## INTRODUCTION

EPA Region IV, in January, requested the National Enforcement Investigations Center (NEIC), to rank selected Federal facilities according to their relative potential for having environmental problems.\* These facilities were ranked with a Multi-Media Priority Ranking Model, developed by NEIC using available information from the various EPA databases and Region files. The Region will use these rankings to help direct their enforcement and compliance effort in the area of Federal facilities.

Facilities were ranked according to the type and magnitude of activities in the various media which actually, or could potentially, result in environmental contamination. These activities include past and present hazardous waste\*\* generation and management, handling and storage of hazardous and toxic materials, wastewater discharges and air emissions. In keeping with agency priorities, emphasis was placed on the potential environmental problems associated with hazardous waste management activities.

To ensure timely and consistent ratings, only information which was easily accessible and available for all or most installations was used to rank the facilities. The major information sources used were the various EPA computer databases and Region file data. Because site inspection reports were available for only a few facilities, information of this type was not used in the ranking process. In addition, facility compliance data was not used because of the dynamic nature of such information.\*\*\*

It should be noted that the ranking model does not compare a facility rating with any fixed number to indicate whether a facility is environmentally "good" or "bad." Rather, the rating provides an indication of whether that facility has the potential, relative to other installations, for having major environmental problems (i.e., the higher the rating the greater the potential for environmental

---

\* Environmental problems, as generally used here, are directly related to the release of contaminants to the environment.

\*\* As defined in 40 CFR 261

\*\*\* Specific facility information and recent compliance data would be used as part of the detailed followup evaluation of a facility, if warranted.

problems). Thus, a high rating indicates that a facility has a high potential for environmental problems and further evaluation is warranted.

## METHODS

The list of facilities to be prioritized was compiled by Region IV from an initial listing of Federal facilities contained in EPA's computerized Facilities Index System (FINDS). The FINDS list contained approximately 675 Federal installations with; (1) known or suspected hazardous waste disposal sites (active and inactive), (2) Resource Conservation and Recovery Act (RCRA) permit application or permits on file with EPA, (3) National Pollutant Discharge Elimination System (NPDES) permits and/or (4) air emission point sources. Of these, the Region selected 193 for prioritization.

Selected facilities were ranked based on the type and level of activity in the following six categories:

- Hazardous waste management
- Site contamination (known and potential)
- Wastewater discharges
- Toxic substances, including polychlorinated biphenyls (PCBs)
- Air emissions
- Drinking water supplies

The above categories generally reflect activities regulated by one or more of six environmental statutes: Resource Conservation and Recovery Act (RCRA), Comprehensive Environmental Response Compensation and Liability Act (CERCLA), Clean Water Act (CWA), Toxic Substances Control Act (TSCA), the Clean Air Act (CAA) and the Safe Drinking Water Act (SDWA), respectively. An explanation on how facilities were ranked in each category follows.

## HAZARDOUS WASTE MANAGEMENT (RCRA)

This category ranks facilities according to the potential for environmental contamination through generation and management of hazardous waste. For rating purposes, the category was divided into four activity subcategories: (1) Annual quantity of hazardous waste generated, (2) waste storage design capacity, (3) waste treatment design capacity and (4) waste disposal design capacity. These general subcategories were used because of the type of information readily available and the wide range and levels of hazardous waste management activities.

The major information source used for this category was the EPA Hazardous Waste Data Management System (HWDMS), a computer database which includes information submitted to EPA by hazardous waste generation/handling facilities in RCRA Part A and/or Part B permit applications. The data includes the type and quantity of hazardous wastes generated, the types of hazardous waste management activity and the design capacity of waste processes. Information was obtained from Regional RCRA files when the computer database was incomplete.

The minimum rating for any facility generating hazardous waste is 3 [Table 1]. This accounts for activities involving actual generation and any short term or small quantity management of waste. Generating facilities with RCRA storage, treatment or disposal activities were rated according to the relative level of activity in each subcategory. An additional rating point was assigned to all these facilities to account for potential problems involved in the actual waste generating process(es). Also, facilities which treat, store or dispose of hazardous waste in a surface impoundment were assigned an additional subcategory rating point due to enhanced contamination potential attributed to the use of impoundments. Facilities which dispose of hazardous waste through underground injection wells were assigned two additional subcategory rating points.

Table 1  
FACILITY RATING CRITERIA

Rating	Hazardous Waste Management <sup>1</sup>					Site Contamination		
	Quantity Generated (m tons/Year)	Storage Capacity (gal.)	Treatment Capacity (gal./day)	Disposal Capacity		Seriousness	Soil/Water Contami- nation	Bulk Storage of Hazardous Material
				Landfill (acres-ft.)	Land Application (acres)			
0	0	0	0	0	0	No <sup>2</sup>	No <sup>2</sup>	No <sup>2</sup>
1	<12	<10,000	<1,000	-	-	-	-	-
2	12-50	10,000- 100,000	1,000- 50,000	-	-	Low	Potential or suspected <sup>3</sup>	Known
3	50-500	>100,000	>50,000	<5	<10	Medium or unknown	-	-
4	500-50,000	-	-	≥5	≥10	High	-	-
5	>50,000	-	-	-	-	NPL <sup>4</sup>	Known <sup>5</sup>	-
Rating	Wastewater Discharges <sup>6</sup>			Toxic Substances	Air Emissions			Water Supplies
	Flow Rate (mgd)	SIC <sup>7</sup> Toxicity Group	Toxic Discharge	PCB Use	Number of Criteria Pollutants <sup>8</sup> Discharged at ≥100 Tons Per Year	Discharge to Nonattainment Areas	Suspected Hazardous Air Pollutant <sup>9</sup> Discharges	No. of Persons Supplied
0	No <sup>2</sup>	<3	No <sup>2</sup>	No <sup>2</sup>	No <sup>2</sup>	No <sup>2</sup>	No <sup>2</sup>	No <sup>2</sup>
1	-	-	-	-	0 <sup>10</sup>	-	-	<1000
2	<0.5	-	Suspected <sup>3</sup>	Suspected <sup>3</sup>	1	-	-	≥1000
3	0.5-1.5	≥3	Known	-	2	1 <sup>11</sup>	-	-
4	1.5-2.5	-	-	Known	>2	2 <sup>12</sup>	Yes	-
5	>2.5	-	-	-	-	>2	-	-

1. The minimum rating for any facility generating hazardous waste, regardless of any storage, treatment or disposal activities is 3. Facilities with RCRA storage, treatment and/or disposal activities are assigned subcategory ratings, as indicated in the table. An additional point is added to these facilities if they are also generators (see text). Facilities which treat, store or dispose of hazardous waste in a surface impoundment are assigned an additional point (see text). Facilities which dispose of hazardous waste through underground injection wells are assigned 2 additional points.
2. No = No known or suspected activity in this activity category or subcategory.
3. Suspected means that information suggests nonspecific activity in the subcategory.
4. NPL means the facility is listed or has been proposed for listing on the National Priorities List.
5. Facilities with known or potential contamination of drinking water supplies are assigned two additional rating points (total of 7).
6. Includes known discharges to municipal wastewater treatment plants.
7. SIC Toxicity Group [a number from 1 (lowest) to 5 (highest)] is an indication of potentially harmful health effects related to a specific Standard Industrial Classification (SIC) code (see text).
8. As defined in 40 CFR 50.
9. Hazardous air pollutant (40 CFR 61) emission sources with or without other air sources.
10. Facility has point source emissions but does not have the potential to discharge at ≥100 tons per year per pollutant.
11. Facility discharges one nonattainment pollutant in nonattainment area for that pollutant.
12. Facility discharges two nonattainment pollutants in nonattainment area for those pollutants.

Subcategory ratings and any additional rating points were combined to provide the overall facility rating for "Hazardous Waste Management" [Table 2 (overall facility ranking) and Table 3 (facility ranking within each state)]. For example, a facility generating 12 metric tons of hazardous waste annually, having 10,000 gallons of container storage capacity and 1,000 gallons per day tank treatment capacity would, using the rating criteria [Table 1], receive 2 rating points for waste quantity generated, 2 points for storage, 2 points for treatment and 1 point for being a waste generator [Table 1, footnote 1] or 7 points total for hazardous waste management. This ranking indicates the relative potential to contaminate the environment through hazardous waste management.

#### SITE CONTAMINATION (INCLUDING CERCLA)

This category ranks facilities according to the actual, suspected or potential for site contamination from either past operations or the present bulk storage of hazardous materials (acids, fuel oil, gasoline, etc).<sup>\*</sup> The category is divided into three activity subcategories: (1) Seriousness of site contamination problems, (2) contamination of soil and water, and (3) bulk storage of hazardous materials.

Information was obtained from the following EPA computer databases: FINDS, Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), Compliance Data System (CDS) and the Federal Facility Compliance Docket. Regional file information supplemented this data. FINDS lists all known or suspected facility sites which were contaminated from past activities. CERCLIS tracks these sites and identifies those which are proposed for, or listed on, the National Priority List (NPL). Regional files contain reports of any EPA/State or Department of Defense site investigations (such as preliminary assessments) for the suspected CERCLA sites. Preliminary assessment and Installation Restoration Program reports rate the "seriousness" of site problems as low, medium or high and, if known, indicate the type of site contamination (soil, water). CDS lists installations with

---

<sup>\*</sup> *Even though the handling of bulk quantities of hazardous materials may not be covered under CERCLA, it is included here because of its potential for site contamination.*

bulk storage facilities for hazardous materials (fuel oil, gasoline) through its inventory of volatile organic air emissions.

Rating points were assigned to each facility for activity in each of the three subcategories using Table 1. Facilities with known contamination of drinking water supplies were assigned two additional rating points. The sum of these ratings is the facility's overall rating for "Site Contamination" and is presented in Tables 2 and 3. An overall rating of 2 indicates that there is no known or suspected site contamination, but there is the potential for contamination due to onsite bulk storage of hazardous materials.

The files did not contain the results of preliminary assessments or other site evaluations for all facilities with known or suspected\* site contamination. Subcategory ratings of 3 for "seriousness" and 2 for "soil/water contamination" were assigned to such facilities with limited or no specific site information to account for the unknown potential for problems in these subcategories [Table 1].

### WASTEWATER DISCHARGES (CWA)

This category rates facilities according to the actual or potential impacts of wastewater discharges into receiving waters. The three subcategories used to rate facility activity in this category were: (1) Average daily flow rate; (2) the Standard Industrial Classification (SIC)\*\* code for the facility's waste generating activities and general wastewater type (industrial, sanitary or both) and (3) suspected discharge of toxic wastewater.

Information on the type and flow rate of wastewater discharges was obtained from the Permit Compliance System (PCS) and Regional NPDES files. SIC codes and toxic discharge information for each facility were taken from the EPA computer systems and Regional files. SIC codes were used to assign each facility to a SIC toxicity group. Each SIC toxicity group from 1 (lowest) to 5 (highest) correlates to the potential for harmful effects from

---

\* Known or suspected as a result of being included in the CERCLIS computer database.

\*\* The SIC is a number which describes an industry by the type of activity in which it is engaged.

wastewater discharges from a specific industry (as identified by the SIC code). The SIC Code/Toxic Pollutant Discharge Potential component of the NPDES permit ranking system, used by EPA nationally to classify dischargers as "major" or "minor," was used to assign Toxicity Group Numbers to the wastewater discharge facilities ranked here.

In cases where SIC codes were not readily available for installations rated, Regional file information regarding facility operations and waste generation was used to determine an appropriate Toxicity Group Number. Toxicity Group Numbers were used to help characterize wastewater discharge in lieu of specific information regarding wastewater characteristics. Also, facilities known or suspected of discharging toxic wastewater were assigned additional rating points. Flow rates, general wastewater type, Toxicity Group Number and suspected discharge of toxic wastewater were used as shown in Table 1 to assign ratings to each facility in each subcategory. Subcategory ratings were totaled to obtain the wastewater discharge ratings presented for each facility in Tables 2 and 3.

#### TOXIC SUBSTANCES INCLUDING PCB STORAGE AND USE (TSCA)

This category rates facilities according to information regarding use of PCBs. Information to identify facilities storing/using these compounds was obtained through all possible sources including, HWDMS, FINDS and Regional files (including the Federal Facilities Compliance Profiles and the A-106 database). Facilities were rated according to Table 1. Department of Defense facilities with no specific information regarding PCBs were assigned a rating point of 2 for this category. This is because general information indicates that most military installations handle PCBs and, therefore, PCB use is "suspected." Category ratings for each facility are presented in Tables 2 and 3.

#### AIR EMISSIONS (CAA)

This category rates facilities according to: (1) The number of criteria air pollutants (particulates, nitrous oxides, sulfur oxides, carbon monoxide and volatile organic carbon) emitted through point sources; (2) emissions of hazardous pollutants and (3) emission of pollutants into areas of nonattainment,

as shown in Table 1. The 100-tons-per-year rate for criteria air pollutants was used in the rating because that is the emission rate normally used to differentiate between major and minor point air emission sources. Facilities which do not have the potential to emit any criteria pollutants at greater than or equal to 100 tons per year were given a ranking of 1 for that subcategory. Additional ranking points were assigned facilities which emit nonattainment pollutants into nonattainment air quality control regions and/or discharge hazardous air pollutants. No attempt was made to incorporate fugitive emissions into the rating system.

Information on emission rates was obtained from the Compliance Data System (CDS), an EPA computer database containing information on permitted point air emission sources and Regional files. Facilities were rated quantitatively according to Table 1. Results for each facility are presented in Tables 2 and 3.

#### SAFE DRINKING WATER ACT (SDWA)

This category rates a facility's potential impact according to: (1) Whether it handles its own drinking water supplies and (2) the size of the population served by the facility. Information was obtained from the Federal Reporting Data System (FRDS), Public Water Source data and the Federal Facilities Environmental Compliance Profiles. Table 1 identifies how the rating points were assigned.

## RESULTS

The selected Federal facilities are listed in decreasing order of their overall potential for environmental problems as identified by the Mult-Media Priority Ranking Model [Table 2]. These same facilities are also listed in decreasing order of their overall potential for environmental problems by State [Table 3]. The rankings are not only useful in identifying the facilities with the highest potential for environmental problems, but also show those activities which need to be emphasized during inspections.

As previously stated, the facility rating was not designed to be compared to a fixed number to indicate whether an installation is environmentally "good" or "bad." Rather, the rating provides an indication of whether that facility has the potential, relative to other installations, for having major environmental problems. A high total rating indicates that, based on the type and level of onsite activities, a facility has a high probability of having environmental problems. It also indicates a more detailed evaluation of the facility is warranted.

This ranking only provides an initial evaluation of the selected facility, based on available information, and should be supplemented by a more detailed analysis of Regional files which includes a review of compliance status prior to any onsite investigations.
