakes and springs in Alaska, Nevada and Colorado was measured over the last decade. The tritium content of these waters has declined approximately 50% to a present maximum of up to 70 pCi/l. This decline is a continuation of the decreasing trend that started shortly after the atmospheric nuclear test ban treaty of the early 1960s. The present concentration of tritium in these natural waters is approaching the concentration expected from the natural production of tritium in the environment. (Copyright (c) 1993 R. Spatial patterns and total amounts of soil organic C (SOC) are important data for studies of soil productivity, soil hydraulic properties, and the cycling of C-based greenhouse gases. The study evaluated several approaches for characterizing SOC to determine their relative merits. The first approach entailed grouping data from global pedon SOC database by type of ecosystem, resulting in a total of 78.0 Pg of C to 1-m depth for the contiguous USA. In a second approach, a pedon database was aggregated using soil taxonomy, giving a total for the contiguous USA of 80.7 + or - 16.6 Pg of C when the great group SOC was spatially distributed with Major Land Resource Areas (MLRAs) using the 1982 National Resource Inventory (NRI) and the Soil Interpretation Record databases. The third approach used pedon and spatial data from a global soil map grouped by soil unit that resulted in 84.5 Pg of C for the contiguous USA.

Greenhouse experiments were conducted to determine whether Arabidopsis thaliana (L.) Heynh., a putative Fe-efficient species, accumulated higher concentrations of Cd from a sparingly soluble Cd source (cadmium dihydrogen phosphate) when growing in Fe-deficient rather than in Fe-sufficient conditions. Analysis of the uptake of other elements by Arabidopsis suggests that the greater accumulation of Cd by plants in the Fe-deficient treatment may be a consequence of the species' Fe efficiency mechanisms. Our results support the hypothesis that uptake of toxic elements by Fe-efficient species can be enhanced when the plants are growing in Fe-deficient soils.

Two large-scale environmental surveys, the National Stream Survey (NSS) and the Environmental Protection Agency's proposed Environmental Monitoring and Assessment Program (EMAP), motivated investigation of estimators of the variance of the Horvitz-Thompson estimator under variable probability systematic sampling. As is common in practice, survey objectives required special design and analysis features that strongly influenced selection of a variance estimator. In this article we investigate properties of the variance estimator used in the NSS and proposed for some applications in EMAP. (Copyright (c) 1994 American Statistical Association.)

The compound growth function of Warren (W. G. Warren, 1980. Tree-Ring Bull. 40:35-44) represented an attempt to develop a model-based approach that standardized tree ring width sequences and was more flexible than the monotonic functions that were then commonly used. While the idea was conceptually attractive, operational difficulties of fitting hindered its use as a practical tool. The paper describes the modifications, and what are believed to be improvements, that have recently been made to the method, and which have led to an interactive computer program by which the fitting of the model to any sequence of ring widths may be readily accomplished. The approach also permits the location of both positive and negative departures from a trend (releases and suppressions, respectively) and estimation of the rate of rung-width increase or decrease. For illustration it has been applied to a sample of red spruce (Picea rubens Sarg.) cores from Whiteface Mountain, New York.

The rapid development of North Carolina's Coastal, Tidewater, and Piedmont regions has caused an urgent need to protect significant natural resources in this part of the state. However, before protection of natural resources and natural areas can be accomplished, it is important to have background information about these resources, such as locations of endangered and rare species and delineation and description of significant natural areas. The North Carolina Nature Preserves Act delegates responsibilities to the North Carolina Natural Heritage Program for maintaining the statewide inventory of important natural areas and rare species habitats. This report describes the natural communities, aquatic habitats, endangered and rare species, and geomorphology of the 17-county A/P III study area. The objectives of this study were to work toward determining the threshold range of water-column nitrate enrichment that promotes destruction of eelgrass (Zostera marina L.), and to examine whether nitrate enrichment is toxic to two other submersed aquatic marine/estuarine plants, shoal grass (the seagrass Halodule wrightii Ascher) and widgeon grass (Ruppia maritima L.). These species are of interest for potential use in re-establishing beds of submersed aquatic vegetation within areas where eelgrass habitat loss has been correlated with nutrient enrichment or other factors associated with cultural eutrophication and coastal development. This research indicates that Halodule wrightii or Ruppia maritima could be established by transplanting efforts as a management strategy in nitrate-enriched waters where eelgrass meadows have disappeared. Unlike Zostera marina, these plants apparently have physiological mechanisms to more efficiently process and control consumed nitrate; indeed, R. maritima seems to have derived a competitive advantage in nitrate-enriched conditions.

The paper identifies the basic site assessment information required to define and understand the release incident and the organic chemicals released in the subsurface environment. It evaluates various remediation technologies, based on the characteristics of concerned pollutants and site geologic properties, that may be applicable to cleaning up organic chemicals from surface spills or leaking underground storage tanks. A systematic discussion of organic chemicals transport in subsurface environment enables the user to: develop a conceptual understanding of site conditions before initiation of extensive field investigation, define remediation goals, evaluate technologies capable of meeting remediation goals, and identify monitoring requirements during and after remediation.

The paper discusses the use of the Integrated Air Pollution Control System (IAPCS) computer model for estimating sulfur dioxide (SO2) and nitrogen oxide (NOx) control system costs for real-world utility plants. The IAPCS can perform cost and performance estimates of 15 air pollution control systems as applied to coal-fired utility boilers. Estimates can also be made for particulate control systems. This personal-computer-based interactive model allows the user to specify boiler, coal, and control system operating parameters. Detroit Edison and New York State Electric and Gas Company, each provided the boiler and coal specifications for three of their existing or proposed units. The IAPCS model was used to provide capital costs, annual operating and maintenance costs, levelized annual revenue required, and pollution reduction estimates for each control system estimated. The model is a tool that utilities can use to evaluate compliance options for meeting the regulatory requirements of the Clean Air Act Amendments of 1990, in addition to options for meeting state regulations. It can also be used by legislators and their staffs, public utilities commmissions, and architectural/engineering companies for preliminary control system design and budget estimates.

Over the past decade there has been interest in exploring possible relationships between atmospheric visibility (extinction of light) and the chemical form of aerosols in the atmosphere. A user-friendly, menu-driven program for the personal computer (AT 286 with math co-processor or higher) has been developed which both calculates the equilibrium composition of the atmospheric aerosol of specified compositions (including particle-bound water as a function of relative humidity) and also applies optical parameters from these end-products to estimating scattering and extinction. Presented here is a description of such a program, with a discussion of the assumptions and approaches implicit in it. The program appears to give results which are similar to results reported by others.

The Fine Particle Network (FPN), a system of fine particle (less than 2.5 micrometers) samplers, was operated at 41 sites selected from the Enviromental Protection Agency Acid MODES program during the two year period in 1988-90. The 24-hour sample results included fine particle mass and the most predominant chemical element concentrations determined by wavelength dispersive x-ray fluorescence analysis. Statistical summaries of the fine mass and sulfur concentrations by site and season were prepared. The availability of simultaneous particulate sulfate measurements from independent collection and analytical procedures provided an opportunity to examine their agreement and provide a more reliable data base for evaluation of regional particulate models and estimation of contribution to urban aerosol concentration.

Transport, Radiative, and Dynamical Effects of the Antarctic Ozone Hole: A GFDL 'SKYHI' Model Experiment. Journal article.

The Geophysical Fluid Dynamics Laboratory 'SKYHI' general circulation model has been used to simulate the effect of the Antarctic 'ozone hole' phenomenon on the radiative and dynamical environment of the lower stratosphere. Both the polar ozone destruction and photochemical restoration chemistries are calculated by parameterized simplifications of the still uncertain, more complete chemical processes. The modeled total column ozone depletions are near 25% in spring over Antarctica, with 1% depletion reaching equatorial latitudes by the end of the 4 1/2 year model experiment. In the lower stratosphere, ozone reductions of 5% reach to the equator. Large coolings of about 8 C are simulated in the lower stratosphere over Antarctica in late spring, while a general cooling of about 1-1.5 C is present throughout the Southern Hemisphere lower stratosphere. The model atmosphere experiences a long-term positive temperature-chemical feedback because significant ozone reductions carry over into the next winter. The overall temperature response to the reduced ozone is essentially radiative in character. However, substantial dynamical changes are induced by the ozone hole effect. The Antarctic middle stratosphere in late spring warms by about 6 C over Antarctica and the lower mid-latitude stratosphere warms by approximately one degree. These warming spots are produced mainly by an increased residual circulation intensity.

The composition of three volatile hydrocarbon sources (emissions from vehicles in motion, evaporation of whole gasoline, and gasoline headspace vapor) have been derived from 550 ambient, hourly concentration measurements of 37 C2-C9 volatile organic compounds (VOC). The source compositions were obtained by a novel combination of graphical analysis and multivariate receptor modeling methodologies: GRACE (Graphical Ratio Analysis for Composition Estimates) and SAFER (Source Apportionment by Factors with Explicit Restrictions). For the relatively unreactive hydrocarbon species, the ambient-derived source compositions were in good agreement with direct source measurements made in Atlanta concurrent with the ambient measurements. The prominence of the whole gasoline profile in the ambient data was an unexpected result.

Several important issues related to the distribution and production of photochemical species are examined through an analysis of results obtained from applications of a comprehensive three-dimensional regional scale photochemical model over the northeast United States. The Regional Oxidant Model (ROM) is used to simulate the response of various photochemical species to specific anthropogenic emissions strategies involving NOx and hydrocarbon reductions for an episodic period during July 1988. Domain and temporal averages of predicted concentrations are examined for various species. Their relative influence on oxidant chemistry over the modeled domain is investigated. Further, spatial distributions of Ozone (O3) with respect to those of NOx, NOy, and hydrocarbons over the modeled domain are examined and the variations in O3 levels for different chemical regimes classified by characteristic NOx/ROG and NOx/NOy ratios are investigated. The relative benefits of reductions in NOx and hydrocarbon emissions on predicted O3 levels are also examined. In general, for this modeled domain, reductions in NOx emissions with or without reductions in hydrocarbon emissions have more impact on reducing predicted O3 levels compared to reductions only in hydrocarbon emissions.

An analysis is presented of the variability in chemical composition of soluble corrosion products on galvanized steel specimens exposed at Research Triangle Park, NC, in the absence of natural precipitation. The specimens varied in size, shape, orientation angle, and previous exposure history. The soluble corrosion products were assumed to represent the effects of dry deposition of airborne substances, which were deduced to include SO2, NOy (presumed HNO3), Cl(-) (presumably HCl), and Ca(+2) (presumably from coarse particles), based on statistical analysis of their variability in relation to atmospheric conditions. The most important specimen characteristic was previous exposure history. Deposition of gases was dependent upon surface conditions, wind speed, and temperature, and to a lesser extent orientation angle. Depositon of particles was dependent upon specimen surface orientation. Soluble zinc loss varied with Reynolds number to the -0.2 power even though Reynolds numbers based on average wind speeds were well below those classically expected to produce turbulent flow.

Tailpipe and evaporative emissions from three pre-1985 passenger motor vehicles operating on an oxygenated blend fuel and on a nonoxgenated base fuel were characterized. Emission data were collected for vehicles operating over the Federal Test Procedure at 40, 75, and 90 F to simulate ambient driving conditions. The two fuels tested were a commercial summer grade regular gasoline (the nonoxgenated base fuel) and an oxygenated fuel containing 9.5 percent methyl ter-butyl ether (MTBE), more olefins, and fewer aromatics than the base fuel. The emissions measured were total hydrocarbons (THCs), speciated hydrocarbons, speciated aldehydes, carbon monoxide (CO), oxides of nitrogen (NOX), benzene, and 1,3-butadiene. This study showed no pattern of tailpipe regulated emission reduction when oxygenated fuel was used. THC, CO, benzene, and 1,3-butadiene emissions from both fuels and all vehicles, in general, decreased with increasing test temperature, whereas NOX emissions, in general, increased with increasing test temperature.

Two elementary schools on Fort Wainwright Army Base in Fairbanks, Alaska were demolished during the Summer of 1992. The primary objective of the study was to assess whether the demolition of the buildings with Category 1 materials in place resulted in a downwind increase in the airborne asbestos concentration. The secondary objective was to document the worker exposure levels encountered by the demolition workers and the workers transporting the debris. There was, however, no statistically significant (p values > 0.05) difference observed between the airborne asbestos concentrations measured upwind and downwind of the demolitions, nor were there any increases in downwind asbestos concentration observed during debris disposal and covering activities at the landfill. Personal air monitoring of workers indicated that asbestos exposures were well below the Occupational Safety and Health Administratin (OSHA) Action Level, and by definition, did not appear to present a significant health risk.

This report describes a comparative technical and economic evaluation of using a dustless needlegun system versus a conventional abrasive grit blasting system in the removal of lead-based paint from steel structures. The objective of the study was to comparatively analyze the operational and logistical aspects of using dustless needleguns for lead-based paint removal as they relate to hazardous waste generation, worker health and safety and associated economic factors. The dustless needlegun system demonstrated its ability to produce a substantial reduction (97.5%) in the generation of hazardous waste when compared to conventional abrasive blasting. Also demonstrated was the ability to substantially reduce (up to 99%) the airborne concentrations of respirable dusts and lead-containing particulates generated during paint removal operations. The dustless needlegun system is shown to be economically competitive with conventional abrasive blasting when considering the reduced requirements for containment, hazardous waste disposal and worker protection.

The report updates and revises the State Authorization Manual with RCRA progam changes for the period July 1, 1990 through December 31, 1990. It provides three new revision checklists: toxicity characteristic, hydrocarbon recovery operations; petroleum refinery primary and secondary oil/water/solids separation sludge listings (F037 and F038); and wood preserving listings. Also included is a consolidated toxicity characteristics checklist for the rules addressing the toxicity characteristics requirements. The State Program Advisory (SPA) revises four checklists and also provides updated tables G-1 and G-2, a model revision attorney general's statement, and a checklist linkage table to insert into the State Authorization Manual.

The report updates and revises the State Authorization Manual with RCRA program changes for the period January 1, 1991 through June 30, 1991. It provides nine new checklists: corrections to the land disposal restrictions, suspension of the toxicity characteristic for certain used chlorofluorocarbon refrigerants, correction to the boilers and industrial furnaces requirements, removal of strontium sulfide from the list of hazardous waste, corrections to the organic air emission standards for process vents and equipment leaks, administrative stay for the K069 listing, revision to the petroleum refining primary and secondary oil/water/solids separation sludge listings. The State Program Advisory (SPA) includes a consolidated land disposal checklist, updated through June 30, 1991. This SPA also provides updated tables G-1 and G-2, a model revision attorney general's statement, and a chekclist linkage table to insert into the State Authorization Manual.

This evaluation addressed product quality, waste reduction/pollution prevention and economics in replacing chemical solvent strippers with a bicarbonate of soda blasting technology for removal of paint from aircraft wheels. Because the paint being removed contained hazardous metal constituents, the liquid and solid wastes as well as the cloud of spray generated were evaluated for metal concentrations present and their leachability. Analyses for Cd, Cr, Cu, Pb, Mn, Ni, and Zn were made as well as total metals concentrations, pH, total suspended solids, and oil and grease. The blasting technology is effective for removing paint from aircraft wheels without significant damage to the anodized surface under the paint. In comparison to solvent depainting this technology reduced the amount of hazardous waste generated as well as cost savings due to operating and disposal costs, resulting in a 15% return on investment in about 4 years.

Jul 94, 144p EPA/453/D-94/052

The purpose of this economic impact analysis (EIA) is to evaluate the effect of the control costs associated with the Petroleum Refining National Emission Standard for Hazardous Air Pollutants (NESHAP) on the behavior of the regulated petroleum refiners. The EIA was conducted based on the cost estimates for one hybrid regulatory option above the maximum achievable control technology (MACT) 'floor' (or minimum standard). This analysis compares the quantitative economic impacts of regulation to baseline industry conditions which would occur in the absence of regulation. The economic impacts of regulation are estimated for the industry, using costs which were supplied on both a national and a refinery level.

A research program has being conducted to study the mechanisms controlling the spread of flames in an oxidizing gas flow moving in the direction of flame propagation. During this reporting period research has been conducted to study the effect of the oxidizer flow characteristics on the concurrent flame spread over thick PMMA sheets. The parameters varied in the experiments are the oxidizer flow velocity, turbulence intensity and oxygen concentration, and the geometrical orientation (floor and ceiling). Their effect on the flame spread process is studied by measuring the rate of flame spread, flame length, surface heat flux, products of combustion and soot. The results of the experiments show that the combined effect of flow velocity, turbulence intensity, and oxygen concentration has a comnplex influence on the flame spread process. At low flow velocity, the flame spread rate increases monotonically with turbulence intensity. At high flow velocity, however, the flame spread rate increases with flow turbulence at low turbulence intensities, but it decreases at high turbulence intensity values. The effect is more pronounced at high oxygen concentration. These trends appear to be due to a strong influence of the turbulence intensity on the flame temperature and length, and on that heat flux from the flame to the solid fuel. Turbulence enhances mixing, which increases the flame temperatrue and then the heat flux.

Many forestry-related practices have been identified as having an impact on water quality and aquatic habitat. These impacts range from increased water temperature and nutrient concentrations to disruptions in stream channel norphology and riparian characteristics that affect stream health. In 1993, the EPA released a guidance specifying management measures for sources of nonpoint source pollution in coastal waters as required under section 6217 of the Coastal Zone Act Reauthorization Amendments (CZARA). The guidance provides the States and Territories with management measures for the following major sources of nonpoint source pollution: (1) agricultural runoff; (2) urban runoff; (3) silvicultural runoff; (4) marinas and recreational boatings; and (5) channelization and channel modification, dams, and streambank and shoreline erosion. The development of the CZARA guidance on management measures provided the impetus for developing this annotated bibliography, which provides a single source of background information on the water quality impacts and the costs and effectiveness of forestry best management practices (BMPs) used to mitigate the impacts.

Forestry practices have been implicated by many states as a contributor to nonpoint source (NPS) pollution of streams, rivers, lakes, and other waterbodies. Many states, recognizing the forestry contribution to water pollution, have developed programs to address forestry NPS. The recent development of the Management Measures Guidance, as required by section 6217 of the Coastal Zone Reauthorization Amendments (CZARA), provided the motivation to develop a summary of the current state forestry NPS programs. The document provides a synopsis of the BMPs currently used by states to address the nonpoint source (NPS) impacts on water quality caused by forestry activities. Summaries of over 41 existing state BMP manuals or regulations that include BMPs are presented. The information presented in the document is intended to provide an increased understanding of the types of forestry activities commonly addressed in existing state NPS programs and to serve as a reference for the type and nature of BMPs included in current state BMP manuals.

The summary describes a new process for photo-oxidation of volatile organic compounds (VOCs) in air using an advanced ultraviolet (UV) source, and a pulsed xenon flashlamp. The flashlamps have greater output at 200 to 250 nm than medium-pressure mercury lamps at the same power and, therefore, cause much more rapid direct photolysis of VOCs. The observation of quantum yields greater than unity indicate the involvement of chain reactions for trichloroethene (TCE), perchloroethene (PCE), 1,1-dichloroethylene (DCE), CHCl3, and CH2Cl2. TCE was examined more closely because of its widespread occurrence and very high destruction rate.

As part of the Superfund Innovative Technology Evaluation (SITE) program, the U.S. Environmental Protection Agency (EPA) demonstrated the Peroxidation Systems, Inc. (PSI), perox-pure chemical oxidation treatment system. The SITE demonstration was conducted at Lawrence Livermore National Laboratory (LLNL) Site 300 in Tracy, CA. Over a 3-wk period in September 1992, about 40,000 gal of groundwater contaminated with trichloroethene (TCE), tetrachloroethene (PCE), and other volatile organic compounds (VOC) was treated in the perox-pure system. The perox-pure system achieved TCE and PCE removal efficiencies greater than 99.7% and 97.1%, respectively. Potential sites for applying this technology include Superfund and other hazardous waste sites where groundwater or other liquid wastes are contaminated with organic compounds. Economic data indicate that groundwater remediation costs could range from about $7 to $11/1,000 gal depending on contaminated groundwater characteristics. Of these costs, perox-pure system direct treatment costs could range from about $3 to $5/1,000 gal.

The Sustainable Industry Project represents a new approach to development of environmental policy on an industry sector basis. The Agency's goal is to develop, test, and implement industry-specific policy recommendations that will remove barriers to innovation and promote strategic environmental protection. The report outlines the progress made to date in developing policy options that will improve environmental and economic performance in the metal finishing, photoimaging, and thermoset plastic industries. This was accomplished by working with the industries, states, nongovernmental organizations, and other interested parties. The Phase 1 Report details the selection of the three industries, the development of a network of 'stakeholders' for the project, identification of the key drivers and barriers that influence environmental performance in each industry, and selection of the policy options that will effect changes in that performance.

Methyl bromide (MeBr), with the chemical formula CH3Br, also called bromomethane, is listed by the 1991 Montreal Protocol as an ozone depleting chemical similar to the other halogenated hydrocarbons such as the chloro-fluorocarbons (CFCs). The U.S. Environmental Protection Agency's (EPA's) regulations authorized by the Clean Air Act (CAA) call for a phase-out of MeBr by the year 2001. MeBr is widely used in United States agriculture as a fumigant. This study has gathered preliminary data that can be used to determine if some of the essential agricultural commodity fumigation applications for MeBr could be continued by the use of some emission control methods on those commodity fumigation applications.

Aug 94, 126p EPA/530/R-94/030

This industry profile presents the results of the EPA's Research into the domestic iron industry and is one of a series of profiles of major mining sectors. This report briefly characterizes the geology of iron ores and the economics of the industry. Following this discussion is a review of iron extraction and beneficiation methods; this section provides the context for descriptions of wastes and materials managed by the industry, as well as a discussion of the potential environmental effects that may result from iron mining. The report concludes with a description of the current regulatory programs that apply to the iron mining industry as implemented by EPA, Federal Land Management Agencies, and selected states. Appendices include comments on this report and EPA responses.

Sampling to estimate production and viability of striped bass eggs was conducted at Barnhill's Landing on the Roanoke River, North Carolina, from 15 April to 15 June 1989. A total of 4,722 eggs was collected in surface nets: first eggs appeared in samples on 16 April and continued sporadically until 9 June, when the last eggs were collected. Estimated striped bass egg production in the Roanoke River for 1989 was 637,919,162 (S.D. = 27,668,383) eggs. A potential major spawning activity at the end of April was terminated by high and prolonged reservoir discharge, which forestalled peak spawning until the last week in May. Seasonal egg production was 50% complete by 26 May, 80% complete by 29 May, and 99% complete by 2 June. Egg viability was estimated as 41.8%, the seventh lowest on record. Major egg deposition ensued when water temperatures reached 18 deg. C. Approximately 89% of all eggs was collected at water temperatures between 18 and 21.0 deg. C. Over half of the eggs were collected at water velocities ranging from 100 to 119.9 cm/second; an additional 22% were collected at 60-79.9 cm/second.

The objective of this project is to develop economic models of how individuals use the Albemarle-Pamlico Sounds for recreational fishing. In the process, the authors sought to describe demands for marine fishing. These models would be used to evaluate one aspect of the benefits people would realize from improvements in the quality of these resources. Management policies directed to reducing the effluent loading entering the sounds could then be evaluated. These models include the average catch rates for all boat fishermen using specific entry points as a measure of the quality of area of the estuary for fishing. The preliminary findings suggest that a 25 percent increase in the catch rate would increase the value to a fisherman of a typical fishing trip to each area by between $10 and $71 in 1981 dollars.

The Albemarle-Pamlico (A/P) estuarine system is one of 17 estuaries identified nationwide under EPA's National Estuary Program. This report presents the results of a project to analyze multimedia toxics data from the system, one of several efforts by Research Triangle Institute (RTI) to support watershed planning in the A/P Study Area. The main purposes of this project were to: analyze toxics information from diverse agencies and databases in a consistent manner; estimate annual toxics loadings from point sources in the A/P basins and predict the potential for exceedances of water quality standards due to these sources; compare ambient water column, sediment, and fish tissue data to the most appropriate standards or criteria available to identify areas of concern where these standards or criteria are exceeded; and use Geographic Information System (GIS) technology to display the above results in graphical (map) form for further analysis and action by State agencies.

Robert S. Kerr Environmental Research Lab., Ada, OK.
M. L. Brusseau. May 93, 17p EPA/600/S-93/004
Prepared in cooperation with Arizona Univ., Tucson. Dept. of Soil and Water Science.

The occurrence of organic chemicals in soil and groundwater has become an issue of great interest and import. Concomitantly, research on the transport and fate of organic contaminants in subsurface environments has expanded greatly in recent years. However, the behavior of 'complex mixtures' is beginning to receive increased attention. Examples of pertinent problems involving complex mixtures include the transport of oxygenated gasoline in the subsurface, the dissolution of diesel fuel and coal-tar, and the use of chemical agents such as surfactants or solvents to enhance the removal of contaminants by pump-and-treat remediation. A discussion of these few selected examples will serve to highlight some of the issues associated with complex mixtures, with a focus on potential groundwater contamination and remediation.

Colchicine Inhibits Elevations in Both Alveolar-Capillary Membrane Permeability and Lavage Surfactant After Exposure of the Rat to Phosgene. Journal article.
Health Effects Research Lab., Research Triangle Park, NC. Inhalation Toxicology Div.
A. J. Ghio, and G. E. Hatch. c1992, 11p EPA/600/J-94/333
Pub. in Inhalation Toxicology, v4 p383-392 1992. See also PB92-136332. Prepared in cooperation with Duke Univ., Durham, NC. Dept. of Medicine.

The authors tested the hypothesis that colchicine diminishes the neutrophil influx and associated elevations in permeability of the alveolar-capillary membrane but does not affect lavage surfactant accumulation after COCl2 exposure. Rats were treated with either colchicine or saline prior to COCl2 at 0.5 ppm x 60 min. To measure membrane permeability, (125)I-labeled bovine serum albumin was injected via the tail vein immediately and 1 day after exposure. After 2 h, radioactivity of blood and lavage fluid was measured. Lavage surfactant was quantified as phospholipid immediately and 1 day after exposure. Permeability was elevated immediately but returned to normal values 1 day after inhalation. Phospholipid in the lavage fluid showed no immediate change but was increased 1 day after COCl2 inhalation. Colchicine inhibited both the immediate rise in the permeability index and the elevation of phospholipid 1 day after exposure to phosgene. The authors conclude that colchicine inhibited elevations in both alveolar-capillary membrane permeability and lavage surfactant after exposure to phosgene. The U.S. Environmental Protection Agency's Incineration Research Facility (IRF) in Jefferson, Arkansas, is an experimental facility that houses a pilot-scale rotary kiln incineration system (RKS) and the associated waste handling, emission control, process control, and safety equipment; as well as onsite laboratory facilities. During fiscal year 1993, two major test programs were completed at the IRF: an evaluation of rotary kiln incinerator operation at low to moderate temperatures, and a series of tests in which simulated mixed wastes were incinerated to support the Westinghouse Savannah River Company. Results of a pilot-scale test program previously completed, a parametric evaluation of the fate of trace metals fed to a rotary kiln incinerator equipped with a Calvert Flux-Force/Condensation scrubber system, were reported during FY93. Finally, a fabric filter air pollution control system, including flue gas reheat, was incorporated into the RKS. This report summarizes all efforts completed or onging at the IRF during FY93.

The anticonvulsant valproic acid (VPA), or 2-propylpentanoic acid, is a short-chain aliphatic acid that is teratogenic in humans and rodents. VPA and 14 related chemicals were screened for developmental toxicity using the Chernoff/Kavlock assay. Sprague-Dawley rats were gavaged with the test agent in corn oil once daily organogensis. The dams were allowed to deliver and the pups were examined postnatally. Segment II studies were also conducted using VPA and pentanoic acid in rats, and with VPA in CD-1 mice. For both species, VPA caused transient maternal ataxia and developmental defects of the digits and, especially, the axial skeleton. Exencephaly, however, was seen only in mice. All congeners tested induced maternal respiratory effects and six compounds caused motor depression. These data indicate a broader specificity for activity in the maternal system than in the embryo and suggest differing mechanisms for the two effects.

Theoretical Investigation into the Potential of Halogenated Methanes to Undergo Reductive Metabolism. Journal article.

The density-functional theory (DFT) based computational chemistry software package DMol was used to provide insight into the reductive potentials of a series of halomethanes. It is known that certain members of this series are readily reduced in vivo via catalysis by cytochrome P450. DMol was used to calculate the electron affinities of these molecules to be used as measures of their reduction potentials. Our results are consistent with experimental electrochemical reduction potentials and indicate that electron affinity is dependent upon the number and type of halogens present in the molecule. Concurrent with this study was the discovery of a linear empirical relationship between electron affinity and the lowest unoccupied molecular orbital (LUMO) energy. It is possible that these values could be used as indicators of reductive potentials and ultimately of metabolic rates for use in PB-PK models designed to predict the dose associated with the toxicity of molecules of this and other classes.

Prepared in cooperation with International Commission for Protection against Environmental Mutagens and Carcinogens, Rijswijk (Netherlands).

The highly structurally diverse nature of current carcinogenicity and mutagenicity data bases has motivated development of more general structure-activity relationships (SAR) approaches, potentially applicable to the treatment of diverse, non-congeneric mutagenicity and carcinogenicity data bases. Three specific approaches are considered in some detail--Ashby's structural alerts model, classified as a 'rule-based' SAR approach, and the computerized CASE fragment-based method and TOPKAT linear discriminant equation method, both classified as 'correlative' SAR approaches. Relative strengths and limitations, and a number of common features and important distinctions between these 3 methods are discussed. Finally, problems in comparing the relative predictive capabilities of different SAR approaches are discussed, and strategies for SAR investigation involving integration of existing techniques are suggested.

Mathematical Model for Aerosol Deposition in the Respiratory Tract of the Guinea Pig. Journal article.

Laboratory animals are used as surrogates in inhalation exposure studies for (1) risk assessments of air pollutants and (2) evaluations of pharmacologic drugs. Herein, a mathematical model is presented that identifies factors affecting the regional distributions of inhaled aerosols within the complete respiratory system of the guinea pig. The model couples empirical and deterministic techniques. An original empirical formula is presented to describe particle losses in airways of the head and throat. Regarding the lung, its structure is defined using the asymmetric morphology of Schreider and Hutchens (1980), and deposition is calculated in a deterministic manner using the protocol of Martonen et al. (1992a, 1992b). Results of our deposition model are compared separately with the theory of Schreider and Hutchens (1979) and the experimental data of Raabe et al. (1988). Results of the deposition model presented herein are in qualitative agreement with the laboratory data of Raabe et al. (1988). Quantitative differences in desposition values may be attributable to different strains of guinea pig being used in the repective morphological and deposition studies. By identifying the factors that most affect the behavior of inhaled particles, our deposition model can aid in the design of inhalation exposure experiments and interpretation of data.

The role of altered biosynthesis was investigated in the mouse gonadotrope cell line, by studying the homologous up-regulation of GnRH receptor binding, mRNA levels, and mRNA activity. After GnRH exposure, ligand binding was performed on cell membranes. To correlate changes in receptor number and measurements of biosynthetic activity, GnRH receptor mRNA levels were quantitated by solution hybridization/RNase protection assay and Northern blot analysis, and the capacity of RNA from treated cells to direct the synthesis of new receptors (mRNA activity) was evaluated using a Xenopus oocyte-based bioassay. The authors' results show that although the levels of GnRH receptor mRNA do not vary, treated cells with increased binding capacity show a corresponding increase in cellular GnRH receptor mRNA activity in oocytes.

Effects of Methanol on Embryonic Mouse Palate in Serum-Free Organ Culture. Journal article.

The present study examines the developmental toxicity of methanol in the palate using a serum-free organ culture model. Gestation day 12 CD-1 mouse embryos were dissected and mid-craniofacial tissues were cultured in BGJ medium at 37 C for 4 days with medium changes at 24 hr intervals. Cultures were exposed to methanol from 0-20 mg/ml for 6 hr, 12 hr, 1 or 4 days. Some cultures were exposed to ethanol for 4 days at doses ranging from 0-15 mg/ml. All cultures were gassed with a 50% O2, 5% CO2, and 45% N2 upon addition of fresh medium and prior to the addition of alcohol. In general the ethanol was more potent than methanol for inhibition of protein and DNA synthesis and palatal fusion. The study demonstrated that methanol can selectively affect specific sensitive cell populations and has effects on proliferation and cell fate.

Thermoregulatory Effects of Chlorpyrifos in the Rat: Long-Term Changes in Cholinergic and Noradrenergic Sensitivity. Journal article.

C. J. Gordon. 15 Jul 93, 12p EPA/600/J-94/322
Pub. in Neurotoxicology and Teratology, v16 n1 p1-9 Jan 94.

Subcutaneous injection of a sublethal dose of chlorpyrifos (CHLP), an organophosphate (OP) pesticide, causes long-term inhibition in cholinesterase activity (ChE) of brain, blood, and other tissues. Such prolonged inhibition in ChE should lead to marked behavioral and autonomic thermoregulatory patterns, especially in terms of altered noradrenergic and cholinergic sensitivity. To evaluate the behavioral and autonomic effects of long-term ChE inhibition, Long-Evans rats were implanted with radiotelemetry transmitters that continuously monitored core temperature (Tc), heart rate (HR), and motor activity (MA). These parameters were monitored for 7 days following a single injection of peanut oil (vehicle control) or 280 mg/kg CHLP. CHLP led to a significant reduction in Tc during the first night after treatment but had no other effects on Tc. CHLP also resulted in a significant elevation in HR which lasted for about 72 h. Motor activity was unaffected by CHLP. Cholinergic and noradrenergic drug sensitivity was assessed between 7 and 25 days after CHLP. CHLP-treated rats were more sensitive to norepinephrine as based on a greater hyperthermic response. MA of CHLP-treated rats was more sensitive to scopolamine. On the other hand, the hypothermic effects of oxotremorine (0.4 mg/kg) were nearly abolished by CHLP treatment, indicating tolerance to cholinergic stimulation. The tachycardic effects of methylscopolamine were also greater in the CHLP group. Overall, the acute effects of CHLP are unusual compared to other OPs in that there is no hypothermic response, an attenuated nocturnal elevation in Tc and a prolonged elevation in HR. The CHLP treated rat exhibits a prolonged elevation in HR, hypersensitivity to noradrenergic stimulation and cholinergic antagonism but hyposensitivity to central cholinergic stimulation. Long-Evans rat pumps were injected i.p. on postnatal day 5 (PND5) or 12 with 0, 3, or 5 mg/kg triethyltin sulfate (TET) and then tested on T-maze delayed alternation on PND21 or 28. Delayed alternation learning was impaired on PND21 and 28 in pups given 5 mg/kg TET. Pups given 5 mg/kg TET on PND5 were more impaired on delayed alternation than pups given 5 mg/kg TET on PND12. Pups given 3 mg/kg TET on PND5 or 12 were unimpaired at either age of testing. On the day following training, pups were sacrificed for histological assessment employing Nissl- or immunohistochemical staining for glial fibrillary acidic protein (GFAP), a putative marker of gliosis. Pups given 5 mg/kg TET on PND5 showed increases in GFAP immunoreactivity (IR) in subiculum, amygdala, hippocampus, piriform cortex, and entorhinal cortex with concomitant decreases in Nissl-stained cells in these regions. Pups given 5 mg/kg TET on PND12 showed increases in GFAP IR in piriform cortex amygdala and dorsal hippocampus with concomitant decreases in Nissl-stained cells in these regions. Exposure to 3 mg/kg TET on PND5 and PND12 produced a mild increase in GFAP IR in piriform cortex and amygdala but no discernible loss of Nissl-staining in these respective regions. TET-induced behavioral deficits appear related to damage of structural correlates of the human temporal lobe and not piriform cortical pathology. These results demonstrate that the day of exposure greatly influences the mangitude of the cognitive deficits and neuropathology associated with exposure to TET.

In the study, the effect that 2,3,7,8-Tetrachlorodibenzo-p-dioxin (TCDD) has on the antibody plaque-forming cell (PFC) response to sheep red blood cells (SRBC) in adult female B6C3F1 mice and F344 rats was compared. The effect that TCDD has on the PFC response of male F344 and female Long-Evans rats was also determined. Mice or rats were given a single intraperitoneal injection of TCDD at doses ranging from 0.1 to 30 micrograms/kg, 7 days prior to intravenous immunization with SRBC. Four days later the PFC response to SRBC was determined. Results demonstrate species differences in the effect of TCDD on the PFC response to SRBC which were unrelated to hepatic CYP1A1 or CYP1A2 induction, time to peak response, gender, and strain. The failure of TCDD to suppress and in fact to enhance the PFC response to SRBC in rats appears to be related to alterations in splenic CD4(-)CD8(+) lymphocytes.

Physiologically-Based Pharmacokinetic Modeling. Journal article.

Physiologically-based pharmacokinetic (PB-PK) models attempt to provide both a realistic anatomic description of the animal to which a drug or toxic chemical has been administered and a biologically accurate representation of the physiological pathways for chemical storage, metabolism, and elimination in the animal. Because these models explicitly incorporate information about the biological factors which affect chemical disposition, they are particularly useful for high- to low-dose and interspecies extrapolation of pharmacokinetics. The complexity of any particular PB-PK model depends on the chemical studied and the objectives underlying model development. The primary focus of the brief overview is the structure of PB-PK models developed for three specific classes of chemicals: volatile organic compounds (VOCs), dioxin-like chlorinated aromatic hydrocarbons, and retinoids. In addition, the risk assessment objectives underpinning model development and the continuing data needs in refining and extending these models are briefly discussed. Colchicine and ibotenic acid were compared for their ability to produce neurodegeneration and cognitive deficit after bilateral infusions into the nucleus basalis magnocellularis of male Long-Evans rats. Four weeks post-lesion, there was no difference in locomotor activity following infusion of either neurotoxicant or vehicle. In a passive avoidance task, both treated groups had significantly shorter step-through latencies compared with vehicle. Five weeks post-lesion, rats were killed for neurochemistry or histochemistry. Choline acetyltransferase (ChAT) activity in both the frontal and parietal cortex was significantly decreased (25-35%) in the colchicine- and ibotenic acid-infused rats when compared to control. There was no effect of either neurotoxicant on ChAT activity in the hippocampus or striatum. Both neurotoxicants produced damage in the general area of the ventromedial pallidum, although ibotenic acid infusion consistently produced a large area of damage as assessed in Nissl-stained sections. Analysis of the number of ChAT-immunoreactive cells in the nucleus basalis magnocellularis (NBM) showed an average 60% cell loss following colchicine infusion and a 75% cell loss after ibotenic acid infusion. Area of glutamic acid decarboxy-

lase (GAD) staining was significantly decreased in several regions surrounding the NBM for ibotenic acid (51% average decrease), and showed non-significant decreases (28%) following colchicine infusion. Colchicine infusion decreased dopamine and 3,4-dihydroxyphenylacetic acid (DOPAC) in the striatum; ibotenic acid had no effect on brain catechol or indoleamine levels. The results indicate that although similar cholinergic hypofunction and behavioral deficits were achieved, several non-cholinergic differences between the neurotoxicants were detected. The present studies were designed to characterize the chemical disposition of a tetrabrominated dibenzofuran. The isomer-specific pattern of 1,2,7,8-tetrabromodibenzofuran (TBDF) was chemically characterized using high-pressure liquid chromatography, gas chromatography/mass spectrometry, infrared absorption, and proton nuclear magnetic resonance techniques. The absorption, distribution, and elimination of 1,2,7,8-(4,6-(3)H)-TBDF were examined in the rat following a single oral, dermal, or intravenous dose of 1 nmol/kg. The decline in hepatic concentrations observed in the iv and bile studies occurred in conjunction with metabolic elimination as well as a slight accumulation in adipose tissue. Dermal absorption of 1,2,7,8-TBDF, quantified as the amount contained in tissues (excluding the skin site) and excreta at 72h, was estimated to be 29% of the administered dose. Thus, the general disposition profile of 1,2,7,8-TBDF in the rat is similar to that of other polyhalogenated aromatic hydrocarbons. Due to its rapid elimination, which is consistent with its predicted susceptibility to metabolic elimination, acute exposure to 1,2,7,8-TBDF would not be expected to result in the degree of toxicity associated with other more persistent congeners.

Mice were exposed by inhalation to trichloroethylene (TCE) or by i.p. injection to the TCE metabolite, chloral hydrate (CH). Early spermatids were analyzed for micronucleus (MN) frequency and the presence or absence of kinetochore(s) using fluorochrome-labeled anti-kinetochore antibodies. It was determined that 5 consecutive days of exposure to 5, 50 or 500 ppm TCE during preleptotene through early pachytene stages of meiotic cell development do not result in increased frequencies of spermatid MN. CH at 41, 83 or 165 mg/kg was positive for spermatid MN induction when treatments corresponded to spermatogonial stem cell or preleptotene spermatocyte stages of development; negative results were obtained after treatments of leptotene-zygotene or diakinesis-metaphase stages. The significantly increased levels of MN observed were invariably of the kinetochore-negative type. (Copyright (c) 1994 Elsevier Science B.V.)

A Total Human Exposure Model (THEM) has been developed that calculates 24-hour exposure profiles using real human activity patterns and indoor air models derived from actual measurements of pollutants. THEM was designed for implementation on personal computers. These data include diaries of over 1700 adults and children that contain coded information on locations and activities. The diary codes correspond to locations in factories, offices, restaurants and homes (room specific) and activities such as cooking, cleaning and being in the presence of a smoker. THEM determines RSP exposure by taking the location and activity information from the CAP data and assigning RSP levels for (1) Environmental Tobacco Smoke (ETS), (2) cooking, (3) cleaning, and (4) ambient levels (from motor vehicles and wood smoke). Actual RSP levels are obtained from real microenvironmental measurements conducted recently in over 300 locations. For ambient data, actual hourly diurnal particulate measurements are obtained from a continuous monitoring instrument. THEM computes RSP exposures from ETS using validated models based on the mass balance equation. Source strengths, smoking rates, room air exchange rates and room volumes are incorporated into the model by randomly sampling from actual distributions of data.

Combustion of organic motor vehicle fuels produces carbon dioxide and water (H20) vapor (and also products of incomplete combustion, e.g. hydrocarbons and carbon monoxide, at lower concentrations). The Constant Volume Sampling (CVS) system, commonly used to condition auto exhaust for sampling and analysis, provides for controlled ambient air dilution of the engine exhaust. Water condensation can be a problem during CVS system sample conditioning, depending upon vehicle fuel composition and fuel economy, and diluent air humidity and exhaust/diluent ratio. The paper describes a 'spreadsheet' procedure for detailed, second by second, determination of diluted exhaust dew point and the necessary CVS system flow rates to avoid H20 vapor condensation. A wind-tunnel study has been conducted to examine the effects of several parameters on the downwash of effluents released from stacks in the vicinity of rectangular-shaped buildings. The situations modeled included idealized or generic steam-boiler and combustion-turbine electric-generating plants. Systematically varied were parameters such as the stack height, location of stack, wind direction, effluent-speed to wind-speed ratio, and effluent buoyancy. Measurements included over 300 concentration profiles. Vertical profiles were measured at a fixed distance downwind, both in the presence and in the absence of the buildings, to ascertain the building effects. In several of the more interesting cases, more extensive measurements were made to more fully describe the entire concentration field. The data set should prove especially useful to the mathematicians attempting to develop models to predict concentration fields when a plume is downwashed in the presence of a structure. The U.S. Environmental Protection Agency's Atmospheric Research and Exposure Assessment Laboratory is leading a major effort to advance urban/regional multi-pollutant air quality modeling through development of a third-generation modeling system, Models-3. The Models-3 system is being developed within a high-performance computing technology framework to take advantage of developments in science and the computer and communication fields. In the paper, the authors discuss several issues with Models-3 prototype examples. One area of important work is assessing the trade-off between speed and accuracy, either through development of new algorithms or optimizing existing ones to the computer architecture. The authors pro-

vide examples of such work on characterization of numerical algorithms. A second issue is how best to optimize codes for high performance architectures. Finally, the authors compare sensitivity estimation methods such as an automatic differentiation of the air quality model and a simple brute-force sensitivity analysis.

A study was conducted to examine interferences and other measurement anomalies in chemiluminescence and ultraviolet ozone monitors. Previous results had shown that there was a positive deviation in the chemiluminescence monitors and no direct interference with ultraviolet monitors due to the presence of water at non-condensing concentrations. The present study continues this effort, examining both potential positive and negative effects of moisture and other interferences on these monitors. Aromatic compounds and their oxidation products could potentially show a positive interference with ultraviolet monitors, and test measurements were made with aromatics such as toluene, benzaldehyde, and nitrotoluene to determine their possible retention in the ozone scrubber and their absorption in the cell as a function of the humidity. A detailed examination of the scrubbers used in ultraviolet ozone monitors has also been undertaken. Ozone scrubbers that have shown anomalous behavior in the field have been studied in various reduced-efficacy modes under controlled laboratory conditions. Longer term tests of unused scrubbers for possible ozone breakthrough under exposure to various simulated field conditions were initiated.

The National Human Activity Pattern Survey (NHAPS) was initiated to fill a need for updated activity information on a nationwide scale. The NHAPS, which begain in September, 1992, is a two-year probability-based national telephone interview survey of approximately 10,000 persons that is being conducted by the University of Maryland Survey Research Center assisted by the USEPA to ascertain the time, location, and other characteristics of those activities which are most relevant to estimating pollutant exposure. The survey design, location and activity codes, data examples, and appropriate analyses are described for the NHAPS data base. Time-diary data from this survey will provide standardized activity reports which, when available in early 1995, will be used to refine current human exposure models. Activity diary data have been effectively used in the following types of analyses: descriptive, relational, temporal, and exposure modeling. Examples of these analyses will be discussed and illustrated with data from previous activity surveys, including the recently available California survey. The applicability of these previous analyses to the new NHAPS data will be emphasized.

Personal, microenvironmental and indoor ozone monitoring is currently conducted using a lightweight, inexpensive passive sampling device. Although the passive device is adequate for many studies, the authors are developing a relatively light weight active hollow tube diffusion denuder system which increases the sensivity of ozone measurements and reduces effects associated with variations in wind velocity, for improved personal monitoring. The new hollow tube denuder (HTD) system consists of a 1.4(ID) x 10(L) cm etched borosilicate glass tube attached to a small, low-flow, and relatively inexpensive personal pump. Tube diameter and length were chosen to maximize collection efficiency at a sampling rate of 65 mL/min. The tube is coated with a nitrite reagent which has been successfully used with passive ozone samplers.

The Environmental Protection Agency, in developing and evaluating sampling and analysis methodology for stationary sources, has collected information on availability and applicability of sampling and analytical methods. All of this information is compiled in three reference documents: Stationary Source Sampling and Analysis Directory, Version 2 (SSSADIR), Handbook of GC/MS Data and Information for Selected Clean Air Act Amendments Compounds (Handbook) (PB94-155884), and Literature Review of CAAA Compounds (LitRev). The SSSADIR has information on which sampling and analytical methods to use for organic compounds listed in Title III of the Clean Air Act Amendments (CAAA) of 1990, as well as Appendices VIII and IX of RCRA compounds, and the status of method evaluation for these analytes. The Handbook provides information on the mass spectra of selected CAAA analytes, primary quantitation ions, relative retention times and compatibility of the organic compounds in solution. The LitRev provides information on CAAA compounds for which EPA has no potential methods available but provides suggestions on ways to develop methods.

Better characterization and control of emissions from stationary sources of compounds under the Clean Air Act Amendments of 1990, Title III could be met by a continuous or semi-continuous measurement of total gaseous nonmethane organic carbon (TGNMOC). A search was initiated to identify detection systems for TGNMOC that are both simple to use and accurate. The measurement of oxygenated organic compounds was of particular interest since they are in many emission sources. Several detector systems, marketed as appropriate for TGNMOC measurement, were identified and evaluated in the laboratory. None of the detection systems evaluated would uniformly measure organic carbon in all types of organic mixtures. While some success was realized for many classes of organic compounds, oxygenated compounds could not be measured in a mixture of other organic compounds.

A field test waste performed to evaluate a possible replacement sorbent for sampling volatile organic compounds in stationary sources using SW-846 Method 0030. On the basis of laboratory results, Anasorb 747 was selected for testing in the field dynamic spiking procedures. The modification of the VOST method uses a single tube containing Anasorb 747 that is preceded by two tubes containing Tenax. The modified VOST method was compared in the field with the VOST method using traditional absorbents. Both the VOST and modified VOST used a quadruple probe and four similar sampling trains. Known amounts of the analytes were introduced into the sampling trains, using the same certified compressed gas cylinder as a source of test compounds. As a general observation, the recovery and precision of most compounds is improved by using the modified VOST procedures.

A field evaluation study for SW-846 Method 0010 was conducted at a stationary source emission site with a high moisture content. The sampling train media had been prepared according to Method 0010 protocol, so the laboratory procedures were examined in detail for sources of error. The low recoveries were attributed to the presence of the methanol in the final extract. (The methanol is removed from the probe rinses during the laboratory sample preparation process). A proposed method will be presented that permits the physical removal of wet XAD-2 from the sampling trap without the use of methanol and an alternate procedure is provided for removal of methanol from the trap rinse before sample extract concentration.

A detailed characterization of the underlying and adjacent soils of a chromeplating shop was performed to provide information on the extent of soil and aquifer contamination at the site on the potential for off-site migration and environmental impact. Intact, moist cores were obtained from more than 40 different locations, resulting in more than 200 discrete samples for total metal analysis, selective extraction tests, and adsorption-reduction experiments, to assess the chemical speciation and distribution of chromium on the contaminated soils and its leaching potential. Surface analytical techniques were also used to determine chemical speciation and to further elucidate mineral fractions responsible for retention of the chromium on the soils and sediments. Adsorption and reduction capacities of the saturated aquifer sediments were variable and low, while the unsaturated soils' reduction capacities were much greater and were correlated with depth (decreasing capacity with increasing depth). The soils' adsorption and reduction capacities were eventually overwhelmed, however, and permitted the passage of Cr(VI) into the underlying ground water. (Copyright (c) 1994 AEHS).

The impact of molecular oxygen on the adsorptive capacity of activated carbon for volatile organic compounds (VOCs) was evaluated in the study. Investigations involved VOC solutions in Milli-Q water supplemented with background organic matter (BOM). It was determined that adsorption isotherms for chloroform, chlorobenzene, and dibromo-chloropropane (DBCP) conducted in autoclaved Milli-Q water showed no difference in their adsorption behavior when oxygen was present (oxic condition) or absent (anoxic condition) from the test environment. The presence of BOM reduced the adsoptive capacity of carbon for these compounds. The adsorptive capacity of carbon for the target VOC was further reduced under oxic conditions. The IAST was found to accurately describe anoxic adsorption isotherms for VOCs in BOM. This approach failed to predict this competition for data collected under oxic conditions.

Soil microbial processes are an integral part of soil quality. Soil organisms contribute to the maintenance of soil quality in that they control the decomposition of plant and animal materials, biogeochemical cycling of elements such as C, N, P, S, etc.; the formation of soil structure; and the fate of organics applied to soil. A variety of methods are available to assess the microbial status of a soil. There is still a need, however, for a better understanding of biological soil processes and community structure. Moreover, few attempts have been made to define what should be included in a data set of microbial indicators of soil quality. As a consequence, lacking is a complete data set on the microbial portion of soil quality. The challenge ahead is to define the proper data set so that informed management and regulatory decisions can be made. The indicators the authors choose need to respond to perturbations, accurately assess the functioning of the system, indicate temporal or spatial differences, and be cost effective and relatively rapid. One method will not be adequate for all situations. Each assay is an indicator of some portion of soil biology and needs to be selected with considerations of the purpose of the assessment. The task is to identify the minimal number of biological parameters that consider processes as well as the community diversity for the successful estimation of the role of the biotic component in determining soil quality. These methods also will need to be considered in concert with soil physical and chemical measurements. Soil microorganisms are potentially one of the most sensitive markers available to classify and assess soil quality.

The U.S. Environmental Protection Agency (EPA), in cooperation with the Toronto Harbour Commissioners (THC), conducted a Superfund Innovative Technology Evaluation (SITE) demonstration of the THC Soil Recycle Treatment Train. The treatment train consists of three technologies operated in sequence: a soil wash process, a metals removal process, and a biological treatment process. The THC conducted an extensive demonstration of the treatment train at a 55 tons per day pilot plant in order to evaluate an approach for remediation of industrial/commercial sites that are situated in the Toronto Port Industrial District (PID). Three soils were processed during the THC demonstration. The EPA SITE demonstration project examined, in detail, soil processing from one of the sites being evaluated as part of the overall THC project. Contaminants included organic compounds and heavy metals. It has been estimated by THC that as much as 2,200,000 tons of soil from locations within the PID may require some form of treatment due to heavy metal and/or organic contamination that resulted from various industrial processing operations. The objective of the SITE demonstration was to evaluate the technical effectiveness of the process in relation to THC's target criteria. (Copyright (c) 1994 - Air and Waste Management Association).

A simulation program, CYCLE11, which is useful for the preliminary evaluation of the performance of refrigerants and refrigerant mixtures in the vapor compression cycle is described. The program simulates a theoretical vapor-compression cycle and departures from the theoretical cycle as occur in a heat pump and in a refrigerator. The cycles are prescribed in terms of the temperatures of the external heat transfer fluids with the heat exchangers generalized by their average effective temperature differences. The isenthalpic expansion process is assumed. The program includes a rudimentary model of a compressor and a representation of the suction line and liquid line heat exchange. Refrigerant thermodynamic properties are calculated using the Carnahan-Starling-DeSantes equation-of-state. Refrigerant transport properties are not included in the simulations. The program can generate merit ratings of refrigerants for which limited measurement data are available. An example of simulation results stresses the need for careful application of simplified models and consideration for the involved assumptions.

The Green Bay Metropolitan Sewerage District retrofitted two quadrants of their activated sludge aeration system with ceramic and membrane fine pore diffusers to provide savings in energy usage compared to the sparged turbine aerators originally installed. Because significant diffuser fouling was expected, the two diffuser types were closely monitored over an 18-month period. The oxygen transfer efficiencies of the full-scale systems were measured using off-gas techniques. The effects of diffuser fouling and the effectiveness of cleaning procedures were evaluated in the laboratory using dynamic wet pressure and steady-state clean water oxygen transfer tests. Although fouling was significant on both types of diffusers, cost-effective cleaning procedures were developed. The ceramic disc diffuser provided better long-term performance than the membrane tube diffusers, which irreversibly lost oxygen transfer efficiency with time in use. Collectively, the fine pore diffuser systems provided a 30% savings in electrical power usage compared to the original sparged turbine aerators.

Ceramic plate diffusers were among the earliest forms of fine pore diffusers used for oxygen transfer in activated sludge treatment. They have been successfully used for over 60 years in the Jones Island West Plant of the Milwaukee Metropolitan Sewerage District and, since initial start-up, in the Jones Island East Plant and the South Shore Plant. Surveys of performance of these diffusers in all three plants were included in the EPA/ASCE Fine Pore Aeration Project. This report presents the results of off-gas sampling surveys carried out at the original Jones Island West Plant and in the newly rehabilitated East Plant. The West Plant basins were scheduled for rehabilitation in 1989-90.

This report describes five fine pore diffuser evaluations conducted at three different wastewater treatment plants located in the greater Los Angeles area. The overall goal of the study was to evaluate the performance of fine pore diffusers using selected cleaning methods for extended periods of time at selected treatment plants. The major part of this study was conducted at the Whittier Narrows Water Reclamation Plant, which is operated by the Los Angeles County Sanitation Districts. This study evaluated fine pore ceramic disk and dome aeration systems using Hcl acid gas cleaning and a dome aeration systems without acid gas cleaning over a 25-month period. A second study, smaller in scope and effort, was conducted at the Valencia Water Reclamation Plant (also operated by the Districts). This study evaluated fine pore plastic disk diffusers over a 13-month period. A third study, also smaller in scope and effort than the Whittier Narrows study, was conducted at the Terminal Island Wastewater Treatment Plant, operated by the City of Los Angeles. In this study, the performance of two membrane tube diffusers was evaluated over a 12-month period. This report summarizes the performance of six different aeration systems. The principal indicator of performance was oxygen transfer efficiency, as measured through off-gas analysis. For the Whittier Narrows study, changes in diffuser characteristics are also reported.

Field studies at the Madison Metropolitan Sewerage District facilities were conducted over a 3-year period to obtain long-term data on the performance of fine pore aeration equipment in municipal wastewater. The studies were conducted on several basins in the East Plant containing ceramic domes installed in 1977 and two sets of first-pass basins in the West Plant with newly installed ceramic discs. The performance of the domes was excellent even after 10 years of service. The conclusion was based on measured oxygen transfer efficiencies by off-gas analysis, alpha calculations, and diffuser characterization. Reasons for excellent performance included routine maintenance of the diffusers and the use of high quality ceramic diffusers and hardware. There was evidence presented in the plant that operation at high SRTs (low F/M loadings), which produced complete nitrification, resulted in higher alpha Standard Oxygen Transfer Efficiency (alpha SOTE) values than operations at low SRTs. Studies on the impact of diffuser cleaning and hydraulic flow patterns on performance were also reported.

A study of the fine pore aeration system at the Monroe, Wisconsin wastewater treatment plant was conducted to monitor, over a 2-year period, the oxygen transfer efficiency (OTE) and fouling tendencies of four different effective pore size ceramic discs. The plant treats a mixture of municipal and industrial wastes. Major industrial contributions stem from breweries, dairies, and cheese plants that account for approximately half the organic load to the plant. The average plant flow during the study was 2.2. mgd, and the average influent BOD was 400 mg/L.

In April 1983, the Ridgewood, New Jersey Wastewater Treatment Plant underwent a retrofit from a coarse bubble to a fine pore aeration system. Also, process modification from contact stabilization to tapered aeration occurred. The report presents a case history of plant and aeration performance of each system from 1981 through 1986. Extensive aeration studies were conducted on the fine pore aeration system in 1985 and 1986 to highlight the changing oxygen transfer efficiency with time and evaluate cleaning frequency requirements to maintain the efficiency at a viable level. An economic evaluation including bid prices, maintenance costs, and payoff period based on power savings is included.

Ceramic plate diffusers were among the earliest forms of fine pore diffusers used for oxygen transfer in activated sludge treatment. They have been successfully used for over 60 years in the Jones Island West Plant of the Milwaukee Metropolitan Sewerage District and, since initial start-up, in the Jones Island East Plant and the South Shore Plant. Surveys of performance of these diffusers in all three plants were included in the EPA/ASCE Fine Pore Aeration Project. This report presents the results of 20 off-gas sampling surveys carried out at the South Shore Wastewater Treatment Plant.

Frankenmuth is a community of 4,000 people in central Michigan. About 25-30% of the flow and 50-70% of the BOD load to the wastewater treatment plant are contributed by a brewery. In January 1986, conversion from a stainless steel broad band coarse bubble diffuser system to fine pore aeration was completed in all of the six existing aeration tanks. The Frankenmuth retrofit was designed with in-situ wastewater oxygen transfer efficiencies (OTE) at average air flow and peak flow based on off-gas tests at other locations. These values were adjusted to account for the significant high strength industrial component of the influent wastewater. The design OTE at 2 scfm/diffuser was only two-thirds that used at 1 scfm/diffuser (alpha SOTEs of 16.9% and 11.0%, respectively). In spite of lower than expected OTEs, the Frankenmuth retrofit to fine pore diffusers was an economic success. The actual capital cost of installation was slightly more than estimated during the evaluation period, but the projected energy savings appeared to be slightly greater as well.

In the summer of 1984, the Glastonbury, Connecticut Water Pollution Control Plant underwent a retrofit from a spiral roll coarse buble to a spiral roll fine pore aeration system. Only diffuser replacement was performed in the aeration tanks. From November 1985 through September 1988, on-site studies were performed using off-gass analysis as part of the ASCE/EPA Fine Pore Aeration Project. This report presents the results of over 160 off-gas tests together with a case history of the retrofit to upgrade the aeration system. Historical information, retrofit evolution and implementation, aeration performance after the retrofit, and comparison of performance with pre-retrofit data are included in the report.

The purpose of the study was two-fold: first, to define the efficiency of various methods of cleaning fine pore diffusers and, second, to develop a methodology that could be used to evaluate the efficiency of the cleaning techniques. Dirty fine pore domes from the North Texas Municipal Water District were cleaned by a variety of techniques, and the improvement in oxygen transfer efficiency was measured. The domes were reinstalled in the aeration tanks and withdrawn at various time intervals thereafter. The deterioration in oxygen transfer efficiency was then noted. The cleaning techniques were repeated, and the improvement in transfer was recorded.

There has been increasing interest in fine pore aeration systems, along with concern about diffuser fouling and the subsequent loss of aeration efficiency. The objective of the study was to assess the relative fouling tendency of fine bubble diffusers at nine activated sludge treatment plants. A secondary objective was to relate fouling to mixed liquor and process parameters. A standardized diffuser test header containing four removable diffusers was installed at each of the participating plants. Diffusers were periodically removed and tested for oxygen transfer efficiency (OTE), bubble release vacuum (BRV), dynamic wet pressure (DWP), foulant accumulation, and increase in OTE after acid cleaning.

Historically, while alternative media materials have been employed over the years with varying degrees of success, the principal fine pore diffuser medium has been porous ceramic. In the early-to-mid 1970s, diffusers with plastic porous media were installed in secondary treatment plants in Europe, primarily in Finland and Sweden. In order to document operation and maintenance experience with porous plastic media diffusers, plants in Europe were visited to observe and report on their experiences. This report discusses these observations and reviews on-site, long-term operating and maintenance information. The conclusions, in general, were that plastic porous media diffusers were performing satisfactorily. The application and design of aeration basins with porous plastic media diffusers appeared to be similar to those for ceramic media diffusers.

Ceramic plate diffusers were among the earliest forms of fine pore diffusers used in activated sludge treatment. They have been successfully used for over 60 years in the Jones Island West Plant of the Milwaukee Metropolitan Sewerage District (MMSD) and since 1935 and 1974, respectively, in the MMSD Jones Island East and MMSD South Shore Plants. The Jones Island East Plant aeration basins were completely rehabilitated in 1982-1983, and the West Plant basins were scheduled for rehabilitation in 1989-1990. In both cases, alternative fine pore systems were evaluated and ceramic plate diffusers were again selected. Three separate case history reviews are presented: the Jones Island East Plant, the Jones Island West Plant, and the South Shore Plant. The Jones Island East Plant case history is divided into two separate reports: one covering the period of 1930-1981 and the other the period of 1982-1988. All of the historical reviews discuss the conceptual designs and selection process involved for each of the plants.

Microbiologically-based procedures were used to describe biofouling phenomena on fine pore aeration devices and to determine whether biofilm characteristics could be related to diffuser process performance parameters. Fine pore diffusers were obtained from five municipal wastewater treatment plants in Wisconsin, one in Michigan, and one in California. Biofilm thickness and carbohydrate content were measured as were the film's ability to retain air bubbles. Scanning electron microscopy (SEM) procedures were used to examine biofilm structure. Diffusers were also tested for standard oxygen transfer efficiency (SOTE), bubble release vacuum (BRV), and dynamic wet pressure (DWP). Subsequently, one of the plants in Wisconsin was revisited where the three most useful of the biofilm characterization techniques were deployed to determine any relationship between biofilm thickness and content and operational parameters such as SOTE. The effect of four different cleaning procedures on diffuser characteristics was also measured. A parallel laboratory-scale investigation simulated microbially induced fouling of small-scale diffusers and the effect of bleach and acid cleaning.

Like other Central European countries, Poland faces the twin challenges of improving environmental quality while also promoting economic development. The study examines the cost of achieving alternative emission standards and the savings in abatement cost that might be achieved with policies that rely on economic incentives rather than with rigid command and control measures. Treatment of Cyanide Heap Leaches and Tailings. Technical Report.
Environmental Protection Agency, Washington, DC. Office of Solid Waste.
Sep 94, 58p EPA/530/R-94/037

The purpose of this report is to provide information on cyanide treatment methods for heap leaches and tailings activities associated with cyanidation operations, including disposal units that receive wastes from such operations. The agency has collected this information for use in regulatory agencies and the mining industry to better understand treatment options; however, the agency has not evaluated the efficiency of the methods discussed. The report discusses cyanide detoxification or treatment in terms of chemistry, duration, removal efficiencies, and advantages and limitations. After a discussion of treatment techniques, the report describes typical closure and reclamation activities for heaps and tailings impoundments, identifying issues that are still outstanding. The report also describes Federal and state requirements that apply to cyanide operations. In addition, selected case studies, chosen to reflect a range of facility types, are presented.

Water is collected in a polyethylene or glass container and shipped to the laboratory. Known aliquots of the sample are filtered through a 0.1 to 0.22 micrometer pore mixed cellulose ester (MCE). A carbon extraction replica is prepared from a portion of the filter and is examined in the TEM at a magnification of 10,000 to 20,000X. Asbestos structures are identified by morphology, selected area electron diffraction (SAED) and energy dispersive x-ray analysis (EDXA). Structures are classified according to the counting rules specified in the Chatfield polycarbonate filter protocol (1). Only asbestos structures greater than 10 micrometers in length are counted.

The study of health effects induced by exposure to mixtures of pollutants is a complex task. The purpose of this paper is to identify areas of research in which the conduct of chamber studies may contribute to better understanding of the health effects of exposure to indoor air and other mixtures. The strengths and weaknesses of clinical studies in general are reviewed as well as examples from the literature of approaches which have been utilized. It is concluded that chamber studies play an important role alongside epidemiologic and animal toxicologic studies in such research. The chamber studies are powerful in assessing acute, reversible effects from short duration exposures in the species of interest.

A quantitative theory was developed to predict coupled mass and energy transport phenomena during breathing of hygroscopic aerosol-laden air, and was applied to simulate exhalation (as well as inhalation) under different boundary conditions (BCs). It is shown that wall temperature may influence particle/vapor interaction, but the impact appears to be stronger at low particle concentration. At the same time, aerosol-induced (on the particle surface) vapor evaporation and condensation at high particle concentrations will influence strongly the air temperature and relative humidity patterns within the respiratory system.

The relationship between delivered ozone dose and variability of pulmonary function response to ozone was investigated in 20 young, healthy non-smoking male volunteers. The subjects were exposed to 0.4 ppm ozone for one hour during which they walked on a treadmill at a speed and inclination sufficient to induce a minute ventilation (V sub E) of 20 L/min/sq m body surface area. Prior to, and immediately following exposure, spirometric and plethysmographic measurements of lung function were made. In addition, five minutes after the beginning of exposure and five minutes before the end of exposure the uptake efficiency of ozone in the upper and lower respiratory tract, spontaneous tidal volume (V sub t), and breathing frequency (f) were measured.

The concept of activity profile listings and plots, already applied successfully to the display of mutagenicity data, has been modified for application to antimutagenicity data. The activity profiles are bar graphs that have been organized in two general ways: for antimutagens that have been tested in combination with a given mutagen and for mutagens that have been tested in combination with a given antimutagen. The report examines synthetic as well as natural antimutagens and compares their activity against known mutagens. It is not clear at the present time whether the inhibition of carcinogen-induced mutation is a good indicator of anticarcinogenic properties, and further research is needed. Nevertheless, the activity profiles are useful for the assessment of the available antimutagenesis data by providing rapid visualization of dose information and experimental results.

Comparative molecular field analysis was performed on polyhalogenated dibenzo-p-dioxins, dibenzofurans, and biphenyls for Arly hydrocarbon (Ah) receptor binding and enzyme inducing activities determined by others using in vitro assays. Since various members of all three classes of compounds have been shown to produce qualitatively similar toxicities, a separate Comparative Molecular Field Analysis (CoMFA) was performed on each class of compounds and on combinations of the different classes for each bioactivity. For the Ah receptor binding, the CoMFA-derived Quantitative Structure-Activity Relationships (QSARs) for all three classes of compounds and combinations thereof showed strong cross-validated correlations indicating that they are highly predictive. For enzyme induction, the QSARs were highly predictive for the furans, partially successful for the dioxins, and clearly unpredictive for the biphenyls.

Deposition Patterns of Polydisperse Aerosols within Human Lungs. Journal article.

Pub. in Jnl. of Aerosol Medicine, v6 n4 p251-274 Oct 93. Prepared in cooperation with North Carolina Univ. at Chapel Hill. Div. of Pulmonary Diseases. and Trinity Univ., San Antonio, TX. Dept. of Engineering Science.

The efficacy of airborne pharmaceuticals in the treatment of lung diseases may be improved with the selective deposition of inhaled drugs. Herein, a validated mathematical model is used to examine the effects of aerosol polydispersity upon deposition in the human lung. Localized deposition patterns are calculated on an airway-by-airway basis. For log-normal particle size distributions, as produced by metered-dose inhalers (MDIs) and nebulizers, deposition efficiencies are shown to be sensitive functions of the mass median aerodynamic diameter (MMAD) and geometric standard deviation (GSD). The relevance of the count median diameter (CMD) of a log-normal distribution is also examined. The model provides a heretofore unavailable basis for interpreting and information obtained from gamma camera lung scans. The agreement between theory and experiment indicates that the behavior of inhaled particles is accurately modeled.

Journal article.

For many toxic inhalants, sensory irritation is the first detectable response. A standardization bioassay, ASTM E 981-84, that quantitates irritancy as a reduction in breathing rate of the mouse during inhalation exposure, has been developed. The validation of this screen for detecting irritation is based on the high rank-correlation between 0.03 x RD(50) and the TLVs-TWAs for numerous inhaled chemicals. The screen does not indicate the relative offensiveness of an odor, does not address all pulmonary hazards or non-irritating systemic hazards, and is not a replacement for chronic toxicity testing. Despite the limitations, prudent application of ASTM E 981-84 appears to provide a rapid, inexpensive means to identify indoor atmospheres of irritant potential.

Repeated exposures to high concentrations of ozone results first in augmentation and then attenuation of pulmonary response in humans. To determine the effects of repeated prolonged low concentration ozone exposure, we exposed 17 healthy, non-smoking males to 0.12 ppm ozone for 6.6 h on five consecutive days. Subjects were also exposed once to filtered air. Volunteers exercised at a ventilation of ~39 L/min for 50 min of each hour during the exposure. Spirometry, plethysmography, and symptom responses were obtained before and after each exposure. Nasal lavage and aerosol bolus dispersion were obtained before and after each exposure. Spirometry decreased and symptoms increased on the first day. Responses were less on the second day compared to the first, and were absent, compared to control, on the subsequent three days of ozone exposure.

Several interpretive reviews on the effects of arsenic have suggested there is a threshold dose, at which toxic or carcinogenic effects change disproportionately with relatively small changes in the dose of arsenic. A threshold (nonlinear) response may be related in part to the potential saturation of arsenic methylation, which could lead to increases in the reactive trivalent arsenicals. Therefore, the objective of the present study was to examine the effect of dose on the in vivo disposition of arsenate after oral administration in mice. A refined chromatographic method was used to examine excretion of metabolites over several time points, and the degree of linearity of the various dose-response relationships was assessed.

The fact sheet summarizes the information in the RED for hexadecadienol acetates, including the active ingredients (Z,E)-7,11-Hexadecadien-1-yl acetate and (Z,Z)-7,11-Hexadecadien-1-yl acetate, which are marketed under the trade name Gossyplure. Hexadecadienol acetates are sex-attractant pheromones of the pink bollworm, Pectinophora gossypiella, Saunders, registered only for use on growing cotton to disrupt the male-female mating behavior. They are used in small quantities--less than 100 pounds of the active ingredients are applied each year, and only about 1% of the California cotton crop is treated with these biochemical pesticides.

In 1988 the Division of Environmental Management (DEM) expanded its ambient water quality monitoring program in the Albemarle-Pamlico estuary area. This report summarizes water quality information for the Tar-Pamlico, Neuse, Roanoke, Chowan and Pasquotank River basins collected between October 1991 and July 1992. Elevated nutrient concentrations were found throughout the upper and mid-portions of the study area. The majority of algal blooms occurred in the upper estuary of the Neuse River below New Bern. In the Pasquotank River basin, dissolved oxygen stratification occurred at several Albemarle Sound sites and near Edenton. Algal blooms were present in November 1991 and February 1992 in the Albemarle and Currituck Sounds. The highest upper river conductivity and

salinity values occurred in conjunction with Union Camp's discharge at downstream monitoring stations.

Guide to Environmental and Economic Stewardship in the Albermarle-Pamlico Region. A Comprehensive Conservation and Management Plan Summary.
Albemarle-Pamlico Estuarine Study, Raleigh, NC.
1994, 41p

The Albemarle-Pamlico region includes the rivers, creeks and streams that flow into the sounds and marshes, as well as the fields, forests, cities and towns that surround them. The region supports an abundant array of plant and animal life, and provides us with a rich natural heritage. It also is generous in its economic opportunities: Farmers cultivate its soils, fishermen ply its waters, loggers harvest its forests and miners unearth its minerals. The area's natural beauty attracts tourism and resort development. The Albemarle-Pamlico region is one of diversity, not just in its natural environment but in the various groups of people who live and make their living there. Since 1987, a group of scientists, private citizens, and federal, state and local officials has been looking at how best to balance competing interests and protect the region's natural resources.

Multijurisdictional Pretreatment Programs. Guidance Manual.
Environmental Protection Agency, Washington, DC. Office of Water.
Jun 94, 35p EPA/833/B-94/005

The National Pretreatment Program was designed to be developed, implemented, and enforced primarily by the municipal entities that own or operate wastewater treatment facilities. As a general rule, the powers of a municipal entity are limited to its geographic boundaries, and additional authority will be needed to regulate industrial users located beyond these boundaries. The U.S. Environmental Protection Agency (EPA) refers to these types of situations as 'multijurisdictional', because industrial users are located within the boundaries of one or more jurisdictions other than the municipal entity that is charged with program implementation and enforcement responsibilities. The guidance document is intended to address these multijurisdictional program implementation and enforcement issues and offer some of the options that municipal entities may employ to satisfy federal and state program requirements. This guidance document does not provide specific legal advice on whether any one of the options is adequate to solve the problems presented by a particular situation. Each municipal entity must rely on advice of its legal counsel when evaluating the use of the options presented.

The document describes a methodology and associated computer model, SLDGFILL (sludge-only landfill), for assessing the risk to humans of pathogens in treated municipal sewage sludge landfills. The purpose of the model is to determine the probability of infection of a human receptor from pathogens in a sludge-only landfill, or monofill. The ultimate objective is to assist the U.S. Environmental Protection Agency (EPA) in its technical criteria development and regulatory activities, but the immediate uses include (1) using the model as a research and risk assessment tool to illustrate information gaps and research needs and (2) applying the methodology in performing actual pathogen risk assessments.

The purpose of the report is to serve as a guide for the measurement of fugitive dust. To that end, the methods of measuring fugitive particulate emissions are reviewed. The methods included are the quasi-stack method, the roof monitor method, the upwind-downwind method, the exposure profiling method, the portable wind tunnel method, the scale model wind tunnel method, the tracer method and the balloon method. Each measurement method is explained, along with its advantages and disadvantages. Sources of error are discussed, as are sampling protocols. The literature on each method is reviewed. A section of the report is devoted to the issues of error, accuracy and precision of the methods.

Keywords: *Air pollution sampling, *Particulates, Test methods, Exhaust emissions, Dust, Aerosols, Emission factors, Air pollution dispersion, Wind tunnel tests, Tracer methods, Balloons, Air samplers, Collection methods, Quality control, Errors, Precision, Accuracy, *Fugitive emissions, *PM-10, Quasi-stack method, Roof monitors.

Supersedes PB94-164340.

This report is divided into seven sections. Section I briefly describes the Chesapeake Bay Water Quality Model and introduces the scenarios analyzed. Section II describes the scenarios and associated nutrient sediment loads in detail. The third section provides background for the more detailed analysis of Bay water quality response that follows. Sections IV and V summarize aspects of Bay circulation and its influence on water quality. Section VI surveys the nutrient, phytoplankton, and sediment response to loading reductions. Section VI also examines the overall nutrient budget and the exchange among the tributaries and mainstem. Section VII concludes the report with a detailed examination of the mainstem dissolved oxygen response to the interactions among nutrient loads, transport, sediment processes, and phytoplankton processes examined in the previous sections. A summary of major findings is included in each section and an overview of these findings is provided in the Technical Summary.

Keywords: *Nutrients, *Water quality data, *Pollution control, *Chesapeake Bay, Surveys, Habitats, Sediment transport, Watersheds, Mathematical models, Nitrification, Dissolved oxygen, Phosphorus, Phytoplankton, Ocean environments, Chemical analysis, Algae, Biomass, Primary biological productivity, Graphs(Charts), Tables(Data), Organic loading, Tributaries, Total organic carbon.

In 1990, the U.S. Department of Agriculture (USDA) Forest Service (FS) and the U.S. Environmental Protection Agency (EPA) initiated a cooperative national program to monitor the condition of the nation's forests. This multi-agency effort, within EPA's Environmental Monitoring and Assessment Program (EMAP), is called the Forest Health Monitoring (FHM) program. In 1992, Detection Monitoring activities were conducted in twelve states: Alabama; Connecticut; Delaware; Georgia; Maine; Maryland; Massachusetts; New Hampshire; New Jersey; Rhode Island; Vermont; and Virginia. Data analysis results for the following indicators are presented; tree species and stand density (mensuration); tree crown condition; tree species diversity; and air pollution bioindicator plants. The cumulative distribution function methods used in the analysis provide a statistical summary of most measurements. Tabular summaries were also prepared in some cases.

The U.S. Environmental Protection Agency has undertaken the task of preparing a scientific reassessment of the health risks of exposure to 2,3,7,8-tetrachlorodibenzo-p-dioxin and chemically similar compounds collectively known as dioxin. Significant advances have occurred in the scientific understanding of mechanisms of dioxin toxicity, of the carcinogenic and other adverse health effects of dioxin in people, of the pathways to human exposure, and of the toxic effects of dioxin to the environment. The health assessment document consists of three volumes. Volume 1 describes the disposition and pharmacokinetics; mechanism(s) of action; acute, subchronic, and chronic toxicity; immunotoxicity; developmental and reproductive toxicity; and carcinogenicity of TCDD in animals.

Keywords: *Tetrachlorodibenzodioxin, *Health hazards, *Risk assessment, *Toxicity, Dioxins, Public health, Biological effects, Health effects, Exposure, Tolerances(Physiology), Dose-response relationships, Epidemiology, Pharmacokinetics, Immunology, Nervous system, Immune system, Reproduction(Physiology), Fetal development, Growth abnormalities, Carcinogenicity.

A research project was undertaken to study the effectiveness of soil vapor extraction (SVE), an emerging technology for remediation of soils contaminated with volatile organic compounds (VOCs). As part of the project, two soil vapor extraction systems, Site D and Site G at the Twin Cities Army Ammunition Plant, New Brighton, Minnesota were selected for evaluation. The approach of the project was to gather and compare site information regarding residual soil concentrations before and after treatment, and obtain operational data to evaluate the performance of the systems. The residual levels of volatile organics before and after treatment are compared for magnitude and distribution. Operational data are analyzed to present the performance of the systems and the progression of treatment with time. Capital, operating and maintenance costs are presented. Results of the evaluation indicate that SVE has been effective in reducing the residual concentrations, generally by several orders of magnitude. In most cases, residual concentrations were nondetectable. Samples taken in silty clays and waste materials showed the hightest residual concentrations.

A metal finishing process can create environmental problems because it uses chemicals that are not only toxic but also resistant to degradation or decomposition. A study was undertaken at a zinc electroplating operation to achieve zero discharge of wastewater and total recycle of recovered precipitates. The first step in this project was to change an existing zinc cyanide (CN) plating line to one that used an alkaline noncyanide (ANC) zinc bath. The project then investigated a closed-loop system to treat plating rinsewater from the ANC zinc plating line so the plating chemicals were recovered and the water purified. The goal was to return both the recovered zinc hydroxide and the clean water to the plating line for continued use. The replacement of this single CN line with an ANC line resulted in an annual savings to P&H Plating of $14,000 from the elimination of the need to pretreat the plating line rinsewater to oxidize cyanide. The addition of the recovery/recycle system increased the company's savings to $62,000/year. The reuse of 30% of the recovered zinc hydroxide and 70% of the treated rinsewater reduced annual water usage and wastewater discharge by 841,911 gallons and reduced the amount of sludge disposed annually by 14 cubic yards. The payback period for the recovery/recycle system is slightly less than 18 months.

The International Boundary and Water Commission, U.S. Section (USIBWC), has constructed the Land Outfall (LO), a 12,300 linear foot (3,749 m), 144-inch concrete pipeline in the Tijuana River valley. The purpose of the pipeline is to transport treated sewage from the USIBWC International Wastewater Treatment Plant (IWTP) to the Ocean Outfall (OO), both of which are yet to be constructed. Treated effluent will pass from the plant through the LO into the OO and into the Pacific Ocean. As with the IWTP, the OO has not been constructed. Construction is complete on the 144-inch LO pipeline. Archaeological monitoring of activities associated with construction of this pipeline are described in this report. The results of previous monitoring and some salvage excavations conducted by the U.S. Army Corps of Engineers, Los Angeles District (COE) are also described here. Finally, for completeness, results of archaeological testing along part of the reach are summarized herein.

Using TSCREEN, a particular release scenario is selected via input parameters, and TSCREEN automatically selects and executes the appropriate dispersion model to simulate that scenario. The model to be used and the worst case meteorological conditions are automatically selected based on criteria given in the workbook. The correct release scenario and associated characteristics of a toxic emissions release are selected with the help of on-screen text and graphics and data input is performed in a full-screen edit mode. TSCREEN saves the input data for each release scenario to a file that can be retrieved and later edited or executed. TSCREEN also provides a method of easily viewing and saving the modeling results for each modeled scenario.

The report provides information on the spray booth cleaning process and alternative cleaning practices that reduce or eliminate the use of organic cleaning solvents. It provides a ready reference to actions reported by eight automobile companies to reduce emissions from booth cleaning operations. It is carefully referenced to allow readers to take advantage of others' work. A summary of the cleaning practices currently being used by 15 automobile assembly plants is included, as is each plant's VOC emissions from spray booth cleaning. Additionally, a summary of the alternative cleaning practices identified for each major component of the booth is presented, and the non-VOC cleaning practices are identified. The Unit Operation System (UOS) material balance approach was used to calculate VOC emissions from cleaning spray booths.

International Symposium on the Ecological Effects of Arctic Airborne Contaminants. Held in Reykjavik, Iceland on October 4-8, 1993. Journal article.

D. H. Landers, and S. J. Christie. cOct 93, 525p EPA/600/J-94/343
Pub. in Science of the Total Environment (STOTEN) Special Edition, Fall 94. See also AD-A269 955. Prepared in cooperation with ManTech Environmental Technology International, Inc., Corvallis, OR.

These scientific papers were presented at the Symposium, which was convened in October 1993 in Reykjav EDk, Iceland. (1) It was desinged to be interdisciplinary, forcing scientists from varied academic backgrounds to participate in sessions focused on germane but unfamiliar disciplines and (2) a serious effort was made to involve practicing arctic scientists from the former Soviet Union, whose arctic holdings represents over 65% of the arctic landmass. Arctic airborne contaminants, represented by a broad suite of substances, are known to be transported great distances from their sites of origin, often crossing national and ecological boundaries, where they are deposited and potentially incorporated into ecological systems. The Arctic environment presents an ideal situation in which to study global change. This is true particularly with respect to airborne contaminants. Many regions of the Arctic are thousands of kilometers from significant emission sources, yet it is clear that ecosystems in many of these distant locations are exposed to airborne contaminants. The relatively simple food web structure and low biodiversity (especially with regard to inland systems) combine to offer an excellent investigative environment.

Prepared in cooperation with Resource Analytics Inc., Raleigh, NC. Sponsored by Environmental Protection Agency, Research Triangle Park, NC. National Estuary Program.

This document describes the existing federal, state and local management structure governing the Albemarle-Pamlico (A-P) estuarine region. It includes those organizations and programs that have the most direct bearing on management and stewardship of the natural resources in the A-P region. Many of these programs and agencies directly regulate environmentally sensitive areas and activities. Others influence environmental stewardship through resource-based economic development, planning or education.

Phytoplankton primary production and its environmental regulation were examined at 3 stations representative of the lower Neuse River Estuary near the Pamlico Sound interface. This study covered a 3-year period (November 1987-October 1990). The authors also examined the roles of the major phytoplankton nutrients nitrogen and phosphorus in controlling growth and bloom formation. The overall potential for nuisance blooms and associated episodes of bottom water hypoxia and anoxia was investigated in field studies. Algal biomass and production varied seasonally, with high values in summer and low values in winter. In situ nutrient addition bioassays indicated the estuary experienced a general state of N limitation with especially profound limitation during summer periods. The authors recommendations for a management strategy include reductions in Dissolved inorganic nitrogen (DIN), dissolved inorganic phosphorus (DIP), and suspended sediment loads in order to maintain the system in a nuisance bloom-free condition.

Potential for Long-Term Persistence of the Red Tide Dinoflagellate 'Ptychodiscus brevis' in North Carolina Coastal Waters. Final rept.

Sponsored by Albemarle-Pamlico Estuarine Study, Raleigh, NC. and North Carolina Dept. of Natural Resources and Community Development, Raleigh. Div. of Procurement.

In October of 1987, the toxic red tide dinoflagellate Ptychodiscus brevis which normally resides along the Florida coast was introduced into North Carolina waters via the intrusion of a Gulf Stream eddy. The transported population resulted in the closure of shellfish beds in North Carolina due to the presence of brevetoxin in the shellfish. A major field effort was undertaken in February 1988 to determine the extent of the organism distribution. Benthic samples were collected as well as water column samples and were incubated in the laboratory for a one month period to determine the presence of cysts. Incubation of the sediment samples yielded no motile population which suggests that Ptychodiscus did not form a resting stage in North Carolina waters. Without further study, however, one cannot rule out the possibility that Ptychodiscus formed a resting stage, but its obligate period of dormancy was not complete during the short one month incubation.

Comparison of ISC2 Dry Deposition Estimates Based on Current and Proposed Deposition Algorithms.
Environmental Protection Agency, Research Triangle Park, NC. Office of Air Quality Planning and Standards.
D. T. Bailey. Jul 94, 55p EPA/454/R-94/018

The ability to accurately estimate deposition of particulate matter is of special concern in assessing environmental impacts from a variety of sources including Superfund sites, municipal waste incinerators, and surface coal mines. The current deposition algorithm in ISC2 simulates deposition as the movement of particles toward the surface by the combined processes of atmospheric turbulence and gravitational settling. The method was developed for applications to large particles dominated by gravitational settling; these are typically particles greater than 20 micrometers diameter. The current algorithm was not intended for use with particles smaller than about 20 micrometers which are often of concern in air toxics assessments. In light of this limitation, a new deposition algorithm is being considered for use in ISC2. The proposed algorithm is intended to simulate processes important over the entire range of significant particle sizes (0.1 to 100 micrometers). The proposed algorithm employs a deposition velocity based on a resistance model. In this approach, deposition flux is calculated as the product of the near-surface air concentration and the deposition velocity. The latter is computed as the inverse sum of the aerodynamic layer and deposition layer resistances, plus gravitational settling. The new deposition algorithm has been tested within the framework of the ISC2 model and comparisons of deposition estimates using the old (current) and new deposition algorithms have been made for a range of source types and particulate emission scenarios. Similar comparisons have been made of particulate concentration estimates as affected by the old and new deposition algorithms.

Sponsored by Environmental Protection Agency, Annapolis, MD. Chesapeake Bay Program.

In response to findings from the reevaluation of the Chesapeake Bay Basinwide Toxics Reduction Strategy, the Chesapeake Executive Council directed the Bay Agreement signatories to revise the basinwide strategy through a process that incorporates broad public involvement in the Strategy's development, review and implementation. The Chesapeake Bay Program's Toxics Subcommittee sponsored a series of stakeholder rountables to solicit active public participation in the strategy development. Roundtables were held in Pennsylvania on June 8, in Maryland on June 8, and in the District of Columbia on June 14, 1994. Stakeholders representing businesses, agricultural community, public interest groups, and local, regional, state, and federal government agencies, were invited to participate, (Appendix A). Each roundtable was structured to inform targeted stakeholders in each jurisdiction on the most recent findings regarding the effects of chemical contaminants on the Chesapeake Bay system and the wide range of reduction and prevention management actions being directed towards chemical contaminants. This summary of the Pennsylvania, Maryland, and District of Columbia stakeholder roundtables reflects discussions and recommendations made during the roundtables as well as followup written responses annotated on the draft commitments worksheets or in letter format.

Exterior acrylic latex and alkyd architectural coatings were exposed to different conditions in a chamber exposure system involving simulated sunlight, dew, and photochemical smog-containing sulfur dioxide (SO2). A simulated sunlight exposure of the coating films in the presence of clean air was also incorporated into the experimental design. Changes in surface features after 1,370 hours of exposure were characterized by scanning electron microscope (SEM) and energy dispersive analysis of x-rays (EDAX). Gaseous species that deposited to the films were determined by ion chromatography of the dew collections. Color-change measurements of the exposed films were recorded as Delta E values. Latex and alkyd films that were formulated with calcium carbonate (CACO3) as an extender pigment were found to undergo the most change in surface features, composition, and color.

In a private residence using gasoline-contaminated ground water (approximately 300 micrograms/l benzene), a series of experiments were performed to assess the potential benzene exposures that may occur in the shower stall, bathroom, master bedroom, and living room as a result of a single 20-min shower. Integrated fixed site SUMMA(Trademark)-polished canister and Tenax GC(Patented) air samples were collected in the target microenvironments over 20, 60, and 240 min periods. Inhalation exposures in the shower stall during the 20-min shower were 2.1 - 4.9 times higher than corresponding 20-min bathroom exposures. The results indicate that domestic use of gasoline-contaminated water can produce relatively high benzene exposures that vary significantly according to an individual's proximity to the water use zone.

Several recent events in mobile sources emissions measurements have caused a major reassessment of the amounts of volatile organic compounds (VOC) and carbon monoxide (CO) in the ambient air attributed to mobile sources. These include the comparison of real-world in-use vehicle emissions with those predicted by mobile emission factor models and the development of cross-road remote sensors for measuring emissions from in-use passing vehicles. The real-world measurements were generally higher than model predictions. A tunnel study in the Southern California Air Quality Study (SCAQS) found two-fold to seven-fold differences. Additional real-world studies, including the remote sensor, roadside I/M inspections and testing on the U.S. Environmental Protection Agency portable dynamometer have shown that 50% of the tailpipe emissions come from only 10% of the vehicles and 80% come from 20% of the vehicles. This paper describes the portable dynamometer study and several tunnel studies.

A quantitative measurement method for fine particle bisulfate in ammonium bisulfate collected from the ambient air onto Teflon filters is described. Infrared absorbance measurements of the Teflon filters are made before and after particle collection. Subtraction of the two spectra reveals the absorbance spectrum of the particles. This method provides a specific, nondestructive, direct measurement of ammonium bisulfate. As such, the method has distinct advantages over indirect methods involving ion balance in solution.

The University of Denver in cooperation with the Desert Research Institute, U.S. EPA, and General Motors Corporation have successfully adapted the University of Denver's remote sensing system for vehicle exhaust to the measurement of vehicle emissions in a tunnel environment. Two studies conducted at the Fort McHenry Tunnel in Baltimore, MD and the Tuscarora Mountain Tunnel located west of Harrisburg, PA on the Pennsylvania Turnpike are described. The difficulties associated with remote sensing in a tunnel environment have led to a number of improvements in the remote sensing technology. Due to logistics and restrictions on placement of equipment in the Fort McHenry tunnel, a prototype periscope system was employed to optimize the height of the remote sensor's infrared beam path relative to vehicle exhaust plumes. At the Tuscarora Tunnel, first-time measurements of dual lane traffic were conducted using a single source and detector and two cameras for vehicle identification. This precluded the normal practice of directing traffic into a single lane which can alter normal driving patterns.

Desert Research Inst., Rutgers - The State Univ., New Brunswick, NJ., and Environmental and Occupational Health Sciences Inst., Piscataway, NJ.

The possibility of using a two step method of identifying and quantifying air pollution emissions in an urban environment was examined in this paper. The procedure uses a numerical model called Target Transformation Factor Analysis (TTFA) to estimate source emission profiles using ambient trace element air concentration data. The profiles estimated by TTFA are then employed in a Chemical Mass Balance (CMB) source apportionment analysis for an air shed. The results show that TTFA can be used to provide quantitative estimates of air pollution source profiles for an urban center in China. TTFA can identify source categories of airborne pollution for specific locations, as well as give quantitative data on the composition of the emissions from those source types. Including source profiles estimated by TTFA in a chemical mass balance analysis provides a comprehensive source apportionment methodology which can help researchers more accurately characterize the air pollution source types that pose the greatest concern to human health. The development and use of a version of the Regional Acid Deposition Model/Engineering Model (RADM/EM) called the Comprehensive Sulfate Tracking Model (COMSTM) is reported. The COMSTM is used to diagnose the relative contributions of each sulfate production pathway to the total atmospheric ambient sulfate predicted by RADM. Thirty meteorological cases are used to aggregate the results into annual estimates. For the operational RADM (denoted RADM 2.6), nonprecipitating cloud production of ambient sulfate dominates over precipitating cloud production, and the hydrogen peroxide pathway dominates over four other aqueous formation routes. Gas-phase production of sulfate contributes less than 40% of the ambient budget. Further, the COMSTM is used to explore the sensitivity of the RADM's cloud water and rainwater pH's and ambient sulfate predictions to uncertainties in the ammonia emissions inventory. By developing correction factors to improve in-cloud and deposited ammonia, and utilizing them in the COMSTM, it is shown that the uncertainties should have a minimal effect on predicted cloud water and rainwater pH's and on the overall ambient sulfate budget in the operational RADM 2.6. Reactive chemicals pose unique problems in the development of structure-activity relationships (SAR) and quantitative structure-activity relationships (QSAR) in environmental chemistry and toxicology. Models of the stereoelectronic interactions of reactive toxicants with biological systems require formulation of parameters that quantify the electronic structure of the chemicals. A review of early approaches to modeling reactivity is presented in this work, with emphasis on the generalized polyelectronic perturbation theory. Applications of generalized polyelectronic perturbation theory (GPPT) are demonstrated with QSARs for predicting toxicity of soft electrophiles and proelectrophiles using superdelocalizability and the charges on frontier orbitals. Prediction of toxicity for hard electrophiles such as organophosphates require atomic charges and bond orders in the QSAR. Special considerations for the orthogonality of factors and for the classification of reactive chemicals are reviewed. (Copyright (c) 1994 Gordon and Breach Science Publishers S.A.)

A new preprocessor has been developed which enhanced the implementation of ground water flow models using the analytic element method. This preprocessor allows the user to generate model elements from digital maps which can be created by the preprocessor's digitizing module or imported from various electronic data sources. Once a set of model elements has been defined, the preprocessor allows the user to modify his model as necessary for refinement and calibration. Model results are improved by enhancing the modeler's ability to perform many simulations, adjusting assumed boundary conditions and testing hypotheses. While the preprocessor is capable of generating input files for many element modelling programs, versions are currently available for the CZAEM (Capture Zone Analytic Element Model) and GFLOW1 (Conjunctive Ground Water/Surface Water Model) programs.

Extensive research has shown that microorganisms exhibit increased resistance due to clumping, aggregation, particle association or modification of antecedent growth conditions. During the course of investigating a major waterborne V. cholerae outbreak in Peru, U.S. EPA investigators discovered an extremely rough form of V. cholerae that was highly resistant to disinfection by chlorine. This form of V. cholerae also tends to form large aggregates, which contribute to the resistance. Particle counting was used to characterize each of the cultures examined. Statistical analysis revealed that the rugose, or rough, strain of V. cholerae was much more resistant to disinfection than the common, or smooth, strain. Resistance was attributed to both aggregation and a mucoid coating. The larger aggregates associated with the rugose organism are of a size as to be easily removed by filtration, but if the variant were to contaminate a distribution system through a line break or cross connection it would be difficult to control by chlorine disinfection.

The U.S. Environmental Protection Agency (U.S. EPA) is currently attempting to balance the complex tradeoffs in chemical and microbial risks associated with controlling disinfection and disinfection by-products (D/DBP) in drinking water. In attempting to achieve the balance, the U.S. EPA will propose three rules: an information collection (ICR); an enhanced surface water treatment rule (ESWTR) and a two-stage D/DBP rule. Controlling D/DBP will have a major impact on drinking water utilities in the United States. There are several options for D/DBP control, including moving the point of disinfection, removal of by-products once they are found, removing precursor material or natural organic matter before it interacts with the disinfectant, or use of a disinfectant that minimizes the formation of by-products. Overall, the most effective approach to D/DBP control is to remove precursor before it reacts with the disinfectant. The choice of any given strategy is very site specific. Differences in sensitivity to waterborne contaminants between wildlife species have prompted investigations on the sensitivity of amphibians to potentially hazardous environmental chemicals. The development of Xenopus laevis (African clawed frog) embryos exposed to the pesticide Guthion(Trademark) (technical grade) and Guthion(Trademark) 2S (commercial formulation) was evaluated in modified Frog Embryo Teratogenesis Assay--Xenopus (FETAX) tests. The embryos were exposed to five or six increasing concentrations of pesticide in 10- and 100-ml exposure volumes of test solution for 96 h. Embryos exposed to 10-ml volumes of Guthion exhibited increased mortality, increased deformation, and decreased size as compared to those exposed in 100-ml volumes. LC50s for embryos exposed in the 10-ml Guthion tests ranged from 6.1 to 6.3 mg/L as compared to 10.6 to 11.9 mg/L for those in the 100-ml tests.

Ambient air samples of strong acid aerosol, sulfate, ammonia, and ammonium were collected in Pittsburgh and Uniontown, Pennsylvania during the summer of 1990. High correlations were found for both acid aerosol and sulfate concentrations between Pittsburgh and the semi-rural site in Uniontown. One possible implication is that acid aerosols and their precursors are regionally transported. To test this hypothesis, air samples from the Uniontown site were statistically analyzed for the meteorological relationships that resulted in episodic events of elevated ambient acid aerosol levels. Standard measures of atmospheric conditions in both Pittsburgh and Uniontown were used; they included temperature, pressure, relative humidity, wind speed and direction. Results show that the episodic events of elevated acid aerosol occurred with the same general set of meteorological conditions. The major meteorological variables which correlated with the episodes were the mean wind speed in Pittsburgh and the mean westerly wind component (U) at Uniontown. These two variables accounted for one-third of the variance.

Real-Time Monitoring of Polycyclic Aromatic Hydrocarbons and Respirable Suspended Particles from Environmental Tobacco Smoke in a Home.

Proceedings of an Air and Waste Management Association Toxics Meeting. See also PB94-157401. Prepared in cooperation with Stanford Univ., CA. Dept. of Statistics.

Real-time measurement of polycyclic aromatic hydrocarbons (PAH) on fine particles was evaluated in a home with environmental tobacco smoke (ETS) as a source. Respirable suspended particles (RSP) were also monitored. Comparison of PAH and RSP concentrations from these experiments suggests: (1) the PAH concentrations for the two types of cigarettes--a regular Marlboro filter cigarette and a University of Kentucky reference cigarette No. 2R1--were similar, but the RSP concentrations were different; (2) concentrations from the real-time PAH monitor were linearly related to RSP concentrations; (3) the slopes of the regression lines between PAH and RSP differed for the two types of cigarettes. The real-time PAH monitor appears to be a useful tool for evaluating mathematical models to predict the concentration time series in indoor microenvironments.

Ecoregions: A Spatial Framework for Environmental Management. Book chapter.

J. A. Omernik. 1993, 34p EPA/600/A-94/170
Pub. in Biological Assessment and Criteria: Tools for Water Resource Planning and Decision Making for Rivers and Streams, 1993.

The recent interest in ecosystem management has brought an awareness of the need for an appropriate spatial framework for effectively structuring ecosystem management as well as the research, inventory, and monitoring of ecosystems and their components. This paper addresses the complexity of the task of defining ecological regions as well as the concept of regional reference sites, and provides an explanation of the development of the hierarchical ecoregion framework within the U.S. Environmental Protection Agency. Comparisons are made with other frameworks such as watersheds or basins. Also covered are the processes by which ecoregions are refined, subregions are defined, and sets of reference sites are selected via collaborative projects involving state and federal resource managers and EPA geographers. Although development of the ecoregion/reference site framework has to date been largely driven by the needs of state resource management agencies for developing biological criteria, and for setting water quality standards and lake management goals, support has grown for structuring biological risk assessment and ecosystem management in general.

Use of Greenhouse Chambers for Enhancing Growth of Tundra Transplants on Gravel Fill in Prudhoe Bay, Alaska. Symposium paper.

An approach is presented that could facilitate disturbed tundra revegetation and monitoring in Alaska North Slope Oil Fields. Experiments were conducted on an abandoned drilling pad where the gravel was removed to a thin layer (Ca. 20 cm) above tundra grade and mixed with underlying compacted original sod. Intact plugs 13.3 cm in diameter were transplanted from a donor plot into the thin gravel in treatments with and without mini greenhouses covering single plugs and double plugs. At the end of the first growth season, the greenhouse air temperature (in aggregate thawing degree C days) was elevated 68% and the greenhouse soil temperature was elevated 17% above the ambient air and soil temperatures, respectively. Two independent methods were used for estimating plug growth. Visual cover estimation showed that double plugs with greenhouse produced cover values significantly greater than single plugs. Radiometry measurements developed and modeled to predict plug canopy dry weight showed that the dry weight for all treatments except double plugs with greenhouse fall within ranges of samples taken from stressed areas in the native tundra.

The collection of groundwater samples for metals, including metalloids such as arsenic and selenium, is primarily complicated by the fact that many of the target metal contaminants are also part of the immobile geologic matrix through which groundwater flows. It is the purpose of this chapter to familiarize the reader with newer techniques, their value in terms of sample quality and consistency, and the conditions under which they should be considered for use. The latter depends on sampling purpose or objectives and data quality requirements. While the focus will be on metals samples and sampling in routine monitoring wells, some discussions will also have relevance for sampling organic contaminants as well.

The exposure to air pollutants can result in reduced stem growth, changes in wood density, and/or deposition of pollutants in the stem. Several recent reviews summarize the known effects of air pollutants on plant growth and function including trees. Air pollutants many also change the defensive capacities of stems through alternation in chemical constituents. In this chapter, the authors review the literature on the effects of several major types of air pollutants on stem growth and function with the goals of better defining our knowledge in these areas and of suggesting areas in need of further investigation.

The conservation and management of neotropical migratory birds needs to include a landscape perspective. Landscape ecology represents a renewed interest in the development and dynamics of landscape mosaics, the effects of landscape patterns on species, biotic interactions and ecological processes, and how landscape heterogeneity can be managed to benefit society. For neotropical migratory birds, landscapes occupy the spatial scales intermediate between an individual's territory or home work has improved the conceptual basis and quantitative methods regions. Recent work has improved the conceptual basis and quantitative methods for landscape studies. However empirical information for neotropical migratory birds is largely based on short-term, distributional studies in central and northeastern hardwood forests during the breeding season. More detailed and geographically-extensive landscape studies of neotropical migratory birds during the breeding season are needed to provide regionally-specific information to compare among regions.

Rationale for New Source Performance Standards: Starch Production Plants.
Environmental Protection Agency, Research Triangle Park, NC. Office of Air Quality Planning and Standards. Aug 94, 28p EPA/453/R-94/060

New source performance standards (NSPS) implement section 111 of the Clean Air Act, as amended (the Act). The NSPS are issued for categories of sources which the Administrator determines cause, or contribute significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare. The Environmental Protection Agency (EPA) previously determined that starch production plants are major contributors to air pollution that may reasonably be anticipated to endanger public health or welfare and, thus, constitute a major source category for the purpose of Section 111.

The report discusses part of a Phase I carpet bioresponse study sponsored by EPA. The study evaluated emissions from carpet samples that had previously been reported to show toxic effects on experimental mice. The report describes the major findings of only the chemical characterization work conducted at the Indoor Source Characterization Laboratory of EPA's Air and Energy Engineering Research Laboratory. All other results (animal testing, microbial testing, chemical analysis by sample extraction, and pesticide analysis) are reported separately. The experimental system used in this study, developed by Anderson Laboratories, was identical to that used by EPA's Health Effects Research Laboratory in carpet bioresponse testing. An emissions characterization team from the Contractor evaluated the experimental system and concluded that all test system developed by Anderson Laboratories was not suitable for carpet chemical emissions characterization because of poor reproducibility, non-uniform thermal conditions, and emissions from the source chamber itself.

Modeling the Accumulation of Three Waterborne Chlorinated Ethanes in Fathead Minnows ('Pimephales promelas'): A Physiologically Based Approach. Journal article.

A physiologically based kinetic model was used to predict the accumulation of a homologous series of chlorinated ethanes in fathead minnows (Pimephales promelas). Uptake and accumulation of these compounds are described in terms of a few fundamental physiological, morphological, and physicochemical parameters. Chemical residues in 30-d-old fathead minnows exposed to 1,1,2,2-tetrachloroethane, pentachloroethane, and hexachloroethane were used to evaluate model performance. The predicted and observed accumulations of the chlorinated ethanes were in close agreement. A quantitative assessment of the major factors regulating the exchange of these compounds indicates that the cutaneous surface may be an important route of uptake in small fish.

Field-Deployable Monitors for Volatile Organic Compounds in Air. Conference proceedings.

Pub. in Process Control and Quality, v5 p159-164 1993. Presented at the IFPAC Conference (7th), Galveston, TX., January 26-27, 1993.

Volatile organic compounds in ambient air are usually estimated by trapping them from air or collecting whole air samples and returning them to a laboratory for analysis by gas chromatography using selective detection. Data do not appear for several days, during which sample integrity could become compromised. Immediate data can be obtained, and sampling errors minimized, by analyzing with a field-deployable instrument at the time samples are collected. Portable gas chromatographs are available, but they don't fully meet the need for quick, high-quality data under field conditions. Improved waterproofing, temperature regulation, and energy efficiency are particularly crucial to true field-detection, high-speed chromatography, polycapillary chromatography, and peak modulation may lead to useful enhancements in future.

During 1990 and 1991 the U.S. Environmental Protection Agency (EPA) sponsored an effort to identify existing and planned constructed wetlands in the U.S. and to collect readily available information from operating systems. The inventory documented the presence of over 150 constructed wetland systems for wastewater treatment, including both free water surface (FWS) and subsurface flow (SF) systems. The majority of the systems identified were SF systems for treating municipal wastewater. FWS systems were separated into three groups based on the design level of effluent water quality. SF systems were separated into three groups based on the basic design approach. The inventory indicated that neither between or within these groups was there consensus regarding basic hydraulic and engineering design criteria, system configuration, or any other aspect, such as, type of vegetation, size and type of media, or pretreatment. Information on location, type of systems, design approach, hydraulic and organic loading rates; costs, and other aspects is presented.

The article discusses an improved model for estimating emissions of volatile organic compounds (VOCs) from forests in the Eastern U.S. Regional estimates of biogenic volatile organic compound (BVOC) emissions are important inputs for models of atmospheric chemistry and carbon budgets. Since forests are the primary emitters of BVOCs, it is important to develop reliable estimates of their areal coverage and BVOC emission rate. A new system is developed to estimate these emissions for specific tree genera at hourly and county level resolution. The U.S. Department of Agriculture (USDA) Forest Services' Forest Inventory and Analysis (FIA) Eastwide Database is used to describe areal extent, species composition, and tree diameter distribution of U.S. forests. Horizontal canopy occupancy by genera is then estimated as a function of diameter at breast height. Growing season peak foliar masses are derived from the empirical literature for canopies of deciduous and coniferous genera. A simple canopy model is used to adjust photosynthetically active solar radiation at five vertical levels in the canopy.

Metals contamination of subsurface soils and ground water from a variety of industrial sources and uses has increasingly been discovered over the past decade. Strategies are needed to efficiently and accurately characterize these types of sites to determine if soil remediation is possible and/or practical. Chromium is one of several metal contaminants often found at hazardous waste sites (DOE 1992; Sims 1986; U.S. EPA 1989). It has many industrial and manufacturing uses in the United States and other countries. Due to the frequent occurrence of chrome plating sites and attendant environmental pollution, research was initiated to study this generic type of metal site. A cooperative project between the U.S. Cost Guard and the Robert S. Kerr Environmental Research Laboratory, U.S. Environmental Protection Agency, was initiated in 1990 to evaluate various methods of site characterization at metals-contaminated waste sites. In particular, the uses of field-portable X-ray fluorescence (XRF) technology to determine total metals contamination in soils was evaluated.

The reactivity of CCl4 with pyrite was investigated by measuring the CCl4 transformation rates and products under aerobic and anaerobic conditions. Under all reaction conditions, >90% of the CCl4 was transformed within 12-36 days in the presence of 1.2-1.4 sq m/L pyrite at 25 C. A zero-order dependence on the CCl4 concentration supports a surface-controlled reaction mechanism wherein the rate of reaction depends on the absorbed CCl4 concentration. In aerobic systems >70% of the CCl4 was transformed to CO2 whereas in a fresh-ground/anaerobic pyrite system approximately 50% of the CCl4 was transformed to CHCl3. X-ray photoelectron spectroscopy of the reacted pyrite showed that an FeOOH coating formed on the surface under aerobic conditions. Under all reaction conditions, the pyrite surface was depleted of ferrous iron.

Gas chromatographic patterns of polychlorinated biophenyls (PCBs) found in the serum of New Bedford, MA residents with high serum PCBs were compared to patterns found in lobsters and bluefish taken from local waters, and goats fed selected technical Aroclors (e.g., Aroclors 1016, 1242, 1254, or 1260) using Jaccard measures of similarity and Principal Component Analysis. Pattern in humans were silimar to patterns in lobsters and both were more similar to those in the goat fed Aroclor 1254 as demonstrated by both pattern recognition techniques. Air pollution abatement strategies for controlling nitrogen dioxide, sulfur dioxide, and ozone emissions in the United States focus on a 'Standards-based' approach. This approach places limits on air pollution by maintaining a baseline value for air quality, no matter what the ecosystem can or cannot withstand. In the paper, the authors present example critical levels maps for the conterminous U.S. developed using the 'effects-based' mapping approach as defined by the United Nations Economic Commission for Europe's Convention on Long-Range Transboundary Air Pollution, Task Force on Mapping. The approach emphasizes the pollution level or load capacity an ecosystem can accommodate before degradation occurs, and allows for analysis of cumulative effects. They present the first stage of an analysis that reports the distribution of exceedances of critical levels for NO2, SO3, and O3 in sensitive forest, crop, and natural vegetation ecosystems in the contiguous United States. They conclude that extrapolation to surrounding geographic areas requires the analysis of diverse and compounding factors that preclude simple extrapolation methods. Plants and soils are a critically important element in the global carbon-energy equation. It is estimated that in forest ecosystems over two-thirds of the carbon is contained in soils and peat deposits. Despite the importance of forest soils in the global carbon cycle, fluxes of carbon associated with fundamental processes and soil functional groups are inadequately quantified, limiting our understanding of carbon movement and sequestration in soils. The authors report the direct measurement of carbon in and through all major pools of a mycorrhizal (fungus-root) coniferous seedling (a complete carbon budget). The mycorrhizal symbiont reduces overall retention of carbon in the plant-fungus symbiosis by increasing carbon in roots and below-ground respiration and reducing its retention and release above ground. Below ground, mycorrhizal plants shifted allocation of carbon to pools that are rapidly turned over, primarily to fine roots and fungal hyphae, the host root and fungal respiration. Mycorrhizae alter the size of below-ground carbon pools, the quality and, therefore, the retention time of carbon below ground.

Avocet chicks hatched from eggs collected from the south Central Valley of California were studied to determine the impact of elevated concentrations of selenium, boron, and arsenic on the immune system and growth to maturity. Selenium, arsenic, and boron residues were measured in water, eggs, and tissues of birds that died or were killed at the end of the experiment. Westfarmers pond had elevated concentrations of selenium, boron, and arsenic. Pryse ponds also had elevated selenium, arsenic, and boron concentrations as compared to the reference site. The birds that were most severely impacted by exposure to these compounds were those that hatched from eggs collected from Pryse ponds.

Transgenic plants that produce pesticidal proteins have the potential to release these products into the environment when the plants are incorporated into soil. This could result in novel exposure of soil organisms to these pesticidal proteins. There is a lack of knowledge about the fate and persistence of transgenic pesticidal products in the soil. A model system of transgenic cotton, which produces Bacillus thuringiensis kurstaki (delta)-endotoxin (Bt toxin), was used to address this issue. Methods were developed to quantify Btk toxin in soil and soil/plant litter by extraction of the Btk toxin with an aqueous buffer and quantification by ELISA. The highest recovery of Btk toxin from soil was obtained with a high salt, high pH buffer. The method was shown to be useful in tracking over time the persistence of both purified and transgenic Btk toxin in laboratory experiments.

Effects of Activated Charcoal Filtration and Ozonation on Hydrocarbon and Carbonyl Levels of Ambient Air Used in Controlled-Exposure Chamber Studies of Air Pollutant Human Health Effects. Symposium paper.

B. E. Tilton, J. J. Bufalini, S. A. Meeks, and B. W. Gay. 1994, 8p EPA/600/A-94/166

Air sampling experiments were done in 1985, 1987, and 1993 at the human-exposure chamber facility of the U.S. EPA Health Effects Research Laboratory in Chapel Hill, NC. Measurements of volatile organic compounds (VOCs) by GC-FID and aldehyde measurements by the DNPH silica gel cartridge method were made, comparing levels at the outside air intake to levels in the human controlled-exposure chamber. Ambient air passed through activated-charcoal filters can contain varying residual amounts of water vapor and gaseous pollutants such as hydrocarbons, oxygenates, and other organic and inorganic species. When the charcoal-filtered air stream is exposed to high-intensity radiation to generate ozone for use in human controlled-exposure experiments, there may be formation of compounds other than ozone. Results of measurements of some compounds of interest are discussed.

Carbonyl compounds are important constituents in urban and global atmospheres. In urban atmospheres these compounds frequently serve to initiate photochemical smog and certainly sustain the chain reactions leading to ozone formation. Measurement of carbonyl compounds under atmospheric conditions requires techniques that are both sensitive and free of interferences. For low molecular-weight aldehydes and ketones derivatization techniques with 2,4-dinitrophenylhydrazine (DNPH) have been used with some frequency in recent times. In the study, DNPH coated on two of the most popular substrates (silica gel and c(18)) have been examined for measuring C(1) to C(4) carbonyl components found in the atmosphere. The study is designed to evaluate the sensitivity, reproducibility, and effect of interferences, particularly ozone, on carbonyl measurements using these systems.

The study attempts to investigate the relative predictability of two major regional scale photochemical models by comparing concentration predictions for various atmospheric chemical species. The Regional Acid Deposition Model (RADM) and the Regional Oxidant Model (ROM) are used to simulate a specific ozone episode over the northeast United States. Trends in spatial and temporal distributions of various photochemical species are compared. Further, the ability of the two models to elucidate relationships between precursor species such as NOx and hydrocarbons with secondary pollutants such as O3, PAN, HNO3, and H202 is examined. Results from the initial phase of the study indicate that although the models show similar spatial patterns of species concentrations, systematic differences in their predictions do occur. The differences result from a combination of effects arising from among others, differences in input emissions and meteorology, numerical representation of the processes and differences inherent to the chemical mechanisms and formulation of the models.

The trace-level measurement of phenolic compounds in the ambient air is complicated by the acidic and polar nature of the compounds especially during recovery from the sampling medium. Recently, supercritical fluid extraction (SFE) has been proposed as an alternative extraction method to Soxhlet extraction or thermal desorption to achieve more efficient recoveries. For such methodology to become practical, the candidate sorbents must first be tested for stability and cleanliness under SFE conditions. The paper describes exploratory research results of background contamination tests and cleanup properties of some common air sampling sorbent media with respect to future application to phenolic compounds monitoring.

The paper discusses the control of trace metal species in combustion systems. PSI Technology Co., through US Environmental Protection Agency (EPA)-funded research under the Superfund Innovative Technology Program, has developed and patented the MelDAS (Metal Immobilization and Decontamination of Aggregate Solids) process. Details of the process can vary depending on the application, but the essential steps are: (1) combine the toxic-metal-containing solid with the appropriate amount of sorbent, (2) form this mixture into pellets or briquettes, placing the metal compounds into intimate contact with the sorbent, and (3) heat-treat the pellets, causing a reaction to form nonleachable metal compounds. Although the MelDAS process applies to a wide range of metal-contaminated materials, the experiments in the work were conducted to assess its use in the remediation of soils contaminated with organics and metals.

Pub. in Radon: Prevalence, Measurements, Health Risks and Control, ASTM Manual Series; MNL 15, p112-133 Jun 94. Prepared in cooperation with Amway Corp., Ada, MI. Research and Development Div.

The chapter covers strategies that can be used to effectively reduce elevated radon levels in buildings. It provides an overview in diagnosing radon problems and in selecting radon control strategies both in existing structures and in new construction. It covers methods for diagnosing radon problems and detailed descriptions of several radon control strategies: soil depressurization, sealing of radon entry routes, building pressurization, removing sources of radon, ventilation, air cleaning, and removing radon from water. It concludes with a summary of radon control strategies with typical ranges of radon reduction, contractor installation costs, and operating costs; information on post-installation testing; and long-term maintenance of radon control systems.

The relative amounts of the two stable isotopes of Nitrogen (N), 15N and 14N, vary predictably in soils and plant tissues of forests and other non-cultivated ecosystems. Slight fractionations, or discriminations against the heavier N isotope, that can occur as N cycles through vegetation, soils and microbial biomass act over the long term to deplete vegetation and litter of 15N and to enrich humus in 15N. In this chapter, the authors show that 15N natural abundances can be used to make inferences about (1) rates and patterns of N cycling, (2) the relative importance of N inputs versus soil processes in supplying N for plant uptake, (3) retention of N by forests and (4) forest ecosystem health. The authors also discuss uses of 15N-labelling ecosystem-scale experiments on whole forests. Such experiments offer possibilities for checking and improving estimates of N fluxes within and N losses from forests.

Pub. in Acidification of Freshwater Ecosystems: Implications for the Future, 1994. Prepared in cooperation with Ontario Ministry of Natural Resources, Toronto., Alberta Univ., Edmonton., and Maine Univ., Augusta.

Scientific investigations over the last two decades have examined the processes and effects of acidic deposition on surface waters and their catchments. These studies have been performed on various scales: laboratory benchtop, mesocosm/plot studies, whole system manipulations, and regional and national surveys. The processes and mechanisms of acidification of fresh waters have been studied intensively, and investigations have examined closely associated phenomena that influence the availability, transport, and biogeochemistry of acids and related substances. The authors have learned a great deal about the linkages among watershed processes, hydrology, microbial activities, and water chemistry. These factors interact to create the physical and chemical environment in which biota are exposed to an almost infinite array of conditions. Some of these conditions are so adverse that specific organisms can no longer survive; other conditions may result in sublethal effects that have less visible but important results. The purpose of this group report is to relate what the authors have learned about acification and the fate, transport, and effects of other contaminants that may co-occur with acidic ecosystems. Several hundred gravel bed, or subsurface flow (SF) wetland systems exist in the United States ranging in size from single family dwellings to municipal systems designed for flows up to 11,000 cu m/d. Most of these systems have been constructed in the period 1988 to 1992 without the benefit of a consensus on design, construction or operational procedures. The U.S. Environmental Protection Agency (EPA) commenced a continuing series of studies in 1989 to identify the critical issues and to develop appropriate process criteria for this concept. These efforts have included a detailed survey, on-site visits and performance evaluations, and special data collection and evaluation programs at selected sites. The focus of the paper is on the capability of these systems to remove biochemical oxygen demand (BOD5), total suspended solids (TSS), and ammonia nitrogen (NH3 as N), since these are the major water quality parameters controlled by the regulatory agencies in the U.S.

A new fluorometric technique was compared to conventional fluorometry with and without pheophytin a (pheo a) correction and to spectrophotometry using Lorenzen's modified monochromatic equations and Jeffrey and Humphrey's trichromatic equation to calculate chlorophyll a (chl a). The new technique uses excitation and emission filters that are highly selective for chl a, eliminating the interference caused by accessory pigments and pheopigment degradation products. Four method parameters were evaluated using the new technique, conventional fluorometry and spectrophotometry. They were (1) sensitivity, (2) linear dynamic range, (3) precision, and (4) accuracy.

The interaction between human uses of land and the protection and maintenance of health ecosystems has confronted societies throughout the ages. Increased understanding of natural ecosystems has allowed us to begin addressing many concerns such as loss of wildlife habitat and decreased recreational opportunities for inner city children. Natural ecosystems are being managed as wilderness areas and are protected against direct human intervention. In urban areas open spaces, such as park lands, flourish as highly modified ecosystems. Whatever the setting, very few places on Earth have not been affected either directly or indirectly by human activities. To balance human activities and the maintenance of the quality of our natural ecosystems, two new 'tools' are now being employed--ecosystem restoration and creation. Restoration and creation are mechanisms used to either repair a degraded ecosystem or to create a new one. This article addresses specifically the restoration and creation of wetland ecosystems.

The U.S. Environmental Protection Agency (EPA) has joined with industry, States, and local regulatory agencies, as well as pollution prevention experts, to implement the EPA's Industrial Pollution Prevention Project (IP3). The IP3 is an agency-wide, multimedia project focusing on industrial pollution prevention. The objectives of the IP3 are twofold: (1) to incorporate pollution prevention into the industrial effluent guidelines process, and (2) to extend information to industries and to the consuming public to better establish and spread the pollution prevention ethic. The IP3 includes 13 tasks, one of which is to gather together all readily available information on the pollution prevention measures implemented by industries in other countries, to put all that information into electronic files so that it is accessible to all interested parties, and to compile all the case studies into a hard-copy compendium. This compendium has been prepared by the IP3 to provide EPA, States, industries, and other interested parties with access to non-U.S. pollution prevention case studies. The compendium includes many countries' experiences related to a variety of pollution prevention concepts and technologies.

J. P. Baker, J. Boehmer, A. Hartmann, M. Havas, and A. Jenkins. c1994, 40p EPA/600/A-94/158
Pub. in Acidification of Freshwater Ecosystems: Implications for the Future, p275-312 1994. Prepared in cooperation with Wisconsin Univ.-Eau Claire.

Acidification affects all components of biological communities in lakes and streams: microbes, algae, macrophytes, invertebrates, fish amphibians, and other vertebrates that rely on aquatic ecosystems for habitat or food. Mechanisms of effect are both direct (toxic responses to changes in chemistry) and indirect (e.g., expressed through the food chain or caused by changes in habitat), and the responses may be immediate or delayed. In turn, many biological processes, especially microbial processes, can influence surface water acid-base chemistry. Thus, chemical and biological changes are intricately linked and complex, with extensive feedbacks. Research on the effects of acid deposition and acidification on aquatic biota has been ongoing in Europe and North America for over the last 15 years, and many comprehensive reviews have been published. These gaps often have occurred because funding has focused on chemical mechanisms and modeling response of systems rather than in making resource inventories or resolving uncertainties in biological responses to acidification.

The report describes the development of a statistical regression model used for estimating methane (CH4) emissions, which relates landfill gas (LFG) flow rates to waste-in-place data from 105 landfills with LFG recovery projects. The model has three linear segments, each of which applies to a distinct landfill size class. Assumptions were required to account for the recovery efficiency of LFG projects and for the probable oxidation of CH4 in the top soil cover of the landfill. The report details uncertainties which limit the quality of the above estimates. The report concludes with a discussion of trends which will affect future LFG emissions, as well as LFG utilization.

The Administrator has identified organic solvent degreasing, of which cold cleaning machine operations are a subset, as a source of volatile organic compound (VOC) emissions that causes or contributes to air pollution that may reasonably be anticipated to endanger public health or welfare. The intent of the proposed standards is to require new, modified, and reconstructured immersion cold cleaning machines with surface areas greater than or equal to 1.8 square meters (19 square feet) to control emissions to the level achievable by the best demonstrated system of continuous emission reduction, taking into consideration cost of achieving such emission reduction and any nonair quality health and environmental impact and energy requirements.

EPA is proposing revised and expanded air pollutant emission standards for new, and guidelines for existing, municipal waste combustors (MWCs), pursuant to Sections 111(b), 111(d), and 129 of the Clean Air Act of 1990. The regulations will replace or supplement those promulgated by EPA on February 11, 1991. The standards and guidelines will apply to MWCs with a capacity to combust 35 or more Mg of municipal solid waste per day. The pollutants to be regulated are particulate matter (total and fine), opacity, sulfur dioxide, hydrogen chloride, oxides of nitrogen, carbon monoxide, lead, cadmium mercury, and dibenzofurans and dioxins. The report describes the standards and guidelines, their potential economic impacts, and related matters. EPA estimates the national annual cost of the standards in 1994 will be $44 million, plus the cost of the 1991 standards, $157 million, for a total of $201 million. EPA estimates the equivalent cost of the guidelines at $280 million plus $168 million for a total of $448 million.

The Technology Innovation Office (TIO) of the U.S. Environmental Protection Agency (EPA) Office of Solid Waste and Emergency Response (OSWER) has developed the Vendor Information System for Innovative Treatment Technologies (VISITT) to provide current information on innovative treatment technologies for the remediation of contaminated sites. VISITT contains information on innovative treatment technologies for the remediation of contaminated sites. For this database, innovative technologies are defined as those for which a lack of performance and cost data precludes their routine use to clean up sites. Examples of innovative technologies include thermal desorption and soil vapor extraction. Technologies in VISITT address the treatment of soil, sludge, solids, and natural sediments, both above ground and in place (in situ), dense non-aqueous phase liquids (DNAPL); and light non-aqueous phase liquids (LNAPL). Also included are methods of treating ground water in situ and of treating the off-gas generated by innovative treatment systems.

The manual describes ways that local governments can approach the issues surrounding the implementation of urban runoff retrofit technology even when the control options are limited. It reviews appropriate 'ultra-urban' technologies for situations where more conventional, land-intensive control practices are not feasible. Specific recommendations are summarized to help program implementation personnel develop strong institutional frameworks and create effective urban runoff control programs. The recommendations presented are largely based on the program implementation experiences of the case study communities featured in the manual.

The Toxics Subcommittee of the Chesapeake Bay Program Implementation Committee, in responding to its mandate to revise the basinwide toxics reduction strategy; has actively sought the participation of diverse stakeholders. Several mechanisms were employed by the Subcommittee to include representative stakeholders from businesses, agricultural community, public interest groups, local government, state government, and federal agencies in evaluating the draft revised strategy and, in particular, the draft commitments. The commitments are organized under four areas of emphasis--pollution prevention, regulatory program implementation, regional focus, and directed toxics assessments. Stakeholder input was sought on how the commitments met four basic evaluation criteria: (1) understandable by the public, (2) feasible to achieve, (3) measurable so that progress can be reported, and (4) targeted to toxics problems in the Chesapeake Bay. At the stakeholders roundtables, attendees were provided an open forum to get feedback on the commitments.

Estuaries are waterways, such as bays and sounds, where fresh water drained from the surrounding watershed mixes with salt water from the ocean. Section 320 of the Clean Water Act established the National Estuary Program (NEP) to identify nationally significant estuaries threatened by pollution, development, or overuse and to promote the preparation of comprehensive management plans to ensure their ecological integrity. The program's goals are protection and improvement of water quality and enhancement of living resources. To reach these goals, the Administrator of the U.S. Environmental Protection Agency (EPA) convenes management conferences for each estuary in the NEP to provide a forum for consensus building and problem solving among interested agencies and user groups.

The purpose of the study was to determine atmospheric loadings of selected trace elements and organic compounds directly to the surface waters of the Chesapeake Bay. The work in this report represents the first eighteen months of the Chesapeake Bay Atmospheric Deposition Study. Future reports will describe the integrate results from the CBADS network through September 1993. An 18 month field study (6/90 - 12/91), conducted to estimate the deposition of atmospheric trace contaminants to the Chesapeake Bay, represents Phase II of the Chesapeake Bay Atmospheric Deposition Study (CBADS). Previously reported data from Phase I (6/90 - 7/91) is presented here in concert with data from 7/91 - 12/91. The trace elements (aluminum, arsenic, cadmium, chromium, copper, iron, manganese, nickel, lead, selenium, and zinc), polychlorinated biphenyl (PCBs) congeners, and polycyclic aromatic hydrocarbons (PAHs) were measured in the ambient atmosphere and in precipitation. In addition several major ions, (chloride, sulfate, nitrate, sodium) were measured in precipitation at the three sites.

Analyses of major, minor, and trace elements within the organic-rich muds cored at 153 stations within the Pamlico River estuarine system document specific lateral and vertical distribution and concentration of metals within the basin and define environmental conditions favoring heavy metal enrichment. Anthropogenic sources are believed to be largely responsible for heavy metal enrichment within the Pamlico River estuarine system. Sediments in the vicinity of known point source discharges are enriched in specific metals by factors up to 14 times as compared to sediments in other portions of the Pamlico River. Surface sediments have been enriched up to and occasionally in excess of 100 times the elemental concentrations occurring in sediments deeper in the cores. These areas have surface sediments that are enriched in one or more of the critical elements and include the eight EPA priority pollutant metals (As, Cr, Cd, Cu, Ni, Pb, Zn, and Hg) and other important trace elements (Co, Mn, Mo, Ti, V, F, and the nutrient element P). Enrichment is determined by comparing the concentration for each critical element to the trimmed mean for surface samples in the estuarine system.

Toxicology and carcinogenesis studies were conducted by exposing groups of 60 male and female F344/N rats and B6C3F1 mice to atmospheres containing 0, 0.01, 0.05, or 0.2 ppm hexachlorocyclopentadiene (approximately 98% pure) for 2 years. Under the conditions of these 2-year studies, there was no evidence of carcinogenic activity of hexachlorocyclopentadiene in male or female F344/N rats or B6C3F1 mice exposed to 0.01, 0.05, or 0.2 ppm. Exposure of rats to hexachlorocyclopentadiene produced pigmentation of the respiratory epithelium of the nose, trachea (males), and bronchi and bronchioles of the lung. Squamous metaplasia of the laryngeal epithelium occurred in female rats exposed to hexachlorocyclopentadiene. Suppurative inflammation of the nose as well as pigmentation of the respiratory mucosal epithelium occurred in mice exposed to hexachlorocyclopentadiene.

The National Acid Precipitation Assessment Program concluded (NAPAP, 1991) that direct above ground impacts of acidic deposition at present levels are not expected in low-elevation forest systems, but detrimental effects on some high-elevation eastern forests appear likely. NAPAP also concluded that long-term changes in the chemistry of some sensitive soils are expected, but data were not available at the time to determine whether this would result in reduced forest health or how long it would take for such an effect to occur. The question of the importance of acidic deposition as a factor affecting forest health via the soil remained a significant research and policy issue. This report provides a critical review of the scientific literature dealing with the extent to which acidic deposition may be causing changes in soil chemical properties and the potential for such changes to affect forest trees. Particular attention was paid to large-scale research programs which addressed these issues directly.

This report summarizes a two-phase, laboratory-scale screening study that evaluated solvent blends containing propylene carbonate (PC) as a potential replacement for methyl ethyl ketone (MEK) in aircraft radome depainting operations. The study was conducted at Oklahoma City Air Logistics Center (OC-ALC) at Tinker Air Force Base (TAFB). The first phase of this study screened the performance of three solvent blends provided by Texaco Chemical Company. These blends contained varying concentrations of PC, n-methyl pyrrolidone (NMP), dibasic ester (DBE), and other organic solvents. The performance of each blend was compared with that of MEK-both by the paint removal time and by a visual estimate of the amount of paint removed without any visible substrate damage (removal efficiency). Phase 2 test results revealed that PC Blend 2 performed favorably in comparison with MEK in removing paint from the fiberglass/epoxy (F/E) test panels and in subsequent paint adhesion tests, despite an indication of possible substrate damage.

The report gives results of an investigation of the formation of products of incomplete combustion (PICs) during 'recovered' trichlorofluoromethane (CFC-11) incineration. Tests involved burning the recovered CFC-11 in a propane gas flame. Combustion gas samples were taken and analyzed for volatile organic compounds as well as polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/PCDF). Test results confirm that incineration can be used to effectively destroy recovered CFC-11; CFC destruction efficiencies of greater than 99.9999 (six nines) were consistently demonstrated for CFC-11-to-propane molar ratios of 0.66-0.6. Additionally, low levels were detected when sampling downstream of the flue gas scrubber. Results of a secondary goal of the study, to determine the fate of chlorine (Cl) and fluroine (F), were inconclusive.

Report no. 3 from the California Activity Pattern Survey. See also PB94-130432. Prepared in cooperation with Stanford Univ., CA. Dept. of Statistics. and Maryland Univ., College Park. Dept. of Sociology.

Using the 1987-88 California Activity Pattern (CAP) Survey, the report examines various microenvironmental aspects of personal exposure to environmental tobacco smoke (ETS) that were not explored in earlier reports. These topics include: (1) predictors of those individuals with the highest ETS exposures, (2) daily activities and locations associated with higher and lower amounts of ETS exposure, with special emphasis on the workplace, (3) ETS exposure for persons in those locations with exposure to other sources (for example, gasoline, gas stoves, or chemicals at the workplace). From a multivariate analysis, the report concludes: (1) education remains a major demographic predictor of potential ETS exposure among individuals; (2) time spent working was a major and consistent correlate of exposure to ETS, while drinking at bars/lounges and eating out at restaurants also were significant correlates of ETS exposure; (3) respondents who reported the presence of dust particles at work also reported significantly higher ETS exposure and were exposed to other potential pollutant sources as well. These analysis generally confirm the important role of workplace factors in the public's exposure to ETS.

The Interim Report compiles and critically reviews current scientific literature concerning toxicity and exposure data for (TCDD) ecological risks to aquatic and wildlife species. This report summarizes the discussions of a peer panel workshop that evaluated the utility of the information in the Interim Report for future ecological risk assessments. In addition to the Interim Report, workshop participants used a hypothetical scenario and the EPA report Framework for Ecological Risk Assessment to identify significant issues, discuss major uncertainties and recommend research needs for future assessments. The focus of the workshop was on the problem formulation or scoping phase of the ecological risk assessment process. Participants evaluated a 'conceptual model' from the hypothetical scenario and provided comments and suggestions on the transport, fate, and ecological effects of TCDD and related compounds.

Urban nonpoint source pollution is a major water quality problem in the Pamlico-Tar River watershed. The purpose of this project was to plan, construct, and maintain a 1.75-acre, 500,000 cubic foot stormwater detention pond. The facility will serve as a best management practice for removing nutrients and heavy metals from stormwater runoff within a 200-acre watershed that is representative of typical urban land uses. This project also provided a case study of the experiences of a municipal staff in the development, planning, and implementation of a stormwater BMP. This report discusses various administrative and logistical problems that were encountered during site selection, proposal development, and project start-up. An emphasis on interdepartmental and interagency cooperation resulted in the successful design and construction of the BMP. Project area descriptions and specifications are provided in detail.

The forested wetlands that border Albemarle Sound and its tributaries are largely undescribed and their ecological importance is not well known. The purpose of this study was to assess the locations, quality, and species composition of wetland forests in a zone that is influenced by water level fluctuations in the sound. The zone appears to be up to 200 meters wide. Surveys showed changes in tree species from shoreline to the swamp interior. The forest actually begins in the water beyond the shoreline where cypress trees were stranded as a result of erosion and differential loss of other species. Moving into the forest, a slightly elevated storm levee is first encountered before the sequence eventually grades back into the lower-lying swamps of black gum and red maple. Information about these wetlands is important from several perspectives. First, they represent a resource of unquantified abundance whose shoreline position makes them potentially important habitat for fish and wildlife.

This report is the second of a series of reports summarizing data collected from the Pamlico and Neuse River estuaries. The purpose of this report is to provide a summary of the continuously monitored water-quality data obtained in the Pamlico River and the Neuse River estuaries. This report covers the period from October 1990 through September 1991, which is the end of the second full water year of data collection. Water-quality data were measured at 15-minute intervals at six sites in the Pamlico River estuary and at five sites in the Neuse River estuary. Measurements include near-surface and near-bottom specific conductance; near-surface water temperature; and near-surface, mid-depth, and near-bottom dissolved-oxygen concentrations and percent saturation. Specific-conductance data were converted to and reported as salinity values. Basic statistics were used to present selected data as box plots, and instantaneous data are summarized as daily mean values in tables and graphs.

The Chowan, Northwest, and North Landing Rivers and Back Bay are major tributaries to Currituck and Albemarle Sounds. All are located in or flow through the southern portion of the Hampton Roads region of Virginia. Land use and other activities in these Basins affect environmental quality in the Sounds. Concurrently, management programs developed through the Albemarle-Pamlico Estuarine Study (APES) have the potential to affect future development in the Virginia portion of these Basins. This project was designed to provide an active role in the APES Program for localities and citizens in Hampton Roads, Virginia; to provide for information exchange between North Carolina and Virginia researchers and governmental agencies; and to educate Virginians about the Albemarle-Pamlico Estuarine System, its water quality and natural resource problems, developing solutions to them and the role that they could play in addressing those problems.

Sponsored by Environmental Protection Agency, Research Triangle Park, NC. National Estuary Program.

The estuarine trawl fishery in North Carolina is composed of two harvesting sectors, shrimp and crab trawls. The incidental capture of juvenile finfish and shellfish in conjunction with these fisheries has long been a concern to managers, fishermen, and the public alike. The magnitude of the bycatch is highly variable, influenced by, time, area, depth, and bottom and gear characteristics. Unfortunately, adequate fishery-independent and dependent data are unavailable to quantitatively address this problem. There is general agreement among all concerned that methods that reduce bycatch through manipulation of existing gears or by developing new gears that are species specific need to be examined. The objectives of this study were to: (1) test two tailbag sizes (4 in and 4.5 in) and a belly trawl in crab trawls; (2) develop and test various shrimp pot designs; and (3) examine the feasibility of using cast nets to harvest brown shrimp in the Pamlico Sound complex.

The Albemarle-Pamlico Estuarine Study (A/P Study) was initiated in 1987 under the administration of the United States Environmental Protection Agency (EPA), with funding through the National Estuarine Program (NEP). The goals of the A/P Study include determining the environmental problems facing North Carolina's estuarine areas and protection and management of those estuaries to provide for recreational, industrial, and commercial uses. The baseline water quality monitoring plan was developed by the Division of Environment Management (DEM) with assistance from DMF and USGS. Using DEM's existing ambient monitoring program, 20 new water quality stations were added to the 74 existing ambient stations in the A/P Study area. Other components of the baseline monitoring plan included fish tissue analysis at 26 stations, sediment oxygen demand (SOD) sampling in critical areas, and a synoptic water quality study. Implementation of the baseline monitoring plan began in October 1988. This report presents the results of the synoptic water quality study.

The process for determining specific pollution reductions needed to attain State water quality standards under the Clean Water Act is set out in Section 303(d) of that Act and involves the determination of Total Maximum Daily Loads (TMDLs). As interpreted in EPA regulations and guidance, the TMDL process can be used to address large geographic areas such as river basins and provides water quality managers with an analytical method to address more complex water pollution problems, such as nonpoint sources, and to adopt a more integrated approach to water quality management. This compendium, developed in response to recommendations made at the Workshop on the Water Quality-based Approach for Point Source and Nonpoint Source Controls held in Chicago on June 26-28, 1991, has identified and summarized the most widely used (as well as some of the more obscure) watershed-scale models that can facilitate the TMDL process. It is intended to help water quality managers and other potential users decide which model best suits their needs and available resources.

May 94, 60p EPA/82O/R-94/003

The Office of Water has initiated an Industrial Pollution Prevention Project (IP3) to look at how best to promote multi-media pollution prevention in its current and future regulatory activities. One facet of the IP3 is to explore the degree to which the Section 301(k) innovation waiver provision under the Clean Water Act (CWA) has been, or could become, an effective vehicle for promoting the development and implementation of innovative pollution prevention technologies. While 301(k) variance provision for direct dischargers expired in March 1991, a parallel provision for indirect dischargers, 307(e), is still in effect. Further, the 301(k) provision could be reactivated by Congress during the current CWA reauthorization.

The software is on one 3 1/2 inch DOS diskette, 720K double density. File format: Executable. Documentation included; may be ordered separately as PB94-963222.

The software is a tool to evaluate the feasibility of the Data Quality Objectives (DQOs) based on cost and sample size. By entering the outputs from the DQO process, the software will compute sample sizes for several basic statistical sampling designs. This way you, the decision maker, can decide whether your decision error rates are feasible before a statistician, or someone familiar with statistical design, begins to optimize the sampling design. At the current time, the software only compares a mean against a fixed action level. In more advanced versions, software will be expanded to consider other sampling designs and other parameters of interest. This software can NOT be used to develop the optimal sampling design. The sampling sizes that are computed can only be used for comparison purposes. They are not meant to be used for the final decision.

This software has a program that performs extended period simulation of hydraulic and water quality behavior within water distribution systems. It tracks the flow of water in each pipe, the pressure at each pipe junction, the height of water in each storage tank, and the concentration of a substance throughout a distribution system during a multi-time period simulation. In addition to substance concentrations, water age and source tracing can also be performed. The water quality module of EPANET is equipped to model such phenomena as reactions within the bulk flow, reactions at the pipe wall, and mass transport between the bulk flow and the pipe wall. The documentation describes how to use the EPANET program on a personal computer under both DOS and Microsoft Windows. Under Windows the user is able to edit EPANET input files, run a simulation, display the results on a color coded map of the distribution system and generate additional tabular and graphical views of these results.

SAGE is an expert system for selecting alternative materials and processes for cleaning of metals, electronics, plastics, and stripping of paint. SAGE recommends solvent replacements in cleaning and degreasing operations. It leads the user through a question-and-answer session. The user's responses allow the system to develop a list of alternative chemistries and processes. The user may then review brief descriptions of the alternatives on the computer screen. If any of the alternatives are of interest, the user may request SAGE to generate a detailed report for each. The report includes general information, safety/environmental concerns, industrial case studies for the selected alternative, and information on state technical assistance programs in the user's geographical location that can provide additional information.

Second by second emission data for 80 FTP (Federal Test Procedures) UDDS Runs on 13 vehicles are included. Product gives the results of analyses using real-time dynamometer test emissions data from 13 passenger cars to examine variations in emissions during different speeds or modes of travel. The resulting data provided a way to separately identify idle, cruise, acceleration, and deceleration emissions for examining how emissions differ by vehicle speed during the cruise mode. To select a set of vehicles for the study, the hydrocarbon (HC)/time relationship was established for several vehicles operating on summergrade fuel. Federal Test Procedure results were then produced and examined to identify normal emitters (clean vehicles). After these vehicles were selected, their second-by-second emission characteristics were analyzed. The FTP runs for cold start, hot start, and hot stabilized emissions (Bags 1, 2, and 3 of the FTP) were performed for each of the four driving cycles-acceleration, deceleration, idling, and cruise-and the fraction of overall emissions contributed by each mode was computed for the warmed-up portion of the driving cycle. A protocol was then developed for review of the FTP real-time data. Study results showed significant emissions differences relating to the travel mode.

The PREscore computer program has been developed to assist Superfund site assessment investigations in Hazard Ranking System (HRS) site scoring. The HRS is used to assess the relative threat associated with actual or potential releases of hazardous substances to ground water, surface water, soil, and air. The HRS is the primary means by which EPA evaluates sites for the National Priorities List (NPL), the list of the hazardous waste sites that are eligible for remedial funding under the Superfund program. PREscore is designed to be user-friendly, operating via hierarchically-dependent spreadsheets that allow data to be entered quickly and efficiently. Significant program features include: Instant score calculation and continuous score display; Multiple site-scenario testing capability; Extensive Help screens; Comprehensive documentation ability; PREscore fully automates the HRS, allowing for the entry and evaluation of all types of site-related information including sampling data, waste quantities and waste characteristics, physical parameters of the site, population data, and administrative information. In addition, PREscore contains HRS-related hazardous substance information derived from the Agency's Superfund Chemical Data Matrix (SCDM), which includes substance characteristics such as toxicity and persistence, and concentration benchmarks for the substances commonly encountered at Superfund sites (Currently over 300 substances). PREscore is accompanied by PREprint, a program that produces an extensive documentation record for sites evaluated by PREscore. PREscore requires no specialized computer experience and has no additional software requirements. However, PREscore does require the user to be familiar with the HRS. PREscore Version 3.0 updates the previous PREscore versions 2.0 and 1.1 with program modifications and information on hazardous contaminants from the June 1994 Superfund Chemical Data Matrix.

Toxic Release Inventory (TRI), 1987-1992 (on CD-ROM). Data file.
Environmental Protection Agency, Washington, DC. Information Management Div.
1992, CD-ROM* EPA/DF/CD-94/119
System requires 640K RAM (with 430-480K RAM available for fielded data), Hard Disk, MS-DOS or PC-DOS version 3.3 or higher, CD-ROM drive, color or monochrome monitor and a printer. Includes user instructions. Supersedes PB93-500742. See also PB92-501816 (mag tape), PB91-507509 (mag tape), PB91-508572 (DK), and PB91-509109 (DK).
The datafile is on one 4.72 inch disc. Data format: ISO 9660.

Section 313 of the Emergency Planning and Community Right-to-Know Act (also known as Title III) of the Superfund Amendments and Reauthorization Act of 1986 (Public Law 99-499) requires EPA to establish a national inventory of toxic chemical emissions from certain facilities. The final Toxic Chemical Release Form R and regulations for the 1987 reporting year were published in the Federal Register on February 16, 1988 (53 FR 4500-4554). The list of toxic chemicals subject to reporting consisted initially of chemicals listed for similar reporting purposes by the States of New Jersey and Maryland. There are over 300 chemicals and categories on these lists. The reporting requirement applies to owners and operators of facilities that have 10 or more full-time employees, that are in Standard Industrial Classification (SIC) codes 20 through 39 (i.e., manufacturing facilities) and that manufacture (including importing), process or otherwise use a listed toxic chemical in excess of specified threshold quantities. The following information is required on Form R: the name, location and type of business; off-site locations to which the facility transfers toxic chemicals in waste; whether the chemical is manufactured (including importation), processed, or other-

wise used and the general categories of use of the chemical; an estimate (in ranges) of the maximum amounts of the toxic chemical present at the facility at any time during the preceding year; quantity of the chemical entering each medium-air, land, and water-annually; waste treatment/disposal methods and efficiency of methods for each waste stream; optional information on waste minimization; and a certification by a senior facility official that the report is complete and accurate. The law mandates that the data be made publicly available through a computer database. The online TRI file should appeal to a broad based user audience including industry, state and local environmental agencies, emergency planning committees, the Federal Government and other regulatory groups. Another important user group is likely to be concerned citizens who, on their own or through public interest groups and public libraries, can use TRI to ask questions about chemical releases in their communities.

System: MS DOS Version 3.3 operating system. Language: Base SAS. 2 MB of RAM with memory over 640K configured as expanded memory, hard disk with at least 10 MB of available space, printer with wide carriage or ability to compress print. This application requires a minimum of 585K of base memory. Supersedes PB94-501335. See also PB94-501467.
The software is on one 5 1/4 inch DOS diskette, 1.2M high density. File format: Executable code. Files are compressed. Documentation included; may be ordered separately as PB92-169564.

OCCSS software is a version of a mainframe-based application developed for the U.S. Environmental Protection Agency's National Contract Laboratory Program (CLP). OCCSS is designed to automate the determination of contractural compliance and completeness of data submitted to the EPA under the Routine Analytical Services (RAS) programs of CERCLA (Comprehensive Emergency Response Clean-up and Liability Act). In order to remain consistent with the mainframe system, this PC version of OCCSS is written in SAS, and requires that SAS/PC be installed on the host PC. It will load analytical data from diskettes into SAS file format, perform technical edits on data, produce technical defect and summary reports, and reproduce forms which contain defects. In addition, OCCSS includes software to assist in identifying these critical structural defects in the data format, to assist in identifying these for correction prior to performing technical edits.

Manual of Instructional Problems for the U.S.G.S. MODFLOW Model (for Microcomputers). Data file.
Robert S. Kerr Environmental Research Lab., Ada, OK.
1993, 3 diskettes EPA/DF/DK-94/114
This product contains text only. Customers must provide their own search and retrieval software.
The datafile is on three 5 1/4 inch DOS diskettes, 1.2M high density. Documentation included; may be ordered separately as PB94-189941.

The manual is a practical self study guide illustrating the application of the USGS modular ground-water flow model, MODFLOW. It was developed as a text for modeling and ground-water hydrology courses and as a self study guide to aid regulators, modelers, and educators in learning MODFLOW. The information in the manual should be of interest to both the beginner and advanced modeler for hands-on experience with the practical application of MODFLOW. In addition, the problems in the manual can be used to verify the correct installation of the MODFLOW code on a particular computer system as a benchmark for the verification of other flow models. The text introduces each problem, describes the available input data, outlines the output, and discusses the results. Each problem is supported by several figures and tables to illustrate and clarify the model scenario. The diskettes contain input and output data sets for each problem. A copy of MODFLOW is not included in the manual. It is assumed the user has obtained a copy of MODFLOW and has the necessary computer hardware to execute the program.

Under the Superfund Amendments and Reauthorization Act (SARA) of 1986, Congress requires EPA to involve States in the Superfund program in a 'substantial and meaningful' way. EPA's State and Local Coordination Branch (SLCB) is responsible for developing regulations, guidance, and policy related to this Congressional mandate. As part of its responsibilities, the SLCB tries to maintain comprehensive information about State capabilities to contribute to or manage cleanups at hazardous waste sites. Under a cooperative agreement with EPA, ELI has collected, organized, and summarized the information presented here on the 52 State cleanup programs.

The purpose of this plan is to promote the coordination of a timely, effective response by various Federal agencies and local, state, and non-government organizations to discharges of oil and releases of hazardous substances, pollutants and contaminants in order to protect public health, welfare and the environment. Although this plan includes information on Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) remedial response actions, the primary purpose of the plan is to provide guidance for emergency response and removal under the provisions of the Clean Water Act (CWA) as amended by the Oil Pollution Act of 1990 (OPA), for response actions under provisions of CERCLA, and for regional contingency planning under the provisions of the Superfund Amendments and Reauthorization Act of 1986 (SARA).

The Plan is a Regional Contingency Plan (RCP) for USEPA Region IX - Oceania which includes the State of Hawaii, Commonwealth of the Northern Marianas Islands, Territory of Guam and Territory of American Samoa as well as all other islands under U.S. jurisdiction in the south and central Pacific Ocean. It reflects updates and revisions to the Oceania Plan developed by the U.S. Coast Guard (USCG). The individual sub-Area plans address areas of environmental or special economic importance. Environmentally sensitive areas are broadly defined to include unique or pristine areas, critical or endangered wildlife species habitats, National, state or local parks, fish hatcheries, shore areas, and research, cultural or archaeological sites. Due to the scope and detail required to identify these areas, drinking water intakes and environmentally sensitive areas will be covered in the specific sub-Area plans.

The Northwest Area Contingency Plan (ACP) supersedes the working draft released in March 1993 which officially replaced the Local Contingency Plans for MSO Puget Sound and MSO Portland; it functions as the Inland Area Contingency Plan for the Environmental Protection Agency; and it replaces Washington and Oregon Statewide Master Plans as the primary response and planning document for oil spill response. This volume represents the basic plan. It is the summation of policies and procedures for two Coast Guard Captain of the Port Zones, the Statewide Master Plans for the States of Oregon and Washington, and EPA Inland Region Ten. It provides Federal, state, and local responders in the Pacific Northwest with a single comprehensive response and planning document.

The Area Contingency Plan (ACP) is written in conjunction with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) and Comprehensive Environmental Response, Compensation and Liability Act of 1980. The purpose of this Plan is to meet the requirements of Section 311(j)(4) of CWA. The ACP is designed to coordinate timely and effective response by Federal On-Scene Coordinators (OSC), various Federal agencies, State and local officials, and private industry to minimize damage resulting from releases of oil or hazardous materials. The ACP includes resource information that may be utilized during a response. The Plan outlines the type of cooperative response that should be carried out by the OSC during response actions.

This directive transmits guidance on the use of authority of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, to conduct response actions to address releases of hazardous substances, pollutants, or contaminants that are found within buildings. Use of this guidance may assist Regional Decision Teams (RDTs) in implementing early actions under the Superfund Accelerated Cleanup Model (SACM).

In an effort to speed and maximize cleanup of the worst sites first, the Environmental Protection Agency (EPA) developed the Superfund Accelerated Cleanup Model (SACM). SACM streamlines the Superfund process so hazardous waste sites can be addressed quicker and in a more cost effective manner. EPA Regional offices developed a number of pilot projects to test the principles of SACM. Although many pilots are underway in the Regions, the pilots described here involve four areas: accelerating cleanup through early actions; integrating site assessments; using Regional Decision Teams to establish priorities; and accelerating cleanup through the use of new technology.

The Clean Water Act of 1977 as amended by the Oil Pollution Act of 1990 required the creation of 'federal areas', for which broadly based area committees, chaired by federal On-Scene Coordinators would prepare Area Contingency Plans. In EPA Region VI, the five state regional area has been designated as the federal planning area, and the Regional Response Team serves as the planning committee. An Area Contingency Plan has been prepared which fully meets the requirements set forth in Section 4202(b)(1)(A) of the Oil Pollution Act of 1990. This plan recognizes the existence of several areas that have disproportionately high risk of major oil spills, and provides greater levels of detail for those areas.

Paper copy available on Standing Order, deposit account required ($100 U.S., Canada, and Mexico; all others $200). Single copies also available in paper copy or microfiche.

As part of the Superfund Administrative Improvements Initiative, this interim directive establishes a streamlined approach for determining protective levels for lead in soil at CERCLA sites and RCRA facilities that are subject to corrective action under RCRA section 3004(u) or 3008(h). This interim directive replaces all previous directives on soil lead cleanup for CERCLA and RCRA programs.

The purpose of the memorandum is to amend OSWER Directive 9355.7-02 (May 23, 1991) (PB91-921369). Structure and Components of Five-Year Reviews, by providing supplemental guidance on five-year reviews. The supplemental guidance provides necessary clarifi-

cations as well as new direction to streamline the five-year review process and ensure the effective and efficient use of program resources. Specifically, this supplemental guidance: changes the trigger date for policy reviews to construction completion; provides a prioritization plan for conducting five-year reviews when Regions cannot conduct all required reviews; clarifies responsibility for conduct of five-year reviews at Federal facilities; restates that the five-year review covers all operable units (OUs) at a site; and, introduces a streamlined Type Ia review at sites where construction is ongoing, and provides model language.

Guidance on Residential Lead-Based Paint, Lead-Contaminated Dust, and Lead-Contaminated Soil.

Recently EPA has received an increasing number of requests for advice on residential lead-based paint hazards, including hazards from lead-contaminated dust and soil in and around homes. These requests have come from State and EPA Regional Officials, as well as from public health and housing personnel, concerned with childhood lead poisoning. While the Agency is in the process of developing a rule to identify these hazards under section 403 of the Toxic Substances Control Act (TSCA), 15 USC 2683, the authors believe it is appropriate to respond to these requests by issuing guidance at this time based upon their best currently available information. It is the Agency's intent that this guidance be used to prioritize primary prevention activities that address hazards from lead in and around residences. The levels and conditions described in this guidance should be used by decision-makers (risk assessors, risk managers, etc.) to identify lead-based paint hazards, sources of lead exposure, and the need for control actions in residential environments where children may be present.

This Interim Guidance supplements the proposed response plan revisions to 40 CFR Part 112 of February 17, 1993 (PB93-963408). The purpose of this guidance is to assist Agency personnel in determining whether a facility could reasonably be expected to cause significant and substantial harm to the environment. The Oil Pollution Act (OPA) of 1990 requires that such facilities must have their facility response plans reviewed and approved by the Agency. The Interim Guidance includes a description of the screening process, forms to document the determination process, and an attachment that explains the justification for each criterion.

Dense nonaqueous phase liquids (DNAPLs), such as some chlorinated solvents, coal tar wastes, creosote based wood-treating oils, and some pesticides, are immiscible fluids with a density greater than water. As a result of widespread production, transportation, use, and disposal of hazardous DNAPLs, particularly since 1940, there are numerous DNAPL contamination sites in North America. The potential for significant long-term groundwater contamination by DNAPL chemicals at many sites is high due to their toxicity, limited solubility (but much higher than drinking water limits), and significant migration potential in soil gas, groundwater, and/or as a separate phase liquid, DNAPL chemicals, particularly chlorinated solvents, are among the most prevalent groundwater contaminants identified in groundwater supplies and at waste disposal sites.

The Rocky Mountain Arsenal (RMA), located north of Denver, CO, is a large (27 sq mi.) Superfund site composed of many habitats. To meet specific sampling needs, investigators selected several smaller reference areas representing specific habitats at RMA. The Wellington Wildlife Refuge, for example, more than 50 miles north of RMA, was selected for collecting mallard ducks, mallard eggs, cottontail rabbits, mule deer, and prairie dogs for chemical analyses. And investigators selected land five miles away as a reference site for soils because it was composed of the same soil type as that found at RMA. Investigators should try to match soil characteristics--such as particle size distribution, organic matter content, hydrologic regime, and pH--as closely as possible. For example, organic matter content, pH, and texture determine a soil's cation exchange capacity, or its ability to adsorb positively charged ions such as H(+), Mg(+2), or Cd(+2). These cations may include pollutants as well as nutrients.

The purpose of this Manual is to enumerate a universal set of cost management practices and procedures for EPA personnel who have responsibility for managing Work Assignments under contracts where EPA Contracting Officers (COs), EPA Project Officers (POs), and Work Assignment Managers (WAMs) are co-located (e.g., ARCS contracts and RAC contracts, as well as other Long-Term Contracting Strategy (LTCS) contracts under which remedial work is done and that use Work Assignments as the ordering document). The Manual presents cost management techniques that can be employed by EPA officials at each step in the life of a Work Assignment. In general, the Manual is designed to improve oversight of EPA contractors without creating an unnecessary administrative burden on WAMs, POs, and COs. Checklists and sample forms are included in the Manual to assist EPA personnel in monitoring contractor's costs.

The report presents the results of an analysis of the State/Territory non-National Priorities List (non-NPL) cleanup activities in the United States. It discusses Superfund removal and remedial actions, the predominant remedies selected, and the costs of cleanup. The time frame of the data presented within this report covers the period from 1980 through 1992. The report focuses on State/Territory non-NPL hazardous waste cleanup efforts. A key point is that the data is historical. The report represents what has happened over the first twelve years of the Superfund program. It does not purport to represent what is currently happening in Superfund or what is anticipated to happen in Superfund.

Frequently at Superfund sites, excavation of contaminated material is part of the selected remedy. There are a variety of approaches for determining and documenting the removal of the appropriate amount of material. This fact sheet documents one specific approach taken by Region 6 and the Texas Natural Resource Conservation Commission at the Sikes Disposal Pits Superfund project. The Texas Natural Resource Conservation Commission (TNRCC) administered the clean-up of the Sikes Disposal Pits under a Cooperative Agreement with Region 6 of the U.S. Environmental Protection Agency. The high level of on-site oversight support used by TNRCC to make determinations, provide direction and monitor the remediation contractor's efforts made this project unique. Remediation goals included the excavation of contaminated material for incineration, the minimization of the excavation of material that does not exceed the action criteria, and the minimization of contractor remobilization when halting excavation for sampling and analysis.

The Superfund Delegations Work Group was established on August 10, 1993 by Deputy Administrator Sussman as part of the Superfund Administrative Improvements Task Force. The Work Group examined current delegations of authority (both formal and informal) to assure that Superfund decisions are being made at the most efficient and effective level. The Work Group reviewed the 55 formal Superfund delegations and other policy directives and developed recommendations for 17 Superfund delegations and two directives. Of these, eleven delegations have been accepted for implementation by the Assistant Administrator for the Office of Solid Waste and Emergency Response (OSWER). Enforcement related recommendations have been forwarded to the recently formed Office of Enforcement (OE) Enforcement Delegations Work Group for further action consistent with the reorganization of OE to the Office of Enforcement and Compliance Assurance (OECA).

In response to increasing concern over the safety and health of hazardous waste workers at Superfund incinerator sites, the Environmental Protection Agency (EPA) recently established a joint EPA-Labor Superfund Health and Safety Task Force to coordinate activities designed to ensure vigorous oversight of occupational safety and health at these sites. As a result of EPA/Labor Task Force-sponsored inspections, operators of the inspected incinerators have agreed to address the team's findings and to improve their safety and health programs. The EPA/Labor Task Force also has developed a draft 'Protocol for Safety and Health Inspections at Superfund Sites' to be used for inspections of all types of Superfund sites. In 1993, the EPA/Labor Task Force will continue to conduct additional Superfund incinerator site inspections. EPA believes that the initiaties launched with the EPA/Labor Task Force will ensure that the safety and health of workers engaged in hazardous waste cleanup activities is a top priority at these sites.

The Superfund Chemical Data Matrix (SCDM) is a source for factor values and benchmark values applied when evaluating potential National Priority List (NPL) sites using the Hazard Ranking System (HRS). The HRS assigns factor values for toxicity, gas migration potential, gas and ground water mobility, surface water persistence, and bioaccumulation potential based on the physical, chemical, and radiological properties of CERCLA hazardous substances (defined for HRS purposes as CERCLA hazardous substances plus CERCLA pollutants and contaminants) present at a site for a particular migration pathway. The HRS also assigns extra weight to targets with exposure levels to hazardous substances that are at or above benchmarks. These benchmarks include both screening concentrations and concentrations specified in regulatory limits for the hazardous substances present at a site for a particular migration pathway. Section 2 of this document explains how data are selected and calculated for inclusion in SCDM. Section 3 describes how SCDM data, HRS factor values, and benchmarks are presented.

This decision document presents a selected source control remedial action designed to provide containment of landfill wastes at Landfill 5, Pease AFB, NH. The selected remedy includes excavation and consolidation, above the groundwater table, of saturated Landfill 5 debris and construction of a cap over Landfill 5. It is also proposed that all soil and debris from Landfills 2 and 4 would be excavated and transported to

Landfill 5 for consolidation and used as subgrade fill material prior to capping of Landfill 5. A final decision under CERCLA for Landfills 2 and 4 will be required prior to implementation of the proposed consolidation plan. The selected remedy also includes extraction of groundwater to facilitate excavation of saturated landfill debris, treatment of the groundwater in an on-site mobile treatment system and discharge of treated groundwater to the base wastewater treatment facility.

The U.S. Naval Education and Training Center (NETC) Newport is a National Priorities List (NPL) site. There are currently four areas of contamination (AOC) and six study areas (SAs) within NETC Newport that are under investigation. This Record of Decision (ROD) relates to the presence of the existing landfill area at McAllister Point as a source of contamination. McAllister Point Landfill was the site of a sanitary landfill which operated over a 20-year period. From 1955 until the mid-1970's, the site accepted all wastes generated at the Naval complex. The landfill received waste from all operational areas (machine shops, ship repair, etc.), Navy housing areas (domestic refuse), and from the 55 ships homeported at Newport prior to 1973 (approximately fourteen 40-cubic yard containers each day). The materials disposed of at the site reportedly included spent acids, paints, solvents, waste oils (diesel, lube and fuel), and polychlorinated biphenyl (PCB)-contaminated transformer oil.

This decision document presents the selected remedial action for the Kenmark Textiles Printing Corporation (Kenmark) site (Site). The United States Environmental Protection Agency (EPA), in consultation with the State of New York, has determined that the Site does not pose a significant threat to human health or the environment and, therefore, remediation is not appropriate. Thus, 'No Action' is the selected remedy for the Site. The determination is based on the results of remedial investigation activities conducted by a potentially responsible party (PRP) for the Site under NYSDEC supervision from 1987 to August 1990 and under EPA supervision from August 1991 through December 1993.

This Record of Decision (ROD) documents the U.S. Environmental Protection Agency's (EPA's) selection of a remedial action to augment the previously implemented remedial action (PB85-213734) and to address contamination detected outside the containment system at the Pollution Abatement Services (PAS) site. The selected remedial action represents the third operable unit of site remediation. The first operable unit was for removal actions taken from 1973 to 1982 by EPA and NYSDEC. The remedy for the second operable unit which addressed the on-site contaminated groundwater was specified in a ROD issued in June 1984. The selected remedy for this operable unit will incorporate all of the existing components of the second operable unit of site remediation. These components include: the existing containment system (including a cover, slurry wall and leachate and groundwater collection system); treatment and disposal of the collected leachate and groundwater; site security and access control by a perimeter fence; site maintenance; and long-term monitoring.

The decision document presents the selected remedial action for Operable Unit Two (OU-II) of the Juncos Landfill located in the Municipality of Juncos, Puerto Rico. This decision document explains the factual and legal basis for selecting the remedy for this site. The operable unit is the second of two operable units for the Juncos Landfill Site. It focuses on groundwater contamination, resulting from contaminant migration from the landfill. The key components of the OU-II remedy include the following: Natural attenuation or no action for the groundwater; and Recommendation that institutional controls consisting of restrictions on groundwater withdrawal in the area north of the landfill be implemented by the Commonwealth. The implementation of this selected remedy in conjunction with the OU-I remedy will minimize or eliminate the potential carcinogenic and noncarcinogenic impacts.

The decision document presents the selected interim remedial action for Operable Unit One at the Universal Oil Products (UOP) site, in the Borough of East Rutherford, Bergen County. The response action described in the document represents an interim remedy for the first of three planned operable units at the site. Operable Unit One consists of the uplands soils and leachate at the site. The selected interim action will address the threats due to contaminated soils and contaminated leachate, designated as Operable Unit One. It addresses the principle threats through treatment of the most highly contaminated materials and the lower level threats through containment. Since a portion of the selected remedy calls for the containment of contaminated soils, the remedial action for Operable Unit One will require long-term management.

This decision document presents the selected remedial action for the Tronic Plating Site (Site) located in the Town of Babylon, Suffolk County, New York. The United State Environmental Protection Agency (EPA), in consultation with the State of New York has determined that the Site does not pose a significant threat to human health and the environment and, therefore, remediation is not necessary nor appropriate. This determination is based on the results of the Phase I and Phase II remedial investigations conducted at the Site from 1989 to 1992, the risk assessment performed for the Site and the sediment and soil removal activities performed pursuant to an Administrative Order on Consent that were completed on August 13, 1993.

This Record of Decision (ROD) presents a selected remedial action for soils at Site SS-011 on Plattsburg AFB in Plattsburgh, New York. Inasmuch as prior removal actions taken to excavate and dispose of DDT (4,4'-dichlorodiphenyltrichloroethane) contaminated soils in 1991 have proven protective of human health and the environment, no further action has been determined necessary at Site SS-011 to reduce site contaminants beyond their current levels. Inspections will be conducted, once per five-year period, to assess the general condition of the site, including the progress of revegetation in areas disturbed by the 1991 removal action and the potential effects of runoff from or onto the site.

This decision document presents the U.S. Environmental Protection Agency's (EPA's) selection of the remedial action for the third operable unit of the Preferred Plating Corporation Superfund Site (Site). This is the third and final operable unit for the Site, which addresses potential groundwater contamination that has been detected in the upgradient portion of the Site at

Del Laboratories, Inc. (Del). EPA in consultation with the NYSDEC has determined that this contamination does not pose a significant threat to human health or the environment and, therefore, remediation is not appropriate. This determination is based on previous cleanup activities at Del's facility, the cleanup activities that are planned under the two other operable units at the Site, and the remedial investigation and the human health risk assessment that were conducted for the third operable unit.

The Lodi Municipal Well site was placed on the National Priorities List primarily due to radiological contamination. After performing extensive field investigations, the authors have determined that the radiological contamination is naturally occurring. Remedial action is not necessary to ensure protection of human health and the environment from non-radiological compounds at the Lodi Municipal Well site since the concentrations of those compounds in the ground water at the well do not pose an unacceptable risk. However, because ground water in the area has been found to contain sporadic contamination that is regional in nature, EPA recommends that the ground water not be used for potable water supply purposes without appropriate treatment.

The decision document presents the selected remedial action for the Robintech, Inc./National Pipe Co. Site (hereinafter, the Site or the Robintech Site), Operable Unit Two (OU-2), located in the Town of Vestal, Broome County, New York. The United States Environmental Protection Agency (EPA) has determined that no action is necessary for the suspected lead contamination of Site-related soil and sediment at the Robintech Site. The concentration of lead in Site-related soil and sediment were found to be acceptable for protection of human health and the environment. Thus, No Action is the selected remedy for the second operable unit for the Site.

This decision document presents the selected remedial action for the Reynolds Metals Company Site Study Area, in Massena, New York. The New York State Department of Environmental Conservation (NYSDEC) strongly supports the proposed dredging of contaminated sediments from the river, agrees with EPA's cleanup levels for the Site, and agrees with and supports the concept of using the Black Mud Pond for the disposal of untreated sediments and treatment residuals. This action or 'operable unit' is the first and only operable unit planned by the U.S. Environmental Protection Agency for the Reynolds Metals Company Site Study Area and addresses the principal threat posed by contaminated sediments in this Area by utilizing a mixed treatment/containment remedy for these contaminated sediments.

The decision document presents the selected remedial action for one site (Site 13), located at the Naval Air Warfare Center, Aircraft Division (NAWCADLKE) in Lakehurst, New Jersey. The United States Department of the Navy, the lead agency for this Site, has selected In-Situ Vapor Extraction as the selected remedy for Site 13. Implementation of this alternative entails extracting contaminants from the subsurface soils in vapor phase. The subsurface soil will be remediated to risk based levels, and the New Jersey soil clean up criteria. It should be noted that this Record of Decision (ROD) addresses only Site 13 and it is not intended to represent the remedial action status for other areas of concern at NAWCADLKE. This decision document presents the selected remedial action for the Revere Chemical Site (the Site), located on the southeast side of U. S. Route 611, just north of Route 412 and south of the town of Revere, Pennsylvania. The contaminated media at the Site are divided into Operable Units as follows: OU1 - Contaminated soil areas, Solid waste, and miscellaneous debris and OU2 - Ground water and Mercury-contaminated sediments. This ROD addresses the first Operable Unit. The selected remedial action for the first Operable Unit is a final remedy and will address contaminated soil and solid waste and miscellaneous debris on portions of the Site. The volatile organic (VOC) soil contamination represents the principal threat. Therefore, treatment of the VOC-contaminated soil will be required.

This decision document presents the selected remedial action for Operable Unit 3 of the William Dick Lagoons Site (Site), in West Caln Township, Pennsylvania. The remedy described in this Record of Decision is for Operable Unit 3 at the Site. The remedy selected for Operable Unit 3 will reduce the concentrations of hazardous substances in the Site soils so that leaching of contaminants into the groundwater will be minimized. Reduction of the volatile organic compounds and semi-volatile organic compounds in the soils is necessary in order the groundwater will not continue to be impacted above acceptable levels. In addition, the installation of a vegetative soil cover or multi-layer cap will prevent the surrounding community from exposure to Site-related contaminants through inhalation, ingestion, and dermal contact.

This decision document presents the selected remedial action for the Woodlawn Landfill site (the Site) located in Colora, Cecil County, Maryland. The remedial action selected for the Site is a final remedy which will address contaminated ground water, contaminated soils, and wastes buried at the Site. The ground water contamination represents a significant threat. Therefore, remediation of contaminated ground water will be required. The wastes and contaminated soils at the Site pose a relatively low long-term threat. Therefore, the wastes and contaminated soils will be addressed through a combination of engineering and institutional controls.

This decision document presents the final selected remedial action for the Recticon/Allied Steel site in Parker Ford, East Coventry Township, Chester County, Pennsylvania. This is the only planned response action for the site. This remedy addresses source control of contaminated soil, groundwater remediation and an alternative water supply. Groundwater contamination represents a primary threat; therefore, the extraction and treatment of groundwater and an alternative water supply will be required. Soils on-site represent a low-level threat that may potentially impact groundwater quality; therefore, an excavation and off-site disposal remedy for source control will be required.

This decision document presents the selected remedial action for the Novak Sanitary Landfill Site (the 'Site'), South Whitehall Township, Lehigh County, Pennsylvania. The remedial action selected for the Site is a final remedy which will address the principle threat and reduce risk to human health and the environment caused by the unlined landfill. To achieve this objective, the selected remedy will: (1) ensure containment of the landfill contents, (2) provide long term monitoring of ground water for residences adjacent to the Site that are utilizing the ground water for drinking water; (3) mitigate the continued release of contaminants leaching from the landfill to the aquifer; (4) control the migration of combustible gases such as methane, (5) ensure landfill contaminants in the Site's surface storm-water and leachate drainages outside the proposed landfill cap are either not of environmental risk or contained by the proposed cap.

This decision document revises the Record of Decision (ROD) signed on April 22, 1988, (PB89-206205) for the Delaware Sand and Gravel Site (Site), in New Castle, New Castle County, Delaware. This ROD amendment revises the remedy previously selected to address the buried materials and contaminated soils in the Drum Disposal, Ridge and Inert areas of the Site. This ROD amendment will be the final Record of Decision for the Site. The principal threats associated with these portions of the Site are buried drums and contaminated soils containing hazardous substances in the Drum Disposal Area and contaminated soils containing hazardous substances in the Ridge Area.

The decision document presents the selected interim remedial action for the Townsend Saw Chain Company Site, Pontiac, Richland County, South Carolina. the purpose of this interim action is to prevent the continued offsite migration of the plume of contaminated groundwater. As a result of the site remedial investigation, the offsite area affected by chromium contamination in the surficial aquifer was found to extend a much greater distance from the site than previously known. Additionally, because the RI work to date has known that the contaminated groundwater discharges to a tributary and a creek, a potential threat exists to the environment within and surrounding those surface water bodies.

This decision document presents the selected remedial action for the Caldwell Lace Leather Site, located in Auburn, Kentucky. From 1972 until 1985, the Site received sludge and solid wastes generated by the Caldwell Lace Leather tannery facility located in Auburn, Kentucky. The Site is divided into two areas, one a landfill and the other a landfarm. Tanning-sludges and cowhide scraps were landfilled in unlined trenches or lagoons. Although EPA recommends that no Superfund action be taken, EPA does recommend that the Commonwealth of Kentucky or the current landfill owner continue groundwater/spring monitoring; and future land use restrictions be placed on the landfill property as well as maintenance of the landfill cover to prevent land use activities that would expose subsurface waste.

The remedial investigation (RI) and the risk assessments (RAs) conducted for Site 48 support a no action remedial alternative. The RI and RAs addressed all media at the site, and therefore, no other actions will be considered for Site 48. The selected remedy is protective of human health and the environment, complies with Federal and State requirements that are legally applicable or relevant and appropriate to the remedial action, and is cost-effective. The statutory preference for treatment is not satisfied because no treatment was necessary for the protection of human health and the environment. Contaminant levels detected in the media at the site were found to present no imminent or substantial threat to human health or the environment. A five-year review will not be necessary for the site.

The document presents the selected final preventive action for the H-Area HWMF Operable Unit at the Savannah River Site (SRS). The selected final action remedy involved the stabilization and placement of all contaminated materials under a low permeability cap. This remedy prevents physical exposure to contaminants and mitigates further migration of contaminants to the groundwater by minimizing a liquid medium pathway (rainwater percolation) for transport. No further action is necessary for the unit. However, as a condition of the RCRA Hazardous Waste Permit, post closure groundwater monitoring is required to verify that no unacceptable exposures to potential hazards posed by conditions at the operable unit occur in the future.

The purpose of this interim remedial action is to reduce the potential threat to human health and the environment from the radiologically contaminated scrap and debris lying on the surface of Waste Area Grouping (WAG) 11. Contaminated surface debris that litters much of the surface of WAG 11 is a result of the intentional storage on the site of contaminated scrap, debris, and industrial waste. Measurement surveys of alpha, beta, and gamma radiation have revealed that contaminants are present on some of the debris in levels high enough to be of concern. Swipe sample analytical results have shown elevated concentration of Uranium 238, Cesium 137, and other isotopes. Results

of radiological surveys on the debris range from 0.5 mrad/h to 21 mrad/h. Physical hazards include sharp pieces of metal and broken glass on the ground surface.

This decision document presents the selected interim remedial action for the ORNL WAG 13 in Oak Ridge, Tennessee. The purpose of this interim action is to reduce the risk to human health and the environment resulting from current elevated levels of gamma radiation on the site and at areas accessible to the public and adjacent to the site. To achieve this, only the cesium-contaminated soil within the plot will be addressed. This is not the final action planned for WAG 13. Subsequent actions are planned to fully address the remaining threats posed by the conditions at the site.

This decision document (Record of Decision), presents the selected remedial action for Cold Creek Swamp (OU3) for the Stauffer Chemical (LeMoyne Plant) Superfund Site and the Stauffer Chemical (Cole Creek Plant) Superfund Site, Mobile County, Alabama. This operable unit is the third of four at the Stauffer Sites. Operable unit one was enumerated by a Record of Decision that was signed by EPA on September 27, 1989. Operable unit two addressed the migration of contaminants present in the surficial aquifer at the Site. Operable unit three, which is enumerated by this Record of Decision, addresses contamination at the Site in Cold Creek Swamp.

This decision document presents the selected remedial action for the Koppers Co., Inc. (Morrisville Plant) Superfund Site in Morrisville, North Carolina. A primary remedy and a contingency remedy have been selected for soils. The primary selection for soils, alternative S-9, will permanently remove and destroy contamination in the soil through treatment. Alternative GW-4 for groundwater will remove site-related contaminants in the groundwater through groundwater extraction and on-site treatment by carbon adsorption. Alternative SW-3 for surface water will remove site-related contaminants in the surface water by the dewatering of the ponds, backfilling with clean fill, and regarding the areas for proper drainage flow.

This decision document presents the selected Interim Remedial Action for the National Southwire Aluminum Company (NSA) Site, approximately four miles northwest of Hawesville, Hancock County, Kentucky. This Interim Remedial Action employs the use of extraction wells combined with a pump and treat system in order to prevent further ground water plume migration, to reduce contaminants in the Ohio River Valley alluvial aquifer at the Site, and to reduce the threat of additional contamination of the Ohio River. This action will also initiate ground water restoration while the Remedial Investigation and Feasibility Study (RI/FS) and post RI/FS activities are being completed. Onsite contamination identified in the unconsolidated alluvial aquifer consists of cyanide, metals, and fluoride in two onsite ground water plumes. Leachate identified in the onsite landfills contains the above contaminants as well as volatile and semi-volatile organics, and polychlorinated biphenyls (PCBs).

This decision document presents the selected remedial action for the Geiger (C & M Oil) Site, in Rantowles, South Carolina. This decision addresses the principal threat remaining at the Site by treating the most highly contaminated soils and ground-water. The soils will be treated in situ using solidification/stabilization, such that the Site's soils will not require any long-term management. The contaminated ground-water will be extracted, treated on-site, and disposed of either on-site or off-site. Treated ground-water will be disposed of either to an on-site stream which flows off-site or to the same stream off-site.

This decision document (Record of Decision) presents the selected remedial action for the Mathis Brothers - South Marble Top Road Landfill site, Walker County, Georgia. At this time the remedial action is proposed as both the first, and the final remedial action for the site. The function of this remedy is to treat contamination and reduce it to health based levels. Source material and contaminated soils are the principal threat at the site.

The decision document presents the selected remedial action for Operable Unit Two (OU2) at the O-Line Ponds Area, Milan Army Ammunition Plant, Milan, Tennessee. The goal of the overall cleanup activities at the site is to prevent migration of contaminants from soil at the site and to prevent exposures to these contaminants, so that no adverse health effects will result from current or future off-post or on-post use. Soil contaminated with explosives compounds is known to exist in the O-Line Ponds area, and under current conditions, this contamination poses a potential threat to groundwater at the site. Currently contaminated groundwater is being addressed by separate remedial actions under different Operable Units (OUs).

The decision document (Record of Decision), presents the selected remedial action for the Davie Landfill Site, Davie, Broward County, Florida. This action is the second and final action planned for the Site. This action addresses ground water contamination at the Site and calls for the implementation of response measures which will protect human health and the environment. The selected remedy relies on natural attenuation of vinyl chloride and antimony. A ground water monitoring program would be performed to ensure that attenuation is effective.

The document presents the decision for no further action for the Abandoned Nitric Acid Pipeline at the Oak Ridge Y-12 Plant in Oak Ridge, Tennessee. The baseline risk assessment, conducted as part of the Remedial Investigation (RI) for the site, indicates that conditions related to the Abandoned Nitric Acid Pipeline do not pose an unacceptable threat to human health or the environment. The total carcinogenic risks to either workers or future homesteaders at the Abandoned Nitric Acid Pipeline from all pathways are below 10 to the minus 4 power, the U.S. Environmental Protection Agency's thresholds of concern for remedial action. Noncarcinogenic hazard indices are below the action level of 1.0 established by the U.S. Environmental Protection Agency.

The 2,200-acre Alabama Army Ammunition Plant (AAAP) site was located in Talladega County, Alabama, near the junction of Talladega Creek and the Coosa River. AAAP was built in 1941 as a government-owned and contractor-operated facility that produced nitrocellulose, nitroaromatic explosives, and 2,4,6-trinitrophenyl methyl nitramine. In 1978, the U.S. Army's Toxic and Hazardous Materials Agency (USATHAMA), managing the Army's Installation Restoration Program (IRP), identified soil, sediment, and ground water potentially contaminated by explosives, asbestos, and lead as a result of past site operations. This remedial action describes remedial action for soil and sediment contaminated by explosives (DNT, TNT, nitrotoluenes, and nitrobenzenes) and metals (mostly lead).

The decision document presents the selected remedial action for the J&L Landfill, in Rochester Hills, Michigan. The purpose of this remedy is to reduce the risks associated with exposure to the contaminated materials and to reduce the potential for migration of contaminants to the groundwater. The selected remedy for OU1 consists of a 1-foot compacted clay layer overlain with a Geosynthetic Clay Liner (GCL)/60 mil Flexible Membrane Liner (FML) barrier layer, a drainage layer consisting of geonet with geotextile filter fabric, a 36-inch clean fill layer, and a 6-inch topsoil layer; consolidation of the contaminated soil and sediments from the east ditch; and monitoring of the contaminated groundwater beneath the site. In addition, a proper slope will be constructed and maintained so that all surface water runoff properly drains off the cap into a collection system, or drainage ditches around the perimeter of the site.

The decision document presents the selected remedial action for the American Anodco site, in Ionia, Michigan. EPA has determined that conditions at the site due to contamination by inorganic chemicals pose no current or potential threat to human health or the environment. While the American Anodco site does appear to exhibit trace amounts of inorganic contamination which result in slightly elevated calculations of potential future risk from exposure to the groundwater, EPA has also determined that the presence of these compounds does not appear to pose an unacceptable risk to human health or the environment since the levels are below Maximum Contaminant Levels (MCLs). Accordingly, no further remedial action will be undertaken. However, monitoring of the inorganic contaminants in the groundwater will continue for a period of twenty-four months.

The decision document presents the selected remedial action for Ground Water Operable Unit at the Packaging Corporation of America site, in Filer City, Michigan. EPA has determined that conditions at the site pose no current or potential unacceptable risk to human health or the environment. While the Packaging Corporation of America site does appear to exhibit elevated levels of heavy metals and some organics, calculations of potential future risk indicate that the contamination does not appear to pose an unacceptable risk to human health or the environment. Accordingly, no remedial action for the ground water operable unit is necessary to ensure protection of human health and the environment. EPA will however, continue to monitor Manistee Lake and the contaminants in the groundwater until the contaminanted plume has fully discharged into the lake.

This decision document presents the selected ground water operable unit remedial action for the East Bethel Landfill Site in East Bethel, Minnesota. This operable unit is the first of two operable units for the site. The operable unit described in this decision document addresses ground water contamination. The remedy selected for ground water contamination consists of withdrawal of contaminated ground water, treatment of ground water, and discharge of treated water, as well as continued monitoring of the contaminated aquifers. The remedy addresses remediation of ground water by eliminating or reducing the risks posed by the site, through engineering controls.

This decision document serves as United States Environmental Protection Agency (USEPA) concurrence with and adoption of the remedial action decision for the Adams County Quincy Landfills 2 & 3 site. The remedial action addresses two areas of concern–leachate and groundwater. The leachate remedial action addresses the source of the contamination by collecting and treating on-site waste. The function of this action is to control the landfill site as a source of groundwater contamination, to reduce the risks associated with exposure to contaminated materials, and to prevent untreated leachate from running off site. The groundwater remedial action involves long-term monitoring with cleanup levels.

The document presents the decision of the Wisconsin Department of Natural Resources (WDNR) that no further source control interim action is necessary at the Land and Gas Reclamation Landfill site in the Town of Williamstown, Dodge County, Wisconsin. The WDNR has determined that no further source control interim action is necessary at this site for this first operable unit. The reason for this determination is that the source control action which was implemented under the Dodge County Circuit Court Order has eliminated potential exposure to source related contaminants, except for contaminants in the groundwater, which will be addressed in the second operable unit.

The decision document presents the selection of the no-action remedial alternative for the Olmsted County Sanitary Landfill, Superfund site (the Site). No remedial action under CERCLA or MERLA is necessary at this site to ensure protection of human health and the environment. Potential problems associated with this site will be addressed by the Minnesota Solid Waste Landfill Compliance program, the Resource Conservation and Recovery Act and a Closure Order by Consent between the Minnesota Pollution Control Agency (MPCA) and Olmsted County. Under these programs, monitoring and review of the site will be continued to verify that no unacceptable risks posed by the site occur in the future.

The N.W. Mauthe site is a former electroplating facility located at 725 South Outagamie Street in Appleton, Wisconsin. Hydrogen gas and chromic acid mists generated from the chromium plating process were blown outside of the building by a ventilating fan, while splashes, drips, and spills from the plating and degreasing activities were directed to a shallow floor trench and channeled into the sanitary sewer system. The plating bath solutions reacted with components of concrete which produced cracks and pits within trenches and the floor itself. This allowed infiltration of chromium and solvent solutions into the soil and groundwater below the building.

The decision document presents the selected remedial action for the Prestolite Battery Superfund Site in Vincennes, Knox County, Indiana, which was chosen in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), 42 U.S.C. Section 9601 et seq., and is consistent with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), 40 CFR Part 300 to the extent practicable. The decision is based upon the contents of the Administrative Record for the site. The actual or threatened releases of hazardous substances from this site, if not addressed by implementing the response action in this Record of Decision (ROD), may present an imminent and substantial endangerment to public health, selfare, or the environment. The remedy selected for ground water contamination includes continued monitoring of the shallow and intermediate aquifers at the site as well as monitoring of surface water and sediments. The selected remedy also incorporates institutional controls on the placement of drinking water wells and natural attenuation of shallow contaminated ground water.

The Record of Decision (ROD) presents the selected remedial action for the Soldier Creek Sediment and Surface Water Operable Unit of the Tinker AFB (Soldier Creek/Building 3001) Site, in Oklahoma County, Oklahoma. A limited action remedy has been selected for the Soldier Creek Sediment and Surface Water Operable Unit based on the Administrative Record. The baseline risk assessment determined that Soldier Creek sediment and surface water do not pose a risk to human health and the environment in excess of the acceptable risk-based exposure levels established by EPA. The remedy selected for the operable unit incorporates the following components: five-year monitoring program of Soldier Creek sediment and surface water at on-base and off-base locations; ecological investigation (quantitative and qualitative) of Soldier Creek sediment and surface water to further define the risk to the environment; yearly monitoring report; and five-year review.

The decision document presents the selected remedial action for the Fourth Street Refinery Site (FSR site), Oklahoma City, Oklahoma, for the Ground Water Operable Unit. The Record of Decision (ROD) addresses the contamination in the ground water, which includes non-aqueous phase liquids. Principal threat wastes include 'pools' of dense non-aqueous phase liquids (DNAPLs) submerged beneath the ground water or in fractured bedrock, or NAPLs floating on water. This Ground Water Operable Unit addresses the principal threat at the site by monitoring the ground water to ensure that the contaminant levels are reduced with time due to natural attenuation, once the surface contamination is removed.

This decision document presents the selected remedial action for the American Creosote Works, Inc., in Winnfield, Louisiana. This Record of Decision (ROD) addresses the source of hazardous substances, which includes surface sludges, subsurface pooled creosote and pentachlorophenol liquids defined as nonaqueous phased liquids (NAPLs), and contaminated soil and debris. This is the final remedy and addresses remediation of the source of shallow ground water contamination and contaminated soils at the American Creosote Works, Inc. site. The principal threats posed by the site will be eliminated through treatment.

The decision document presents the selected interim remedial actions for the Well Number 3 ground water operable units. The Well Number 3 Subsite is a subsite of the Hastings Ground Water Contamination Site, Hastings, Nebraska. The interim action ROD addresses two separate areas of groundwater contamination. Plume 1 is characterized by carbon tetrachloride (CCl4) and chloroform (CHCl3) contamination. Plume 2 is characterized primarily by trichloroethene (TCE), 1,1,1-trichloroethane (TCA), tetrachloroethene (PCE) and dichloroethene (DEC) contamination. These interim ground water remedies were developed to protect public health, welfare and the environment by controlling the migration and reducing the volume and mass of contaminants present in the ground water beneath and downgradient from each source area of the Well Number 3 Subsite.

This decision document presents the selected remedial action for the chemical plant area of the Weldon Spring site in St. Charles County, Missouri. This operable unit addresses the various sources of contamination at the chemical plant area including soils, sludge, sediment, and materials placed in short-term storage as a result of previous response actions. The remedial action uses treatment to address the principal threat remaining at the site, (e.g., raffinate pit sludges and certain soil from the quarry).

This decision document presents the selected remedial action for the Red Oak Landfill Superfund site, in Red Oak, Montgomery County, Iowa. The selected remedial action at the Red Oak City Landfill Superfund Site (herein referred to as 'the Red Oak Landfill' or 'the Site') addresses all identified remedial action objectives, and is to be implemented in a single operable unit. This action addresses the principal threat at the Site through containment of the waste materials. The containment system will limit the threat of direct contact with wastes, and minimize the potential for migration of contaminants to ground water and surface water.

This decision document represents the selected remedial action for the ground water at the Syntex Agribusiness, Inc. site near Verona, Missouri. EPA believes that no further remedial action is necessary for ground water at the site to ensure protection of human health and the environment. Previous and ongoing remedial responses under operable unit 1 have greatly reduced the threat from past sources of contamination. Ground and surface water monitoring will continue for two years following the issuance of this record of decision. An assessment will be conducted by EPA at the end of the monitoring program to ensure that this remedy remains protective of human health and the environment.

This decision document presents the final remedy selected for the North U Drive Well Contamination site in Springfield, Missouri. The EPA, in consultation with the State of Missouri, has determined that it lacks jurisdiction to undertake or require additional response or remedial actions under CERCLA for the petroleum-related releases and the elevated levels of metals in groundwater at the site. Therefore, the final remedy for the site is No Further Action. It should be noted that in 1985, the EPA conducted a removal action at this site. As part of the removal, municipal drinking water lines were extended to provide drinking water users of well which were contaminated. Contaminated wells were then plugged in accordance with state requirements.

The decision document presents the selected remedy for the Montana Pole and Treating Plant site (the Site), in Butte, Montana. This is the final action for the only operable unit for the Site. The operable unit includes all known sources and contaminated media at the Site. This action addresses the principal threats remaining and provides for treatment of contaminated soils and groundwater. Some treatment residuals and soils contaminanted at lower levels will remain on-site, such that the Site will require long-term management. The principle contaminants of concern at the Site are pentachlorophenol (PCP), polynuclear aromatic hydrocarbons (PAHs), polychlorinated dibenzo-p-dioxins and polychlorinated dibenzofurans. The Record of Decision establishes cleanup levels for these and all other contaminants of concern at the Site.

The decision document presents the selected remedy for Operable Unit 4 (OU4), Site-wide groundwater at the Sand Creek Industrial Superfund Site in Commerce City, Colorado. The Sand Creek Industrial Superfund Site has an extensive history of industrial use, including pesticide manufacturing, petroleum refining, acidic waste disposal, municipul landfilling, and chemical storage and distribution. OU4 addresses groundwater underlying the Site and is contaminated with volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, and metals. The remedy selected for OU4 will minimize direct contact with and ingestion of groundwater underlying the Site and prevents further offsite migration of contaminants in excess of federal and state groundwater standards. Municipal water for the area surrounding OU4 is supplied by the South Adams County Water and Sanitation District (SACWSD) and the Denver Water Department (DWD). Water supplied by the DWD is obtained primarily from surface-water sources located outside of the Site area. Residents near the OU4 area are not currently using contaminated groundwater for domestic purposes.

This decision document presents the selected remedial action for the Utah Power & Light/American Barrel Site in Salt Lake City, Utah. The objective of this Record of Decision (ROD) is to provide a remedy to address all contamination caused by previous site activities located on the American Barrel Yard and adjacent properties which affect surface soils, subsurface soils, and groundwater. Contamination from historical operations and contaminant sources left on-site at the time of abandonment have migrated into soil and groundwater. Remediation will be to the extent of contamination emanating from the American Barrel Yard and Denver Rio Grande and Western properties. The response action described in this ROD will permanently address all principal threats through treatment.

The decision document outlines remediation and management alternatives to coordinate disposal options for polychlorinated biphenyls (PCB) wastes at the Rocky Mountain Arsenal (RMA) under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) activities. This decision document selects specific disposal options associated with Element Two under the expansion of the Pretreatment of CERCLA Liquid Wastes Interim Response Action (IRA). Section 2 of this decision document provides a brief overview of the Interim Response Action (IRA) currently being conducted at RMA, including an expansion of the original IRA to include three additional elements. Section 3 identifies the objectives of Element Two of this IRA expansion. Section 4 identifies potential alternatives that are applicable to the disposal of the wastes generated under Element Two. A description of the preferred or selected disposal alternative, and the evaluation process used to support this selection, as background is provided in Section 5. Information including a list of chronological events is presented in Section 6, and the IRA process for Element Two is identified in Section 7. A brief discussion of applicable or relevant and appropriate requirements (ARARs) is included in Section 8. Additional requirements to be considered are discussed in Section 9.

This decision document is an amendment to the Record of Decision (ROD) signed September 28, 1990 (PB94-921479) and presents the new selected remedial action for cleanup of contaminated shallow soils at OU5 at the Sand Creek Industrial Superfund Site. OU5 is located immediately north of 52nd and Dahlia Street in Commerce City, Colorado. Based on new technical data and cost information obtained subsequent to the September 1990 ROD, EPA has reconsidered its decision to employ soil washing and incineration of the generated residuals as a source control measure for OU5.

The decision document presents the selected remedial action for Operable Unit 2, the L. C. Corporation Property, at the Sand Creek Industrial Site in Commerce City, Colorado. As a result of prior cleanup activity on the OU2 property there is no significant risk to the public health by ingestion, inhalation, or skin absorption. The former neutralization of the acid pits does not need augmentation or additional activity. No further action is therefore recommended for OU2.

This decision document presents the selected remedial action (RA) for Operable Unit 4 (OU4) of the CSC Site, located in Commerce City Colorado. The objective of the OU4 remedy is to minimize or eliminate exposure or potential human exposure to contaminants present in the contaminated ground water. No principal threat exists in CSC OU4. Nevertheless treatment is used as a major component of the remedy.

The decision document presents the selected remedial action for Operable Units 3 and 6 (OU3/OU6), the 48th and Holly Landfill (the Landfill), at the Sand Creek Industrial Superfund Site in Commerce City, Colorado. The remedial action selected for OU3/OU6 will address the principal threats existing at the Landfill and will ensure that: (1) emissions of landfill gas are controlled to present inhalation at levels that pose an endangerment to human health or the environment, (2) accumulation of landfill gas is minimized in order to

prevent explosion hazards, (3) dermal contact with the landfill contents is prevented, and (4) the use of ground water underlying the Landfill as a drinking water source is prevented.

This decision document presents the selected remedial action for the Eagle Mine Site, Operable Unit 1 (OU-1) (Site), located in Eagle County, Colorado. This Operable Unit, one of two designated for the Site, addresses the principal sources of mine waste pollution that are impacting the Eagle River and certain ground water resources. The purpose of this Operable Unit (OU-1) is to control the transport of toxic metals originating from various sources to the Eagle River and to Site ground waters. The identified sources include the Eagle Mine, the Roaster Pile area, the Waste Rock Piles, Rex Flats, the Old Tailings Pile (OTP), the Consolidated Tailings Pile (CTP) and the Maloit Park Wetlands.

The decision document presents the selected remedial action for the Baldwin Park Operable Unit (OU), San Gabriel Valley Superfund Sites. The Baldwin Park Operable Unit addresses a large area of groundwater contamination in the San Gabriel Valley. Volatile organic compounds (VOCs) are present in the groundwater throughout a several mile long area, extending beneath the cities of Azusa, Irwindale, and Baldwin Park. The remedy will limit further migration of contaminated groundwater to areas and depths that would benefit most from additional protection, and collect data necessary to determine final clean up standards for the Baldwin Park area.

This decision document, a Record of Decision (ROD), presents the selected remedial action for the AC&W Site, Installation Restoration Program (IRP) Site 12, at Mather Air Force Base (AFB), Sacramento County, California. Reports indicate that from 1958 to 1966 waste solvents and transformer oils were disposed in a waste disposal pipe in the AC&W area. Investigations conducted as part of the Air Force Installation Restoration Program (IRP) failed to locate the waste disposal pipe but did find trichloroethylene (TCE) contamination in the shallow water bearing zone (SWBZ) in the AC&W area. The SWBZ is classified as a potential source of drinking water by the State of California, although it is not currently used in the AC&W area. The selected remedy will address the potential threat to human health posed by TCE contamination in groundwater (primarily in the SWBZ).

The Record of Decision (ROD) presents the selected remedial action for the Southern California Edison, Visalia Pole Yard, Superfund Site (the Site) in Visalia, California. The facility was used for utility pole treatment operations from 1925 until 1980. The interim response actions addressed the principal threats at the Site. The final remedy addresses threats remaining after the interim measures. Estimated potential risks under current conditions include both occupational and off-site residential exposure scenarios. The major components of the selected remedy include: in-situ bioremediation; property access restrictions; and deed restrictions; and may include if necessary soil capping.

The Record of Decision (ROD) presents the selected remedial action for the Hexcel Site located in Livermore, California. For the HMP OU the remedy consists of removing sources of organic compounds (acetone, methyl ethyl ketone, and benzene) in two locations by in-situ soil vapor extraction, soil aeration, and sparging to enhance aerobic biodegradation. For the ADS OU the remedy consists of monitoring concentrations of methane in the subsurface soils with a contingency for methane control measures if necessary, regarding the surface to prevent ponding and excess infiltration of water, continued groudwater monitoring, and a deed notification identifying areas of buried waste.

This decision document presents the selected interim remedial action for control of heavy-metal-bearing acidic discharges, termed acid mine drainage, or AMD, from the Old and No. 8 Mines into Slickrock Creek. These discharges are the third largest source of AMD at the Iron Mountain Mine Superfund Site. Slickrock Creek is a tributary of Spring Creek, which in turn is a tributary of the Sacramento River. Slickrock Creek is on the south side of the Iron Mountain Mine (IMM) site. The IMM site is located about 9 miles northwest of Redding, California. The selected interim remedial action is to collect and treat the AMD for Old/No. 8 Mine Seep. The California Department of Toxic Substances Control (DTSC) and Regional Water Quality Control Board (RWQCB) concur with the selection of lime treatment and use of a process option that will produce a dense sludge as the interim remedial action for the Old/No. 8 Mine Seep acid mine drainage discharges.

The decision document presents the selected remedial action for the Waste Disposal, Inc. site in Santa Fe Springs, California. This action addresses the principal threat at the site, which is exposure to contaminated soil, through containment and institutional controls. The major components of the selected remedy include: consolidation of contaminated soil beneath a multilayered, RCRA-equivalent cap; capping approximately 17 acres of the 43-acre site with above mentioned cap (approximately 75% asphalt, 25% vegetation top cover); extraction and treatment by flaring of subsurface gases, if necessary; institutional controls that restrict future use of properties with residual contamination that pose an exposure risk; and groundwater monitoring.

Williams Air Force Base (AFB) is located in Maricopa County, east of the City of Chandler, Arizona. Opreable Unit 2 (OU-2) of the Williams AFB National Priority List (NPL) site is located at the Base's Liquid Fuels Storage Area (LFSA), which is also referred to by its site designation 'ST-12'. Releases of Jet Propulsion Fuel Grade 4 (JP-4) and aviation gasoline (AVGAS) have contaminated soils and groundwater at OU-2. A variety of non-petroleum related CERCLA hazardous substances were also detected in OU-2 soils and groundwater. Actual or threatened releases of hazardous substances from this site, if not addressed by implementing the response actions selected in this ROD, may present an imminent and substantial endangerment to public health and the environment. Benzene, which is present in JP-4, is the most prevalent and mobile of the contaminants at OU-2.

This Record of Decision (ROD) presents the selected remedial action for the Liquid Gold Oil Corporation Superfund site (the Site) in Richmond, California. Interim remedial measures, begun in 1982, have included the removal of 25 storage tanks, 73 drums, 760 cubic yards of contaminated soils, and all remaining structures and debris. The final remedy addresses threats remaining after the interim measures. The major components of the selected remedy include: a deed restriction prohibiting residential development; grading, addition of soil, and seeding to control runoff patterns; groundwater monitoring for a minimum of five years; and removal of sediments and debris from two drainage channels leading to the adjacent marsh to mitigate possible past adverse impacts from Liquid Gold.

This Record of Decision (ROD) presents the selected remedial action for the McColl Superfund site in Fullerton, California. This ROD selects a remedy for the source soils operable unit, addressing the waste and the contaminated surrounding soils. (Groundwater issues will be addressed in a later operable unit ROD.) The selected remedy will involve solidification of all soft material in each sump above the char/soft material interface.

The purpose of the Record of Decision (ROD) is to set forth the remedial action to be conducted at the Sacramento Army Depot (SAAD) to remedy soil contamination associated with the Burn Pits. This is the fourth of several remedial actions addressing soil and groundwater contamination that may be conducted, or are currently being conducted at SAAD. Subsequent RODs will address other potential threats posed by conditions at SAAD, both on and off site. A final comprehensive ROD will address the entire facility prior to SAAD's closure in 1997.

This Record of Decision (ROD) presents the selected remedial actions for Operable Unit One (OU-1) at the Lorentz Barrel & Drum (LB&D) Superfund site in San Jose, California. This operable unit (OU-1) addresses all remaining sources of contamination not already addressed by the removal of barrels, drums, and soils completed in 1988; the removal of structures, sumps, drums, and debris scheduled for 1993 and 1994; and the Operble Unit 2 (OU-2) shallow groundwater extraction and treatment system. Therefore, the OU-1 remedy selected in this ROD is considered and referred to as the 'final remedy' for the LB&D site. While this remedy addresses contaminated soil, one of the principal threats at the LB&D site, OU-2 will continue to address the principal threat posed by contaminated shallow groundwater.

This decision document presents the Amendment to the Record of Decision (ROD) for the Suburban Water Systems (SWS)/Bartolo Well Field Operable Unit, in the San Gabriel Valley Superfund Sites Areas 1-4. The remedy selected in the September 29, 1988 (PB89-225551) ROD for the SWS Bartolo Well Field OU consisted of the installation of a groundwater treatment system at the SWS Bartolo Well Field to treat water contaminated with perchloroethene (PCE) to 1 part per billion (ppb). This Amendment sets the treatment level for all contamination at the federal or state drinking water standard, whichever is lower. This Amendment also considers Southern California Air Quality Management District Regulation 13 and Rule 1401 as ARARs for the emissions control system of the treatment plant.

The ROD presents the selected remedial action for Operable Unit (OU) B1 at McClellan AFB, Sacramento, CA. Operable Unit B1 includes the Defense Reutilization and Marketing Office (DRMO) storage lot and Civil Engineering storage lot at McClellan AFB. The main chemicals of concern are PCBs, dioxins, and furans which may have leaked from transformers stored at OU B1 or were constituents of waste oil supplied to soils to control dust. Part I outlines the purpose of the ROD and the selected remedy. Part II Sections 1.0 and 2.0 describe the site and Section 3.0 provides highlights of community participation. Part II Sections 4.0 and 5.0 present results from the RI, the potential for contaminant migration/transport from OU B1, and the current and future risks associated with OU B1. Section 6.0 identified the remedial action objectives and potential remedial alternatives. The final seven remedial alternatives are analyzed and compared to each other using the criteria established in the National Contingency Plan in Section 7.0. The selected remedy is presented in Section 8.0.

This Record of Decision (ROD) presents the interim remedial action the Arizona Department of Environmental Quality (ADEQ) and the United States Environmental Protection Agency (EPA) have selected for Operable Unit Two at the Motorola 52nd Street site in Phoenix, Arizona. This Record of Decision is for Operable Unit Two at the site, which is an area of contaminated groundwater downgradient of Operable Unit One. In comparing and selecting remedial alternatives for Operable Unit Two, effective and continued operation of Operable Unit One was assumed. The selected remedy is an interim remedy designed to address groundwater that is contaminated with volatile organic compounds (VOCs).

The decision document presents the selected final remedial action for Operable Unit (OU) 1, one of four operable units, at the Naval Air Station Whidbey Island, Ault Field, Superfund site near Oak Harbor, Washington. This remedial action addresses the risk to the public posed by volatile organic compounds in leachate and groundwater. The purpose of this action is to reduce the risk associated with the continued spread of the contaminated groundwater plume at Area 6 and remediate the groundwater through two different categories of actions. The second action category is groundwater controls, which are intended to prevent further movement of contaminated groundwater across the site boundary and to prevent consumption by area residents of groundwater exceeding maximum contaminant levels. Major components of the remedy include the following: Capping the Area 6 landfill operations area; Extracting groundwater from the shallow aquifer beneath the western boundary of the Area 6 landfill, treating it by air stripping; Monitoring groundwater; Monitoring off-site water supply wells; Monitoring groundwater in the shallow aquifer at Area 5 for inorganics; Implementing institutional control. The selected remedies are protective of human health and the environment, in compliance with federal and state requirements that are legally applicable or relevant and appropriate to the remedial action, and cost-effective.

The decision document presents the selected remedial action for the Craig Road Landfill (CRL) operable unit, Fairchild Air Force Base (AFB), Spokane, Washington. The selected remedy for the CRL includes elements from two different categories of actions. The first category is source controls, which are intended to minimize movement of contaminants from the fill material in the landfill to the groundwater and to prevent direct exposure to contaminated subsurface soil and debris. The second action category is groundwater controls. These controls are intended to prevent further movement of contaminated groundwater across the site boundary and to prevent consumption by area residents of groundwater exceeding maximum contaminant levels (MCL). The combination of both source control and groundwater control actions is necessary to achieve the broader objective of restoring contaminated groundwater in the upper aquifer to levels that are safe for drinking.

This decision document presents the selected remedial actions for the Teledyne Wah Chang Albany Site (Site or TWCA Site), in Millersburg, Linn County, Oregon. The remedial actions described below are the final response actions planned for the groundwater and sediments operable unit at the Site. Teledyne Wah Chang Albany is an active operating facility which primarily manufactures zirconium metal from zircon sands. The processing of the zircon sands generates sludge, waste water, residues and gases as by-products. The cleanup actions described in this ROD address the threats to groundwater and sediment posed by radionuclides, metals, polychlorinated biphenyls (PCBs), methyl isobutyl ketone (MIBK), thrichloroethylene, tetrachloroethylene, 1,1,1-trichloroethane, and other contaminants at the Site.

The decision document presents the selected action for Operable Unit (OU) 5 at the Naval Submarine Base (SUBASE), Bangor, in Bangor, Washington. No remedial action is necessary to ensure protection of human health and the environment. A 5-year review is not required. Using EPA guidelines and information developed during the site investigation, the Navy evaluated the potential adverse effects to human health and the environment associated with exposure to site chemicals. The potential exposure of workers and residents to chemicals detected at each site was estimated for current and future scenarios. The evaluation, performed according to EPA's NCP and policy guidance, indicated that no unacceptable risks are present at the site.

The decision document presents the selected remedial action for the Deactivation Furnace Soils Operable Unit at the U.S. Army Depot Activity, Umatilla (UMDA) in Hermiston, Oregon. The selected remedy addresses contaminated soils at the Deactivation Furnace Soils Operable Unit and is the final remedial action planned for those soils. The function of the remedy is to reduce the risks associated with exposure to surficial soils and thus address one of the principle threats at the site. The major components of the selected remedy include the following: excavation of soils surrounding the furnace having lead concentrations greater than 500 mg/kg (initially estimated to be 4,640 cubic yards or 6,264 tons of soil); solidification and stabilization treatment of the excavated soils; and on-site disposal of the treated soils in the UMDA Active Landfill.

This decision document presents the remedial action selected for the Central Facilities Area Motor Pool Pond at the Idaho National Engineering Laboratory (INEL), Operable Unit 4-11. It has been determined that no remedial action is necessary at this operable unit to ensure protection of human health and the environment. This determination is based on the results of the site-specific risk assessment, however, a risk assessment using default exposure factors indicates that hazardous substances may remain on the site above health-based levels. Therefore, five-year reviews will be conducted to confirm the assumptions used to arrive at the no remedial action decision.

The Decision Document presents the selected no-action remedial alternative for the Active Landfill Operable Unit at the U.S. Army Depot Activity, Umatilla (UMDA) in Hermiston, Oregon. The Army, EPA, and ODEQ have selected 'No Action' as the remedy for the Active Landfill Operable Unit at UMDA, in Hermiston, Oregon. This selection was made based upon information generated during the RI which indicates that the site does not pose an unacceptable threat to human health and/or the environment.

The Decision Document presents the selected no-action remedial alternative for the Inactive Landfills Operable Unit at the U.S. Army Depot Activity, Umatilla (UMDA) in Hermiston, Oregon. The Inactive Landfills Operable Unit (ILOU) is one of eight operable units at UMDA. The ILOU includes six discrete former disposal areas totalling an area of approximately 300,000 square feet, (approximately 8 acres) located west of the UMDA administration area. The selection was made based upon information generated during the RI which indicates that the site does not pose an unacceptable threat to human health and/or the environment.

The ROD addresses the contamination of Pit 9 at the Radioactive Waste Management Complex (RWMC), Subsurface Disposal Area (SDA), at the Idaho National Engineering Laboratory (INEL). The selected remedy for Pit 9 will use a combination of chemical extraction, physical separation, and/or stabilization technologies to recover contaminants and reduce the source of contamination. The major components of the remedy are: Proof-of-Process (POP) to demonstrate that designated performance objectives and cleanup criteria are attainable; Limited Production Test (LPT) to give a high degree of confidence that performance objectives and cleanup criteria can be met and all systems are reliable before full-scale remediation; Excavation and segregation of waste with greater than 10 nanocuries per gram transuranic (TRU) elements for input into the treatment process; Treatment of waste using chemical extraction, physical separation, and/or stabilization to remove radionuclides and hazardous constituents and to reduce the toxicity, mobility, and/or volume of those wastes that remain; Treatment of listed hazardous waste to levels which will allow for delisting of the waste (for material being returned to the pit) in accordance with the Resource Conservation and Recovery Act (RCRA) and the Idaho Hazardous Waste Management Act (HWMA); Return of treated materials to Pit 9 (treated materials will contain less or equal to 10 nanocuries per gram TRU elements and meet regulatory standards for hazardous substances of concern); Volume reduction by approximately 90% (for material undergoing treatment); and Onsite storage of concentrated waste residuals in accordance with ARAs until final disposal.

The decision document presents the selected final remedial action for Landfill No. 2 (B Street Landfill, LF-02) at Mountain Home Air Force Base in Mountain Home, Idaho. USAF, EPA, and IDHW have determined that no remedial action is necessary under CERCLA at the B Street Landfill to ensure protection of human health and the environment. This decision is based on the results of the Remedial Investigation (RI) and baseline human health risk assessment and ecological evaluation. The risk assessment determined that hazardous substances remaining in the soil pose no unacceptable risks to human health remaining in the soil pose no unacceptable risks to human health or the environment under current and probable future use scenarios.

This decision document presents the selected final remedial action for the American Crossarm & Conduit (ACC) site, in Chehalis, Lewis County, Washington. The remedial action presented in this ROD addresses the remaining low-level threats (to human health and environment) by (1) demolish, remove and recycle existing facility structures, (2) removing the most highly contaminated soil on the facility to prevent human contact and future dispersion into the environment, (3) excavate soil from the Chehalis Ave. Area and consolidate it on the facility, (4) reducing gross floating product in groundwater beneath the facility to meet applicable or relevant and appropriate requirements (ARARs) at the facility boundary and prevent migration, (5) covering the facility with clean soil and vegetation to prevent human contact with and dispersion of the lessor contaminated soil, (6) invoking institutional controls at the facility to warn future property owners of potential threats and limit the use of the property (specifically to prevent intrusive activities), and (7) implementing performance monitoring to assess the effectiveness of the remedial action.

The document presents the decision by the U.S. Environmental Protection Agency (EPA) for No Further Action at the ABE Superfund Site (Site) in Fairbanks, Alaska. The removal actions conducted in 1988-89, and the excavation of soil for the Superfund Innovative Technology Evaluation (SITE) demonstration conducted in 1992, have reduced concentrations of contaminants in soils to levels that do not pose a risk to human health and the environment and have eliminated the need to conduct additional remedial action at the site. Groundwater monitoring will be conducted for a period of two years to confirm that the groundwater has not been contaminated.

This decision document presents the selected remedial action for the Ruston/North Tacoma Study Area, in Ruston and Tacoma, Washington. The EPA has divided the Commencement Bay/Nearshore Tideflats Superfund site into seven operable units (OU's) in order to facilitate the investigation, analysis, and cleanup of this very large site. Four of these OU's are associated with the Asarco smelter: OU 02 - Asarco Tacoma Smelter; OU 04 - Asarco Off-Property (Ruston/North Tacoma Study Area); OU 06 - Asarco Sediments; and OU 07 - Asarco Demolition. The remedy described in this ROD addresses OU 04 and involves the cleanup of arsenic and lead contaminated soils and slag in the Study Area, the residential community surrounding the smelter. This remedy will address the principal threat posed by conditions at the site, which is the ingestion of contaminated soil and dust.

For each model year, the Energy Policy and Conservation Act requires that a compilation of fuel economy values be provided to the public. These data are intended to help the consumer compare the fuel economy of similar size cars, light-duty trucks, and special purpose vehicles. The adjusted and unadjusted fuel economy values are provided for city, highway, and a combination of city and highway driving. The unadjusted, or as tested, fuel economy values are as calculated during the testing of a vehicle on a chassis dynamometer. The adjusted fuel economy values have been adjusted to reflect conditions which would normally be encountered during actual driving. These values are always lower than the values calculated during the actual testing in laboratory controlled conditions. In addition, the interior volume and estimated annual fuel costs are provided. These data were submitted to the Environmental Protection Agency's Certification Division at the National Vehicle and Fuel Emissions Laboratory.

KEYWORD INDEX

Index entries in this section are selected to indicate important ideas and concepts presented in a report. When using the keyword index, be sure to look under terms narrower, broader, or related to a particular topic. Although some of the keywords are not selected from a controlled vocabulary of terms, most of them have been selected from the DoD, DoE, NASA, of NTIS controlled vocabularies. The entries are arranged by keyword and then by the NTIS order number.
