---

## ACKNOWLEDGMENTS

The Guide to Selected National Environmental Statistics in the U.S. Government (1992) has been prepared by members of the Environmental Statistics and Information Division (ESID) under the direction of Dr. N. Phillip Ross in the Office of Policy, Planning and Evaluation of the U.S. Environmental Protection Agency.

This publication is the product of contributions by many individuals, both inside and outside the federal government. ESID wishes especially to thank the many government statisticians and analysts who provided information, documents, and advice. Appreciation also goes to members of an ad hoc advisory review committee composed of members from both government and outside agencies, who reviewed the selections and provided input on statistical programs, and to those contractors who helped to produce this final product.

Without the cooperation of these many people, this project would not have been possible. However, because ESID has been selective in coverage and content, it is solely responsible for errors or omissions.

---

# FOREWORD

I am pleased to make publicly available the Guide to Selected National Environmental Statistics in the U.S. Government. This Guide contains information on selected sources of environmental statistics from U.S. government agencies. It is one of the first major outputs developed by EPA's new Environmental Statistics and Information Division in the Office of Policy, Planning and Evaluation.

Increasingly, statistically valid information is an essential component of risk-based, scientifically-sound environmental policy. Data on environmental problems cannot contribute to good policy if it is scattered across many agencies, if its quality is uncertain, or if it is difficult to access. This Guide is intended to help overcome these problems. It lists and describes environmental data sources from twenty-three offices in six federal departments and the Environmental Protection Agency. The range is impressive, from data on the health of forests to surveys of hazardous and non-hazardous waste. Particularly innovative is the computerized version of the Guide, which allows users to view excerpts of the actual data in the various collections.

This Guide is an important step forward in cooperative efforts to address highly varied environmental responsibilities and legal mandates.

My thanks to the managers and staff of the many agencies who worked closely with EPA to complete this important contribution to our base of environmental knowledge.

# INTRODUCTION

At a time when management of natural resources and protection of environmental quality is high on the national agenda, access to relevant environmental statistics is essential. Many of today's environmental policy initiatives and priorities are data driven; they reflect underlying facts and information on the environment. This document – A Guide to Selected National Environmental Statistics in the U.S. Government (Guide) – responds to the need to help analysts, decision makers, researchers, students, and others obtain policy-relevant environmental statistics and publications and locate experts who are knowledgeable about the data.

The Guide is a reference to selected, frequently sought-after, national-level, time-series environmental statistics that are compiled and distributed by the U.S. government on a regular basis. As a starting point, it is a guide to learn more about various environmental statistical programs and the data they collect, and is not intended to supplant information that can be obtained directly from the government agencies.

This is an updated second edition of the Guide and the prototype of an evolving sourcebook that will continue to be updated and expanded over time. One-time-only statistical surveys and regional statistical programs that do not represent the "national" picture were not included in this issue.

Contents of this second edition of the Guide reflect the Agency's draft conceptual framework for environmental statistics and indicators. Therefore the Guide includes references to statistical programs that characterize the state of the natural environment, those that study underlying and proximate pressures on the environment, and those that monitor environmentally-mediated impacts on society (i.e. human health and welfare), and those that record societal responses to environmental problems. These programs include: statistical programs on environmental quality such as ambient air and water quality and on natural resources such as water and land resources; statistical programs on environmental pressures such as energy, mining, agriculture, manufacturing, transportation, and other human activities that have direct impacts on the environment; and statistical programs on human health and welfare such as human chemical exposure and availability of outdoor recreational facilities; and statistical programs on societal responses to environmental problems such as activities and expenditures to prevent or control pollution, establish parks and protected areas, protect critical ecosystems, fight forest fires, and manage fisheries.

The statistical programs in the Guide are arranged by government department, agency, and program title. Each entry contains information about a separate statistical program (e.g., program purpose, data coverage and collection methods, geographic coverage, agency contacts, pertinent publications, and database access options). Information in the records was prepared and provided by government agencies in response to a questionnaire. The Guide also contains an index of over 150 key words and phrases that can be used to locate desired programs.

In the future, this Guide initiative may be expanded to include regional and national spatial environmental data; provide more information on international, transnational, and global environmental data; and include additional references to important health, ecological, and economic impacts. Environmental statistics gathered by private sources – state and local governmental organizations, research institutions, corporations, and national associations – may also be developed. If possible, future editions will more clearly document the quality, completeness, and limitations of the data.

In addition to the hardcopy version, the Guide is available in an electronic version that can be viewed on an IBM-compatible personal computer with 640K of memory, DOS 3.0 or higher, and an EGA or VGA monitor. Either version of the Guide can be used by starting with the

---

Table of Contents or with the Index of Key Words. Statistical programs are listed by agency and title in the Table of Contents. For example, to find out about air quality statistics collected by EPA, use the Table of Contents to find "EPA, Office of Air Quality Planning and Standards," and then "National Air Pollution Control Program." However, to find statistics on carbon monoxide, search the Index of Key Words for carbon monoxide. One may also start a search by consulting the Index of Data Programs. Any of these actions will lead to the appropriate program or programs. In addition, the User's Guide for the electronic version explains how to conduct a customized search on any word or group of words in the Guide.

Comments on the Guide and suggestions for expanding the coverage of the Guide in future editions are welcomed. If you would like to place an order for the electronic version or for additional hard copies of the Guide, please contact:

## **STATISTICAL PROGRAMS**

## DEPARTMENT OF AGRICULTURE

# Major Uses of Land in the United States

### OFFICE:

Economic Research Service  
Resource and Technology Division  
Land and Capital Assets Branch

### SUMMARY PROGRAM DESCRIPTION:

For more than fifty years, the Economic Research Service and its predecessor agencies have estimated acreages and maintained an inventory of the major uses of land in the United States at intervals coinciding with the Census of Agriculture.

### DATA COVERAGE:

Estimates are made for major land use classes: cropland; grassland pasture and range; forest land; special use; and unclassified use. Each major class is further classified by specified uses and some by ownership. Land uses are also designated as agricultural and nonagricultural.

Agricultural land uses include: cropland (cropland harvested, cropland failure, cultivated summer fallow, and idle cropland); grazing lands (cropland pasture and permanent pasture and range); grazed forest land; and miscellaneous agricultural uses (farmsteads, farm roads, and farm lanes).

Special land uses include: forest land not grazed; intensive uses (highways and roads, railroads, and airports); and extensive uses (national parks, state parks, wilderness areas, federal wildlife areas, state wildlife areas, national defense areas, and federal industrial facilities). Unclassified other land uses include: urban and other special uses not inventoried and other miscellaneous areas such as marshes, open swamps, bare rock areas, deserts, and tundra. Data are analyzed for trends.

### COLLECTION METHODS:

Data from the Bureau of the Census, agencies of the Department of Agriculture, public land management and conservation organizations, and other sources are assembled, analyzed, and synthesized to estimate state, regional, and national land use acreages. Barnard and Hexem (1988) describe how the statistical series on acreages of cropland and other land in the United States are constructed and used; they also identify sources of current and historical data and information used in constructing the series.

### COLLECTION FREQUENCY:

The major uses of land are inventoried every five years coinciding with years in which the Census of Agriculture is completed. The inventories generally have been comparable in format and coverage since 1945. The series on "cropland used for crops" dates back to 1909.

### GEOGRAPHIC COVERAGE:

All 50 states.

## DEPARTMENT OF AGRICULTURE

# National Resources Inventory

### OFFICE:

Soil Conservation Service  
Resources Inventory Division

### SUMMARY PROGRAM DESCRIPTION:

For 50 years, the Soil Conservation Service (SCS) has been conducting periodic inventories of the Nation's soil, water, and related resources. The National Resources Inventory (NRI), which is an extension and modification of earlier inventories, provides data on the status, condition, and trends of these resources of nonfederal land in the United States.

### DATA COVERAGE:

The many types of data collected by the NRI process are organized into eight general categories: soil characteristics and interpretations (including agricultural land capability); land cover; land use (including irrigated and non-irrigated cropland, grazed and ungrazed forest land, prime farmland, etc.); erosion (such as sheet and rill, wind, and ephemeral gullies); land treatment (such as irrigation, tillage, and windbreaks); conservation treatment needs; vegetative conditions (such as wetlands, rangeland condition and species, and pasture management); and potential for conversion to cropland.

### COLLECTION METHODS:

The NRI is a multi-resource inventory based on soils and related resource data collected at scientifically selected random sample sites. The NRI sample design was developed by the Iowa State University (ISU) Statistical Laboratory at Ames. It uses census area and point methods for data collection. Data collection involves both field investigation and remote sensing (photo-interpretation).

### COLLECTION FREQUENCY:

Data are collected on a five-year cycle. Recent surveys were conducted in 1977, 1982, and 1987.

### GEOGRAPHIC COVERAGE:

The 1987 NRI data were collected from nearly 300,000 sample sites from all counties of the United States except those in Alaska, and in Puerto Rico and the Virgin Islands. Most of these samples were part of the 1982 NRI which had nearly 1 million sample sites. The 1987 NRI data has a

high degree of reliability at the state level and the 1982 NRI provides a high degree of reliability at the multi-county level. Data estimates can be made by Major Land Resources Areas; SCS Administrative Areas; Water Resources Council Aggregated Subareas; and other multi-county geographic subdivisions.

## DEPARTMENT OF AGRICULTURE

### Forest Insect and Disease Conditions in the United States

#### OFFICE:

U.S. Forest Service  
Forest Pest Management

#### SUMMARY PROGRAM DESCRIPTION:

The Forest Pest Management offices have been collecting data on insect and disease conditions on forest lands of all ownerships since 1952.

#### DATA COVERAGE:

Data are collected on federal, state, and private forest lands in the United States. Data are analyzed for type of insect/disease damage (e.g., pine beetle, gypsy moth, spruce budworm, dwarf mistletoe, root diseases, etc.), size of area affected, and dollars lost by region and ownership. Trend data are available.

#### COLLECTION METHODS:

Much of the data is collected in special aerial and ground surveys which record short-term changes in pest activity. The information supplements tree mortality information gathered in periodic forest resource inventories done by the Forest Service.

#### COLLECTION FREQUENCY:

Data are collected yearly.

#### GEOGRAPHIC COVERAGE:

Entire United States.

#### CONTACT:

#### DATABASE(S):

Maintained by Forest Pest Management offices nationwide.

## DEPARTMENT OF AGRICULTURE

### Forest Inventory and Analysis

#### OFFICE:

U.S. Forest Service  
Forest Inventory, Economics, and Recreation Research

#### SUMMARY PROGRAM DESCRIPTION:

The Forest Inventory and Analysis (FIA) program is responsible for making and keeping current a comprehensive inventory and analysis of the renewable forest and rangeland resources of the United States. Initial inventory efforts began in the West in 1930 and, by the 1960's, inventories were completed for all of the 48 conterminous states and many of the important forested states had been re-inventoried. The inventory data and analysis provide trend information on the extent, condition, ownership, and composition of the nation's forests as well as information about wildlife habitat, forage production, and other resource characteristics needed for resource planning.

#### DATA COVERAGE:

At least 43 kinds of resource data are collected for sample plots during the inventory, including land use, land ownership, forest type, stand age, stand size and volume classes, harvest history, soils data, tree data (species, diameter at breast height, height, cull, etc.), other vegetation data, and non-timber data. These data are used to make estimates of forest land area, species composition, timber volume, and net annual timber growth, removals, and mortality by forest type, state, region, ownership, softwood and hardwood sawtimber species, productivity class, diameter class, and other classifications. The volume of roundwood products harvested by material, species group, region, and product are estimated. Estimates also are made of areas harvested or otherwise disturbed, regenerated to forest, or cleared for other use. Additional estimates of recreation use, wildlife values, site productivity, physiographic characteristics, and other items are made.

#### COLLECTION METHODS:

Data are gathered using a two-phase sampling design, with the first phase involving the interpretation of aerial photography and the second phase involving ground measurements at sample plots, each covering one acre. Depending upon the extent to which remote sensing is used, ground sample intensity ranges from one plot per 3,000 acres to one plot per 10,000 acres. Methodologies

are generally described in the various publications listed below.

#### COLLECTION FREQUENCY:

Statewide timber inventory information has been collected continuously for about 50 years. In most regions of the United States, the third inventory cycle has been completed and some areas have been inventoried as many as five times. Each year, some 50 million acres are inventoried in the conterminous United States. Currently, this rate of coverage translates into an inventory cycle of 12 years for the nation.

#### GEOGRAPHIC COVERAGE:

Entire United States and Puerto Rico.

**DATABASE(S):**

**National Resources Planning Act (RPA) Timber Database**

This database provides sample plot level statistics as described under Data Coverage. Public access is via data tape or direct linkage.

**Eastwide Forest Inventory Database**

This database provides county level, sample plot level, and tree level statistics as described under Data Coverage. Public access is via data tape or direct linkage.

**Forest Inventory and Analysis**

This database provides individual project databases of county level, sample plot level, and tree level statistics as described under Data Coverage. Seven databases are maintained by individual inventory projects. Public access is via data tape or direct linkage.

## DEPARTMENT OF AGRICULTURE

# Forest Service Range Management Information System

### OFFICE:

U.S. Forest Service  
Range Management Staff

### SUMMARY PROGRAM DESCRIPTION:

The Forest Service Range Management Information System (FSRAMIS) collects and analyzes data on grazing in National Forests and National Grasslands.

### DATA COVERAGE:

FSRAMIS provides grazing use statistical data. Data on the number of grazing animals (cattle, horses and burros, sheep and goats), animal unit month, and number of permittees are reported at the national level and for each type of Forest Service land (National Forests, National Grasslands), region, and state. Other variables measured include: allotment condition, improvement inventory and activity, grazing capacity, actual use, authorized use, and unauthorized use. Data are analyzed for trends in ecological potential.

### COLLECTION METHODS:

Data on grazing on the National Forest System lands are extracted from the grazing permits. Data on free-roaming horse and burro populations are estimated by census.

### COLLECTION FREQUENCY:

Data are collected on cycles ranging from annual to once every 3–5 years.

### GEOGRAPHIC COVERAGE:

National Forest System lands throughout the United States.

### CONTACT:

Robert M. Williamson, Director  
Range Management Staff  
U.S. Forest Service  
Department of Agriculture  
P.O. Box 96090  
Washington, DC 20090-6090  
Phone: (202) 205-1460

### FOR PUBLIC INQUIRIES:

See Contact.

### PUBLICATIONS:

—. Administration of the Wild Free-Roaming Horse and Burro Act – Report to Congress. Biennial Report in cooperation with U.S. Department of the Interior, Bureau of Land Management. Washington, DC.

### DATABASE(S):

Forest Service Range Management Information System (FSRAMIS)

FSRAMIS contains three types of information. The first, allotment, is production potential, acreages, analysis, and geographic identification data. The second, improvement, includes cost, status, maintenance, condition, and geographic identification. The third, permits, includes permittee, livestock grazing, and other use information for permitted, authorized, and actual use.

## DEPARTMENT OF AGRICULTURE

### Land Areas of the National Forest System

#### OFFICE:

U.S. Forest Service  
Lands Staff

#### SUMMARY PROGRAM DESCRIPTION:

The Lands Staff collects data on the extent and characteristics of forest, range and related lands within the National Forest System.

#### DATA COVERAGE:

Data are available on the number of units and acreages of National Forest, Purchase Units, National Grasslands, Land Utilization Project Areas, Experimental Forest Areas, Experimental Range Areas, designated Experimental Areas, Wilderness Areas, Primitive Areas, National Scenic Research Areas, National Wild and Scenic Rivers Areas, National Recreation Areas, National Game Refuges, National Monument Areas, and other land areas, water areas, and interests in land that are administered by the National Forest System or designated for administration through the National Forest System for Forest Service regions, state and county, and congressional districts.

#### COLLECTION METHODS:

Gross and net areas are generated by survey and map compilation. Other data are generated by census and inventory.

#### COLLECTION FREQUENCY:

Statistics are updated annually. Some data are available from 1891 to present.

#### GEOGRAPHIC COVERAGE:

All fifty states (containing National Forest System Lands), Puerto Rico, and the Virgin Islands.

#### CONTACT:

Philip S. Dunning, Computer/Program Analyst  
U.S. Forest Service  
Department of Agriculture  
P.O. Box 96090  
Washington, DC 20090-6090  
Phone: (202) 205-0843

#### FOR PUBLIC INQUIRIES:

See Contact.

#### PUBLICATIONS:

Department of Agriculture, Forest Service. Land Areas of the National Forest System (annual). Washington, DC.

#### DATABASE(S):

Land Ownership Status (LOS)

The LOS contains data on ownership, partial interests, encumbrances, and use restrictions. Data are geographically located by administrative forest, proclaimed National Forest, state, county, ranger district, congressional district, principal meridian, township, range, and by map quad and tract number for colonial metes and bounds areas.

## DEPARTMENT OF AGRICULTURE

### Recreation Information Management System

#### OFFICE:

U.S. Forest Service  
Recreation, Cultural Resources and Wilderness  
Management Staff

#### SUMMARY PROGRAM DESCRIPTION:

The Recreation Information Management (RIM) System collects information on the use, condition, and facilities of recreation sites within the over 191 million acres of the National Forest System.

#### DATA COVERAGE:

The following statistics are available by state, region, and fiscal year: recreation visitor days by type of activity (e.g. camping, hiking, winter sports, hunting, fishing, and non-consumptive wildlife use); number of sites and capacity by kind of site (e.g. boating, campgrounds, skiing); recreation trail mileage by primary management objective (motorized or non-motorized); and service level (standard or less than standard) for various types of trails (e.g. wilderness, National Recreation Trails, National Scenic Trails, National Historic Trails). In addition, a national recreation directory is maintained that provides information on campground location, size, elevation, number of various types of units, and facilities.

#### COLLECTION METHODS:

Data are extracted from user and entrance fee receipts and non-fee visitation counts for lands and waters administered by the Forest Service.

#### COLLECTION FREQUENCY:

Statistics are updated annually at the end of the fiscal year.

#### GEOGRAPHIC COVERAGE:

All Forest Service owned land (over 191 million acres) in the continental United States, Alaska, and Puerto Rico.

and Data Coverage).

## DEPARTMENT OF AGRICULTURE

### Tree Planting in the United States

#### OFFICE:

U.S. Forest Service  
State and Private Forestry (Cooperative Forestry)

#### SUMMARY PROGRAM DESCRIPTION:

The program consists of a national summary of tree planting in the United States.

#### DATA COVERAGE:

The Forest Service compiles data on the number of tree seedlings planted or seeded; acres of tree planting (including acres seeded and acres of windbarriers planted); acres of timber stand improvement; and production of tree planting stock (including seedlings produced for windbarrier stock). Data are categorized by state and by ownership categories (federal, state, other public, industrial, or nonindustrial private).

#### COLLECTION METHODS:

Data are reported to the Forest Service by state forestry agencies, territories, and other federal agencies.

#### COLLECTION FREQUENCY:

Data are collected yearly.

#### GEOGRAPHIC COVERAGE:

United States and territories.

#### CONTACT:

## DEPARTMENT OF AGRICULTURE

### Wildland Fire Statistics

#### OFFICE:

U.S. Forest Service  
Fire and Aviation Management Staff

#### SUMMARY PROGRAM DESCRIPTION:

The Fire and Aviation Management Staff collects data on wildland fires on public and private lands throughout the United States. They also make available the year-to-date data collected by the Boise Interagency Fire Center.

#### DATA COVERAGE:

Data include: year-to-date and annual figures for number of wildland fires and acres burned on public and private lands. Origin of fires (lightning, human, etc.) is available for Forest Service lands only. Trend data are available.

#### COLLECTION METHODS:

Actual counts of the number of wildfires and acres of forest land burned.

#### COLLECTION FREQUENCY:

Data are collected daily by the Boise Interagency Fire Center and yearly by the Fire and Aviation Staff.

#### GEOGRAPHIC COVERAGE:

Entire United States.

#### CONTACT:

### Farm and Ranch Irrigation Survey

#### OFFICE:

Bureau of the Census  
Agriculture Division

#### SUMMARY PROGRAM DESCRIPTION:

The Farm and Ranch Irrigation Survey is conducted on a sample of the farms and ranches reporting irrigation in the Census of Agriculture to provide detailed data relating to on-farm irrigation practices.

#### DATA COVERAGE:

The survey generates statistics on: total acres of farm and ranch land irrigated; acres irrigated by category of land use; acres and yield of irrigated and nonirrigated crops; quantity of water applied; method of application to selected crops; acres irrigated and quantity of water used by source; acres irrigated by type of water distribution systems; and number of irrigation wells and pumps.

Also reported are irrigation expenditures for maintenance and repair of irrigation equipment and facilities; purchase of energy for on-farm pumping of irrigation water; investment in irrigation equipment, facilities, and land improvement; and cost of water received from off-farm water suppliers.

Additional information is provided on the number of irrigated farms; depth and pumping capacity of wells used; the number of pumps and quantity of energy used in irrigation; application of chemicals in irrigation; timing of irrigation; and crop yields from irrigated farms.

#### COLLECTION METHODS:

The survey is a probability sample of all irrigated farms and ranches identified in the Census of Agriculture, except farms in Alaska and Hawaii, horticultural speciality farms, and abnormal farms. The survey is conducted by questionnaire. Two types of statistical estimation procedures are used to account for selection of survey sample and for nonresponse to the questionnaire. Methodologies are more generally described in the publications listed below.

#### COLLECTION FREQUENCY:

Farm and Ranch Irrigation Surveys were conducted in 1979, 1984, and 1988. The next survey is scheduled for

1993. Selected irrigation data for on-farm irrigation have been collected in the Census of Agriculture since 1890.

#### GEOGRAPHIC COVERAGE:

Estimates are made for the 27 leading irrigation states, 18 water resource areas, and the entire conterminous United States.

## DEPARTMENT OF COMMERCE

# Annual Surveys of Government Finances and Government Employment

### OFFICE:

Bureau of the Census  
Governments Division

### SUMMARY PROGRAM DESCRIPTION:

These parallel surveys of state and local government finances and employment cover all aspects of state and local government activities and contain detailed data for some specific activities that relate to the environment.

### DATA COVERAGE:

The finance survey variables include: functions and services such as health, sanitation, environmental services (natural resources, parks and recreation, sewerage, and solid waste management), housing and community development, and water utilities; character and object items such as current operations, construction and land and equipment; and revenue items.

The employment survey variables are: employees – full-time, part-time, and full-time equivalent; payroll; and functions that are the same as those described under the finance survey.

The finance survey produces detailed data for expenditures for both current operations and capital outlay. The employment survey contains data for these same functions, showing number of employees and monthly payroll.

Both the finance and employment surveys are designed primarily to generate data on the total activity of state and local governments. This provides analysts with the ability to determine the relationships among the various functions of government – for example, comparing education or police expenditures with sewerage outlays or the percentage that any specific function is of the total.

Trend data for both series are available in national summations that go back to the early 1950s for employment and early 1900s for finance data. Individual government data for the largest units of government (cities greater than 50,000 population, counties greater than 100,000 population, and all the state governments) follow relatively consistent patterns for about the past 30 years.

### COLLECTION METHODS:

The sample is the same for both surveys. It is a stratified random sample of local governments in the United States. Units include: all state governments; all county governments with a population of 50,000 or more; all municipalities with a population of 25,000 or more; and other units of local government that meet specified financial or functional criteria. Estimates of major U.S. totals, such as total revenue or total expenditures, are subject to a computed sampling variability of less than one-half of one percent. Other local government totals, such as functional expenditures, are generally subject to sampling variability of less than one percent.

### COLLECTION FREQUENCY:

Surveys are conducted annually.

### GEOGRAPHIC COVERAGE:

The data are aggregated to national totals and to totals for each of the fifty states and the District of Columbia. The surveys also publish data for large individual governments such as county governments (population greater than 100,000), municipal governments (populations greater than 75,000), and each of the state governments.

- Public Employment. (annual).
- City Employment. (annual).
- County Government Employment. (annual).

## **DATABASE(S):**

### **Annual Survey of Government Finance**

File A is a data file for a sample of approximately 35,000 individual units of government containing revenue, expenditures, debt, and assets for each unit. File B is a data file for U.S. and state area aggregations. The totals of each state area are divided into eight different records (state and local summation, state government only, local government summation, county government summation, municipal government summation, township government summation, special district government summation, and school district summation). This file contains 416 records.

### **Annual Survey of Government Employment**

This is a single data file for a sample of approximately 23,000 individual units of government containing employment and payroll data for the month of October. (Note: The samples for the Annual Finance and Annual Employment Surveys are the same. The difference in the counts between Finance File A and the Employment File is that the former includes additional units in states where it was possible to obtain universe data annually instead of relying on the sample.)

## DEPARTMENT OF COMMERCE

# Decennial Census of Population

### OFFICE:

Bureau of the Census  
Population Division

### SUMMARY PROGRAM DESCRIPTION:

The decennial census provides a comprehensive set of population statistics for the United States. Basic demographic characteristics are collected on a 100-percent basis. Social and economic characteristics are collected from a large sample of all households and persons in group quarters.

### DATA COVERAGE:

The decennial census provides demographic (e.g., age, race, sex, relationship, Hispanic origin), social (e.g., education, migration, ancestry, language), and economic (e.g., occupation, industry, income, place of work) characteristics of the population of the United States, Puerto Rico, the Virgin Islands, Guam, American Samoa, the Northern Marianas, and Palau. Trend data are available from previous decennial censuses.

### COLLECTION METHODS:

Basic demographic data are collected from 100-percent of the population. Social and economic characteristics are collected from a large sample—approximately one-in-six in 1980 and 1990.

### COLLECTION FREQUENCY:

Decennial.

### GEOGRAPHIC COVERAGE:

The fifty states, the District of Columbia, and substate areas such as counties, county subdivisions, cities, towns, villages, and census tracts. Also covers Puerto Rico, the Virgin Islands, Guam, American Samoa, the Northern Marianas, and Palau.

### CONTACT:

Philip N. Fulton  
Assistant Division Chief for Census Programs  
Population Division, U.S. Bureau of the Census  
Washington, DC 20233  
Phone: (301) 763-7890

### FOR PUBLIC INQUIRIES:

See Contact.

### PUBLICATIONS:

The results of the Census of Population are issued in various forms; printed reports, computer tape files, CD-ROM, and microfiche. Computer tape files are designed to provide statistics with greater detail than is feasible or desirable to provide in printed and microfiche reports. Many computer tape files also are released on CD-ROM. The following is a brief summary of 1990--census data releases:

P.L. 94-171, Population Counts – In accordance with Public Law (P.L.) 94-171, the Census Bureau has provided population tabulations to all states for legislative reapportionment/redistricting.

Summary Tape Files (STFs) 1A, 1B, and 1C, and 2A, 2B, and 2C – Complete count population and housing data summarized for a wide range of census geography (United States, metropolitan areas, urbanized areas, American Indian and Alaska Native areas, states, county subdivisions, places, census tracts, block numbering areas, block groups, and block).

Summary Tape Files (STFs) 3A and 3C – Sample population and housing data summarized for a wide range of census geography (as shown above but excluding blocks).

Census/Equal Employment Opportunity (EEO) Special File – Sample census data to support affirmative action planning.

Summary Population and Housing Characteristics (CPH-1) reports – Complete count population and housing data derived from STF 1.

Summary Social, Economic, and Housing Characteristics (CPH-5) reports – Sample population and housing data for local governments, including American Indian and Alaska Native areas.

General Population Characteristics (CP-1) reports – Detailed statistics on age, sex, race, and/or Hispanic origin, marital status and household relationship presented for states, counties, places of 1,000 or more inhabitants, etc.

The Census Bureau is in the process of releasing STF 3B (data by ZIP Code) and STF 4 (detailed sample population and housing characteristics), and STFs 1D and 3D (population and housing data for Congressional Districts of the 103rd Congress) as well as Public Use Microdata Sample (PUMS) tape files. Numerous additional report series are in preparation. All products are expected to be released by October 1993.

Customized special tabulations of census data may be obtained on a cost reimbursable basis.

## DEPARTMENT OF COMMERCE

# National and Subnational Population Estimates and National and State Population Projections

### OFFICE:

Bureau of the Census  
Population Division  
Population Estimates and Projections Branches

### SUMMARY PROGRAM DESCRIPTION:

The Population Estimates and Projections Branches produce current estimates of the U.S. population (the fifty states, the District of Columbia, the counties, incorporated areas, Puerto Rico, and the territories) and project the future population.

### DATA COVERAGE:

Statistics include: estimates of the total, resident, and civilian population of the United States and by state, with components of change; estimates of national and state population by age, sex, race, and/or Hispanic origin; projections of future population by age and sex for states and by age, sex, race, and/or Hispanic origin for the United States; yearly estimates of county population; biennial estimates of the population of incorporated places and functional minor civil divisions; and estimates of populations of metropolitan and nonmetropolitan areas; population migration by region; population density; and population growth rate.

### COLLECTION METHODS:

Estimates of the U.S. population are derived by updating the total population including Armed Forces overseas at the time of the last census, year by year, through the components of population change. State population totals are estimated using vital statistics, school enrollment, internal migration (based on Federal income tax data), net international migration, and Medicare enrollment. State estimates for age and sex are developed by a procedure that carries forward the decennial census data for each single year of age by state, and allows for births, deaths, and net migration. Net migration is estimated using school enrollment to obtain a school-age migration rate, which is then converted to rates for single years of age. The methodology to develop household estimates is based on national trends and estimated state trends in adult population per household, and on estimates of adult population for states. For detailed descriptions of specific methodologies, see reports referenced in Publications.

### COLLECTION FREQUENCY:

Data are updated annually.

### GEOGRAPHIC COVERAGE:

Entire United States.

## DEPARTMENT OF COMMERCE

# Survey of Pollution Abatement Costs and Expenditures

### OFFICE:

Bureau of the Census  
Industry Division  
Special Surveys Branch

### SUMMARY PROGRAM DESCRIPTION:

The survey collects information on annual operating costs and capital expenditures for pollution abatement activities in manufacturing industries. The survey was started in 1973 and has been conducted annually except for 1987. The survey provides estimates of pollution abatement spending for detailed levels of industrial classification.

### DATA COVERAGE:

Estimates of pollution abatement operating costs and capital expenditures are made for manufacturing plants with 20 employees or more (except the apparel group). Detailed estimates are provided by pollution type and for the following three-digit standard industrial classification (SIC) industries: food and kindred products; tobacco manufacturers; textile mill products; lumber and wood products; furniture and fixtures; paper and allied products; printing and publishing; chemicals and allied products; petroleum and coal products; rubber and miscellaneous plastics products; leather and leather products; stone, clay, and glass products; primary metal industries; fabricated metal products; machinery, except electrical; electric and electronic equipment; transportation equipment; instruments and related products; and miscellaneous manufacturing industries. Detail is also provided for expenditures by sector, for industries by four-digit SIC codes, and for States by two-digit SIC codes. Capital expenditures are provided for air and water pollution abatement by abatement technique (changes-in-production processes and end-of-line techniques), for air pollution abatement by type of pollution abated, and for hazardous and nonhazardous solid waste management. Operating costs include labor, depreciation, materials and supplies, services, equipment leasing, and other costs. Costs recovered by manufacturing plants from their pollution abatement activities also are given.

### COLLECTION METHODS:

The probability sample includes about 20,000 manufacturing plants. The sample is selected as a subsample of the Annual Survey of Manufacturers which

represents about 360,000 plants in the country. The probability of selection is based on the plant size in terms of total value of shipments. Response to the survey is about ninety percent.

### COLLECTION FREQUENCY:

Except for 1987, when no survey was conducted, data have been collected annually since 1973.

### GEOGRAPHIC COVERAGE:

The sample is selected to represent the entire United States. Estimates are given also for states and regions, but with less detail.

## DEPARTMENT OF COMMERCE

# Benthic Surveillance Project

### OFFICE:

National Oceanic and Atmospheric Administration  
National Ocean Service  
Office of Ocean Resources Conservation  
and Assessment  
Coastal Monitoring Bioeffects Assessment Division  
Bioeffects Assessment Branch

### SUMMARY PROGRAM DESCRIPTION:

The Benthic Surveillance Project, an element of the National Status and Trends (NS&T) Program, monitors contaminant concentrations in bottomfish and sediments in nearshore waters of the United States. The Project also monitors bottomfish for indicators of contaminant exposure. The measurement of contaminant concentrations in marine organisms bridges the gap between which chemicals are associated with sediment particulates, and which ones are taken up and potentially bioaccumulated by marine species. Because of their mobility, bottomfish reflect environmental conditions over a wider geographical area than do sediments or sedentary organisms.

### DATA COVERAGE:

Bottomfish and surficial sediment are analyzed for over 70 contaminants including 24 polycyclic aromatic hydrocarbons (PAHs); 20 congeners of polychlorinated biphenyls (PCBs); 15 chlorinated pesticides, including Chlordane and DDT (and breakdown elements of DDT); butyltins; four major elements; and 12 trace elements. Sediments also are analyzed for total organic carbon content (TOC), and for spore concentrations of the bacterium *Clostridium perfringens*, which is associated with sewage contamination. For bottomfish, chemical analyses are performed on stomach contents, liver and bile tissue matrices. The frequency of external disease conditions (such as external tumors and fin rot) and internal lesions (such as liver and kidney tumors) also is recorded at each site. DNA adducts, bile metabolites, and mixed function oxidase enzyme levels are measured in fish at selected sites. The length, age, gender, and stomach contents are recorded for each fish sample. Analytical data include correlations of contaminant findings (i.e., urban contamination levels vs. rural levels, temporal trends in contaminant levels for specific regions, and national rankings of contaminated areas for major contaminant groups).

### COLLECTION METHODS:

Composite sediment, tissue, and stomach content samples are collected from three collection stations per site, and are stored for subsequent chemical analysis. Sites are chosen to represent contaminant levels in the surrounding area and to avoid small-scale patches of contamination, or "hot spots". Multiple fish species are sampled to accommodate the project's national scope; the species selected at a site depends on availability. Fish are collected in bottom trawl nets in waters ranging from 1 to 70 meters in depth. Sediments are skimmed from the top three centimeters of the bottom surface at stations located within 500 meters of the site center and positioned near trawl sampling track(s). The occurrence of pollution-associated diseases are derived from the observed incidences of each disease per number of fish sampled at each site.

Analytical procedures adhere to the standard procedures of the NS&T Quality Assurance (QA) Project, established for all laboratories participating in the NS&T Program. As part of the QA Project, laboratories associated with the Benthic Surveillance Project participate in yearly intercomparison exercises administered by the National Research Institute of Standards and Technology (NIST), and the National Research Council (NRC) of Canada. Because different fish species metabolize contaminants at different rates and are more likely than others to develop tumors, data from individual sampling sites may depend to some extent on the selected species.

### COLLECTION FREQUENCY:

From 1984 through 1986, samples were collected from monitoring sites on an annual basis. Since 1987, sites have been monitored every other year. As of July 1992, the database contains six years of analytical data, from 1984 to 1989; sediment and fish tissue samples are collected from March through September along U.S. coasts. Samples collected in 1991 are now being analyzed for contaminants. Data representing 1984-88 conditions are summarized in NOAA reports.

### GEOGRAPHICAL COVERAGE:

Samples are collected from estuaries, bays, and near-shore marine areas of the East, Gulf, and West coasts of the United States, as well as Alaska. Presently, sampling is conducted at approximately 100 sites, however, fewer sites (about 50) were monitored when the Project was initiated in 1984. Sites generally are located

between 10 and 100 kilometers apart. Monitoring activities are designed to describe national and regional distributions of contamination.

## DEPARTMENT OF COMMERCE

### Biological Effects Surveys and Research

#### OFFICE:

National Oceanic and Atmospheric Administration  
National Ocean Service  
Office of Ocean Resources Conservation  
and Assessment  
Coastal Monitoring Bioeffects Assessment Division  
Bioeffects Assessment Branch

#### SUMMARY PROGRAM DESCRIPTION:

The National Status and Trends (NS&T) Program conducts multi-year bioeffects assessment studies in selected coastal areas where NS&T monitoring data indicate moderate-to-high levels of contaminants. These studies complement NS&T contaminant monitoring activities, by examining the relationships between contaminant exposure and indicators of biological response. Analyses concentrate on sediment toxicity, reproductive impairment, genetic damage, and the prevalence of disease. Results will be used to develop estimates concerning the magnitude and extent of environmental degradation in the selected study areas and, when all areas have been surveyed, the cumulative data will be assembled to provide an overall national estimate. The studies also provide a means to determine the applicability of new bioeffects indicators for future monitoring projects.

#### DATA COVERAGE:

Bottomfish are examined for prevalences of liver tumors and external lesions; signs of genetic damage (DNA alternatives in blood cells); enzyme activity associated with PAH metabolism; indicators of reproductive dysfunction, including ovarian development, plasma estradiol levels, and vitellogen levels; and signs of reproductive impairment, including egg size, egg yolk development, and embryo abnormalities. Bioassay toxicity analyses are conducted on the survival and development of benthic invertebrates exposed to sediment and water samples of varying degrees of contamination. Bioassay test organisms are also examined for signs of genetic damage and cell toxicity.

#### COLLECTION METHODS:

Bioeffects surveys are conducted in areas where NS&T monitoring data and related assessments indicate elevated levels of multiple contaminants in sediment and tissues, prevalences of diseases, or low abundances and species richness of benthic invertebrates. Sample designs vary

among study areas, and are determined for each study area by specific problems requiring greater resolution. Generally, sites are non-random, representing highly contaminated areas to areas of moderate to low contaminant levels. The data are primarily the incidences of observed biological effects that occur as a result of exposure of biota to toxicants, and correlations with contaminant levels associated with toxicity and adverse bioeffects. Measurements of toxicant-related effects in biota are mostly the observed incidences of sublethal effects in collected bottom fish and benthic organisms, as well as bioassay test results. Data are compiled on several categories of toxic effects associated with known levels of sediment contaminants to identify, where possible, two guidelines for each chemical analyte: effects range-low (ERL) values, the contaminant concentrations at which effects begin, and effects range-medium (ERM), the concentrations at which effects usually occur.

#### COLLECTION FREQUENCY:

Biological effects studies were initiated in 1986 and range from two to four years in duration at each study area.

#### GEOGRAPHIC COVERAGE:

Study areas are located primarily in urban estuaries. Studies have been or are being conducted in Boston Harbor, Long Island Sound, the Hudson-Raritan Estuary, Tampa Bay, Southern California, and San Francisco Bay.

### Classified Shellfishing Waters

#### OFFICE:

National Oceanic and Atmospheric Administration  
National Ocean Service  
Office of Ocean Resources Conservation and Assessment  
Strategic Environmental Assessment Division

#### SUMMARY PROGRAM DESCRIPTION:

Classified shellfishing waters are monitored as an indicator of bacterial water quality nationwide. Waters are classified for the commercial harvest of oysters, clams, and mussels based on the presence of actual or potential pollution sources and coliform bacteria levels in surface waters. Each shellfish-producing state classifies its waters in accordance with guidelines established by the National Shellfish Sanitation Program.

#### DATA COVERAGE:

Approximately 2,000 classified shellfishing areas are defined by name, location (nautical chart number, estuary, state, region), classification (approved, prohibited, conditionally approved, or restricted), size, and pollution sources (identified for all non-approved areas).

Trends in classification by region from 1966 to 1990 and by selected estuaries in the northeast, southeast, Gulf of Mexico, and Pacific from 1971 to 1990 are available. Areas that were reclassified because of improved or diminished water quality are distinguished from those that were reclassified as a result of improved monitoring.

Data also are collected on administration of state programs, including: identification of state agencies responsible for monitoring waters, assigning classification, analyzing water samples, etc.; number of personnel; budgets; number of sampling stations; frequency of sampling; and other factors that may influence classification.

#### COLLECTION METHODS:

Data are collected by questionnaire and followed by interviews. Classifications are noted on 265 Nautical Charts (NOS 1:80,000).

#### COLLECTION FREQUENCY:

Data were compiled in 1966, 1971, 1974, 1980, 1985, and 1990. The next survey is scheduled for 1995.

#### GEOGRAPHIC COVERAGE:

East, West, and Gulf Coasts of the United States.

### Fisheries Statistics Program

#### OFFICE:

National Oceanic and Atmospheric Administration  
National Marine Fisheries Service  
Office of Research and Environmental Information  
Fishery Statistics Division, F/RE1

#### SUMMARY PROGRAM DESCRIPTION:

The Fishery Statistics Division develops and maintains a national collection of statistics (biological, economic, and sociological) on domestic commercial and recreational fisheries, as well as joint ventures and foreign catch in the U.S. Exclusive Economic Zone (EEZ). It maintains data files on the processing, freezing, and holding of fishery products, and monthly information on imports and exports of fishery products. The Division also aids in developing policies and operational guidelines for the coordinated collection and publication of basic fishery statistics. It develops, implements, and manages computerized data systems for handling, archiving, and retrieving statistical databases.

#### DATA COVERAGE:

The following data are collected: monthly and annual commercial landings (catch) in pounds and value by species, state, county, year, waterbody, and distance from shore; annual operating units and number of vessels and fishermen by state, year, and country; annual processed products data by state, county, plant, species, and type of processing; annual world catch by species, country, and area; weekly shrimp imports by country and count size; and recreational finfish saltwater catch by species and geographic area.

#### COLLECTION METHODS:

Commercial data are obtained through census of first buyers of seafood, review of logbooks, intercept surveys, and reporting by observers. Recreational data are collected through extensive telephone and intercept surveys designed as a stratified random sample. Approximately 44,000 households in coastal counties are contacted for the telephone survey.

On-site interviews are conducted with as many as 56,000 marine recreational anglers for an intercept survey.

#### COLLECTION FREQUENCY:

Data are collected daily, monthly, and/or yearly depending on subject and area covered.

#### GEOGRAPHIC COVERAGE:

All commercial catch by U.S. flag-vessels landed in the continental United States, Puerto Rico, and other ports outside the fifty states. Recreational information covers marine waters only.

## DEPARTMENT OF COMMERCE

### Living Marine Resources

#### OFFICE:

National Oceanic and Atmospheric Administration  
National Ocean Service  
Office of Ocean Resources Conservation and Assessment  
Strategic Environmental Assessment Division

#### SUMMARY PROGRAM DESCRIPTION:

The Living Marine Resources Program gathers data from published sources on spatial and temporal distributions of marine species (invertebrates, fishes, seabirds, and mammals). Information includes distributions by life stage, statistics on commercial harvest, and status of seabird colonies. In 1990, additional information was gathered on sampling programs.

#### DATA COVERAGE:

Gulf of Mexico: spatial and temporal distributions for adult, juvenile, and reproductive life stages of 73 species of invertebrates and fishes.

Gulf of Mexico shrimp harvest: 1960–1988 (by month) harvest weight for seven shrimp species.

Gulf of Mexico estuaries: spatial and temporal distributions for adult, juvenile, reproductive, larval and egg life stages of 44 species of invertebrates and fishes in 25 estuaries.

Bering, Chukchi, and Beaufort Seas: spatial and temporal distributions for adult and juvenile stages of 102 species of invertebrates, fishes and marine mammals.

West Coast: spatial and temporal distributions for adult, juvenile, and reproductive life stages of 130 species of invertebrates, fishes, and marine mammals.

Southeast estuaries: spatial and temporal distributions for adult, juvenile, reproductive, larval and egg life stages of 40 species of invertebrates and fishes in 20 estuaries.

Alaska seabird colonies: populations of thirty species of seabirds within 1,300 individual colonies.

#### COLLECTION METHODS:

Data are compiled from published literature and agency databases.

#### COLLECTION FREQUENCY:

Ongoing.

#### GEOGRAPHIC COVERAGE:

Entire U.S., Exclusive Economic Zone including Alaska, excluding Hawaii, Puerto Rico, and protectorates.

### Mussel Watch Project

#### OFFICE:

National Oceanic and Atmospheric Administration  
National Ocean Service  
Office of Ocean Resources Conservation  
and Assessment  
Coastal Monitoring Bioeffects Assessment Division  
Bioeffects Assessment Branch

#### SUMMARY PROGRAM DESCRIPTION:

The Mussel Watch Project, an element of the National Status and Trends (NS&T) Program, monitors a suite of contaminants in the tissue of bivalve mollusks (mussels and oysters) and in sediments in coastal and estuarine waters of the United States. Mussels and oysters serve as useful indicators of temporal trends in environmental equity because they accumulate some contaminants in their tissue at levels many times higher than in the surrounding water and they adjust quickly to changes in contamination.

#### DATA COVERAGE:

Molluscan tissue samples are monitored annually at over 200 sites for about 70 contaminants including 24 polycyclic aromatic hydrocarbons (PAHs); 20 congeners of polychlorinated biphenyls (PCBs); 15 chlorinated pesticides, including Chlordane and DDT (and breakdown elements of DDT); butylins; four major elements; and 12 trace elements. On a less frequent basis, sediments are collected at Mussel Watch sites and analyzed for the same chemicals. Also, on less than annual frequency, mussels and oysters are examined for disease incidences (neoplasia and *Perkinsus marinus*, or "Dermo" disease). The first five years of mussel tissue data have been examined for temporal trends.

#### COLLECTION METHODS:

Samples are collected from the same sites each year, and stored for subsequent chemical analysis. Sampling sites are chosen to represent contaminant levels in the surrounding area to avoid small-scale patches of contamination, or "hot spots". Three composite samples (30 mussels or 20 oysters) are collected at each site. Sediment samples are collected at three stations within each site, a station being anywhere within 500 meters of a site center. Generally, mollusks are collected in the intertidal to shallow subtidal zones. Associated sediments may be collected as much as 2 kilometers away from the site center. Sediment samples are skimmed from the top 2

centimeters of the sediment surface. To minimize the effects of seasonal influences on contaminant concentrations, mollusks are collected within three weeks of each annual cycle. Because no single bivalve molluscan species occupies the entire geographic range monitored by the Mussel Watch Project, samples must be obtained from several species.

All Mussel Watch laboratories participate in the NS&T Quality Assurance Project. Since it is possible that chemical concentrations in molluscan tissues can be affected by reproductive stage, the stage of gonadal maturation is determined at each site. Because the same molluscan species cannot be collected throughout the country, tissue data cannot be used uncritically to describe the spatial distribution of contamination. For organic contaminants, it is probably acceptable to consider mussels and oysters as equivalent matrices, but for elemental analytes, especially silver, copper, and zinc, uptake by the different genera are not always equivalent.

#### COLLECTION FREQUENCY:

Bivalve mollusks are collected from most sites once a year. Surface sediments were monitored annually from 1986 to 1988 and have been monitored on a less-than-annual basis since that time. The database presently contains six years of analytical data, from 1986 to 1991. Some Mussel Watch sites coincide with sites occupied from 1976 to 1978 by the EPA Mussel Watch Program, which enables the examination of decadal contaminant trends.

#### GEOGRAPHIC COVERAGE:

Samples are collected from approximately 240 sites in all marine coastal U.S. states, including Alaska and Hawaii. About 200 of these sites are monitored on an annual basis. Fewer sites (about 150) were represented when the Project was initiated in 1986. Site locations were expanded in 1992 to include the Great Lakes (using zebra mussels, *Dreissena polymorpha*), the U.S. Virgin Islands, and Puerto Rico. On average, the distances between sampling sites are 20 kilometers in estuaries and embayments and 100 kilometers along open coastline.

## DEPARTMENT OF COMMERCE

# National Climatic Data Center

### OFFICE:

National Oceanic and Atmospheric Administration  
National Environmental Satellite and Data  
Information Service

### SUMMARY PROGRAM DESCRIPTION:

The National Climatic Data Center (NCDC) collects, processes, and archives meteorological and climatological data from a global network of stations. Records begin in the mid-19th century and continue to the present.

### DATA COVERAGE:

Climatic variables (e.g., temperature, precipitation, solar radiation, storms, wind, and floods) are summarized for both short-term and long-term periods of record. Data are available in published form, on microfiche, or on magnetic tape. Derived values relating to growing season and heating and cooling degree days are also produced. Special statistical summaries of actual and derived values of meteorological elements over the world's oceans as well as summaries used in the study of air pollution are available.

### COLLECTION METHODS:

For about four decades, NCDC has been receiving climatic data from across the United States and around the globe. Principal sources in the United States are the National Weather Service (NWS), the Federal Aviation Administration, the U.S. Air Force, the U.S. Navy, and the U.S. Coast Guard. The NWS's Cooperative Station Network is comprised mainly of 10,000 volunteer observers and has been recording daily records since the 1800's. As aircraft began to fill the skies, information on the upper atmosphere was needed. Balloon-borne instruments radioed data; radars began to probe the clouds; rockets reached the fringes of the atmosphere; and by weather satellites, both geo-stationary and polar orbiting, which continuously record the weather. Technical advancements led NCDC to archive some of their data on CD-ROMs so that users could look at a large amount of climatic data at one time. The NCDC plans to archive new datasets using the latest technical advances available, such as ASOS, Profiler, NEXRAD, and STORM.

### COLLECTION FREQUENCY:

Observations are taken at varying intervals, from every fifteen minutes to once per month. Collections are daily or monthly depending on type and source of information.

### GEOGRAPHIC COVERAGE:

Global land and sea, but coverage is primarily U.S. and dependencies, especially for summarized data.

### CONTACT:

National Climatic Data Center  
Federal Building  
Asheville, NC 28801  
Phone: (704) 259-0682

Climate Research Requests:  
Phone: (704) 259-0994

### FOR PUBLIC INQUIRIES:

# National Coastal Pollutant Discharge Inventory Program

### OFFICE:

National Oceanic and Atmospheric Administration  
National Ocean Service  
Office of Ocean Resources Conservation and Assessment  
Strategic Environmental Assessments Division  
Pollutant Source Characterization Branch

### SUMMARY PROGRAM DESCRIPTION:

The National Coastal Pollutant Discharge Inventory (NCPDI) Program is a series of database development and analytical activities within the National Oceanic and Atmospheric Administration's Strategic Assessment Program of coastal and estuarine areas. The cornerstone of the program is a comprehensive database and computational framework that has been developed over the last nine years. The database contains pollutant loading estimates for all major categories of point, nonpoint, and riverine sources located in coastal counties or the 200-mile Exclusive Economic Zone that discharge to the estuarine, coastal, and oceanic waters of the contiguous U.S. (excluding the Great Lakes).

### DATA COVERAGE:

The pollutant discharge estimates in the NCPDI are made for the following base years for each coastal component: East Coast - 1982; West Coast - 1984; and Gulf Coast - 1987. The estimates can be considered to approximate pollutant discharge conditions for a five-year period around the base year. Estimates are made for nine major source categories and 17 pollutants. Source categories include: point sources; urban nonpoint sources; nonurban nonpoint sources; irrigation return flow; oil and gas operations; marine transportation operations; accidental spills; and dredging operations. Pollutant parameters include: flow (wastewater flow or surface runoff); oxygen-demanding materials (BOD); particulate matter; nutrients (total nitrogen and phosphorus); metals (arsenic, cadmium, chromium, copper, iron, lead, mercury, and zinc); petroleum hydrocarbons (oil and grease); pesticides (35 compounds); pathogens (fecal coliform bacteria); and wastewater treatment sludges. The pollutant estimates can be aggregated by county, USGS hydrologic cataloging unit, or estuarine watershed.

### COLLECTION METHODS:

Estimates are based on a combination of computed methodologies and actual monitored observations. For

detailed descriptions of the methodologies, the reader is directed to the various reports listed under Publications.

### COLLECTION FREQUENCY:

Estimates are based on a combination of computed methodologies and actual monitored observations. Data sources include EPA's Permit Compliance System, Industrial Discharge File, and Construction Grants Needs Survey, USGS Land Use/Land Cover Database, and USDA's National Resource Inventory and SOILS-5 Database. For detailed descriptions of the methodologies, the reader is directed to the various reports listed under Publications.

### GEOGRAPHIC COVERAGE:

Coastal areas of the continental United States, excluding the Great Lakes.

## DEPARTMENT OF ENERGY

### Month and State Current Emissions Trends

#### OFFICE:

Argonne National Laboratory  
Energy and Environmental Systems Division  
Policy and Economic Analysis Group  
Energy Policy Section

#### SUMMARY PROGRAM DESCRIPTION:

The Month and State Current Emissions Trends (MSCET) program provides emissions estimates for nitrogen oxides, sulfur dioxide, and nonmethane volatile organic compounds. The data set can be used to monitor regional and/or seasonal emissions trends or trends for specific emission source groups.

#### DATA COVERAGE:

National and sectoral emissions estimates for nitrogen oxides, sulfur dioxide, and nonmethane volatile organic compounds are generated for all states in the contiguous United States. The database contains emissions data estimated by month and state for 68 emission source groups. Six general emission categories are: electric utilities, industrial fuel combustion, commercial/residential fuel combustion, industrial processes, transportation, and miscellaneous. The database has been updated to include the National Acid Precipitation Assessment Program's emissions inventory.

#### COLLECTION METHODS:

Emissions are estimated from fuel consumption and economic activity data. The fuel consumption data are taken from Department of Energy, Energy Information Administration data tapes and reports. Economic activity data are taken from various economic statistics reports, most frequently the Bureau of Economic Analysis publication Survey of Current Business. A detailed description of the methodology is presented in Kohout et.al., 1990.

#### COLLECTION FREQUENCY:

Monthly fuel consumption and economic activity data are collected annually, and preliminary data are updated as they become available. Emissions are estimated twice: a preliminary flash estimate early in the following calendar year, and a final estimate about six months later.

#### GEOGRAPHIC COVERAGE:

Forty-eight contiguous states and Washington, DC.

#### CONTACT:

Dan Miller

Argonne, IL.

#### DATABASE(S):

Month and State Current Emissions Trends (MSCET) Database

The MSCET database contains emissions estimates by state and month for 1975 to 1990 for 68 emission source groups. Data are available in ASCII, SAS, or tab-delimited formats on magnetic tape, floppy diskettes, or hardcopy.

## DEPARTMENT OF ENERGY

# National Energy Information Center

### OFFICE:

Energy Information Administration  
National Energy Information Center

### SUMMARY PROGRAM DESCRIPTION:

The Energy Information Administration (EIA) is the Department of Energy's independent statistical and analytical agency, with a mandate to collect and publish data and prepare analyses on energy production, consumption, prices, and resources, and projections of energy supply and demand.

### DATA COVERAGE:

EIA collects and disseminates data on the following: energy sources; energy reserves; total production; consumption by source, by end use sector, per capita, and per GNP dollar; energy imports and exports; and related economic and statistical information, both historical and forecasted (e.g., energy efficiency indicators). Also available are data on the production of specific fuel types (e.g., coal, oil and natural gas plant liquids, and natural gas); production of nuclear and hydroelectric power; use of certain renewable energy sources – such as solar, geothermal, wood, and wind; and production of electricity by source.

### COLLECTION METHODS:

The methods for generating energy statistics, which are varied, are described in Appendix E of the Annual Energy Review. They include survey reporting by energy production, transmission, and distribution companies and end users, and calculations and estimations made by EIA.

### COLLECTION FREQUENCY:

Data are collected monthly, quarterly, yearly, biennially, and triennially.

### GEOGRAPHIC COVERAGE:

Entire United States and some global.

### CONTACT:

National Energy Information Center  
U.S. Department of Energy  
Forrestal Building, 1F-048  
Washington, DC 20585  
Phone: (202) 586-8800

### FOR PUBLIC INQUIRIES:

## DEPARTMENT OF ENERGY

### Carbon Dioxide Information Analysis Center

#### OFFICE:

Oak Ridge National Laboratory  
Environmental Sciences Division

#### SUMMARY PROGRAM DESCRIPTION:

The objective of the Carbon Dioxide Information Analysis Center (CDIAC) is to compile, evaluate, and distribute information related to carbon dioxide (CO<sub>2</sub>) in support of the Department of Energy's Carbon Dioxide Research Program (CDRP). To accomplish this objective, CDIAC identifies researchers' needs for data, models, and information; obtains, evaluates, and ensures the quality of the information; and works with other national and international data centers as well as with individual researchers to promote and facilitate the exchange of data. CDIAC supports the data and information needs of researchers studying the effects of increasing atmospheric CO<sub>2</sub> on climate, carbon cycle processes, and resources.

#### DATA COVERAGE:

Variables measured and analyzed include any CO<sub>2</sub>-related or greenhouse gas-related parameter. Trend data include: atmospheric CO<sub>2</sub> and methane concentrations from surface monitoring sites and from ice cores; CO<sub>2</sub> emissions resulting from fossil fuel consumption and cement production; historical land use data in Southeast Asia; long-term temperature and precipitation, cloudiness, and sunshine records for the United States; global and hemispheric temperature anomalies; dust veil indices; umbral/penumbral ratios; and radiocarbon data from oceanographic cruises.

#### COLLECTION METHODS:

Data sets that are archived and distributed by CDIAC have either been sent to CDIAC voluntarily by the collecting agency or researcher or have been sent to CDIAC as a result of contracts made by CDIAC. CDIAC identifies data sets critical to greenhouse and global warming issues by conducting surveys of researchers and users of CDIAC's data products; contacting researchers and agencies addressing global warming issues; attending scientific conferences and symposia; and soliciting suggestions from DOE managers. CDIAC does not impose format restrictions on individuals and agencies that archive data at CDIAC. CDIAC accepts the data in whatever form (i.e., hardcopy, dBASE files, LOTUS files, flat ASCII files) is most convenient for the contributor. Irrespective of the source, CDIAC reviews all data sent to

CDIAC before documenting and distributing the data set. These reviews, which are often extensive, involve consultation with the contributing agency or researcher. CDIAC does not correct or distribute any data sets or computer models without the written consent of the contributing individual or agency.

#### COLLECTION FREQUENCY:

The frequency of data collection with the CDRP program ranges from hourly (e.g., atmospheric CO<sub>2</sub> concentrations) to decennial (e.g., land use changes in Southeast Asia).

#### GEOGRAPHIC COVERAGE:

Global.

### Integrated Data Base Program

#### OFFICE:

Oak Ridge National Laboratory  
Office of Civilian Radioactive Waste Management and  
Office of Environmental Restoration and  
Waste Management

#### SUMMARY PROGRAM DESCRIPTION:

The Integrated Data Base Program (IDB) maintains data on all spent radioactive fuel and waste in the United States.

#### DATA COVERAGE:

The radioactive materials considered are spent fuel, high-level waste, transuranic waste, low-level waste, mixed waste, commercial uranium mill tailings, remedial action waste, and decommissioning waste. For each category, current and projected inventories are given through the year 2020, and the radioactivity and thermal power are calculated based on reported or estimated isotopic compositions. In addition, characteristics and current inventories are reported for miscellaneous, highly radioactive materials that may require geologic disposal.

#### COLLECTION METHODS:

Yearly query of national DOE lead sites for each waste type and occasional direct inquiry of individual generator/storage sites.

#### COLLECTION FREQUENCY:

Data are collected annually.

#### GEOGRAPHIC COVERAGE:

Entire United States.

#### CONTACT:

Jerry A. Klein, Program Manager  
Oak Ridge National Laboratory  
P.O. Box 2003  
Oak Ridge, TN 37831-7358

## DEPARTMENT OF HEALTH AND HUMAN SERVICES

### Health and Nutrition Examination Surveys

#### OFFICE:

National Center for Health Statistics  
Office of Vital and Health Statistics Systems  
Division of Health Examination Statistics

#### HHANES:

Data comparable to the NHANES II study were collected from the Hispanic population.

#### SUMMARY PROGRAM DESCRIPTION:

The National Health Survey Act of 1956 provided for the establishment and continuation of a National Health Survey to obtain information about the health status of the population in the United States. The National Center for Health Statistics is responsible for this program. During the 1960s three Health Examination Surveys (HES Cycle I, II, and III) were conducted on probability samples of the civilian, non-institutionalized population of the United States. A nutritional component was included in subsequent health examination surveys: the first National Health and Nutrition Examination Survey (NHANES I) conducted during 1971-75, NHANES II conducted during 1976-80, the Hispanic Health and Nutrition Examination Survey (HHANES) conducted during 1982-84, and the ongoing NHANES III. Environmental data collection effort mainly started with NHANES II.

#### DATA COVERAGE:

##### NHANES I:

Data collected include: general physical examination, nutrition examination, carbon monoxide tests, and tobacco use.

##### NHANES II:

In addition to the variables listed above, the following data were collected: lead and carboxyhemoglobin in whole blood; organo-chlorine pesticides, residues, and metabolites in urine specimens (2,4,6-trichlorophenol; 2,5,6-trichloro-2-pyridinol; 2,4,5-trichlorophenol; pentachlorophenol; para-nitrophenol; 2,4,5-T; 2,4,-D; silvex; dicamba; alpha-monocarboxylic acid; dicarboxylic acid); and organochlorine pesticides, residues, and metabolites in serum (trans-nonachlor; heptachlor epoxide; oxy-chlordane; heptachlor; alpha-BHC; beta-BHC; gamma-BHC; delta-BHC; aldrin; endrin; dieldrin; DDT; DDE; DDD; hexachlorobenzene; and mirex). Also analyzed were: heating fuel used; tobacco use; and pesticide and disinfectant exposure and poisoning.

#### NHANES III:

Data collected include lung function assessment, tests of central nervous system function, and dietary intake. In addition to variables listed above, the following data are collected: occupation and protective equipment and exposure to volatile substances; source of drinking water; cadmium and cotinine in urine. Blood from the Priority Toxicant Reference Range Study is analyzed for: benzene; toluene; ethylbenzene; xylenes; styrene; trimethylbenzenes; carbon tetrachloride; chloroform; dichloromethane; trichloromethane; trichloroethylene; tetrachloroethylene; and dichlorobenzenes. Also the following pesticides in urine are measured: pentachlorophenol; 2, 4-dichlorophenol; 2, 5-dichlorophenol; 1, 4, 5-trichlorophenol; 2, 4, 6-trichlorophenol; 4-nitrophenol; 3, 4, 5-trichloro-2-pyridinol; 1-naphthol; 2-naphthol; isopropoxyphenol; carbofuranphenol; and 2, 4-dichlorophenoxyacetic acid.

#### COLLECTION METHODS:

The Health and Nutrition Examination Surveys are complex, multi-stage, stratified, probability sample surveys. The process of selecting a sample of persons to be examined involves the selection of primary sampling units, census enumeration districts, segments, households, eligible persons, and finally sample persons. The pesticides and volatiles are being measured on a volunteer subgroup only. Data are collected by direct physical examinations, tests, measurements, and interviews.

#### COLLECTION FREQUENCY:

Periodic (as determined appropriate).

#### GEOGRAPHIC COVERAGE:

Entire United States.

## DEPARTMENT OF THE INTERIOR

### Public Lands Statistics

#### OFFICE:

Bureau of Land Management  
Office of Public Affairs

#### SUMMARY PROGRAM DESCRIPTION:

This program provides a national summary of key statistics for all of the Bureau of Land Management (BLM) lands, at the state level in most cases.

#### DATA COVERAGE:

Data summarized include statistics on: mineral and surface ownership; grazing permits/leases; range conditions; forest utilization; wildlife populations; threatened and endangered species; status of wild horses and burros; cultural resources activities; recreation visits; and listing of recreation, wilderness, and wilderness study areas. Data also contain national mineral statistics such as leasing, permitting, development/exploration activity, patents issued, and plans of operation approved.

#### COLLECTION METHODS:

Some data are estimates whereas other data reflect actual counts or measurements.

#### COLLECTION FREQUENCY:

Annual.

#### GEOGRAPHIC COVERAGE:

Most of the surface resource statistics are restricted to the 270 million acres administered by BLM throughout the United States. Mineral statistics pertain to the 732 million acres of federal mineral estates subject to surface and subsurface mineral development. Mineral lands include public lands administered by BLM and other agencies, acquired lands, and lands that have been patented with some or all minerals reserved to the United States.

#### CONTACT:

June Wrona  
Office of Public Affairs  
Bureau of Land Management (130)  
1849 C Street, NW  
Washington, DC 20240  
Phone: (202) 208-5717

#### FOR PUBLIC INQUIRIES:

#### DATABASE(S):

Various data management systems maintained at headquarters and state-level offices of the BLM (e.g., the Grazing Authorization and Billing System, the Range Management Automated System).

## DEPARTMENT OF THE INTERIOR

### Range Site Inventory

#### OFFICE:

Bureau of Land Management  
Division of Rangeland Resources

#### SUMMARY PROGRAM DESCRIPTION:

The Range Site Inventory provides an on-the-ground assessment of rangeland administered by the Bureau of Land Management (BLM).

#### DATA COVERAGE:

The Range Site Inventory produces data and maps on habitat types which can be interpreted, along with other data, as to their production capabilities and suitability for grazing, wildlife, recreation, natural beauty, watershed management, and open space. A range or ecological site map provides the basic ecological data for planning the use, development, rehabilitation, and management of rangeland. To date, data on approximately 89,648,000 acres have been compiled. Additional inventories are being conducted annually. Data are also used to evaluate the potential of range ecosystems to produce and sustain distinctive kinds and amounts of vegetation.

#### COLLECTION METHODS:

Data are collected by double sampling range sites (harvesting and estimating) and soil survey.

#### COLLECTION FREQUENCY:

Every ten years.

#### GEOGRAPHIC COVERAGE:

All inventories completed to date are within the administrative boundaries of BLM lands authorized for livestock grazing in the western United States.

#### CONTACT:

Jim Fox, Chief  
Division of Rangeland Resources  
Bureau of Land Management (220)  
1725 I Street, NW  
Premier Building, Room 909  
Washington, DC 20240  
Phone: (202) 653-9193

#### FOR PUBLIC INQUIRIES:

Contact State Director and Service Center Director of the affiliated state.

#### PUBLICATIONS:

—. 1992. Public Land Statistics 1991 (and earlier reports in this series). Washington, DC.

#### DATABASE(S):

Inventory Data System (IDS)

The IDS is maintained at the BLM Service Center using ASPEN2 database software on a Honeywell mainframe. BLM uses SITEFORM as input data to describe soil, vegetation composition and production, and ecological status as well as location and climate characteristics.

## DEPARTMENT OF THE INTERIOR

# Timber Sale Information System

### OFFICE:

Bureau of Land Management  
Division of Forestry

### SUMMARY PROGRAM DESCRIPTION:

This program maintains a database on all Bureau of Land Management (BLM) timber sales. It produces detailed information on every timber sale offered and/or sold and is capable of generating reports to give current status of individual timber sales or summaries of particular information for any administrative unit from the resource area level up to the bureau level.

### DATA COVERAGE:

Data include information on each cutting unit (e.g., acreage, volume, value, and species of timber, uncut volume and acreage, and unhailed volume and acreage). For each timber sale, the database has the following information: appraised value; total purchase price; sale date; approval date; expiration date; purchaser; total volume and value by species; unpaid balance; contract modifications; and termination date.

### COLLECTION METHODS:

The information on cutting unit acreage and volume and appraised sale value is generated when the sale is advertised. The information on total purchase price, value of cutting units, sale date, purchaser, and total purchase price is generated when the sale is made. Information on cutting and payment is generated monthly, and contract modifications and termination data are generated as they occur.

### COLLECTION FREQUENCY:

Periodically (dependent on activity in the timber sales program).

### GEOGRAPHIC COVERAGE:

This program covers all timber sales made by the BLM. The BLM timber sale program is mostly in California, Colorado, Idaho, Montana, Oregon, Washington, and Wyoming.

### CONTACT:

Bob Bierer  
Division of Forestry  
Bureau of Land Management (230)  
1849 C Street, NW  
Washington, DC 20240

### FOR PUBLIC INQUIRIES:

See Contact.

### PUBLICATIONS:

Department of the Interior, Bureau of Land Management.  
Material Disposal Report (annual). Denver, CO:  
Bureau of Land Management.

—. 1992. Public Land Statistics 1991 (and earlier reports in this series). Washington, DC.

### DATABASE(S):

The Timber Sale Information System

This system is made up of two separate databases for BLM: the Oregon Consolidated Timber Sale Information System which covers the states of Oregon and Washington and the Material Disposal System which covers all other states.

The Consolidated Timber Sale Information System

This system is made up of the following Aspen/2 databases: prospectus information; sale appraisal information; purchaser information; posting NO-BIDS; approval and expiration dates; cutting unit specifics; sale modification entries; timber payment entries; contract termination and defaults; and road maintenance, contributed payments, etc.

The Material Disposal System

This system is made up of the following Aspen/2 databases for sawtimber: timber sale contract information; species summaries; cutting and hauling information; and sale unit and modifications information.

## DEPARTMENT OF THE INTERIOR

### Minerals Information Program

#### OFFICE:

Bureau of Mines

#### SUMMARY PROGRAM DESCRIPTION:

The Bureau of Mines collects and interprets data concerning mineral production, consumption, and trade both in the United States and worldwide. It performs assessments on the worldwide availability of minerals and identifies potential mineral resources. Comprehensive analyses are also made on the impact of government policies, economic conditions, and political events on the mineral industry and mineral supplies.

#### DATA COVERAGE:

Data are collected on over 100 ferrous, nonferrous, and industrial mineral commodities, including abrasives, aluminum, antimony, arsenic, asbestos, natural asphalt, barium, bauxite, beryllium, bismuth, boron, bromine, cadmium, calcium, calcium carbonate, cement, cesium, chromium, clays, cobalt, columbium, copper, corundum-emery, diamond, diatomite, explosives, feldspar, ferroalloys, fluorspar, fused alumina, gallium, garnet, gemstones, germanium, gold, graphite, greensand, gypsum, hafnium, helium, indium, iodine, iron ore, iron and steel, iron oxide pigments, kyanite-mullite, lead, lime, lithium, magnesium and magnesium compounds, manganese, mercury, mica, molybdenum, nepheline syenite, nickel, nitrogen, peat, perlite, phosphate rock, platinum-group metals, potash, pumice, quartz crystal, rare earths, rhenium, rubidium, salt, sand and gravel, scandium, selenium, silicon, silicon carbide, silver, sodium compounds, staurolite, crushed stone, dimension stone, strontium, sulfur, talc, tantalum, tellurium, thallium, thorium, tin, titanium, tripoli, tungsten, vanadium, vermiculite, wollastonite, yttrium, zeolites, zinc, and zirconium.

For most of these mineral commodities, statistical coverage includes uses and production by weight and by state and country, imports, exports, value, recovery from scrap, mine locations, mine capacities, and mine wastes.

#### COLLECTION METHODS:

Bureau of Mines commodity specialists collect data on specific minerals and materials, and state activity specialists collect information from U.S. companies operating mines and mineral processing plants. Country specialists obtain data from foreign governments, U.S.

embassies, and international publications, and they visit mines overseas to monitor mineral production and consumption worldwide.

#### COLLECTION FREQUENCY:

Data are collected monthly, quarterly, semi-annually, and/or annually.

#### GEOGRAPHIC COVERAGE:

Entire United States and over 160 foreign countries.

#### CONTACTS:

**DATABASE(S):**

**MINES-DATA**

Late in 1989, a computer bulletin board service was introduced by the Bureau of Mines. Coverage includes aluminum, bauxite, beryllium, bismuth, cadmium, chromium, copper, gallium, gold and silver, iron and steel scrap, lead, magnesium, mercury, molybdenum, platinum-group metals, silicon, thallium, thorium, tin, titanium, vanadium, and zinc.

## DEPARTMENT OF THE INTERIOR

### Master Deed Listing

#### OFFICE:

National Park Service  
Land Resources Division

#### SUMMARY PROGRAM DESCRIPTION:

The Master Deed Listing provides data and information on the number of units and size of all lands within the authorized boundaries of the National Park System (NPS).

#### DATA COVERAGE:

Primary data are number of units and size in acres by type (e.g., national park, national monument, etc.), by ownership (e.g., federal, private, state or political subdivision thereof), and by state. Data also include: owner's name; size of ownership (if federal, how and when acquired, at what cost, and with what reservations); and size of NPS unit.

#### COLLECTION METHODS:

Data are generated through surveys and inventories of NPS properties.

#### COLLECTION FREQUENCY:

The database is updated monthly.

#### GEOGRAPHIC COVERAGE:

Entire United States, American Samoa, Guam, Puerto Rico, and the Virgin Islands.

#### CONTACT:

Renee Minnick, Chief  
Coordination and Control Branch  
National Park Service  
P.O. Box 37127  
Washington, DC 20013-7127  
Phone: (202) 343-3862

#### FOR PUBLIC INQUIRIES:

See Contact.

#### PUBLICATIONS:

The Department of the Interior, National Park Service publishes the following reports as of September 30 and December 31 annually:

Summary of Acreages (alphabetical by area with summary by type of unit);

Listing of Acreages by Region (alphabetical by area within regional jurisdictions);

Listing of Acreage, by State and County (alphabetical by area on regional basis, showing acreage by county/state);

Listing of Acreage by State (total acreage by state);

State and County Reports by States (alphabetical by state, showing acreage by county and area(s) within county).

Master Deed Listing

## DEPARTMENT OF THE INTERIOR

# National Park Service Gaseous Pollutant Monitoring Network

### OFFICE:

National Park Service  
Air Quality Division  
Monitoring and Data Analysis Branch

Denver, CO 80225  
Phone: (303) 969-2072

### FOR PUBLIC INQUIRIES:

Ron Lawler Heavner or Bob Carson  
Air Quality Monitoring Systems Specialists  
National Park Service – AIR  
P.O. Box 25287  
Denver, CO 80225  
Phone: (303) 969-2072

### SUMMARY PROGRAM DESCRIPTION:

The primary objectives of the gaseous pollutant monitoring program are to: establish existing or baseline concentrations in National Park Service (NPS) units; assess trends in air quality in NPS units; judge compliance with national air quality standards; assist in the development and revision of national and regional air pollution control policies for rural areas; provide data for atmospheric model development and evaluation; and correlate effects of existing air quality on park resources.

### DATA COVERAGE:

Variables measured include ozone, sulfur dioxide, and meteorological parameters including wind speed, wind direction, temperature, dew point, solar radiation, and precipitation.

### COLLECTION METHODS:

U.S. Environmental Protection Agency (EPA) reference or equivalent methods are used to monitor ozone and sulfur dioxide on a continuous basis. Sulfur dioxide is measured on a 24-hour time-integrated basis using filter packs with subsequent analysis of the filters using ion chromatography. Ozone is measured at 41 NPS areas; sulfur dioxide at 33; and meteorological parameters at 39.

### COLLECTION FREQUENCY:

Hourly; additionally, sulfur dioxide is collected on a time-integrated basis with two twenty-four-hour samples per week.

### GEOGRAPHIC COVERAGE:

Nationwide in selected Class I and Class II National Park units as designated under the Clean Air Act.

### CONTACT:

Miguel I. Flores, Chief  
Monitoring and Data Analysis Branch  
National Park Service – AIR  
P.O. Box 25287

### PUBLICATIONS:

Technical report series are available on request. The series are entitled, Gaseous Pollutant and Meteorological Monitoring Annual Data Summary. The Reports are available for each National Park area that is in the network. Requests should be made to the address listed under For Public Inquiries.

### DATABASE(S):

The NPS maintains an environmental database management system based on ORACLE for internal use. All NPS data are submitted to the EPA's AIRS database.

## DEPARTMENT OF THE INTERIOR

### National Park Service Visibility Monitoring Network

#### OFFICE:

National Park Service  
Air Quality Division  
Research Branch  
Fort Collins Office

Fort Collins, CO 80523  
Phone: (303) 491-8292

#### FOR PUBLIC INQUIRIES:

See Contact.

#### SUMMARY PROGRAM DESCRIPTION:

The Visibility Monitoring Program consists of two major components: optical monitoring and fine particle sampling. The program began in 1978 and now covers fifty-six National Park Service units. The program provides basic information on visibility conditions in National Park Service Class I areas throughout the country, primarily in the western United States. Information is used to assess trends, develop source-receptor relationships, and identify cause-effect relationships.

#### PUBLICATIONS:

Malm, W.C. and J.V. Molenar. 1984. Visibility measurements in national parks in the western United States. J. Air Poll. Control Assoc. 34(9):899-903.

Malm, W.C. 1989. Atmospheric haze: Its sources and effects on visibility in rural areas of the continental United States. Environ. Mon. Assess. 12:203-225.

#### DATABASE(S):

None available for public access.

#### DATA COVERAGE:

Principal components measured by optical monitoring are: view (scenic vistas), atmospheric extinction coefficient, and Beta scattering. Principal components measured by fine particle sampling are: PM-10, fine mass, nitrates, sulfates, organic carbon, elemental carbon, elements (Na-Pb), optical absorption, and atmospheric levels of hydrogen, carbon, nitrogen, and oxygen.

#### COLLECTION METHODS:

Visual range measurements and instrument measurements of fine particle mass and chemical composition are made at field locations.

#### COLLECTION FREQUENCY:

Data are collected hourly and weekly.

#### GEOGRAPHIC COVERAGE:

Nationwide; however, primarily in the western United States.

Foothills Campus  
Colorado State University

## DEPARTMENT OF THE INTERIOR

# National Recreational Trails, Long-Distance Trail Management, and National Trail Inventory and Plan

### OFFICE:

National Park Service  
National Trails System Branch

### SUMMARY PROGRAM DESCRIPTION:

National Recreational Trails are defined within the National Trails System Act. Since 1968, over 780 trails have been recognized by either the Secretary of Interior or the Secretary of Agriculture. Although the majority are on federal lands, the trails are found in all states and reflect a broad diversity of trails cherished by Americans. The National Park Service (NPS) expedites certification and re-certification, and maintains files on all registered trails.

Long-Distance Trail Management seeks to implement the National Trails System Act by promoting and enhancing the nation's 17 national scenic and national historic trails. Management responsibilities include funding and staffing, monitoring trail conditions, protecting trail corridors, providing public and press information, and fostering certification, interpretation, public involvement, and interagency coordination.

The National Trail Inventory and Plan program seeks to implement the requirement in the National Trails System Act for a National Trail Plan. To provide a foundation for the Plan, a national inventory is being conducted and regional directories of trail resources are being published. The program works with regional trails interest groups to identify new trail opportunities and strategies to protect the region's system of trails, and assists individual states and metropolitan areas in developing trails, recreational greenways, and corridors.

### DATA COVERAGE:

For National Recreational Trails, data for each trail include: state(s) where trail is located; trail name and registration number; seasons and types of use; types of surface; trail length; date designated; and address of administering agency.

For Long-Distance Trails, statistics vary widely, but generally include: numbers of trails by type; length of route, completed route, adjacent motor route, or high potential route segments; contacts for agency and citizen volunteer groups associated with each trail; dates of Congressional establishment and planning steps; and

general budgets and expenses for each NPS-administered trail for fiscal years 1989-1991. More detailed information, such as trail condition or ownership by state, may not be known or may only be available from field offices.

Under the National Trail Inventory and Plan, primary data elements include: trail or area name; managing agency and type; area acreage; total number and mileage of trails in the management area; designated trail use mileage; and information on associated activities and services, access, and contacts.

### COLLECTION METHODS:

Data are collected through inventory, research in field offices, surveys using standardized forms, inspection of planning documents, and analysis of application submissions.

### COLLECTION FREQUENCY:

Data for National Recreational Trails are collected once, upon application. Collection frequency for Long-Distance Trails varies as needed. For the National Trail Inventory and Plan, nine NPS Regions will be inventoried between 1987 and 1995 and re-inventoried every 5 years as funding and staffing allow.

### GEOGRAPHIC COVERAGE:

Entire United States.

# National Wild and Scenic Rivers System

### OFFICE:

National Park Service  
Park Planning and Protection Division

### SUMMARY PROGRAM DESCRIPTION:

This program is designed to collect data on wild and scenic rivers of the nation which have outstanding natural, recreational, or cultural values in a free-flowing condition and which provide for public enjoyment without destroying those values.

### DATA COVERAGE:

The basic statistics are: number of rivers in National Wild and Scenic Rivers System; river miles in the system, including miles by agency administration and classification (wild, scenic, and recreational); number of rivers formally studied pursuant to congressional direction; and number of rivers and river mileage potentially eligible for designation as listed on the Nationwide Rivers Inventory.

### COLLECTION METHODS:

Inventory of designated and proposed wild and scenic rivers.

### COLLECTION FREQUENCY:

Data for the Nationwide Rivers Inventory were collected in the late 1970s and early 1980s. National Wild and Scenic River designations are updated biennially or as designations occur.

### GEOGRAPHIC COVERAGE:

Entire United States.

### CONTACTS:

### Public Use Analysis and Reporting Program

#### OFFICE:

National Park Service  
Public Use Reporting Branch  
Socio-Economic Studies Division

#### SUMMARY PROGRAM DESCRIPTION:

The National Park Service (NPS) public use data collection program emphasizes timely production of edited information for a variety of administrative, resource management, planning, and other technical applications.

#### DATA COVERAGE:

Statistical data include: total visits; recreational visits, visitor hours, and visitor days; nonrecreational visits, visitor hours, and visitor days; bus traffic; and overnight stays (tent, recreation vehicle, backcountry, concession lodging, concession campgrounds) by state, region, category, urban/rural location, theme, fee collection status, acreage, and wilderness.

#### COLLECTION METHODS:

Actual counts of visitors entering areas administered by the NPS. Multipliers and conversion factors used in compiling data are verified by twelve month sample surveys of visitors conducted every three years. Monthly data are audited and reconciled before being published by the end of the third week following the close of the month. Thirty field audits are conducted by a central office at major reporting areas every year.

#### COLLECTION FREQUENCY:

Data are collected, edited, and published monthly. The computer database contains monthly data back to 1979; paper records go back to 1904.

#### GEOGRAPHIC COVERAGE:

All areas of the national park system (National Parks, Monuments, Recreation Areas, Battlefields, Historic Sites, etc.) receiving public use (326 out of 359 designated areas) in the continental United States, Alaska, Virgin Islands, Guam, Hawaii, Samoa, and Puerto Rico.

## DEPARTMENT OF THE INTERIOR

# National Contaminant Biomonitoring Program

### OFFICE:

U.S. Fish and Wildlife Service  
Fish and Wildlife Enhancement  
Division of Environmental Contaminants

### SUMMARY PROGRAM DESCRIPTION:

The National Contaminant Biomonitoring Program (NCBP) is maintained by the Fish and Wildlife Service (FWS) to document temporal and geographic trends in concentrations of certain persistent environmental contaminants that may threaten fish and wildlife. The NCBP originated as the FWS segment of the National Pesticide Monitoring Program, a multi-agency monitoring effort by the member agencies of the Federal Committee on Pest Control. Since 1965, FWS has periodically determined concentrations of potentially toxic elements and selected organochlorine chemicals in fish and wildlife collected from a nationwide network of stations. The NCBP is being phased out with the implementation of the broader Biomonitoring of Environmental Status and Trends (BEST) Program.

### DATA COVERAGE:

Organochlorine chemical residues measured in freshwater fish, starlings, and waterfowl samples and analyzed for trends include: p,p'-DDT and DDT-metabolites p,p'-DDE and p,p'-DDD (TDE); PCBs (aroclor 1242, 1248, 1254, 1260); aldrin, dieldrin, endrin; heptachlor; heptachlor epoxide; chlordane (five isomers); toxaphene; benzene hexachloride; lindane; hexachlorobenzene; methoxychlor; mirex; pentachloranisole; and dacthal. In addition, freshwater fish are analyzed for elemental contaminants, including: arsenic; cadmium; copper; lead; mercury; selenium; and zinc.

### COLLECTION METHODS:

Composite samples of whole freshwater fish are collected in replicate from 112 stations in major rivers throughout the United States and in the Great Lakes. Preferred fish species, methods of collecting, shipping, archiving, and preparing samples, and data analysis procedures are described in Ribick et al., 1983; Lowe et al., 1985; Schmidt et al., 1990; Schmidt and Brumbaugh, 1990 (See Publications). Quality control samples are analyzed to estimate accuracy and precision of results.

Starlings are collected in replicate from 139 terrestrial sites in the contiguous 48 states. Chemical and statistical methodologies are described in Bunck et al., 1987.

Wings of mallards and black ducks shot by hunters in the continental United States are collected to assess body burden of organochlorine compounds in migratory birds. Procedures for collecting, pooling, sample preparation, chemical analysis, and statistical analysis are described in Cain, 1981 and Prouty and Bunck, 1986.

### COLLECTION FREQUENCY:

This monitoring program has continued at two- to four-year intervals since 1965.

### GEOGRAPHIC COVERAGE:

The fish monitoring network covers the major rivers of the United States and the Great Lakes. Starling collection sites are located within each five-degree block of latitude and longitude in the contiguous 48 states. Mallards are collected throughout the continental United States and black duck are collected from the Atlantic Flyway.

## DATABASE(S):

Environmental Contaminant Data Management System (ECDMS)

The ECDMS is the cataloging, sample management, and data storage system for residue

data from field studies conducted by the Fish and Wildlife Service. Data are from same matrices consisting of animal and plant tissues, sediments, soils, and water. The system contains data on pesticides, elements, PCBs, and other compounds.

## DEPARTMENT OF THE INTERIOR

# National Survey of Fishing, Hunting, and Wildlife-Associated Recreation

### OFFICE:

U.S. Fish and Wildlife Service  
Federal Aid Division

### SUMMARY PROGRAM DESCRIPTION:

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation has been conducted every five years since 1955. It represents one of the oldest and most comprehensive continuing recreation surveys.

The purpose of the survey is to gather information on the number of anglers, hunters, and non-consumptive wildlife recreation participants in the United States, as well as how often they participate and how much money they spend on these activities. Non-consumptive recreationists are those who enjoy photographing, observing, and feeding wildlife.

### DATA COVERAGE:

Numerical data include: number of participants in different types of hunting, fishing, and wildlife-associated recreation activities; days of participation and trips; species hunted and fished; types of expenditures; and selected socioeconomic characteristics of participants.

### COLLECTION METHODS:

The 1985 survey was conducted in two phases. In the first phase, a sample of almost 110,000 households nationwide was screened, mostly by telephone, to determine who in the household had participated in wildlife activities. The second phase of the survey consisted of detailed in-person interviews conducted with subsamples of anglers, hunters, and non-consumptive wildlife participants who were identified in the screening phase. Sample sizes were designed to provide statistically reliable results at the state level for the surveyed activities. In 1985, a total of 33,973 anglers and hunters and 30,177 non-consumptive users were in the detailed sample.

Some changes have been made in the 1991 survey design. For example, telephone interviews were conducted three times during the year (as opposed to once) and interviewees were asked to recall hunting, fishing, and non-consumptive activities for the previous four months (as opposed to one-year recall). Despite these changes, data from the 1991 survey will be comparable with previous survey results.

### COLLECTION FREQUENCY:

Five-year intervals (except between the 1985 and 1991 surveys because additional time was required to revise survey design).

### GEOGRAPHIC COVERAGE:

The entire United States.

# National Wetlands Inventory

### OFFICE:

U.S. Fish and Wildlife Service  
Fish and Wildlife Enhancement  
Branch of Special Projects

### SUMMARY PROGRAM DESCRIPTION:

In 1975, the U.S. Fish and Wildlife Service established the National Wetlands Inventory (NWI) to develop technically sound and comprehensive information on the characteristics and extent of wetland resources in the United States.

### DATA COVERAGE:

Status and trends information is available for selected wetland types including: estuarine wetlands; palustrine wetlands; lacustrine wetlands; and deepwater habitats in the lower forty-eight states. In addition, statistical data are available for coastal waters and bay bottoms, coastal marshlands and mangroves, recent changes in inland vegetated wetlands, recent changes in lacustrine deepwater habitats, estimates of current annual wetland losses, estimates of wetland losses by flyways, states with significant changes in wetland resources, indicators of development pressures on wetland resources, and causes of wetland losses. The Emergency Wetlands Resources Act of 1986 requires that updates of the wetland status and trends be produced on a 10 year cycle with reports due in 1990, 2000, 2010, etc.

### COLLECTION METHODS:

A stratified random sample is used with the basic data strata being formed by state boundaries and the 35 physical subdivisions described by E.H. Hammond (1970). Additional strata specific to the study are special coastal strata encompassing the Marine Intertidal category, the Estuarine System, and other strata encompassing the Great lakes. This results in over 200 strata for the study. Sample units are allocated to strata in proportion to the expected amount of wetland and deepwater habitat acreage as estimated by earlier work. Each sample unit is a four-square-mile area, two miles on each side. After the units are selected at random within strata and plotted on U.S. Geological Survey topographic maps, aerial photography is obtained for the new time period. All wetland and deepwater habitat changes are marked as to cause, either natural or human induced. The photointerpreted data for each unit is then prepared for

computer analysis. Several quality control checks are routinely made to eliminate errors.

### COLLECTION FREQUENCY:

Data are collected continuously with updates on a ten-year cycle. The 1990 update provides trend data on wetlands losses and gains between the 1970s and the 1980s.

### GEOGRAPHIC COVERAGE:

The wetland mapping phase of the project has produced map coverage for approximately seventy percent of the lower forty-eight states, twenty-two percent of Alaska, and all of Hawaii, Puerto Rico, and Guam. Wetland status and trends information is designed to provide statistical estimates on a national basis (lower forty-eight states). In addition, regional intensification studies are available for the Chesapeake Bay Region (Delaware, Maryland, Pennsylvania, West Virginia, and Virginia), and the Central Valley of California. Other statewide status information is available for the states of Florida, Delaware, New Jersey, Illinois, Washington, Maryland, and Connecticut. Status reports covering the coastal wetlands of Alaska and the Prairie Pothole Region (North Dakota, South Dakota, Minnesota) are also available.

### CONTACTS:

#### **DATABASE(S):**

##### **Wetland Plant Species Database**

The database is a listing of plants occurring in wetlands, as defined by the U.S. Fish and Wildlife Service's wetland definition and classification system. It lists scientific and common names and distribution of 6,728 plant species. It can be accessed by family, scientific, or common name,

region, state, and wetland indicator status. The database is updated as additional information is received.

State and regional subdivisions of the Wetland Plant Species Database are available on floppy disks from:

BIODATA, Inc.  
13950 West 20th Avenue  
Golden, CO 80401  
Phone: (303) 278-1046

#### **Books**

Books contains bibliographic citations for almost 300 sources such as national, regional, and state floras, checklists, and botanical manuals used to compile the Wetland Plant Species Database.

#### **Wetland Values Citation Database**

This is a bibliographic database with over 12,000 listings of worldwide published scientific literature on wetland functions and values. It has an extensive number of searchable fields, including geographic descriptors, hydrological units, ecological regions, and wetlands types, as well as subject, title, and abstract fields. It includes literature from the 1950s to the present.

Information on the Wetlands Values Citation Database is available from:

Paul Alford  
National Wetlands Inventory  
U.S. Fish and Wildlife Services  
9720 Executive Center Drive  
Suite 101 Monroe Building  
St. Petersburg, FL 33702-2440  
Phone: (813) 893-3624

#### **Wetland Geographic Information System**

The National Wetlands Inventory is constructing a geo-referenced wetland database using geographic information system (GIS) technologies. Three systems comprise the GIS:

- (1) The Wetlands Analytical Mapping System (WAMS);
- (2) The Map Overlay and Statistical System (MOSS); and
- (3) The Cartographic Output System (COS). To date, more than 7,746 NWI maps representing

12.8% of the continental United States have been digitized. Statewide databases have been built for New Jersey, Indiana, Washington, Illinois, Delaware, and Maryland and are in progress for Virginia, Minnesota, South Dakota, and South Carolina. NWI digital data are also available for portions of 33 other states. Wetland GIS database files may be purchased from The National Wetlands Inventory office in St. Petersburg, FL (see Contacts).

## DEPARTMENT OF THE INTERIOR

### North American Breeding Bird Survey

#### OFFICE:

U.S. Fish and Wildlife Service  
Office of Migratory Bird Management  
Patuxent Wildlife Research Center

#### SUMMARY PROGRAM DESCRIPTION:

The Breeding Bird Survey Program, started in 1966, provides a uniform basis for assessing long-term trends in avian populations throughout North America.

#### DATA COVERAGE:

Total number of individuals recorded by species, survey route, and state are available. Long-term trend analyses are performed every two years.

#### COLLECTION METHODS:

Field procedures provide uniform sampling of bird populations by major physiographic regions across the continent. The data collection methods, which involve censusing of birds by sight and sound for specified periods of time along established survey routes during the breeding season (usually the month of June), and methods for data processing and analysis are described in Robbins, Bystrak and Geissler (1986).

#### COLLECTION FREQUENCY:

Data are collected annually.

#### GEOGRAPHIC COVERAGE:

Randomly distributed roadside routes have been established within each one degree block of latitude and longitude in the coterminous United States and the roaded areas of Alaska and Canada.

## DEPARTMENT OF THE INTERIOR

### U.S. Fish and Wildlife Service Lands

#### OFFICE:

U.S. Fish and Wildlife Service  
Division of Realty  
Branch of Operations

#### SUMMARY PROGRAM DESCRIPTION:

There are two primary data series that are compiled and reported to the general public: the "Annual Report of Lands Under Control of the U.S. Fish and Wildlife Service" and the "Migratory Bird Conservation Commission Annual Report."

#### DATA COVERAGE:

The following data are collected: unit number and acreages; acquisition type; and location of FWS properties, including National Wildlife Refuges, Waterfowl Production Areas, and National Fish Hatcheries, coordination areas, and administrative sites.

#### COLLECTION METHODS:

Inventories of property are conducted for the Real Property Management Information System.

#### COLLECTION FREQUENCY:

Updated annually since 1945.

#### GEOGRAPHIC COVERAGE:

The contiguous United States, Alaska, Hawaii, and associated governments and possessions.

# Waterfowl Breeding Population and Habitat Survey

### OFFICE:

U.S. Fish and Wildlife Service  
Office of Migratory Bird Management

Mailstop 634 ARLSQ  
4401 North Fairfax Drive  
Arlington, VA 22030  
Phone: (703) 358-1838

### SUMMARY PROGRAM DESCRIPTION:

This survey is designed to provide annual breeding population estimates and measure breeding habitat changes over a major portion of the duck breeding range in North America.

### DATA COVERAGE:

Variables measured include number of breeding waterfowl by species (for example, northern pintail and mallard, Canada goose, canvasback and redhead, and Tundra swan) and number of waterbodies (ponds) available during the breeding season. Annual comparisons and long-term trend information are available.

### COLLECTION METHODS:

This survey is an aerial plot survey. Individual duck, goose, and swan populations by species and ponds are counted on strip transects that total 71,110 kilometers for an approximately one percent sample of the total surveyed area. Detectability bias is corrected through the use of a double-sampling scheme. Waterfowl along a small portion of the transect lengths are counted from the ground. These counts represent a census, allowing the correction of the aerial counts by using ratio estimators. The number of breeding waterfowl for each species and the number of waterbodies is the target population.

### COLLECTION FREQUENCY:

Data collected on an annual basis.

### GEOGRAPHIC COVERAGE:

Includes the fifty states, Yukon Territory, Northwest Territories, Alberta, Manitoba, Saskatchewan, western Ontario, North and South Dakota, and Montana.

## DEPARTMENT OF THE INTERIOR

# National Hydrologic Bench-Mark Network Program

### OFFICE:

U.S. Geological Survey  
Water Resources Division  
Office of Water Quality

### SUMMARY PROGRAM DESCRIPTION:

The National Hydrologic Bench-Mark Network Program was initiated in 1964 to provide a nationally uniform basis for assessing long-term trends in the physical and chemical characteristics of surface waters largely unaffected by land use activities. Water quality monitoring is carried out in basins where there is generally no man-made storage, regulation, or diversion. Groundwater in hydrologic benchmark basins is not affected by pumping, and the probability is small that human activity would increase within the basin.

### DATA COVERAGE:

Principal constituents monitored in freshwater and analyzed for trends are pH, alkalinity, sulfate, nitrate, phosphorus, calcium, magnesium, sodium, potassium, chloride, suspended sediment, fecal coliform bacteria, fecal streptococcal bacteria, dissolved oxygen, and dissolved oxygen deficit. Trace elements monitored in freshwater and analyzed for trends are arsenic, cadmium, chromium, iron, lead, manganese, mercury, selenium, and zinc. The following radionuclides are also monitored but have not been analyzed for trends: gross alpha, gross beta, radium-226, and uranium.

### COLLECTION METHODS:

Data-collection stations are maintained at selected locations to provide standardized records on surface- and ground-water conditions. A variety of automated instruments are used to measure and record water conditions.

### COLLECTION FREQUENCY:

Data are collected monthly at four percent of the sites, bimonthly at eighteen percent of the sites; and quarterly at seventy-eight percent of the sites. Trace element collection is quarterly only, and radionuclides are only collected semiannually.

### GEOGRAPHIC COVERAGE:

Coverage includes fifty-eight locations in thirty-seven states.

### CONTACTS:

# National Land Use and Land Cover Mapping Program

### OFFICE:

U.S. Geological Survey  
Office of Geographic and Cartographic Research

### SUMMARY PROGRAM DESCRIPTION:

As part of its National Mapping Program, the USGS produces and distributes land use and land cover maps and digitized data. Land use refers to human activities that are directly related to the land. Land cover describes the vegetation, water, natural surface, and artificial constructions at the land surface. Associated maps display information on political units, hydrologic units, census county subdivisions, and in some cases, federal land ownership.

### DATA COVERAGE:

Land use and land cover areas are classified into nine major classes: urban or built-up land; agricultural land; rangeland; forest land; water areas; wetland; barren land; tundra; and perennial snow or ice. Each major class is subdivided into several minor classes, for thirty-seven minor classes total. For example, forest lands are further classified as deciduous, evergreen, or mixed forest land, and water is further classified as streams and canals, lakes, reservoirs, or bays and estuaries.

### COLLECTION METHODS:

Remote sensing methods are used, including satellite imagery, high-altitude imagery, medium-altitude remote sensing (1:20,000), and low-altitude imagery.

### COLLECTION FREQUENCY:

Data were collected in the late 1970s and early 1980s.

### GEOGRAPHIC COVERAGE:

1:250,000 maps are available for the continental United States. Digitized data at 1:250,000 scale are available for most of the East, Midwest, West Coast, and parts of the Rocky Mountain states and Texas. A few areas, including Hawaii, are available at 1:100,000 scale.

### CONTACT:

### PUBLICATIONS:

Department of the Interior, U.S. Geological Survey. 1986. Land Use and Land Cover Digital Data from 1:250,000 and 1:100,000 Scale Maps, U.S. Geodata Users Guide 4. Washington, DC: Department of the Interior, U.S. Geological Survey.

### DATABASE(S):

U.S.GeoData

The U.S.GeoData database contains digitized data on land use and land cover (see above description), elevation models, digital line graphs for planimetric data, and geographic names information. Land use and land cover data are produced in two formats: (the vector polygon and the composite theme grid cell) and are available in ASCII character or in IBM binary format from the Earth Sciences Information Center. Summary land use data for census county subdivisions, hydrologic units, and political units are available on microfiche from the Earth Sciences Information Center.

## DEPARTMENT OF THE INTERIOR

# National Stream Quality Accounting Network

### OFFICE:

U.S. Geological Survey  
Water Resources Division  
Office of Water Quality

### SUMMARY PROGRAM DESCRIPTION:

The National Stream Quality Accounting Network (NASQAN) program, started in 1972, provides a nationally uniform basis for assessing large-scale and long-term trends in the physical, chemical, and biological characteristics of the nation's surface waters. Water quality monitoring is carried out at the stations which are generally located on major rivers at the downstream end of the accounting unit.

### DATA COVERAGE:

Principal constituents monitored in freshwater and analyzed for trends are pH, alkalinity, sulfate, nitrate, phosphorus, calcium, magnesium, sodium, potassium, chloride, suspended sediment, fecal coliform bacteria, fecal streptococcal bacteria, dissolved oxygen, and dissolved oxygen deficit.

Trace elements monitored in freshwater and analyzed for trends are arsenic, cadmium, chromium, iron, lead, manganese, mercury, selenium, and zinc.

Operating within NASQAN is the Radiochemical Surveillance Network consisting of 46 sampling sites. The following radionuclides are also monitored at forty-six sites but have not been analyzed for trends: gross alpha, gross beta, radium-226, and uranium. Additional radiochemical data are collected from the Tritium Network, which monitors tritium concentrations at 13 streamflow and 9 atmospheric precipitation sampling sites throughout the United States.

### COLLECTION METHODS:

Data-collection stations are maintained at selected locations to provide standardized records on surface- and ground-water conditions. A variety of automated instruments are used to measure and record water conditions. Standard laboratory analyses are performed on samples according to the substance being measured. Quality control procedures are carried out in the laboratory.

### COLLECTION FREQUENCY:

Data are collected bimonthly at fifty-eight percent of sites and quarterly at forty-two percent of sites. Trace element collection is quarterly and radionuclides are collected semiannually. Annual data summaries are available for each state.

### GEOGRAPHIC COVERAGE:

Coverage includes: twenty-one water resource regions, 213 water resource subregions, 411 monitoring stations, and the fifty states plus Puerto Rico.

## DEPARTMENT OF THE INTERIOR

### National Trends Network

#### OFFICE:

U.S. Geological Survey  
Water Resources Division  
Office of Atmospheric Deposition Analysis

#### SUMMARY PROGRAM DESCRIPTION:

The National Trends Network (NTN) for monitoring precipitation chemistry in the U.S. was formally established in 1983 (although some monitoring sites were established in 1978). The NTN is under the sponsorship of the U.S. Geological Survey, as lead agency for deposition monitoring under the National Acid Precipitation Assessment Program (NAPAP). The NTN consists of 150 stations located predominantly in rural areas, but in combination with the National Atmospheric Deposition Program (NADP), includes more than 200 sites nationwide.

#### DATA COVERAGE:

Principal constituents monitored in precipitation and analyzed for trends are pH, specific conductance, hydrogen ions, sulfate and nitrate ions, ammonium and calcium ions, and chloride, magnesium, sodium, and potassium ions.

#### COLLECTION METHODS:

The NADP/NTN monitoring program has developed criteria and protocols which ensure uniformity in siting, sampling methods, analytical techniques, data handling, and overall network operations. Precipitation is collected by wet/dry precipitation collectors and rain gages. Analytical methods for the chemical variables measured are: laboratory pH; field pH; laboratory conductivity; electrometric detection of hydrogen (also reported as pH); automated colorimetric detection of ammonium; atomic absorption spectrophotometric detection of calcium, magnesium, sodium, and potassium; and ion chromatographic detection of sulfate, nitrate, and chloride. Methodologies are described in National Atmospheric Deposition Program (1988) — See Publications. NTN is an interagency program that involves participation by many federal agencies.

#### COLLECTION FREQUENCY:

Samples are collected weekly. Data from some sites are available from 1979.

#### GEOGRAPHIC COVERAGE:

The entire United States; however, not all states have stations located within their boundaries. The trend analysis report covers nineteen stations located mainly in the eastern United States.

## DEPARTMENT OF THE INTERIOR

# National Water Conditions Reporting System

### OFFICE:

U.S. Geological Survey  
Water Resources Division  
Office of Scientific Information Management  
Hydrologic Information Unit

### SUMMARY PROGRAM DESCRIPTION:

This program collects and analyzes streamflow data from 190 sites in the United States, Canada, and Puerto Rico; groundwater levels from about 200 sites in the conterminous United States; reservoir contents from 100 reservoirs in the United States and Canada; and limited water-quality data from five sites on major rivers. These data, or summaries thereof, are published in the free monthly newsletter, "National Water Conditions."

### DATA COVERAGE:

Streamflow data include maximum, minimum, and mean monthly discharge, and also maximum and minimum daily discharges for the period of record. Classed data (quartiles) for the current thirty-year reference period (1951-80 at this time) include monthly, quarterly, and annual (water-year and calendar year) means. Period-of-record monthly averages, maximums and minimums are available for groundwater levels, reservoirs, and water quality data.

Data reveal trends in stream flow and volume (for example, effects of droughts, floods, and reservoirs on discharges). Spatial data (e.g. maps) and descriptive text are generated from the data.

### COLLECTION METHODS:

Sampling locations and rivers sampled are selected so as to provide an overall picture of conditions in the nation. Selection criteria depend upon purpose (e.g., major rivers are chosen by streamflow). The data collection design is based on professional judgment that data are representative; a statistical design was not developed or implemented.

Data parameters are measured by recording instrumentation and stored in the WATSTORE database. USGS personnel extract the data from WATSTORE and the external source listed under Databases (below) and conduct statistical analyses to produce trends in national water conditions.

### COLLECTION FREQUENCY:

Frequency includes: monthly means for all streamflow with highest, lowest, and last available day of month for some sites; month end reservoir contents; and month end groundwater levels.

### GEOGRAPHIC COVERAGE:

Entire United States, Puerto Rico, and southern Canada. Streamflow sites were selected to provide enough data to define maps of streamflow conditions on a monthly basis. Reservoirs were selected to provide a general picture. Groundwater network provides data on areas of significant groundwater use.

## DEPARTMENT OF THE INTERIOR

# National Water Use Information Program

### OFFICE:

U.S. Geological Survey  
Water Resources Division  
Program Coordination and Technical Support  
Branch of Water Use Information

### SUMMARY PROGRAM DESCRIPTION:

The National Water Use Information Program is a federal-state cooperative program designed to collect, store, analyze, and disseminate water-use information both nationally and locally. The program began in 1978 to meet the need for a single source of uniform information on water use. The water-use information from the program complements long-term USGS data on the availability and quality of the nation's water resources.

The objectives of the program are to determine, on a national level, how much fresh and saline surface water and groundwater are withdrawn and for what purposes; how much of this water is consumed during use; and how much water is returned to the source after use.

### DATA COVERAGE:

Water withdrawals from surface and groundwater sources and consumptive use estimates are compiled by state and water resources regions for the following water-use categories: public supply; domestic; commercial; industry; mining; irrigation; livestock; and thermoelectric power generation. Instream use is estimated for hydroelectric power generation. Trend data are available at five-year intervals from 1950 to 1990.

### COLLECTION METHODS:

Water-use data are based on direct measurements or estimation, depending upon whether the parameter is metered or not. The data are compiled through a census, primarily mail surveys or permit reports required to meet state regulations. Personnel of cooperating states collect water-use data and aggregate these data by county and hydrologic unit. The point data are stored on state-level databases; the aggregated data are compiled by the USGS for incorporation into the national Aggregated Water Use Data System (AWUDS).

### COLLECTION FREQUENCY:

National compilations of "Estimated Use of Water in the United States" have been published by the USGS since

1950 at five-year intervals. Many states compile and publish monthly or annual water use data as part of the cooperative program.

### GEOGRAPHIC COVERAGE:

Water use estimates are compiled for all fifty states, Puerto Rico, Virgin Islands, and the District of Columbia. Data are available for 1985 by county and four-digit hydrologic subregion.

### Water Resources Assessment Program

#### OFFICE:

U.S. Geological Survey  
Water Resources Division  
Office of Water Assessment and Data Coordination  
Branch of National Water Summary

#### SUMMARY PROGRAM DESCRIPTION:

The principal goal of the program is to develop summary level statistics on water resources at the state and national levels appropriate for the preparation of USGS's biennial report, National Water Summary. Each report is oriented toward a specific water resource theme (e.g., groundwater quality).

#### DATA COVERAGE:

Summary information is derived from direct measurement data and statistics for national and state levels include: water availability (e.g., surface and groundwater potential, use, and development); water quality (e.g., point and nonpoint sources of pollution, eutrophication, bottom sediment contamination, saline-water intrusion, hazardous wastes, radioactive wastes, and acidic precipitation); hydrologic hazards and land use (e.g., flooding, land subsidence, sinkholes, erosion, sedimentation, wetlands, and resource development); and institutional and management activities. Also covered are seasonal hydrologic conditions and hydrologic events such as precipitation, streamflow, floods, and storms. The results of time-series monitoring, spatial data analyses, and one-time studies are reported. Most of the spatial data are state level.

#### COLLECTION METHODS:

Data summarized in the National Water Summary are compiled from existing U.S. Geological Survey and other-agency data files.

#### COLLECTION FREQUENCY:

Data are compiled periodically.

#### GEOGRAPHIC COVERAGE:

Entire United States, Puerto Rico, and Trust Territories.

#### CONTACT:

#### DATABASE(S):

Because this program uses existing U.S. Geological Survey and other-agency databases, it is not a database source.

## DEPARTMENT OF TRANSPORTATION

### Highway Statistics

#### OFFICE:

Federal Highway Administration  
Office of Highway Information Management

#### SUMMARY PROGRAM DESCRIPTION:

The program includes the collection, analysis, summary, and dissemination of a broad range of data related to the physical characteristics of the nation's highway system, as well as the traffic/travel and related performance activity which occurs on those systems.

#### DATA COVERAGE:

Data are compiled by the state highway and transportation agencies, using guidelines prepared by Federal Highway Administration (FHWA) and approved by the Office of Management and Budget. Data reported to FHWA include characteristics such as: traffic volumes; travel estimates (for example, miles traveled and fuel consumption per vehicle and per capita); vehicle speeds; distribution of vehicle types and weights by highway category; vehicle fuel efficiency ratings and motor fuel consumption; vehicle registrations and driver licensing (including revenues related to latter variables); state and local highway finance; Federal Highway Trust Fund status; highway mileage; pavement condition; and accidents. Data also include personal travel characteristics collected as part of the Nationwide Personal Transportation Study (NPTS). Trend data for many of the characteristics date back to the early 1900s.

#### COLLECTION METHODS:

Data collection methods vary by program. Some data are collected by a full census whereas other data are collected using a statistical sample basis, such as collection of travel data. Methodologies are generally described in reference publications listed below.

#### COLLECTION FREQUENCY:

Highway statistics have been published annually since 1945. Most data are reported on an annual basis with the exception of speed data which are reported quarterly and traffic volumes/fuel consumption data which are reported monthly. NPTS data are available for 1969, 1977, 1983, and 1990.

#### GEOGRAPHIC COVERAGE:

National coverage with further stratification by state and functional highway category.

## DEPARTMENT OF TRANSPORTATION National Transportation Statistics

### OFFICE:

Research and Special Programs Administration  
Volpe National Transportation Systems Center  
Center for Transportation Information

### SUMMARY PROGRAM DESCRIPTION:

The program includes the collection, analysis, and summary of selected national transportation statistics from a wide variety of government and private sources.

### DATA COVERAGE:

Statistics are generated for various transportation modes including air carrier, general aviation, automobile, bus, truck, local transit, rail, water, oil pipeline, and natural gas pipeline. For example, data are reported for passenger travel by automobile, airplane, bus, and railroad and freight miles of travel by truck, railroad, airplane, pipeline, and waterway. Basic descriptions of U.S. transportation, such as operating revenues and expenses, and vehicle and passenger miles, are provided. Supplementary data include transportation and the economy, and energy in transportation. Data show ten-year trends and, in some instances, extend back to 1955.

### COLLECTION METHODS:

Data are abstracted from government and private data.

### COLLECTION FREQUENCY:

Data are collected on an annual basis.

### GEOGRAPHIC COVERAGE:

Entire United States.

### CONTACT:

Kathleen Bradley  
Transportation Data Specialist  
Volpe National Center for Transportation Information  
Transportation Systems Center  
55 Broadway

## DEPARTMENT OF TRANSPORTATION

# Marine Pollution Retrieval System

### OFFICE:

U.S. Coast Guard  
Pollution Response

Washington, DC 20593  
Phone: (202) 267-2611

### FOR PUBLIC INQUIRIES:

See Contact.

### SUMMARY PROGRAM DESCRIPTION:

The Marine Pollution Retrieval System contains details of pollution incidents in the coastal zone where the Coast Guard is the on-scene coordinator and in the inland zone where Coast Guard personnel assist an on-scene coordinator for the Environmental Protection Agency (EPA).

### PUBLICATIONS:

Coast Guard. 1989. Polluting Incidents In and Around U.S. Waters, 1984, 1985, and 1986 (and earlier reports in this series). COMDTINST M16450 series. Washington, DC.

### DATA COVERAGE:

Records are kept on: oil spills (number, volume, date, substance, costs for federally-funded responses, and case histories); spills of hazardous substances (substance name, CHRIS ID code, physical/chemical properties); geographic information (latitude and longitude and/or river mile number, waterbody name, city, state, and, where applicable, vessel name and ID); facility information (name, address, ID codes); and transportation information (air, land, inland, and coastal waterways).

### DATABASE(S):

Marine Pollution Retrieval System (MPRS)

MPRS is a computer-based system developed by the Coast Guard to support Pollution Response. Initially designed for the Collection and Maintenance of discharge data, subsequent modifications have been made to permit the inclusion of additional data describing clean-up (response) activities and penalty actions. MPRS is available to Congress, government agencies, academia, and private interests.

### COLLECTION METHODS:

The Federal Water Pollution Control Act, as amended (Section 311), and Executive Order 11735 require that any discharge of an oil or a hazardous substance in a harmful quantity be reported to the U.S. Coast Guard. Data are reported for actual spills only, i.e., discharges which entered the water. Incidents which are reported to EPA and occurred in waters under Coast Guard jurisdiction are also compiled. A sample data reporting form is provided in the Coast Guard publication listed below.

### COLLECTION FREQUENCY:

Data are collected when spills occur.

### GEOGRAPHIC COVERAGE:

Entire United States.

### CONTACT:

Commandant (G-MEP-2)  
Marine Information Branch  
U.S. Coast Guard  
2100 Second St., SW

## ENVIRONMENTAL PROTECTION AGENCY

### National Air Pollution Control Program

#### OFFICE:

Office of Air Quality Planning and Standards  
Data Analysis Section

#### SUMMARY PROGRAM DESCRIPTION:

The Air Pollution Control Program collects and analyzes data on ambient air quality and air pollution levels and compares them to National Ambient Air Quality Standards (NAAQS).

#### DATA COVERAGE:

Ambient concentrations of the following criteria air pollutants are monitored and analyzed for ten-year trends and recent changes: sulfur dioxide; nitrogen dioxide; carbon monoxide; total suspended particulates; ozone; and lead.

Emission estimates are available for particulates, sulfur oxides, nitrogen oxides, reactive volatile organic compounds, carbon monoxide, and lead. Data are broken down by the following emission sources: transportation (e.g., motor vehicles, aircraft); stationary fuel combustion (e.g., coal, natural gas); industrial processes (e.g., copper, pulp mills); solid waste disposal; and miscellaneous sources (e.g., forest fires, agricultural burning). Air quality trends for major urban areas are provided.

#### COLLECTION METHODS:

Ambient air quality conditions are based upon actual direct measurements. The data are analyzed for trends and these trends are supplemented with trends for nationwide emissions, which are based upon best available engineering calculations. Data are collected and reported to EPA by state and local agencies.

#### COLLECTION FREQUENCY:

Data are collected hourly and daily. Estimates are provided for 1940, 1950, 1960, and 1970 to give an historical perspective on national air quality and pollutant emissions and for 1975 to present as an indication of recent trends.

#### GEOGRAPHIC COVERAGE:

All fifty states, with metropolitan statistical areas (population greater than 500,000) more heavily analyzed.

### Environmental Monitoring and Assessment Program, Long-Term Monitoring Project

#### OFFICE:

Office of Ecological Processes and Effects Research  
Corvallis Environmental Research Laboratory

#### SUMMARY PROGRAM DESCRIPTION:

The Long-Term Monitoring Project (LTMP) was initiated in 1983 to monitor trends in low-acid neutralizing capacity (ANC) surface waters across a gradient of acidic atmospheric deposition. LTMP operates with cooperators affiliated with federal agencies and universities in six geographic regions. The LTMP was preceded by the National Surface Water Survey and continued after it.

#### DATA COVERAGE:

Variables monitored include pH, ANC, calcium, magnesium, potassium, sodium, sulfate, chloride, nitrate, dissolved organic carbon, and aluminum. Trend data are not available because of the short period of record (since 1983).

#### COLLECTION METHODS:

See Publications.

#### COLLECTION FREQUENCY:

Data are collected seasonally.

#### GEOGRAPHIC COVERAGE:

Coverage includes approximately ninety lake sites in Maine, Vermont, the Adirondacks, and the Upper Midwest; two mountainous regions of Colorado; and approximately eight streams in the Catskills area of New York.

#### CONTACT:

John Stoddard

### National Surface Water Survey

#### OFFICE:

Office of Ecological Processes and Effects Research  
Environmental Research Laboratory

#### SUMMARY PROGRAM DESCRIPTION:

The National Surface Water Survey consists of two parts: the National Lake Survey and the National Stream Survey.

The purpose of the National Lake Survey is to quantify, with known statistical confidence, the current status, extent, and chemical and biological characteristics of lakes in regions of the United States that are potentially sensitive to acidic deposition.

The purpose of the National Stream Survey (NSS) is to determine the percentage, extent, and location of streams in the United States that are presently acidic or have low acid-neutralizing capacity and may, therefore, be susceptible to future acidification, as well as to identify streams that represent important classes in each region for possible use in more intensive studies or long-term monitoring. The NSS provides an overview of stream water chemistry in regions of the United States that are expected, on the basis of previous alkalinity data, to contain predominantly low acid-neutralizing capacity waters.

#### DATA COVERAGE:

Variables monitored include: acid neutralizing capacity (ANC), aluminum, ammonium, base cations, conductance, major ions, metals, nitrate, organics, pH, and sulfate.

#### COLLECTION METHODS:

A randomly selected subset of lakes was sampled using appropriate methods. The sample results were then weighted to estimate the chemical compositions of lake populations with known confidence. Uncertainties with time of sampling, spatial variability, and population definition are included in specific research projects to improve confidence in estimates.

The NSS employed a randomized, systematic sample of regional stream populations and used rigorous quality assurance protocols for field sampling and laboratory chemical analysis.

#### COLLECTION FREQUENCY:

"Index" sample taken at the time of the fall overturn for lakes and high and low flow for streams.

#### GEOGRAPHIC COVERAGE:

Northeastern, Southeastern, Upper Midwest, and Western United States for lakes, and Middle Atlantic, Southeast, and Southern Blue Ridge Province for streams.

## ENVIRONMENTAL PROTECTION AGENCY

# Comprehensive Environmental Response, Compensation and Liability Information System

### OFFICE:

Office of Emergency and Remedial Response

### SUMMARY PROGRAM DESCRIPTION:

The Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) contains information on abandoned or uncontrolled hazardous waste sites.

### DATA COVERAGE:

The CERCLIS database contains information on the location of over 30,000 sites. In addition, the database contains information on pre-remedial actions such as the discovery date and the completion date of a preliminary assessment, site inspection, and the date of final hazardous ranking determination. Of the sites, over 1,200 are listed on the National Priority List (NPL). CERCLIS also contains information such as: description of NPL site (predominant land uses, waste treatment storage and disposal, distance to nearest population); owner/generator information; regulatory and response history; waste description (physical state, predominant waste type and quantity of waste); environmental impact information; water use information; and the remedial events occurring at the NPL sites, including planned and actual starts and completions, prior year obligations, current year obligations, and outlays to date.

### COLLECTION METHODS:

Data are collected during inventory, assessment, and cleanup of uncontrolled hazardous waste sites. EPA Regional Offices maintain the data in CERCLIS databases.

### COLLECTION FREQUENCY:

On-line updating.

### GEOGRAPHIC COVERAGE:

Sites throughout the entire United States and the territories.

### CONTACTS:

For telephone inquiries concerning the database, call (703) 538-7234.

### FOR PUBLIC INQUIRIES:

Written requests for information should be addressed to:

## ENVIRONMENTAL PROTECTION AGENCY

### Environmental Radiation Ambient Monitoring System

#### OFFICE:

Office of Radiation Programs  
National Air and Radiation Environmental Laboratory

#### SUMMARY PROGRAM DESCRIPTION:

The Environmental Radiation Ambient Monitoring System (ERAMS) was implemented in 1973 and has operated continuously ever since. The ERAMS monitors radioactivity associated with air, drinking water, surface water, and milk. Prior to 1973 and dating back to 1960, several national networks of environmental radiation sampling stations were operated by the U.S. Public Health Service. When EPA was established, these networks were consolidated and modified into the single national network now known as ERAMS.

#### DATA COVERAGE:

Data for pasteurized milk include concentrations of: Iodine(I)-131, Barium(Ba)-140, Cesium(Cs)-137, Potassium(K)-40, Strontium(Sr)-89, Sr-90, and Carbon(C)-14. For airborne particulates: Geiger-Mueller field estimates, gross beta, gamma scans, Plutonium(Pu)-238, Pu-239, Pu-240, Uranium(U)-234, U-235, U-238, and Krypton(Kr)-85. For precipitation: Hydrogen(H)-3, gross beta, gamma scans, Pu-238, Pu-239, Pu-240, U-234, U-235, and U-238. For drinking water: H-3, gamma scans, gross alpha, gross beta, Radium(Ra)-226, Ra-228, Sr-89, Sr-90, Pu-238, Pu-239, Pu-240, U-234, U-235, U-238, and I-131. For surface water: H-3 and gamma scans.

#### COLLECTION METHODS:

The ERAMS program includes 332 sampling stations distributed throughout the fifty states, the Virgin Islands, Panama Canal, and Puerto Rico. Stations were selected to provide optimum radiation source and population coverage. Many stations are located downstream from nuclear power plants. See Publications for description of methods.

#### COLLECTION FREQUENCY:

Analytical frequency is different for different analyses, ranging from twice weekly for gross beta in air to every two years for Krypton-85. Analytical frequencies for specific radionuclides can be found in the quarterly publication "Environmental Radiation Data" and the

"Environmental Radiation Ambient Monitoring System (ERAMS) Manual."

#### GEOGRAPHIC COVERAGE:

Sampling stations are sited throughout the fifty states, the Virgin Islands, Panama Canal, and Puerto Rico.

#### DATABASE(S):

Environmental Radiation Ambient Monitoring System (ERAMS)

The ERAMS contains analytical data from approximately 1973 to the present covering the main networks of ERAMS for the following media: air particulates, precipitation, drinking water, surface water, and milk. The data are organized geographically by city and state and include latitude and longitude plotting coordinates.

## ENVIRONMENTAL PROTECTION AGENCY

### Hazardous Waste Survey

#### OFFICE:

Office of Solid Waste  
Communications, Analysis and Budget Division  
Information Management Staff

#### SUMMARY PROGRAM DESCRIPTION:

The office of Solid Waste manages two major national information systems to support the Resource Conservation and Recovery Act (RCRA) Subtitle C program: the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS).

#### DATA COVERAGE:

RCRIS is a national program management and inventory system of RCRA hazardous waste handlers. Handlers are characterized as fitting one or more of the following categories: Treatment, storage and disposal facilities (TSDFs); large quantity generators (LQGs); small quantity generators (SQGs); and transporters. RCRIS captures identification and location data for all handlers and a wide range of information on TSDFs regarding permit/closure status, compliance with federal and state regulations, and cleanup activities.

BRS is a national system that collects data on the generation, management, and minimization of hazardous waste. BRS captures detailed data on the generation of hazardous waste from LQGs and data on waste management practices from TSDFs. These data are collected every other year and provide the ability to perform trend analysis.

#### COLLECTION METHODS:

Data are collected through the Biennial Hazardous Waste Report, EPA Forms (Notification and Part A Permit Applications), other data submittals by hazardous waste facilities (Part B Permit Applications) as well as inspections and assessment of RCRA sites.

#### COLLECTION FREQUENCY:

Data maintained in the BRS are collected every two years. Data maintained in the RCRIS are collected as the event or activity occurs (i.e., as the Notification of Hazardous Waste Activity Form is submitted or as inspections are performed).

#### GEOGRAPHIC COVERAGE:

Entire United States.

## U.S. ENVIRONMENTAL PROTECTION AGENCY

### Non-Hazardous Waste Survey

#### OFFICE:

Office of Solid Waste  
Office of Policy, Planning and Information  
Information Management Staff

#### SUMMARY PROGRAM DESCRIPTION:

Data are collected through survey and reporting mechanisms on non-hazardous ("solid") wastes generation and management. Various capabilities are available for retrieving and analyzing these data. Generally, the information available consists of regulated entities and waste volumes generated and managed.

#### DATA COVERAGE:

National statistics are available for wastes generated and managed. The data covers the industrial sector and the municipal landfill sector.

**Industrial:** Statistics are available on the amounts of non-hazardous waste by type of industry (e.g., textile, pulp and paper, water treatment), management practices (e.g., landfills, surface impoundments, incineration, recycling), and by size of establishment.

**Municipal Landfills:** Trend data are available on: quantity of materials generated in the municipal waste stream (including paper, glass, metal, and plastics, rubber, leather, textiles, wood, and other nonfood waste, and food, yard, and miscellaneous inorganic waste); quantity and type of waste accepted and refused (e.g., household, commercial, construction); quantity of materials recovered from the municipal waste stream; quantity of materials generated and recovered per capita; size and capacity of facility; monitoring systems; types of liners and covers; hydrological characteristics and proximity to drinking water supplies; and number of persons using these sources.

#### COLLECTION METHODS:

Data are collected by survey methods and direct reporting.

#### COLLECTION FREQUENCY:

Data collection and reporting frequency range from once to every two years.

#### GEOGRAPHIC COVERAGE:

Entire United States.

#### CONTACT:

### Toxics Release Inventory

#### OFFICE:

Office of Toxic Substances  
Economics and Technology Division

401 M Street, S.W.  
Washington, DC 20460  
Phone: (202) 260-1821

#### FOR PUBLIC INQUIRIES:

See Contact.

#### SUMMARY PROGRAM DESCRIPTION:

The Toxics Release Inventory (TRI) is a mandatory annual inventory of the release of 328 toxic chemicals to air, water, land, and off-site disposal from more than 17,000 manufacturing facilities across the country.

#### PUBLICATIONS:

Environmental Protection Agency. 1991. The Toxics Release Inventory: National and Local Perspectives. EPA 560/4-91-014. Washington, DC.

—. 1992. 1990 Toxic Release Inventory: Public Data Release. EPA-700-S-92-002. Washington, DC.

#### DATA COVERAGE:

Data collected include: facility information, including Resource Conservation and Recovery Act and National Pollution Discharge Elimination System permit numbers; pounds/year emissions information for air, water, and land disposal, and off-site transfers of wastes; treatment processes and efficiencies; and waste reduction data.

#### DATABASE(S):

TOXNET/Toxic Release Inventory

#### COLLECTION METHODS:

The Emergency Planning and Community Right-to-Know Act requires manufacturers to report to EPA and the states on the amounts of over 300 toxic chemicals that they release directly to air, water, or land, or that they transfer to offsite facilities that treat or dispose of wastes. Facilities are required only to report data that are already known or reasonably ascertainable to them, e.g., engineering estimates. They are not required to measure or otherwise verify the data they submit. Survey submissions on forms are tabulated and stored by EPA on computer tape or disc, and the data are compiled into an annual inventory of releases and transfers.

All data from the Toxic Release Inventory include more than 74,000 reports filed by 17,000 manufacturing facilities on 328 toxic chemicals. Data are also available on diskette, CD-ROM, tape, and microfiche.

For more information, contact:

National Library of Medicine  
Phone: (301) 496-6531

#### COLLECTION FREQUENCY:

Data are collected yearly through mandatory industry reporting.

#### GEOGRAPHIC COVERAGE:

Entire United States.
